

Ruckus FastIron Command Reference Guide, 08.0.50

Supporting FastIron Software Release 08.0.50

Copyright, Trademark and Proprietary Rights Information

© 2019 ARRIS Enterprises LLC. All rights reserved.

No part of this content may be reproduced in any form or by any means or used to make any derivative work (such as translation, transformation, or adaptation) without written permission from ARRIS International plc and/or its affiliates ("ARRIS"). ARRIS reserves the right to revise or change this content from time to time without obligation on the part of ARRIS to provide notification of such revision or change.

Export Restrictions

These products and associated technical data (in print or electronic form) may be subject to export control laws of the United States of America. It is your responsibility to determine the applicable regulations and to comply with them. The following notice is applicable for all products or technology subject to export control:

These items are controlled by the U.S. Government and authorized for export only to the country of ultimate destination for use by the ultimate consignee or end-user(s) herein identified. They may not be resold, transferred, or otherwise disposed of, to any other country or to any person other than the authorized ultimate consignee or end-user(s), either in their original form or after being incorporated into other items, without first obtaining approval from the U.S. government or as otherwise authorized by U.S. law and regulations.

Disclaimer

THIS CONTENT AND ASSOCIATED PRODUCTS OR SERVICES ("MATERIALS"), ARE PROVIDED "AS IS" AND WITHOUT WARRANTIES OF ANY KIND, WHETHER EXPRESS OR IMPLIED. TO THE FULLEST EXTENT PERMISSIBLE PURSUANT TO APPLICABLE LAW, ARRIS DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, TITLE, NON-INFRINGEMENT, FREEDOM FROM COMPUTER VIRUS, AND WARRANTIES ARISING FROM COURSE OF DEALING OR COURSE OF PERFORMANCE. ARRIS does not represent or warrant that the functions described or contained in the Materials will be uninterrupted or error-free, that defects will be corrected, or are free of viruses or other harmful components. ARRIS does not make any warranties or representations regarding the use of the Materials in terms of their completeness, correctness, accuracy, adequacy, usefulness, timeliness, reliability or otherwise. As a condition of your use of the Materials, you warrant to ARRIS that you will not make use thereof for any purpose that is unlawful or prohibited by their associated terms of use.

Limitation of Liability

IN NO EVENT SHALL ARRIS, ARRIS AFFILIATES, OR THEIR OFFICERS, DIRECTORS, EMPLOYEES, AGENTS, SUPPLIERS, LICENSORS AND THIRD PARTY PARTNERS, BE LIABLE FOR ANY DIRECT, INDIRECT, SPECIAL, PUNITIVE, INCIDENTAL, EXEMPLARY OR CONSEQUENTIAL DAMAGES, OR ANY DAMAGES WHATSOEVER, EVEN IF ARRIS HAS BEEN PREVIOUSLY ADVISED OF THE POSSIBILITY OF SUCH DAMAGES, WHETHER IN AN ACTION UNDER CONTRACT, TORT, OR ANY OTHER THEORY ARISING FROM YOUR ACCESS TO, OR USE OF, THE MATERIALS. Because some jurisdictions do not allow limitations on how long an implied warranty lasts, or the exclusion or limitation of liability for consequential or incidental damages, some of the above limitations may not apply to you.

Trademarks

ARRIS, the ARRIS logo, Ruckus, Ruckus Wireless, Ruckus Networks, Ruckus logo, the Big Dog design, BeamFlex, ChannelFly, Edgellron, FastIron, HyperEdge, ICX, IronPoint, OPENG, SmartCell, Unleashed, Xclaim, ZoneFlex are trademarks of ARRIS International plc and/or its affiliates. Wi-Fi Alliance, Wi-Fi, the Wi-Fi logo, the Wi-Fi CERTIFIED logo, Wi-Fi Protected Access (WPA), the Wi-Fi Protected Setup logo, and WMM are registered trademarks of Wi-Fi Alliance. Wi-Fi Protected Setup™, Wi-Fi Multimedia™, and WPA2™ are trademarks of Wi-Fi Alliance. All other trademarks are the property of their respective owners.

Preface

- Document Conventions..... 37
- Command Syntax Conventions..... 38
- Document Feedback..... 38
- Ruckus Product Documentation Resources..... 38
- Online Training Resources..... 39
- Contacting Ruckus Customer Services and Support..... 39

Document Conventions

The following table lists the text conventions that are used throughout this guide.

TABLE 1 Text Conventions

Convention	Description	Example
monospace	Identifies command syntax examples	<code>device(config)# interface ethernet 1/1/6</code>
bold	User interface (UI) components such as screen or page names, keyboard keys, software buttons, and field names	On the Start menu, click All Programs .
<i>italics</i>	Publication titles	Refer to the <i>Ruckus Small Cell Release Notes</i> for more information.

Notes, Cautions, and Warnings

Notes, cautions, and warning statements may be used in this document. They are listed in the order of increasing severity of potential hazards.

NOTE

A NOTE provides a tip, guidance, or advice, emphasizes important information, or provides a reference to related information.

ATTENTION

An ATTENTION statement indicates some information that you must read before continuing with the current action or task.

CAUTION

A CAUTION statement alerts you to situations that can be potentially hazardous to you or cause damage to hardware, firmware, software, or data.

DANGER

A DANGER statement indicates conditions or situations that can be potentially lethal or extremely hazardous to you. Safety labels are also attached directly to products to warn of these conditions or situations.

Command Syntax Conventions

Bold and italic text identify command syntax components. Delimiters and operators define groupings of parameters and their logical relationships.

Convention	Description
bold text	Identifies command names, keywords, and command options.
<i>italic text</i>	Identifies a variable.
[]	Syntax components displayed within square brackets are optional. Default responses to system prompts are enclosed in square brackets.
{ x y z }	A choice of required parameters is enclosed in curly brackets separated by vertical bars. You must select one of the options.
x y	A vertical bar separates mutually exclusive elements.
< >	Nonprinting characters, for example, passwords, are enclosed in angle brackets.
...	Repeat the previous element, for example, <i>member[member...]</i> .
\	Indicates a “soft” line break in command examples. If a backslash separates two lines of a command input, enter the entire command at the prompt without the backslash.

Document Feedback

Ruckus is interested in improving its documentation and welcomes your comments and suggestions.

You can email your comments to Ruckus at ruckus-docs@arris.com.

When contacting us, include the following information:

- Document title and release number
- Document part number (on the cover page)
- Page number (if appropriate)

For example:

- Ruckus SmartZone Upgrade Guide, Release 5.0
- Part number: 800-71850-001 Rev A
- Page 7

Ruckus Product Documentation Resources

Visit the Ruckus website to locate related documentation for your product and additional Ruckus resources.

Release Notes and other user documentation are available at <https://support.ruckuswireless.com/documents>. You can locate the documentation by product or perform a text search. Access to Release Notes requires an active support contract and a Ruckus Support Portal user account. Other technical documentation content is available without logging in to the Ruckus Support Portal.

White papers, data sheets, and other product documentation are available at <https://www.ruckuswireless.com>.

Online Training Resources

To access a variety of online Ruckus training modules, including free introductory courses to wireless networking essentials, site surveys, and Ruckus products, visit the Ruckus Training Portal at <https://training.ruckuswireless.com>.

Contacting Ruckus Customer Services and Support

The Customer Services and Support (CSS) organization is available to provide assistance to customers with active warranties on their Ruckus products, and customers and partners with active support contracts.

For product support information and details on contacting the Support Team, go directly to the Ruckus Support Portal using <https://support.ruckuswireless.com>, or go to <https://www.ruckuswireless.com> and select **Support**.

What Support Do I Need?

Technical issues are usually described in terms of priority (or severity). To determine if you need to call and open a case or access the self-service resources, use the following criteria:

- Priority 1 (P1)—Critical. Network or service is down and business is impacted. No known workaround. Go to the **Open a Case** section.
- Priority 2 (P2)—High. Network or service is impacted, but not down. Business impact may be high. Workaround may be available. Go to the **Open a Case** section.
- Priority 3 (P3)—Medium. Network or service is moderately impacted, but most business remains functional. Go to the **Self-Service Resources** section.
- Priority 4 (P4)—Low. Requests for information, product documentation, or product enhancements. Go to the **Self-Service Resources** section.

Open a Case

When your entire network is down (P1), or severely impacted (P2), call the appropriate telephone number listed below to get help:

- Continental United States: 1-855-782-5871
- Canada: 1-855-782-5871
- Europe, Middle East, Africa, Central and South America, and Asia Pacific, toll-free numbers are available at <https://support.ruckuswireless.com/contact-us> and Live Chat is also available.
- Worldwide toll number for our support organization. Phone charges will apply: +1-650-265-0903

We suggest that you keep a physical note of the appropriate support number in case you have an entire network outage.

Self-Service Resources

The Ruckus Support Portal at <https://support.ruckuswireless.com> offers a number of tools to help you to research and resolve problems with your Ruckus products, including:

- Technical Documentation—<https://support.ruckuswireless.com/documents>

Preface

Contacting Ruckus Customer Services and Support

- Community Forums—<https://forums.ruckuswireless.com/ruckuswireless/categories>
- Knowledge Base Articles—<https://support.ruckuswireless.com/answers>
- Software Downloads and Release Notes—https://support.ruckuswireless.com/#products_grid
- Security Bulletins—<https://support.ruckuswireless.com/security>

Using these resources will help you to resolve some issues, and will provide TAC with additional data from your troubleshooting analysis if you still require assistance through a support case or RMA. If you still require help, open and manage your case at https://support.ruckuswireless.com/case_management.

About This Document

- [What's new in this document.....](#)41
- [Supported hardware and software.....](#) 44

What's new in this document

Information has been added or updated to reflect new FastIron features or enhancements to existing FastIron features.

For commands introduced since Release 08.0.01, a history table listed with each command provides information about modifications to the command. For commands introduced prior to Release 08.0.01, a history table is not provided, unless the command has been modified in recent releases.

NOTE

In addition to commands that are new or modified for this release, numerous commands for existing FastIron features have been added that were previously described only in FastIron configuration guides.

New commands in FastIron 08.0.50

The following commands have been added (new for this release).

- **aaa accounting mac-auth**
- **authentication (IKEv2)**
- **clear ikev2 sa**
- **clear ikev2 statistics**
- **clear ipsec sa**
- **default-ipv6 gateway**
- **description (IKEv2)**
- **description (IPsec)**
- **dhcp snooping relay information circuit-id**
- **dhcp snooping relay information remote-id**
- **dhgroup**
- **encapsulation-mode**
- **encryption**
- **encryption-algorithm**
- **ike-profile**
- **ikev2 auth-proposal**
- **ikev2 exchange-max-time**
- **ikev2 limit**
- **ikev2 policy**
- **ikev2 profile**
- **ikev2 proposal**

About This Document

What's new in this document

- **ikev2 retransmit-interval**
- **ikev2 retry-count**
- **initial-contact-payload**
- **integrity**
- **ipsec profile**
- **ipsec proposal**
- **ipv6 default gateway**
- **issu abort**
- **issu primary**
- **issu secondary**
- **keepalive (IKEv2)**
- **lifetime (IKEv2)**
- **lifetime (IPsec)**
- **lldp advertise port-id-subtype**
- **local-identifier**
- **logging enable ikev2**
- **logging enable ipsec**
- **match address-local**
- **match fvrf**
- **match-identity**
- **multicast querier-address**
- **multicast6 querier-address**
- **prf**
- **proposal (IKEv2)**
- **proposal (IPsec)**
- **protected**
- **radius-server accounting**
- **radius-server test**

- **spx-mon enable**
- **transform**
- **trunk-type**
- **vlan-config**
- **zero-touch-enable**
- **zero-touch-ports**

Modified commands in FastIron 08.0.50

The following commands have been modified in this release.

- **aaa authorization coa ignore**
- **clock summer-time**
- **clock timezone**
- **ip address**
- **ip dhcp-client discovery-interval**
- **ip dscp-remark**
- **multi-spx-lag**
- **multi-spx-port**
- **pvlan type**
- **radius-server dead-time**
- **radius-server host**

- **set ip next-hop**
- **show clock**
- **show cpu-utilization**
- **show dot1x ip-acl**
- **show dot1x sessions**
- **show inline power**
- **show inline power detail**
- **show ip vrrp-extended**
- **show lag**
- **show mac-authentication ip-acl**
- **show mac-authentication sessions**
- **show spx**
- **show statistics tunnel**
- **show vlan**
- **spx cb-configure**
- **spx unconfigure**

Deprecated commands in FastIron 08.0.50

The following commands have been removed:

- **priority ignore-8021p** (not supported on ICX 7000 series devices)
- **protected-link-group** (not supported on ICX 7000 series devices)
- **show protected-link-group** (not supported on ICX 7000 series devices)

Supported hardware and software

This guide supports the following product families:

- ICX 7250 Series
- ICX 7450 Series
- ICX 7750 Series

For information about the specific models and modules supported in a product family, refer to the hardware installation guide for that product family.

Using the FastIron Command-Line Interface

- Accessing the CLI..... 45
- Searching and filtering command output..... 48
- Creating an alias for a CLI command..... 52

Accessing the CLI

Once an IP address is assigned to a Ruckus device running Layer 2 software or to an interface on the Ruckus device running Layer 3 software, you can access the CLI either through a direct serial connection or through a local or remote Telnet session.

You can initiate a local Telnet or SNMP or SSH connection by attaching a cable to a port and specifying the assigned management station IP address.

Command configuration modes

The Ruckus CLI uses an industry-standard hierarchical shell familiar to Ethernet/IP networking administrators. You can use one of three major command modes to enter commands and access sub-configuration modes on the device.

User EXEC mode

User EXEC mode is the default mode for the device; it supports the lowest level of user permissions. In this mode, you can execute basic commands such as **ping** and **traceroute**, but only a subset of clear, show, and debug commands can be entered in this mode. The following example shows the User EXEC prompt after login. The **enable** command enters privileged EXEC mode.

```
device> enable
device#
```

Privileged EXEC mode

Privileged EXEC mode supports all clear, show, and debug commands. In addition, you can enter some configuration commands that do not make changes to the system configuration. The following example shows the privileged EXEC prompt. At this prompt, you issue the **configure terminal** command to enter global configuration mode.

```
device# configure terminal
device(config)#
```

Global configuration mode

Global configuration mode supports commands that can change the device configuration. For any changes to be persistent, you must save the system configuration before rebooting the device. The global configuration mode provides access to sub-configuration modes for individual interfaces, VLANs, routing protocols, and other configuration areas. The following example shows how you access the interface sub-configuration mode by issuing the **interface** command with a specified interface.

```
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)#
```

Command help

You can display commands and syntax information in any mode and from any point in the command hierarchy.

Enter a question mark (?) or a tab in any command mode to display the list of commands available in that mode.

```
device(config)#?  
aaa                Define authentication method list  
access-list        Define Access Control List (ACL)  
aggregated-vlan    Support for larger Ethernet frames up to 1536 bytes  
alias              Configure alias or display configured alias  
all-client         Restrict all remote management to a host  
arp                Enter a static IP ARP entry  
arp-internal-priority Set packet priority  
arp-subnet-only    Only learn ARP in the subnet of this device  
authentication     Configure flexible authentication  
banner            Define a login banner  
batch             Define a group of commands  
boot              Set system boot options  
(output truncated)
```

To display a list of commands that start with a specified character, type the character followed by a question mark (?) or a tab.

```
device(config)#e?  
enable            Password, page-mode and other options  
end              End Configuration level and go to Privileged level  
errdisable       Set Error Disable Attributions  
exit             Exit current level  
extern-config-file Extern configuration file
```

To display keywords and arguments associated with a command, enter the command followed by a question mark (?) or a tab.

```
deviceh(config)#qos ?  
egress-buffer-profile User defined QoS egress profile  
mechanism             Change mechanism  
name                  Change name  
profile               Change bandwidth allocation  
scheduler-profile     User defined QoS profile  
tagged-priority       Change tagged frame priority to profile mapping
```

Command completion

Command completion allows you to execute a command by entering a partial string.

To complete the spelling of commands or keywords automatically, begin typing the command or keyword and then press Tab. For example, at the CLI command prompt, type `te` and press Tab. For example, entering **conf t** in privileged EXEC mode auto-completes the keyword and executes the **configure terminal** as shown.

```
device#conf t  
terminal  Configure thru terminal  
deviceh#conf terminal  
device(config)#
```

If there is more than one command or keyword associated with the characters typed, the CLI displays all choices matching the characters. Type another character to identify the keyword you are looking for.

```
device(config)#show li  
license          Show software license information  
link-error-disable Link Debouncing Control  
link-keepalive  Link Layer Keepalive  
device(config)#show lic  
license          Show software license information  
device(config)#show license
```

If you enter an invalid command or partial string that cannot be completed, an error message is displayed.

```
device(config)#shw
Unrecognized command
device(config)#shw
```

Scroll control

By default, the CLI uses a page mode to paginate displays that are longer than 23 lines. The maximum number of lines per page is 23 (line 24 is reserved for printing). Displays that are longer than 23 lines are automatically segmented into pages with 23 lines per page.

If you use the question mark (?) to display a listing of available options in a given mode, the display stops at each 23 line increment and lists your choices for continuing the display.

```
aaa
all-client
appletalk
arp
boot
some lines omitted for brevity...

ipx
lock-address
logging
mac
--More--, next page: Space, next line:
Return key, quit: Control-c
```

Use one of the following scrolling options to display additional information:

- Press the **Space bar** to display the next page (one screen at a time).
- Press the **Return** or **Enter** key to display the next line (one line at a time).
- Press **Ctrl+C** or **Ctrl+Q** to cancel the display.
- Use the **skip** command in privileged EXEC mode to disable page display mode. Use the **page** command to re-enable page display mode

The following example toggles between page display modes.

```
device# skip
Disable page display mode
device# page
Enable page display mode
```

Line editing commands

The CLI supports the following line editing commands. To enter a line-editing command, use the CTRL+key combination for the command by pressing and holding the CTRL key, then pressing the letter associated with the command.

TABLE 2 CLI line editing commands

Ctrl+Key combination	Description
Ctrl+A	Moves to the first character on the command line.
Ctrl+B	Moves the cursor back one character.
Ctrl+C	Escapes and terminates command prompts and ongoing tasks (such as lengthy displays), and displays a fresh command prompt.
Ctrl+D	Deletes the character at the cursor.
Ctrl+E	Moves to the end of the current command line.

TABLE 2 CLI line editing commands (continued)

Ctrl+Key combination	Description
Ctrl+F	Moves the cursor forward one character.
Ctrl+K	Deletes all characters from the cursor to the end of the command line.
Ctrl+L; Ctrl+R	Repeats the current command line on a new line.
Ctrl+N	Enters the next command line in the history buffer.
Ctrl+P	Enters the previous command line in the history buffer.
Ctrl+U; Ctrl+X	Deletes all characters from the cursor to the beginning of the command line.
Ctrl+W	Deletes the last word you typed.
Ctrl+Z	Moves from any CONFIG level of the CLI to the Privileged EXEC level; at the Privileged EXEC level, moves to the User EXEC level.

Searching and filtering command output

You can filter the output from **show** commands at the `--More--` prompt. You can search for characters strings, or you can construct complex regular expressions to filter the output.

Searching and filtering output at the `--More--` prompt

The `--More--` prompt displays when output extends beyond a single page. At this prompt, you can press the Space bar to display the next page, the Return or Enter key to display the next line, or Ctrl+C or Q to cancel the display. In addition, you can search and filter output from this prompt.

At the `--More--` prompt, enter a forward slash (/) followed by a search string. The Ruckus device displays output starting from the first line that contains the search string as shown in the following example. The search feature is similar to the **begin** option for **show** commands.

```
--More--, next page: Space, next line: Return key, quit: Control-c  
/telnet
```

The results of the search are displayed.

```
searching...  
telnet           Telnet by name or IP address  
temperature     temperature sensor commands  
terminal        display syslog  
traceroute      TraceRoute to IP node  
undebg          Disable debugging functions (see also 'debug')  
undetele        Undelete flash card files  
whois           WHOIS lookup  
write           Write running configuration to flash or terminal
```

To display lines containing only a specified search string (similar) press the plus key (+) at the `--More--` prompt followed by a search string. This option is similar to the **include** option supported with **show** commands.

```
--More--, next page: Space, next line: Return key, quit: Control-c  
+telnet
```

The filtered results are displayed.

```
filtering...  
telnet           Telnet by name or IP address
```

To display lines that do not contain a specified search string, press the minus key (-) at the --More-- prompt followed by a search string. This option is similar to the **exclude** option supported with **show** commands.

```
--More--, next page: Space, next line: Return key, quit: Control-c
-telnet
```

The filtered results are displayed.

```
filtering...
temperature          temperature sensor commands
terminal             display syslog
traceroute           TraceRoute to IP node
undebug              Disable debugging functions (see also 'debug')
undetele             Undelete flash card files
whois                WHOIS lookup
write                Write running configuration to flash or terminal
```

As with the commands for filtering output from **show** commands, the search string is a regular expression consisting of a single character or string of characters. You can use special characters to construct complex regular expressions. See the next section for information on special characters used with regular expressions.

Searching and filtering show command output

You can filter output from **show** commands to display lines containing a specified string, lines that do not contain a specified string, or output starting with a line containing a specified string. The search string is a regular expression consisting of a single character or a string of characters. You can use special characters to construct complex regular expressions.

Using special characters to construct complex regular expressions

Special characters allow you to construct complex regular expressions to filter output from **show** commands. You can use a regular expression to specify a single character or multiple characters as a search string. In addition, you can include special characters that influence the way the software matches the output against the search string. Supported special characters are listed in the following table.

TABLE 3 Special characters for regular expressions

Character	Operation
.	The period matches on any single character, including a blank space. For example, the following regular expression matches "aaz", "abz", "acz", and so on, but not just "az": a.z
*	The asterisk matches on zero or more sequential instances of a pattern. For example, the following regular expression matches output that contains the string "abc", followed by zero or more Xs: abcX*
+	The plus sign matches on one or more sequential instances of a pattern. For example, the following regular expression matches output that contains "de", followed by a sequence of "g"s, such as "deg", "degg", "deggg", and so on: deg+

TABLE 3 Special characters for regular expressions (continued)

Character	Operation
?	<p>The question mark matches on zero occurrences or one occurrence of a pattern.</p> <p>For example, the following regular expression matches output that contains "dg" or "deg":</p> <pre>de?g</pre> <p>NOTE Normally when you type a question mark, the CLI lists the commands or options at that CLI level that begin with the character or string you entered. However, if you enter Ctrl +V and then type a question mark, the question mark is inserted into the command line, allowing you to use it as part of a regular expression.</p>
^	<p>A caret (when not used within brackets) matches on the beginning of an input string.</p> <p>For example, the following regular expression matches output that begins with "deg":</p> <pre>^deg</pre>
\$	<p>A dollar sign matches on the end of an input string.</p> <p>For example, the following regular expression matches output that ends with "deg":</p> <pre>deg\$</pre>
_	<p>An underscore matches on one or more of the following:</p> <ul style="list-style-type: none"> • , (comma) • { (left curly brace) • } (right curly brace) • ((left parenthesis) •) (right parenthesis) • The beginning of the input string • The end of the input string • A blank space <p>For example, the following regular expression matches on "100" but not on "1002", "2100", and so on.</p> <pre>_100_</pre>
[]	<p>Square brackets enclose a range of single-character patterns.</p> <p>For example, the following regular expression matches output that contains "1", "2", "3", "4", or "5":</p> <pre>[1-5]</pre> <p>You can use the following expression symbols within the brackets. These symbols are allowed only inside the brackets.</p> <ul style="list-style-type: none"> • ^ - The caret matches on any characters except the ones in the brackets. For example, the following regular expression matches output that does not contain "1", "2", "3", "4", or "5": <code>[^1-5]</code> • - The hyphen separates the beginning and ending of a range of characters. A match occurs if any of the characters within the range is present. See the example above.

TABLE 3 Special characters for regular expressions (continued)

Character	Operation
	A vertical bar separates two alternative values or sets of values. The output can match one or the other value. For example, the following regular expression matches output that contains either "abc" or "defg": abc defg
()	Parentheses allow you to create complex expressions. For example, the following complex expression matches on "abc", "abcabc", or "defg", but not on "abcdefgdefg": (abc+) ((defg)?)

If you want to filter for a special character instead of using the special character as described in the table above, enter a backslash (\) before the character. For example, to filter on output containing an asterisk, enter the asterisk portion of the regular expression as "*".

```
device#show ip route bgp | include \*
```

Displaying lines containing a specified string

The following command filters the output of the **show interface** command for port 1/3/11 to display only lines containing the word "Internet". This command can be used to display the IP address of the interface.

```
device#show interface e 1/3/11 | include Internet
Internet address is 10.168.1.11/24, MTU 1518 bytes, encapsulation ethernet
```

Syntax: *show-command* | **include** *regular-expression*

NOTE

The vertical bar (|) is part of the command.

Note that the regular expression specified as the search string is case sensitive. In the example above, a search string of "Internet" would match the line containing the IP address, but a search string of "internet" would not.

Displaying lines that do not contain a specified string

The following command filters the output of the **show who** command to display only the lines that do not contain the word "closed". This command can be used to display open connections to the Ruckus device.

```
device#show who | exclude closed
Console connections:
  established
  you are connecting to this session
  2 seconds in idle
Telnet connections (inbound):
  1    established, client ip address 10.168.9.37
      27 seconds in idle
Telnet connection (outbound):
SSH connections:
```

Syntax: *show-command* | **exclude** *regular-expression*

Displaying lines starting with a specified string

The following command filters the output of the **show who** command to display output starting with the first line that contains the word "SSH". This command can be used to display information about SSH connections to the Ruckus device.

```
device#show who | begin SSH
SSH connections:
 1      established, client ip address 10.168.9.210
        7 seconds in idle
 2      closed
 3      closed
 4      closed
 5      closed
```

Syntax: *show-command* | **begin** *regular-expression*

Creating an alias for a CLI command

An alias serves as a shorthand version of a longer CLI command. For example, you can create an alias called *shoro* for the **show ip route** command. You can then enter the *shoro* alias at the command prompt and the **show ip route** command is issued.

To create an alias called *shoro* for the CLI command **show ip route**, enter the **alias shoro = show ip route** command.

```
device(config)# alias shoro = show ip route
```

Syntax: [**no**] **alias** *alias-name* = *cli-command*

The *alias-name* must be a single word, without spaces.

After the alias is configured, entering *shoro* in the privileged EXEC mode or in the global configuration mode issues the **show ip route** command.

Enter the command **copy running-config** with the appropriate parameters to create an alias called *wrsbc*.

```
device(config)#alias wrsbc = copy running-config tftp 10.10.10.10 test.cfg
```

To remove the *wrsbc* alias from the configuration, enter one of the following commands.

```
device(config)#no alias wrsbc
```

or

```
device(config)#unalias wrsbc
```

Syntax: **unalias** *alias-name*

The specified *alias-name* must be the name of an alias already configured on the Ruckus device.

To display the aliases currently configured on the Ruckus device, enter the following command in the Privileged EXEC mode or in the global configuration mode.

```
device# alias
      wrsbc      copy running-config tftp 10.10.10.10 test.cfg
      shoro      show ip route
```

Syntax: **alias**

Configuration notes for creating a command alias

The following configuration notes apply to this feature:

- You cannot include additional parameters with the alias at the command prompt. For example, after you create the *shoro* alias, *shoro bgp* would not be a valid command.
- If configured on the Ruckus device, authentication, authorization, and accounting is performed on the actual command, not on the alias for the command.
- To save an alias definition to the startup-config file, use the **write memory** command.

Commands A - E

100-fx

Enables 100Base-FX on chassis-based and stackable devices.

Syntax

100-fx

no 100-fx

Command Default

100Base-FX is not enabled after installation.

Modes

Interface configuration mode

Usage Guidelines

After you physically install a 100Base-FX transceiver, you must use this command to enable 100Base-FX support on the device.

FastIron devices support the following types of SFPs for 100BaseFX:

- *Multimode SFP*—maximum distance is 2 kilometers
- *Long Reach (LR)*—maximum distance is 40 kilometers
- *Intermediate Reach (IR)* —maximum distance is 15 kilometers

For information about supported SFP and SFP+ transceivers on FastIron devices, refer to the *Brocade Optics Family Datasheet* on the Brocade website.

NOTE

You must disable 100Base-FX support before inserting a different type of module in the same port. Otherwise, the device will not recognize traffic traversing the port.

The **no** form of the command disables 100Base-FX support.

Examples

The following example enables support for 100Base-FX on a fiber port.

```
device(config)# interface ethernet 1/1/6
device(config-if-e1000-1/1/6)# 100-fx
```

100-tx

Configures a 1000Base-TX small form-factor pluggable (SFP) transceiver to operate at a speed of 100 Mbps.

Syntax

100-tx

no 100-tx

Command Default

1000Base-TX SFP transceiver is not configured to operate at a speed of 100 Mbps.

Modes

Interface configuration mode

Usage Guidelines

This command requires autonegotiation to be enabled on the other end of the link.

Although combo ports (ports 1 to 4) on Hybrid Fiber (HF) models support the 1000Base-TX SFP, they cannot be configured to operate at 100 Mbps. The 100-Mbps operating speed is supported only with noncombo ports (ports 5 to 24).

1000Base-TX modules must be configured individually, one interface at a time. 1000Base-TX modules do not support digital optical monitoring. Hotswap is supported for this module when it is configured in 100M mode.

The **no** form of the command disables 1000Base-TX SFP support.

Examples

The following example configures a 1000Base-TX SFP transceiver to operate at 100 Mbps.

```
device(config)# interface ethernet 1/5/1
device(config-if-e1000-1/5/1)# 100-tx
```

aaa accounting commands

Configures the AAA accounting configuration parameters for EXEC commands.

Syntax

```
aaa accounting commands privilege-level default start-stop radius [ tacacs+ ] [ none ]  
no aaa accounting commands privilege-level default start-stop radius [ tacacs+ ] [ none ]  
aaa accounting commands privilege-level default start-stop tacacs+ [ radius ] [ none ]  
no aaa accounting commands privilege-level default start-stop tacacs+ [ radius ] [ none ]  
aaa accounting commands privilege-level default start-stop none  
no aaa accounting commands privilege-level default start-stop none
```

Command Default

AAA accounting is disabled.

Parameters

privilege-level

Configures the device to perform AAA accounting for the commands available at the specified privilege level. Valid values are 0 (Super User level - all commands), 4 (Port Configuration level - port-config and read-only commands), and 5 (Read Only level - read-only commands).

default

Configures the default named list.

start-stop

Configures to send an Accounting Start packet to the AAA accounting server when you enter a command, and an Accounting Stop packet when the service provided by the command is completed.

radius

Configures RADIUS accounting.

tacacs+

Configures TACACS+ accounting.

none

Disables accounting. This is equivalent to using the **no** form of the command.

Modes

Global configuration mode

Usage Guidelines

You can configure AAA accounting for CLI commands by specifying a privilege level whose commands require accounting.

NOTE

If authorization is enabled, and the command requires authorization, then authorization is performed before accounting takes place. If authorization fails for the command, no accounting takes place.

You can configure RADIUS, TACACS+, and None as accounting methods. If the configured primary accounting fails due to an error, the device tries the backup accounting methods in the order they are configured.

The **no** form of the command disables accounting.

Examples

The following example shows how to configure the Brocade device to perform RADIUS accounting for the commands available at the Super User privilege level (that is, all commands on the device).

```
device(config)# aaa accounting commands 0 default start-stop radius
```

The following example shows how to configure the Brocade device to perform TACACS+ accounting for the commands available at the Read-only level (that is, read-only commands). The command also configures TACACS+ as the primary accounting followed by RADIUS.

```
device(config)# aaa accounting commands 5 default start-stop tacacs+ radius
```

aaa accounting dot1x

Enables 802.1X accounting.

Syntax

aaa accounting dot1x default start-stop radius [none]

no aaa accounting dot1x default start-stop radius [none]

aaa accounting dot1x default start-stop none

no aaa accounting dot1x default start-stop none

Command Default

AAA accounting is disabled.

Parameters

default

Configures the default named list.

start-stop

Configures to sent an Accounting Start packet is sent to the RADIUS accounting server when 802.1x session is enabled, and an Accounting Stop packet is sent when the service provided by the command is completed.

radius

Configures RADIUS accounting.

none

Disables accounting. The client is automatically authenticated without the device using information supplied by the client.

Modes

Global configuration mode

Usage Guidelines

You can configure both RADIUS and None as accounting methods. If the configured primary accounting fails due to an error, the device tries the backup accounting methods in the order they are configured.

NOTE

If authorization is enabled, and the command requires authorization, then authorization is performed before accounting takes place. If authorization fails for the command, no accounting takes place.

The **no** form of the command disables accounting.

Examples

The following example shows how to enable 802.1x accounting.

```
device(config)# aaa accounting dot1x default start-stop radius
```

The following example shows how to enable 802.1x accounting and configure RADIUS as the primary accounting method. If the configured primary RADIUS accounting fails due to an error, the device tried the backup accounting method "none", that is, accounting will be disabled.

```
device(config)# aaa accounting dot1x default start-stop radius none
```

aaa accounting exec

Configures the AAA accounting configuration parameters for SSH and Telnet access.

Syntax

```
aaa accounting exec default start-stop radius [ tacacs+ ] [ none ]  
no aaa accounting exec default start-stop radius [ tacacs+ ] [ none ]  
aaa accounting exec default start-stop tacacs+ [ radius ] [ none ]  
no aaa accounting exec default start-stop tacacs+ [ radius ] [ none ]  
aaa accounting exec default start-stop none  
no aaa accounting exec default start-stop none
```

Command Default

AAA accounting is disabled.

Parameters

default

Configures the default named list.

start-stop

Configures to send an Accounting Start packet to the AAA accounting server when an authenticated user establishes a Telnet or SSH session on the Brocade device, and an Accounting Stop packet when the user logs out.

radius

Configures RADIUS accounting.

tacacs+

Configures TACACS+ accounting.

none

Disables accounting.

Modes

Global configuration mode

Usage Guidelines

You can configure RADIUS, TACACS+, and None as accounting methods. If the configured primary accounting fails due to an error, the device tries the backup accounting methods in the order they are configured.

NOTE

If authorization is enabled, and the command requires authorization, then authorization is performed before accounting takes place. If authorization fails for the command, no accounting takes place.

Commands A - E
aaa accounting exec

The **no** form of the command disables accounting.

Examples

The following example shows how to configure the Brocade device to perform RADIUS accounting for Telnet or SSH access.

```
device(config)# aaa accounting exec default start-stop radius
```

The following example shows how to configure the Brocade device to perform TACACS+ accounting for Telnet or SSH access and to specify the order of accounting preference.

```
device(config)# aaa accounting exec default start-stop tacacs+ radius none
```

aaa accounting mac-auth

Enables or disables RADIUS accounting for MAC authentication sessions.

Syntax

aaa accounting mac-auth default start-stop radius [none]

no aaa accounting mac-auth default start-stop radius [none]

aaa accounting mac-auth default start-stop none

no aaa accounting mac-auth default start-stop none

Command Default

AAA accounting is disabled.

Parameters

default

Configures the default named list.

start-stop

Configures an accounting start packet to be sent to the RADIUS accounting server when a MAC authentication session is enabled and an accounting stop packet to be sent when the service provided by the command is completed.

radius

Configures RADIUS accounting.

none

Disables accounting. The client is automatically authenticated without the device using information supplied by the client.

Modes

Global configuration mode

Usage Guidelines

You can configure both RADIUS and None as accounting methods. If the configured primary accounting fails due to an error, the device tries the backup accounting methods in the order in which they are configured.

NOTE

If authorization is enabled, and the command requires authorization, then authorization is performed before accounting occurs. If authorization fails for the command, no accounting takes place.

The **no** form of the command disables accounting.

Examples

The following example shows how to enable accounting for MAC authentication sessions.

```
device(config)# aaa accounting mac-auth default start-stop radius
```

The following example shows how to enable accounting for MAC authentication and configure RADIUS as the primary accounting method. If the configured primary RADIUS accounting fails due to an error, the device tries the backup accounting method **none**, that is, accounting is disabled.

```
device(config)# aaa accounting mac-auth default start-stop radius none
```

History

Release version	Command history
08.0.50	This command was introduced.

aaa accounting system

Configures AAA accounting to record when system events occur on the device.

Syntax

```
aaa accounting system default start-stop radius [ tacacs+ ] [ none ]  
no aaa accounting system default start-stop radius [ tacacs+ ] [ none ]  
aaa accounting system default start-stop tacacs+ [ radius ] [ none ]  
no aaa accounting system default start-stop tacacs+ [ radius ] [ none ]  
aaa accounting system default start-stop none  
no aaa accounting system default start-stop none
```

Command Default

AAA accounting is disabled.

Parameters

default

Configures the default named list.

start-stop

Configures to send an Accounting Start packet to be sent to the AAA accounting server when a system event occurs, and an Accounting Stop packet to be sent when the system event is completed.

radius

Configures RADIUS accounting.

tacacs+

Configures TACACS+ accounting.

none

Disables accounting.

Modes

Global configuration mode

Usage Guidelines

You can configure RADIUS, TACACS+, and None as accounting methods. If the configured primary accounting fails due to an error, the device tries the backup accounting methods in the order they are configured.

The **no** form of the command disables accounting.

Examples

The following example shows how to configure the Brocade device to perform RADIUS accounting to record when a system event occurs.

```
device(config)# aaa accounting system default start-stop radius
```

The following example shows how to configure the device to perform TACACS+ accounting to record when a system event occurs and to specify RADIUS and None as the backup accounting methods.

```
device(config)# aaa accounting system default start-stop tacacs+ radius none
```

aaa authentication dot1x

Enables 802.1X authentication.

Syntax

```
aaa authentication dot1x default radius [ none ]  
no aaa authentication dot1x default radius [ none ]  
aaa authentication dot1x default none  
no aaa authentication dot1x default none
```

Command Default

AAA authentication is disabled.

Parameters

default

Configures the default named list.

radius

Configures RADIUS authentication.

none

Disables authentication. The client is automatically authenticated by other means, without the device using information supplied by the client.

Modes

Global configuration mode

Usage Guidelines

To use 802.1X authentication, you must specify an authentication method to be used to authenticate clients. Brocade supports RADIUS authentication with 802.1X authentication. To use RADIUS authentication with 802.1X authentication, you create an authentication method list for 802.1X and specify RADIUS as an authentication method, and then configure communication between the Brocade device and the RADIUS server.

If you specify both **RADIUS** and **none**, make sure **RADIUS** comes before **none** when the command is issued.

The **no** form of the command disables authentication.

Examples

The following example shows how to enable 802.1x authentication.

```
device(config)# aaa authentication dot1x default radius
```

aaa authentication enable

Configures the AAA authentication method for securing access to the Privileged EXEC level and global configuration levels of the CLI.

Syntax

aaa authentication enable default *method-list* [*method-list ...*]

no aaa authentication enable default *method-list* [*method-list ...*]

aaa authentication enable implicit-user

no aaa authentication enable implicit-user

Command Default

The AAA authentication method list is not configured.

By default, the device prompts for a username and password.

Parameters

default

Configures the default authentication method list.

method-list

Configures the following authentication methods.

enable

Authenticate using the password you configured for the Super User privilege level. This password is configured using the **enable super-user-password** command.

line

Authenticate using the password you configured for Telnet access. The Telnet password is configured using the **enable telnet password** command.

local

Authenticate using a local username and password you configured on the device. Local usernames and passwords are configured using the **username** command.

none

Does not use any authentication method. The device automatically permits access.

radius

Authenticate using the database on a RADIUS server. You also must identify the server to the device using the **radius-server** command.

tacacs

Authenticate using the database on a TACACS server. You also must identify the server to the device using the **tacacs-server** command.

tacacs+

Authenticate using the database on a TACACS+ server. You also must identify the server to the device using the **tacacs-server** command.

implicit-user

Configures the device to prompt only for a password when a user attempts to gain Super User access to the Privileged EXEC and global configuration levels of the CLI.

Modes

Global configuration mode

Usage Guidelines

You can specify a primary authentication method and up to six backup authentication methods. If the configured primary authentication fails due to an error, the device tries the backup authentication methods in the order they appear in the list.

If enable authentication is configured on the device, when a user attempts to gain Super User access to the Privileged EXEC and global configuration levels of the CLI, by default the device prompts for a username and password. You can configure the device to prompt only for a password. The device uses the username entered at login, if one is available. If no username was entered at login, the device prompts for both username and password.

The **no** form of the command removes authentication method.

Examples

The following example shows how to configure TACACS/TACACS+ as the primary authentication method for securing access to the Privileged EXEC and global configuration levels of the CLI. In this example, TACACS/TACACS+ is configured to be the primary authentication method for securing access. If TACACS/TACACS+ authentication fails due to an error with the server, local authentication is used instead. If local authentication fails, no authentication is used; the device automatically permits access.

```
device(config)# aaa authentication enable default tacacs local none
```

The following example shows how to configure RADIUS as the primary authentication method and other backup authentication methods.

```
device(config)# aaa authentication enable default radius tacacs tacacs+ enable local line none
```

The following example shows how to configure the device to prompt only for a password when a user attempts to gain Super User access to the Privileged EXEC and global configuration levels of the CLI.

```
device(config)# aaa authentication enable implicit-user
```

aaa authentication login

Configures the AAA authentication method for securing access to Telnet or SSH access to the CLI.

Syntax

aaa authentication login default *method-list* [*method-list ...*]

no aaa authentication login default *method-list* [*method-list ...*]

aaa authentication login privilege-mode

no aaa authentication login privilege-mode

Command Default

The AAA authentication method list is not configured.

By default, a user enters the User EXEC mode after a successful login through Telnet or SSH.

Parameters

default

Configures the default authentication method list.

method-list

Configures the following authentication methods.

enable

Authenticate using the password you configured for the Super User privilege level. This password is configured using the **enable super-user-password** command.

line

Authenticate using the password you configured for Telnet access. The Telnet password is configured using the **enable telnet password** command.

local

Authenticate using a local username and password you configured on the device. Local usernames and passwords are configured using the **username** command.

none

Does not use any authentication method. The device automatically permits access.

radius

Authenticate using the database on a RADIUS server. You also must identify the server to the device using the **radius-server** command.

tacacs

Authenticate using the database on a TACACS server. You also must identify the server to the device using the **tacacs-server** command.

tacacs+

Authenticate using the database on a TACACS+ server. You also must identify the server to the device using the **tacacs-server** command.

privilege-mode

Configures the device to enter the privileged EXEC mode after a successful login through Telnet or SSH.

Modes

Global configuration mode

Usage Guidelines

You can specify a primary authentication method and up to six backup authentication methods. If the configured primary authentication fails due to an error, the device tries the backup authentication methods in the order they appear in the list.

By default, a user enters User EXEC mode after a successful login through Telnet or SSH. Optionally, you can configure the device so that a user enters Privileged EXEC mode after a Telnet or SSH login. The user privilege level is based on the privilege level granted during login.

The **no** form of the command removes the authentication method.

Examples

The following example shows how to configure RADIUS as the primary authentication method for securing Telnet access to the CLI. If RADIUS authentication fails due to an error with the server, local authentication is used instead.

```
device(config)# aaa authentication login default radius local
```

The following example shows how to configure RADIUS as the primary authentication method and other backup authentication methods.

```
device(config)# aaa authentication login default radius tacacs tacacs+ enable local line none
```

The following example shows how to configure the device so that a user enters Privileged EXEC mode after a Telnet or SSH login.

```
device(config)# aaa authentication login privilege-mode
```

aaa authentication snmp-server

Configures the AAA authentication method for SNMP server access.

Syntax

aaa authentication snmp-server default *method-list* [*method-list ...*]

no aaa authentication snmp-server default *method-list* [*method-list ...*]

Command Default

The AAA authentication method list is not configured.

Parameters

default

Configures the default authentication method list.

method-list

Configures the following authentication methods.

enable

Authenticate using the password you configured for the Super User privilege level. This password is configured using the **enable super-user-password** command.

line

Authenticate using the password you configured for Telnet access. The Telnet password is configured using the **enable telnet password** command.

local

Authenticate using a local username and password you configured on the device. Local usernames and passwords are configured using the **username** command.

none

Does not use any authentication method. The device automatically permits access.

radius

Authenticate using the database on a RADIUS server. You also must identify the server to the device using the **radius-server** command.

tacacs

Authenticate using the database on a TACACS server. You also must identify the server to the device using the **tacacs-server** command.

tacacs+

Authenticate using the database on a TACACS+ server. You also must identify the server to the device using the **tacacs-server** command.

Modes

Global configuration mode

Usage Guidelines

You can specify a primary authentication method and up to six backup authentication methods. If the configured primary authentication fails due to an error, the device tries the backup authentication methods in the order they appear in the list.

When this command is enabled, community string validation is not performed for incoming SNMP v1 and v2c packets. This command takes effect as long as the first varbind for SNMP packets is set to one of the following:

- `snAgGblPassword=" username password "` (for AAA method local)
- `snAgGblPassword=" password "` (for AAA method line, enable)

NOTE

Certain SNMP objects need additional validation. These objects include but are not limited to: `snAgReload`, `snAgWriteNVRAM`, `snAgConfigFromNVRAM`, `snAgImgLoad`, `snAgCfgLoad`, and `snAgGblTelnetPassword`.

If AAA is set up to check both the username and password, the string contains the username, followed by a space and then the password. If AAA is set up to authenticate with the current Enable or Line password, the string contains the password only. The configuration can be overridden by the **`no snmp-server pw-check`** command, which disables password checking for SNMP SET requests.

The **`no`** form of the command removes the authentication method.

Examples

The following example shows how to configure incoming SNMP SET operations to be authenticated using the locally configured usernames and passwords.

```
device(config)# aaa authentication snmp-server default local
```

aaa authentication web-server

Configures the AAA authentication method to access the device through the Web Management Interface.

Syntax

aaa authentication web-server default *method-list* [*method-list ...*]

no aaa authentication web-server default *method-list* [*method-list ...*]

Command Default

The AAA authentication is not configured.

Parameters

default

Configures the default authentication method list.

method-list

Configures the following authentication methods.

enable

Authenticate using the password you configured for the Super User privilege level. This password is configured using the **enable super-user-password** command.

line

Authenticate using the password you configured for Telnet access. The Telnet password is configured using the **enable telnet password** command.

local

Authenticate using a local username and password you configured on the device. Local usernames and passwords are configured using the **username** command.

none

Does not use any authentication method. The device automatically permits access.

radius

Authenticate using the database on a RADIUS server. You also must identify the server to the device using the **radius-server** command.

tacacs

Authenticate using the database on a TACACS server. You also must identify the server to the device using the **tacacs-server** command.

tacacs+

Authenticate using the database on a TACACS+ server. You also must identify the server to the device using the **tacacs-server** command.

Modes

Global configuration mode

Usage Guidelines

You can specify a primary authentication method and up to six backup authentication methods. If the configured primary authentication fails due to an error, the device tries the backup authentication methods in the order they appear in the list.

The **no** form of the command removes authentication method.

Examples

The following example shows how to configure the device to use the local user accounts to authenticate access to the device through the Web Management Interface. If the device does not have a user account that matches the username and password entered by the user, the user is not granted access.

```
device(config)# aaa authentication web-server default local
```

aaa authorization coa enable

Enables RADIUS Change of Authorization (CoA).

Syntax

aaa authorization coa enable
no aaa authorization coa enable

Command Default

RADIUS CoA is not enabled.

Parameters

None

Modes

Global configuration mode

Usage Guidelines

Use this command to enable RADIUS CoA authorization. The no form of the command disables the CoA functionality. A change of authorization request packet can be sent by the Dynamic Authorization Client (DAC) to change the session authorizations on the Network Access Server (NAS). This is used to change the filters, such as Layer 3 ACLs.

Before RFC 5176 when a user or device was authenticated on the RADIUS server, the session could only be ended if the user or device logs out. RFC 5176 addresses this issue by adding two more packet types to the current RADIUS standard: Disconnect Message and Change of Authorization. The Dynamic Authorization Client (DAC) server makes the requests to either delete the previously established sessions or replace the previous configuration or policies. Currently, these new extensions can be used to dynamically terminate or authorize sessions that are authenticated through multi-device-port-authentication or dot1x authentication.

Examples

The following example enables RADIUS CoA.

```
device(config)# aaa authorization coa enable
```

History

Release version	Command history
08.0.20	This command was introduced.

aaa authorization coa ignore

Discards the specified RADIUS Change of Authorization (CoA) messages.

Syntax

```
aaa authorization coa ignore { disable-port | dm-request | flip-port | modify-acl | reauth-host }
```

```
no aaa authorization coa ignore { disable-port | dm-request | flip-port | modify-acl | reauth-host }
```

Command Default

The default state is maintained, and the packets are not discarded. All options are enabled for CoA processing.

Parameters

disable-port

Disables the port.

dm-request

Disconnects the message request.

flip-port

Toggles the port.

modify-acl

Modifies the access control list.

reauth-host

Reauthenticates the host.

Modes

Global configuration mode

Usage Guidelines

Use this command to discard the specified RADIUS messages. A CoA request packet can be sent by the Dynamic Authorization Client (DAC) to change the session authorizations on the Network Access Server (NAS). This is used to change the filters, such as Layer 3 ACLs.

Before RFC 5176, when a user or device was authenticated on the RADIUS server, the session could be ended only if the user or device logs out. RFC 5176 addresses this issue by adding two more packet types to the current RADIUS standard: Disconnect Message and Change of Authorization. The Dynamic Authorization Client (DAC) server makes the requests to either delete the previously established sessions or replace the previous configuration or policies. Currently, these new extensions can be used to dynamically terminate or authorize sessions that are authenticated through MAC authentication or 802.1X authentication.

The **no** form of the command honors the dm-request message.

Examples

The following example ignores the disconnect message request.

```
device(config)# aaa authorization coa ignore dm-request
```

The following example ignores the host reauthentication message request.

```
device(config)# aaa authorization coa ignore reauth-host
```

History

Release version	Command history
08.0.20	This command was introduced.
08.0.50	This command was updated with disable-port , flip-port , and reauth-host options.

aaa authorization commands

Configures the AAA authorization configuration parameters for EXEC commands.

Syntax

aaa authorization commands *privilege-level* **default radius** [tacacs+] [none]

no aaa authorization commands *privilege-level* **default radius** [tacacs+] [none]

aaa authorization commands *privilege-level* **default tacacs+** [radius] [none]

no aaa authorization commands *privilege-level* **default tacacs+** [radius] [none]

aaa authorization commands *privilege-level* **default none**

no aaa authorization commands *privilege-level* **default none**

Command Default

AAA authorization is not enabled.

Parameters

privilege-level

Configures the device to perform AAA authorization for the commands available at the specified privilege level. Valid values are 0 (Super User level - all commands), 4 (Port Configuration level - port-config and read-only commands), and 5 (Read Only level - read-only commands).

default

Configures the default named list.

radius

Configures RADIUS authorization.

tacacs+

Configures TACACS+ authorization.

none

Disables accounting.

Modes

Global configuration mode

Usage Guidelines

You can configure RADIUS, TACACS+, and None as authorization methods. If the configured primary authorization fails due to an error, the device tries the backup authorization methods in the order they are configured.

When TACACS+ command authorization is enabled, the Brocade device consults a TACACS+ server to get authorization for commands entered by the user.

When RADIUS command authorization is enabled, the Brocade device consults the list of commands supplied by the RADIUS server during authentication to determine whether a user can issue a command that was entered.

NOTE

TACACS+ and RADIUS command authorization can be performed only for commands entered from Telnet or SSH sessions, or from the console. No authorization is performed for commands entered at the Web Management Interface.

TACACS+ command authorization is not performed for the following commands:

- At all levels: **exit**, **logout**, **end**, and **quit**.
- At the Privileged EXEC level: **enable** or **enable text**, where *text* is the password configured for the Super User privilege level.

Because RADIUS command authorization relies on the command list supplied by the RADIUS server during authentication, you cannot perform RADIUS authorization without RADIUS authentication.

The **no** form of the command disables authorization.

Examples

The following example shows how to configure RADIUS command authorization for the commands available at the Super User privilege level (that is, all commands on the device).

```
device(config)# aaa authorization commands 0 default radius
```

The following example shows how to configure TACACS+ command authorization for the commands available at the Super User privilege level (that is, all commands on the device).

```
device(config)# aaa authorization commands 0 default tacacs+
```

aaa authorization exec

Determines the user privilege level when users are authenticated.

Syntax

```
aaa authorization exec default radius [ tacacs+ ] [ none ]  
no aaa authorization exec default radius [ tacacs+ ] [ none ]  
aaa authorization exec default tacacs+ [ radius ] [ none ]  
no aaa authorization exec default tacacs+ [ radius ] [ none ]  
aaa authorization exec default none  
no aaa authorization exec default none
```

Command Default

AAA authorization is not configured.

Parameters

default
Configures the default named list.

radius
Configures RADIUS authorization.

tacacs+
Configures TACACS+ authorization.

none
Disables accounting.

Modes

Global configuration mode

Usage Guidelines

You can configure RADIUS, TACACS+, and None as authorization methods. If the configured primary authorization fails due to an error, the device tries the backup authorization methods in the order they are configured.

When TACACS+ EXEC authorization is performed, the Brocade device consults a TACACS+ server to determine the privilege level of the authenticated user. If the **aaa authorization exec default tacacs+** command exists in the configuration, following successful authentication, the device assigns the user the privilege level specified by the foundry-privilege-level received from the TACACS+ server. If the **aaa authorization exec default tacacs+** command does not exist in the configuration, then the value in the foundry-privilege-level attribute is ignored, and the user is granted Super User access. Also note that in order for the **aaa authorization exec default tacacs+** command to work,

either the **aaa authentication enable default tacacs+** command, or the **aaa authentication login privilege-mode** command must also exist in the configuration.

When RADIUS EXEC authorization is performed, the Brocade device consults a RADIUS server to determine the privilege level of the authenticated user. If the **aaa authorization exec default radius** command exists in the configuration, following successful authentication, the device assigns the user the privilege level specified by the foundry-privilege-level attribute received from the RADIUS server. If the **aaa authorization exec default radius** command does not exist in the configuration, then the value in the foundry-privilege-level attribute is ignored, and the user is granted Super User access. Also note that in order for the **aaa authorization exec default radius** command to work, either the **aaa authentication enable default radius** command, or the **aaa authentication login privilege-mode** command must also exist in the configuration.

The **no** form of the command disables authorization.

Examples

The following example shows how to configure TACACS+ EXEC authorization.

```
device(config)# aaa authorization exec default tacacs+
```

The following example shows how to configure RADIUS EXEC authorization.

```
device(config)# aaa authorization exec default radius
```

accept-mode

Enables a nonowner master router to respond to ping, traceroute, and Telnet packets that are destined for the virtual IPv4 or IPv6 address of a VRRP session.

Syntax

accept-mode

no accept-mode

Command Default

A VRRP nonowner master router does not respond to any packet that is destined for the virtual IPv4 or IPv6 address.

Modes

VRID interface configuration mode

Usage Guidelines

The **no** form of this command causes the nonowner master router to not respond to any packet that is destined for the virtual IPv4 or IPv6 address of the VRRP session.

A VRRP nonowner master router does not respond to any packet that is destined for the virtual IPv4 or IPv6 address. This prevents troubleshooting network connections to this router using ping, traceroute, or Telnet. To resolve this, you can use this command to enable the router to respond to ping, traceroute, and Telnet packets destined for the virtual IPv4 or IPv6 address of a VRRP cluster. The router drops all other packets destined for the virtual IPv4 or IPv6 address of the VRRP session.

NOTE

The **accept-mode** command enables the device to respond to ping, traceroute, and Telnet packets, but the device will not respond to SSH packets.

Examples

The following example shows the configuration of accept mode on an IPv6 VRRP backup router.

```
device(config)# interface ve 3
device(config-vif-3)# ipv6 vrrp vrid 2
device(config-vif-3-vrid-2)# backup
device(config-vif-3-vrid-2)# advertise backup
device(config-vif-3-vrid-2)# ipv6-address 2001:DB8::1
device(config-vif-3-vrid-2)# accept-mode
device(config-vif-3-vrid-2)# activate
```

History

Release version	Command history
8.0.01	This command was introduced.

Commands A - E
accept-mode

Release version	Command history
8.0.30b	This command was modified to explain that the accept-mode command does not enable a response to SSH packets.

access-control vlan

Enables the VLAN containment for Network Time Protocol (NTP).

Syntax

access-control vlan *vlan-id*

no access-control vlan *vlan-id*

Command Default

VLAN containment for NTP is not enabled.

Parameters

vlan-id

Specifies the VLAN ID number.

Modes

NTP configuration mode

Usage Guidelines

The management interface is not part of any VLAN. When configuring the VLAN containment for NTP, the management interface is not used to send or receive the NTP packets.

When VLAN is configured,

- NTP time servers should be reachable through the interfaces that belong to the configured VLAN. Otherwise, NTP packets are not transmitted. NTP packets are not transmitted in the case of both the unicast and the broadcast server/client if the servers are not reachable through the interfaces that belong to the configured VLAN.
- NTP broadcast packets are sent only on the interface that belongs to the configured VLAN.
- The received unicast or broadcast NTP packets are dropped if the interface on which the packets have been received does not belong to the configured VLAN.

The **no** form of the command removes the specified VLAN containment for NTP.

Examples

The following example enables VLAN containment for NTP.

```
device(config)# ntp
device(config-ntp)# access-control vlan 100
```

access-list (standard numbered)

Creates a standard numbered ACL and a permit or deny rule to filter traffic.

Syntax

```
access-list acl-num [ sequence seq-num ] { deny | permit } { S_IPAddress [ mask ] | host S_IPAddress | any } [ log ]  
[ mirror ]
```

```
no access-list acl-num [ sequence seq-num ] { deny | permit } { S_IPAddress [ mask ] | host S_IPAddress | any } [ log ]  
[ mirror ]
```

Command Default

Access lists are not configured

Parameters

acl-num

Specifies the ACL number. For standard ACLs, values range from 1 through 99. (Extended numbered ACLs, for which values range from 100 through 199, are not discussed in the current topic.)

sequence

(Optional) Enables you to assign a sequence number to the rule. If you do not specify **sequence** *seq-value*, the rule is added at the end of the list.

seq-num

Valid values range from 1 through 65000.

permit

Specifies rules to permit traffic.

deny

Specifies rules to deny traffic.

S_IPAddress

Specifies a source address for which you want to filter the subnet.

mask

Defines a mask, whose effect is to specify a subnet that includes the source address that you specified. For options to specify the mask, see the Usage Guidelines.

host

Specifies a source address.

S_IPAddress

The source address.

any

Specifies all source addresses.

log

Enables logging for the rule. In addition, logging must be enabled, using the **acl-logging** command.

mirror

Mirrors packets matching the rule.

Modes

Global configuration mode

Usage Guidelines

Although the **access-list** command is still supported, Ruckus recommends that you use the **ip access-list** command instead.

The wildcard is in dotted-decimal notation (IP address format). It is a four-part value, where each part is 8 bits (one byte) separated by dots, and each bit is a one or a zero. Each part is a number ranging from 0 to 255, for example, 0.0.0.255. Zeros in the mask mean the packet source address must match the source IP address. Ones mean any value matches. For example, the source IP address and wildcard values 10.157.22.26 0.0.0.255 mean that all hosts in the Class C subnet 10.157.22.x match the policy.

If you prefer to specify the wildcard (mask value) in CIDR format, you can enter a forward (/) after the IP address, and then enter the number of significant bits in the mask. For example, you can enter the CIDR equivalent of 10.157.22.26 0.0.0.255 as 10.157.22.26/24. The CLI automatically converts the CIDR number into the appropriate ACL mask (where zeros instead of ones are the significant bits) and changes the non-significant portion of the IP address into ones. For example, if you specify 10.157.22.26/24 or 10.157.22.26 0.0.0.255, and then save the changes to the startup-config file, the value appears as 10.157.22.0/24 (if you have enabled display of subnet lengths) or 10.157.22.0 0.0.0.255 in the startup-config file.

If you enable the software to display IP subnet masks in CIDR format, the mask is saved in the file in "/ mask-bits " format. To enable the software to display the CIDR masks, enter the **ip show-subnet-length** command at the global configuration level of the CLI. You can use the CIDR format to configure the ACL entry regardless of whether the software is configured to display the masks in CIDR format.

The **no** form of the command removes the access list.

Examples

The following example shows how to configure a standard ACL and apply it to incoming traffic on port 1/1/1.

```
device# configure terminal
device(config)# access-list 1 deny host 10.157.22.26 log
device(config)# access-list 1 deny 10.157.29.12 log
device(config)# access-list 1 deny host IPhost1 log
device(config)# access-list 1 permit any
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# ip access-group 1 in
device(config)# write memory
```

The following example shows how to configure the previous example, using the **ip access-list** command.

```
device# configure terminal
device(config)# device(config)# ip access-list standard 1
device(config-std-nacl)# deny host 10.157.22.26 log
device(config-std-nacl)# deny 10.157.29.12 log
device(config-std-nacl)# deny host IPhost1 log
device(config-std-nacl)# permit any
device(config-std-nacl)# interface ethernet 1/1/1
device(config-std-nacl-if-e1000-1/1/1)# ip access-group 1 in
device(config)# write memory
```

access-list enable accounting

Enables Access Control List (ACL) accounting for IPv4 numbered ACLs.

Syntax

access-list *number* **enable-accounting**

no access-list *number* **enable-accounting**

Command Default

This option is disabled.

Parameters

number

Defines the IPv4 ACL ID.

enable-accounting

Enables ACL accounting on the specified interface.

Modes

Global configuration mode

Usage Guidelines

This command is only applicable to numbered ACLs.

The **no** form of this command disables ACL accounting for IPv4 numbered ACLs.

Examples

The following example enables ACL accounting for a numbered ACL.

```
device(config)# access-list 10 permit host 10.10.10.1
device(config)# access-list 10 enable-accounting
device(config)# interface ethernet 1/1
device(config-if-1/1)# ip access-group 10 in
```

The following example enables ACL accounting for an extended ACL.

```
device(config)# ip access-list extended 101
device(config-ip-access-list-101)# enable-accounting
```

History

Release version	Command history
08.0.10	This command was introduced.

access-list remark

Adds a remark to the following access list entry.

Syntax

access-list remark *comment-text*

no access-list remark *comment-text*

Command Default

Access lists are not remarked.

Parameters

comment-text

Specifies the remark for the following access list entry, up to 256 alphanumeric characters.

Modes

Global configuration mode

Usage Guidelines

ACL comment text describes entries in an ACL. The comment text appears in the output of show commands that display ACL information.

The **no** form of the command removes the remark from the access list.

Examples

The following example adds remarks to entries in a numbered ACL.

```
device(config)# access-list 100 remark The following line permits TCP packets
device(config)# access-list 100 permit tcp 192.168.4.40/24 2.2.2.2/24
device(config)# access-list 100 remark The following permits UDP packets
device(config)# access-list 100 permit udp 192.168.2.52/24 2.2.2.2/24
device(config)# access-list 100 deny ip any any
```

accounting

Enables RADIUS accounting for Web Authentication.

Syntax

accounting

no accounting

Command Default

RADIUS accounting for Web Authentication is not enabled.

Modes

Web Authentication configuration mode

Usage Guidelines

When Web Authentication is enabled, you can enable RADIUS accounting to record login (start) and logout (stop) events per host. The information is sent to a RADIUS server.

The **no** form of the command disables RADIUS accounting for Web Authentication.

Examples

The following example enables RADIUS accounting for Web Authentication.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# accounting
```

acl-logging

For the current interface, enables IPv4 ACL logging for ACL rules that contain the **log** keyword.

Syntax

acl-logging

no acl-logging

Command Default

IPv4 ACL logging is disabled.

Modes

Interface configuration modes

Usage Guidelines

You can enable ACL logging on physical and virtual interfaces.

The **log** parameter is effective within both deny rules and permit rules.

The **log** parameter is effective within both ingress and egress ACLs.

ACL logging is a CPU-intensive feature, intended for debugging purposes. Ruckus recommends that you disable ACL logging after the debug session is over.

ACL logging is not supported for dynamic ACLs with MAC authentication or 802.1X enabled.

The **acl-logging** command applies to IPv4 ACLs only. For IPv6 ACLs, refer to the **logging-enable** topic.

The **no** form of the command disables IPv4 ACL logging on the current interface.

Examples

In the following example, the **acl-logging** command enables ACL logging for the 1/1/4 interface. Because the ACL bound to that interface includes rules with the **log** command, packets that match any such rules are logged.

```
device# configure terminal
device(config)# ip access-list standard 1
device(config-std-nacl)# deny host 10.157.22.26 log
device(config-std-nacl)# deny 10.157.29.12 log
device(config-std-nacl)# deny host IPHost1 log
device(config-std-nacl)# permit any
device(config-std-nacl)# interface e 1/1/4
device(config-if-e1000-1/1/4)# acl-logging
device(config-if-e1000-1/1/4)# ip access-group 1 in
```

History

Release version	Command history
8.0.50	This command was modified to support permit rules (in addition to deny rules) and egress ACLs (in addition to ingress ACLs).

acl-mirror-port

Configures ACL-based inbound mirroring.

Syntax

acl-mirror-port ethernet *stackid/slot/port*

no acl-mirror-port ethernet *stackid/slot/port*

Parameters

ethernet *stackid/slot/port*

Specifies the mirror port to which the monitored port traffic is copied.

Modes

Interface configuration mode

Usage Guidelines

Use this command to set the destination port on which the traffic must be mirrored. The destination port must be the same for all ports in a port region. All traffic mirrored from any single port in a port region is mirrored to the same destination mirror port as traffic mirrored from any other port in the same port region. When a destination port is configured for any port within a port region, traffic from any ACL with a mirroring clause assigned to any port in that port region is mirrored to that destination port. This will occur even if a destination port is not explicitly configured for the port with the ACL configured.

To configure ACL-based mirroring for ACLs bound to virtual interfaces, use the **acl-mirror-port** command on a physical port that is a member of the same VLAN as the virtual interface. You can apply ACL-based mirroring on an entire VE, and enable mirroring in only one port region; traffic that is in the same VE but on a port in a different port region will not be mirrored. If a port is in both mirrored and non-mirrored VLANs, only traffic on the port from the mirrored VLAN is mirrored.

NOTE

If a destination mirror port is not configured for any ports within the port region where the port-mirroring ACL is configured, the ACL does not mirror the traffic but the ACL is applied to traffic on the port.

The **no** form of the command removes the ACL mirror port.

Examples

The following example shows the ACL mirroring traffic from port 1/1/1 is mirrored to port 1/1/3.

```
device(config)# interface ethernet 1/1/1
device(config-if-e10000-1/1)# acl-mirror-port ethernet 1/1/3
```

The following example shows that ports from a port region must be mirrored to the same destination mirror port.

```
device(config)# interface ethernet 1/1/1
device(config-if-e10000-1/1/1)# acl-mirror-port ethernet 1/2/3
device(config)# interface ethernet 1/1/2
device(config-if-e10000-1/1/2)# acl-mirror-port ethernet 1/2/3
```

The following example shows ACL mirroring when the destination port within a port region is configured.

```
device(config)# interface ethernet 1/1/1
device(config-if-e10000-1/1/1)# ip access-group 101 in
device(config)# interface ethernet 1/1/3
device(config-if-e10000-1/1/3)# acl-mirror-port ethernet 1/4/3
```

The following example shows how to specify the destination mirror port for LAG ports.

```
device(config)# lag static
device(config-lag)# ports ethernet 1/1/1 to 1/1/14
device(config-lag)# deploy
device(config)# interface ethernet 1/1/1
device(config-if-e10000-1/1/1)# acl-mirror-port ethernet 1/1/8
```

The following example shows how to configure ACL-based mirroring for ACLs bound to virtual interfaces.

```
device(config)# vlan 10
device(config-vlan-10)# tagged ethernet 1/4/1 to 1/4/2
device(config-vlan-10)# tagged ethernet 1/5/3
device(config-vlan-10)# router-interface ve 10
device(config-vlan-10)# exit
device(config)# interface ethernet 1/4/1
device(config-if-e10000-1/4/1)# acl-mirror-port ethernet 1/5/1
device(config-if-e10000-1/4/1)# exit
device(config)# interface ve 10
device(config-vif-10)# ip address 10.10.10.254/24
device(config-vif-10)# ip access-group 102 in
device(config)# access-list 102 permit ip any any mirror
```

The following example shows the ACL-based mirroring for ports in both mirrored and non-mirrored VLANs.

```
device(config)# vlan 10
device(config-vlan-10)# tagged ethernet 1/4/1 to 1/4/2
device(config-vlan-10)# tagged ethernet 1/5/3
device(config-vlan-10)# router-interface ve 10
device(config-vlan-10)# exit
device(config)# vlan 20
device(config-vlan-20)# tagged ethernet 1/4/1 to 1/4/2
device(config-vlan-20)# exit
device(config)# interface ethernet 1/4/1
device(config-if-e10000-1/4/1)# acl-mirror-port ethernet 1/5/1
device(config-if-e10000-1/4/1)# exit
device(config)# interface ve 10
device(config-vif-10)# ip address 10.10.10.254/24
device(config-vif-10)# ip access-group 102 in
device(config-vif-10)# exit
device(config)# access-list 102 permit ip any any mirror
```

activate (VRRP)

Activates the configured Virtual Router Redundancy Protocol (VRRP) virtual routing instance.

Syntax

activate

no activate

Command Default

A VRRP virtual routing instance is not activated.

Modes

VRID interface configuration mode

Usage Guidelines

Before issuing this command, complete the configuration of the VRRP virtual router. The interface assigned to the Virtual Routing ID (VRID) does not provide backup service for the virtual IP address until you activate the VRRP configuration.

The **no** form of this command disables the VRRP VRID.

Examples

The following example configures and activates VRRP VRID 1.

```
device# configure terminal
device(config)# router vrrp
device(config)# interface ethernet 1/1/6
device(config-if-e1000-1/1/6)# ip address 10.53.5.1/24
device(config-if-e1000-1/1/6)# ip vrrp vrid 1
device(config-if-e1000-1/1/6-vrid-1)# owner
device(config-if-e1000-1/1/6-vrid-1)# ip-address 10.53.5.1
device(config-if-e1000-1/1/6-vrid-1)# activate
VRRP router 1 for this interface is activating
```

activate (VSRP)

Activates the Virtual Switch Redundancy Protocol (VSRP) Virtual Router ID (VRID) for a port-based VLAN.

Syntax

activate

no activate

Command Default

The VRID is not activated by default.

Modes

VSRP VRID configuration mode

Usage Guidelines

The device must be set as a backup. Because VSRP does not have an owner, all VSRP devices are backups. The active device for a VRID is elected based on the VRID priority, which is configurable.

The **no** form of the command deactivates the VSRP VRID on the VLAN.

Examples

The following example shows how to activate the VSRP on a VLAN.

```
device(config)# vlan 200
device(config-vlan-200)# tag ethernet 1/1/1 to 1/1/8
device(config-vlan-200)# vsrp vrid 1
device(config-vlan-200-vrid-1)# backup
device(config-vlan-200-vrid-1)# activate
```

add mac

Permanently authenticates certain hosts.

Syntax

add mac *mac-address* [**ethernet** *stack/slot/port*] [**duration** *time*]

no add mac *mac-address* [**ethernet** *stack/slot/port*] [**duration** *time*]

Command Default

Permanent authentication is not enabled.

Parameters

mac-address

Specifies the MAC address of the host.

ethernet *stack/slot/port*

Specifies the Ethernet interface.

duration *time*

Specifies how long the MAC address remains authenticated. Valid values are from 0 through 128,000 seconds. The default is the time configured using the **reauth-time** command. If 0 is configured, then Web Authentication for the MAC address will not expire.

Modes

Web Authentication configuration mode

Usage Guidelines

Certain hosts, such as a DHCP server, gateway, or printers, may need to be permanently authenticated. Typically, these hosts are managed by the network administrator and are considered to be authorized hosts. Also, some of these hosts (such as printers) may not have a browser and will not be able to perform the Web Authentication.

NOTE

If a MAC address is statically configured, the MAC address will not be allowed to be dynamically configured on any port.

The **no** form of the command without any parameters removes all hosts and sets the duration a MAC address remains authenticated to its default.

Examples

The following example configures the host with MAC address 0000.00eb.2d14 to be permanently authenticated.

```
device(config)# vlan 10
device(config-vlan-10# webauth
device(config-vlan-10-webauth)# add mac 0000.00eb.2d14 duration 0
```

The following example specifies the MAC address to be added by the specified port that is a member of the VLAN.

```
device(config)# vlan 10
device(config-vlan-10# webauth
device(config-vlan-10-webauth)# add mac 0000.00eb.2d14 ethernet 1/1/1 duration 0
```

address-family

Enables IPv4 or IPv6 address-family configuration mode.

Syntax

address-family { **ipv4** | **ipv6** } [**max-route** *num*]

no address-family { **ipv4** | **ipv6** } [**max-route** *num*]

Command Default

An address family is not configured.

Parameters

ipv4

Specifies an IPv4 address family.

ipv6

Specifies an IPv6 address family.

max-route *num*

Configures the maximum number routes in a VRF. The valid range is from 128 through 15168. The default is 1024.

Modes

VRF configuration mode

Usage Guidelines

Use the **no** form of this command to remove IPv4 or IPv6 address family configurations from the device.

Examples

The following example enables IPv4 address-family configuration mode:

```
device(config)# vrf red
device(config-vrf-red)# address-family ipv4
device(config-vrf-red-ipv4)#
```

address-family unicast (BGP)

Enables the IPv4 or IPv6 address family configuration mode to configure a variety of BGP4 unicast routing options.

Syntax

```
address-family ipv4 unicast vrf vrf-name  
address-family ipv6 unicast [ vrf vrf-name ]  
no address-family ipv4 unicast vrf vrf-name  
no address-family ipv6 unicast [ vrf vrf-name ]
```

Parameters

ipv4
Specifies an IPv4 address family.

ipv6
Specifies an IPv6 address family.

vrf *vrf-name*
Specifies the name of the VRF instance to associate with subsequent address-family configuration mode commands.

Modes

BGP configuration mode

Usage Guidelines

Use the **no** form of this command to remove IPv4 or IPv6 address family configurations from the device.

Examples

This example enables BGP IPv6 address family configuration mode.

```
device# configure terminal  
device(config)# router bgp  
device(config-bgp-router)# address-family ipv6 unicast  
device(config-bgp-ipv6u)#
```

This example creates a BGP4 unicast instance for VRF green.

```
device# configure terminal  
device(config)# router bgp  
device(config-bgp-router)# address-family ipv4 unicast vrf green  
device(config-bgp-ipv4u-vrf)#
```

History

Release version	Command history
8.0.30	Multi-VRF support was added for IPv6 BGP.

add-vlan

Adds individual VLANs or a range of VLANs.

Syntax

```
add-vlan vlan-id [ to vlan-id ]
```

Command Default

VLANs are added when creating a VLAN group.

Parameters

vlan-id

Specifies the VLAN ID to add.

to *vlan-id*

Specifies the range of VLANs to add.

Modes

VLAN group configuration mode

Usage Guidelines

Use the **vlan-group** command to add up to 256 VLANs. To add more than 256 VLANs, use the **add-vlan** command.

NOTE

The device memory must be configured to contain at least the number of VLANs you specify for the higher end of the range. For example, if you specify 2048 as the VLAN ID at the high end of the range, you first must increase the memory allocation for VLANs to 2048 or higher. Additionally, on Layer 3 switches, if you allocate additional memory for VLANs, you also need to allocate the same amount of memory for virtual routing interfaces before you configure the VLAN groups. This is true regardless of whether you use the virtual routing interface groups. The memory allocation is required because the VLAN groups and virtual routing interface groups have a one-to-one mapping.

Examples

The following example shows how to add VLANs.

```
device(config)# vlan-group 1 vlan 2 to 1000  
device(config-vlan-group-1)# add-vlan 1001 to 1002
```

advertise backup

Advertises a Virtual Router Redundancy Protocol (VRRP) backup router to a VRRP master router.

Syntax

advertise backup

no advertise backup

Command Default

A VRRP backup router does not advertise itself to a VRRP master router.

Modes

VRID interface configuration mode

Usage Guidelines

Hello messages are used to advertise a backup router to a master router. To configure the interval at which the messages are sent, use the **backup-hello-interval** command.

The **advertise backup** command is configured only on VRRP backup routers and is supported by VRRP and VRRP-E.

The **no** form of the command disables the advertisement of a VRRP backup router to a VRRP master router.

Examples

The following example enables advertisements from the VRRP backup router and configures the hello message interval to 10 seconds.

```
device# configure terminal
device(config)# router vrrp
device(config)# interface ethernet 1/1/6
device(config-if-e1000-1/1/6)# ip address 10.53.5.1/24
device(config-if-e1000-1/1/6)# ip vrrp vrid 1
device(config-if-e1000-1/1/6-vrid-1)# advertise backup
device(config-if-e1000-1/1/6-vrid-1)# backup-hello-interval 10
```

advertise backup (vsrp)

Enables a backup to send Hello messages to the master.

Syntax

advertise backup

no advertise backup

Command Default

By default, backups do not send Hello messages to advertise themselves to the master.

Modes

VSRP VRID configuration mode

Usage Guidelines

When a backup is enabled to send Hello messages, the backup sends a Hello message to the master every 60 seconds by default. You can change the interval to be up to 3600 seconds using the **backup-hello-interval** command.

The **no** form of the command disables the backup from sending the Hello messages.

Examples

The following example enables a backup to send Hello messages to the master.

```
device(config)# vlan 200
device(config-vlan-200)# tagged ethernet 1/1/1 to 1/1/8
device(config-vlan-200)# vsrp vrid 1
device(config-vlan-200-vrid-1)# backup
device(config-vlan-200-vrid-1)# activate
device(config-vlan-200-vrid-1)# advertise backup
```

age

Configures the device to age out secure MAC addresses after a specified amount of time.

Syntax

age *time* [**absolute**]

no age *time* [**absolute**]

Command Default

By default, learned MAC addresses stay secure indefinitely.

Parameters

time

Configures the age timer. Valid values range is from 0 through 1440 minutes. If you configure 0, the MAC addresses stay secure indefinitely.

absolute

Configures all secure MAC addresses to age out immediately once the specified time expires.

Modes

Port security configuration mode

Port security interface configuration mode

Usage Guidelines

If the **absolute** keyword is not specified, secure MAC addresses are aged out only when the configured hardware MAC address age time expires.

NOTE

Even though you can set the age time to specific ports independent of the device-level setting, the age timer will take the greater of the two values. If you set the age timer to 3 minutes for the port, and 10 minutes for the device, the port MAC address aging occurs in 10 minutes (the device-level setting), which is greater than the port setting that you have configured.

On the Brocade ICX 7750, the port security age can only be set to the global hardware age. The absolute age and no aging of secure MACs are configured as static in hardware.

The **no** form of the command configures to never age out secure MAC addresses.

Examples

The following example sets the port security age timer to 10 minutes on all interfaces.

```
device(config)# port security
device(config-port-security)# age 10
```

Commands A - E

age

The following example ages out secure MAC addresses immediately after one minute.

```
device(config)# port security
device(config-port-security)# age 1 absolute
```

The following example sets the port security age timer to 10 minutes on a specific interface.

```
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)#port security
device(config-port-security-e1000-1/1/1)# age 10
```

aggregate-address (BGP)

Configures the device to aggregate routes from a range of networks into a single network prefix.

Syntax

aggregate-address { *ip-addr ip-mask* | *ipv6-addr ipv6-mask* } [**advertise-map** *map-name*] [**as-set**] [**attribute-map** *map-name*] [**summary-only**] [**suppress-map** *map-name*]

no aggregate-address { *ip-addr ip-mask* | *ipv6-addr ipv6-mask* } [**advertise-map** *map-name*] [**as-set**] [**attribute-map** *map-name*] [**summary-only**] [**suppress-map** *map-name*]

Command Default

The address aggregation feature is disabled. By default, the device advertises individual routes for all networks.

Parameters

ip-addr

IPv4 address.

ip-mask

IPv4 mask.

ipv6-addr

IPv6 address.

ipv6-mask

IPv6 mask.

advertise-map

Causes the device to advertise the more-specific routes in the specified route map.

map-name

Specifies a route map to be consulted.

as-set

Causes the device to aggregate AS-path information for all routes in the aggregate routes from a range of networks into a single network prefix.

attribute-map

Causes the device to set attributes for the aggregate routes according to the specified route map.

summary-only

Prevents the device from advertising more-specific routes contained within the aggregate route.

suppress-map

Prevents the more-specific routes contained in the specified route map from being advertised.

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

BGP address-family IPv4 unicast VRF configuration mode

BGP address-family IPv6 unicast VRF configuration mode

Usage Guidelines

Use the **no** form of this command to restore the defaults. When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

Examples

This example aggregates routes from a range of networks into a single network prefix and prevents the device from advertising more-specific routes.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# aggregate-address 10.11.12.0 summary-only
```

This example aggregates routes from a range of networks into a single network prefix under the IPv6 address family and advertises the paths for this route as AS_SET.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast
device(config-bgp-ipv6u)# aggregate-address 2001:DB8:12D:1300::/64 as-set
```

This example aggregates routes from a range of networks into a single network prefix for BGP VRF instance "red".

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv4 unicast vrf red
device(config-bgp-ipv4u-vrf)# aggregate-address 5.0.0.0/8
```

History

Release version	Command history
8.0.30	Support was added for the BGP address-family IPv6 unicast VRF configuration mode.

aggregated-vlan

Enables support for larger Ethernet frames.

Syntax

aggregated-vlan

no aggregated-vlan

Command Default

Support for larger Ethernet frames is not enabled.

Modes

Global configuration mode

Usage Guidelines

This command provides support for Ethernet frames up to 1536 bytes.

The **no** form of the command disables support for larger Ethernet frames.

Examples

The following example provides support for larger Ethernet frames.

```
device(config)# aggregated-vlan
```

alias

An alias serves as a shorthand version of a longer CLI command.

Syntax

alias

alias *alias-name* = *cli-command*

no alias *alias-name*

unalias *alias-name*

Command Default

No aliases are defined.

Parameters

alias-name

Alias name. Must be a single word, without spaces.

=

Operator representing "equals."

cli-command

Command string for which the alias is created.

Modes

Privileged EXEC mode.

Global configuration mode.

Usage Guidelines

To remove an alias you can enter the **no alias** or the **unalias** command followed by the *alias-name*.

An alias saves typing in a longer command that you commonly use. For example, you can create an alias called *shoro* for the CLI command **show ip route**. Then when you enter *shoro* at the command prompt, the **show ip route** command is issued.

Entering the **alias** command with no parameters displays the currently configured aliases on the device.

Examples

The following example creates an alias called *shoro* for the CLI command **show ip route**, enter the **alias shoro = show ip route** command:

```
device(config)# alias shoro = show ip route
```

The following example uses the command **copy running-config** with the appropriate parameters to create an alias called *wrsbc*:

```
device(config)# alias wrsbc = copy running-config tftp 10.10.10.10 test.cfg
```

The following example removes the *wrsbc* alias from the configuration:

```
device(config)# no alias wrsbc
```

An alternate method of removing the alias is shown below:

```
device(config)# unalias wrsbc
```

To display the aliases currently configured on the Ruckus device, enter the following command at either the Privileged EXEC or global configuration modes of the CLI.

```
device# alias
      wrsbc      copy running-config tftp 10.10.10.10 test.cfg
      shoro      show ip route
```

all-client

Restricts all remote management access methods to a host.

Syntax

all-client { *ip-address* | **ipv6** *ipv6-address* }

no all-client { *ip-address* | **ipv6** *ipv6-address* }

Command Default

Remote management access is not restricted.

Parameters

ip-address

The IP address of the host to which you want to restrict the remote management access.

ipv6 *ipv6-address*

The IPv6 address of the host to which you want to restrict the remote management access.

Modes

Global configuration mode

Usage Guidelines

By default, a Brocade device does not control remote management access based on the IP address of the managing device. Using the **all-client** command, you can restrict remote management access to a single IP address for all of the following access methods:

- Telnet access
- SSH access
- Web management access
- SNMP access

You can specify only one IP address at a time. However, you can enter each command ten times to specify up to ten IP addresses.

The **no** form of the command removes the access restriction.

Examples

The following example shows how to restrict all remote management access methods to a host with IP address 10.157.22.69.

```
device(config)# all-client 10.157.22.69
```

always-compare-med

Configures the device always to compare the Multi-Exit Discriminators (MEDs), regardless of the autonomous system (AS) information in the paths.

Syntax

always-compare-med

no always-compare-med

Modes

BGP configuration mode

Usage Guidelines

The **no** form of the command disallows the comparison of the MEDs for paths from neighbors in different autonomous systems.

Examples

The following example configures the device always to compare the MEDs.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# always-compare-med
```

always-propagate

Enables the device to reflect BGP routes even though they are not installed in the Routing Table Manager (RTM).

Syntax

always-propagate
no always-propagate

Command Default

This feature is disabled.

Modes

BGP configuration mode
BGP address-family IPv6 unicast configuration mode
BGP address-family IPv4 unicast VRF configuration mode
BGP address-family IPv6 unicast VRF configuration mode

Usage Guidelines

Use the **no** form of this command to restore the default.

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

Examples

This example configures the device to reflect routes that are not installed in the RTM.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# always-propagate
```

This example configures the device to reflect routes that are not installed in the RTM in IPv6 address-family unicast configuration mode.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast
device(config-bgp-ipv6u)# always-propagate
```

This example configures the device to reflect routes that are not installed in the RTM in a nondefault VRF instance.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv4 unicast vrf red
device(config-bgp-ipv4u-vrf)# always-propagate
```

History

Release version	Command history
8.0.30	Support was added for the BGP address-family IPv6 unicast VRF configuration mode.

anycast-rp

Configures PIM anycast rendezvous points (RPs) in IPv4 and IPv6 multicast domains.

Syntax

anycast-rp *rp-address anycast-rp-set-acl*
no anycast-rp *rp-address anycast-rp-set-acl*

Command Default

PIM anycast RPs are not configured.

Parameters

rp-address

Specifies a shared RP address used among multiple PIM routers.

anycast-rp-set-acl

Specifies a host-based simple access -control list (ACL) used to specify the address of the anycast RP set, including a local address.

Modes

PIM router configuration mode

Usage Guidelines

The **no** form of this command removes the anycast RP configuration.

PIM anycast RP is a way to provide load balancing and fast convergence to PIM RPs in an IPv4 or IPv6 multicast domain. The RP address of the anycast RP is a shared address used among multiple PIM routers, known as PIM RP.

The PIM software supports up to eight PIM anycast RP routers. All deny statements in the my-anycast-rp-set-acl ACL are ignored.

Examples

This example shows how to configure a PIM anycast RP.

```
device(config)# router pim
device(config-pim-router)# rp-address 100.1.1.1
device(config-pim-router)# anycast-rp 100.1.1.1 my-anycast-rp-set-acl
```

This example shows how to configure PIM anycast RP 100.1.1.1. The example avoids using loopback 1 interface when configuring PIM Anycast RP because the loopback 1 address could be used as a router-id. A PIM first-hop router registers the source with the closest RP. The first RP that receives the register re-encapsulates the register to all other anycast RP peers.

```
Device(config)# interface loopback 2
Device(config-lbif-2)# ip address 100.1.1.1/24
Device(config-lbif-2)# ip pim-sparse
Device(config-lbif-2)# interface loopback 3
Device(config-lbif-3)# ip address 1.1.1.1/24
Device(config-lbif-3)# ip pim-sparse
Device(config-lbif-3)# router pim
Device(config-pim-router)# rp-address 100.1.1.1
Device(config-pim-router)# anycast-rp 100.1.1.1 my-anycast-rp-set
Device(config-pim-router)# ip access-list standard my-anycast-rp-set
Device(config-std-nacl)# permit host 1.1.1.1
Device(config-std-nacl)# permit host 2.2.2.2
Device(config-std-nacl)# permit host 3.3.3.
```

This example shows how to configure a PIM anycast RP for a VRF.

```
Device(config)# ipv6 router pim vrf blue
Device(config-ipv6-pim-router-vrf-blue)# rp-address 1001::1
Device(config-ipv6-pim-router-vrf-blue)# anycast-rp 1001::1 my-anycast-rp-set-acl
```

This example shows how to configure PIM anycast RP 1001:1 so that it avoids using loopback 1.

```
Device(config)# interface loopback 2
Device(config-lbif-2)# ipv6 address 1001::1/96
Device(config-lbif-2)# ipv6 pim-sparse
Device(config-lbif-2)# interface loopback 3
Device(config-lbif-3)# ipv6 address 1:1:1::1/96
Device(config-lbif-3)# ipv6 pim-sparse
Device(config-lbif-3)# ipv6 router pim
Device(config-ipv6-pim-router)# rp-address 1001::1
Device(config-ipv6-pim-router)# anycast-rp 1001::1 my-anycast-rp-set
Device(config-ipv6-pim-router)# ipv6 access-list my-anycast-rp-set
Device(config-std-nacl)# permit ipv6 host 1:1:1::1 any
Device(config-std-nacl)# permit ipv6 host 2:2:2::2 any
Device(config-std-nacl)# permit ipv6 host 3:3:3::3 any
```

area authentication

Enables authentication for an OSPF Version 3 (OSPFv3) area.

Syntax

area { *ip-address* | *decimal* } **authentication ipsec spi** *value* **esp sha1** *key*

area { *ip-address* | *decimal* } **authentication ipsec spi** *value* **esp sha1 no-encrypt** *key*

no area { *ipv6-address* | *decimal* } **authentication ipsec spi** *value*

Command Default

Authentication is not enabled on an area.

The key is stored in encrypted format by default.

Parameters

ip-address

Area ID in IP address format.

decimal

Area ID in decimal format.

ipsec

Specifies that IP security (IPsec) is the protocol that authenticates the packets.

spi

Specifies the Security Policy Index (SPI).

value

Specifies the SPI value. Valid values range from decimal numbers 256 through 4294967295. The near-end and far-end values must be the same.

esp

Specifies Encapsulating Security Payload (ESP) as the protocol to provide packet-level security. This is the only option currently available.

sha1

Enables Hashed Message Authentication Code (HMAC) Secure Hash Algorithm 1 (SHA-1) authentication on the OSPFv3 area.

key

Number used in the calculation of the message digest. The 40 hexadecimal character key is stored in encrypted format by default.

no-encrypt

The 40-character key is not encrypted upon either its entry or its display.

key

The 40 hexadecimal character key.

Modes

OSPFv3 router configuration mode

OSPFv3 router VRF configuration mode

Usage Guidelines

The 40 hexadecimal character key is encrypted by default. The system adds the following in the configuration to indicate that the key is encrypted:

- `encrypt` = the key string uses proprietary simple cryptographic 2-way algorithm
- `encryptb64` = the key string uses proprietary base64 cryptographic 2-way algorithm

Use the **no-encrypt** parameter to disable encryption.

Currently certain keyword parameters must be entered though only one keyword choice is possible for that parameter. For example, the only authentication algorithm is HMAC-SHA1-96, but you must nevertheless enter the **sha1** keyword for this algorithm. Also, although ESP is currently the only authentication protocol, you must enter the **esp** keyword.

The **no** form of the command removes an authentication specification for an area from the configuration.

Examples

The following example enables esp and SHA-1 authentication for an OSPFv3 area, setting a SPI value of 900.

```
device# configure terminal
device(config)# ip router-id 10.1.2.3
device(config)# ipv6 router ospf
device(config-ospf6-router)# area 0 authentication ipsec spi 750 esp sha1
abcef12345678901234fedcba098765432109876
```

area nssa (OSPFv2)

Creates a not-so-stubby area (NSSA) or modifies its parameters.

Syntax

```
area { ip-addr | decimal } nssa { metric [ no-summary ] | default-information-originate }  
no area nssa
```

Command Default

No areas are created.

Parameters

ip-addr

Area address in IP address format.

decimal

Area address in decimal format.

metric

Additional cost for using a route to or from this area.

no-summary

When configured on the NSSA area border router (ABR), this parameter prevents any Type 3 and Type 4 summary link-state advertisement (LSA) from being injected into the area. The only exception is that a default route is injected into the NSSA by the ABR, and strictly as a Type 3 LSA (not a Type 7, because that could cause intra-AS traffic to get routed out the AS). This makes the NSSA an NSSA totally stubby area, which can only have Type 1, 2 and 7 LSAs. **Note:** This parameter is disabled by default, which means the default route must use a Type 7 LSA.

default-information-originate

When configured on the ABR, this parameter injects a Type 7 default route into the NSSA area. As a result, the other NSSA routers install the default route through the advertising NSSA ABR. By default the NSSA ABR does not originate a default route to the NSSA.

Modes

OSPF router configuration mode

OSPF router VRF configuration mode

Usage Guidelines

NSSAs are typically needed when one-way transmission of Type-5 LSAs (out of the area) is desired but injection of the same LSAs into the area is not acceptable.

Once created, the type of the area cannot be changed. The only exception to this rule is that an NSSA or stub area can be changed to a totally NSSA or a totally stub area, respectively.

The **no** form of the command deletes a NSSA.

Examples

The following example sets an additional cost of 5 on an NSSA identified as 2, includes the no-summary parameter, and prevents the device from importing type 3 and type 4 summary LSAs into the NSSA area.

```
device# configure terminal
device(config)# router ospf
device(config-ospf-router)# area 2 nssa 5 no-summary
```

area nssa (OSPFv3)

Creates a not-so-stubby area (NSSA) or modifies its parameters.

Syntax

```
area { ip-addr | decimal } nssa [ metric ] [ default-information-originate [ metric num ] [ metric-type { type1 | type2 } ] ] [ no-redistribution ] [ no-summary ] [ translator-always ] [ translator-interval interval ]
```

```
no area nssa
```

Command Default

No areas are created.

Parameters

ip-addr

Area address in IP address format.

decimal

Area address in decimal format.

metric

Additional cost for using a route to or from this area. Valid values range from 1 through 1048575.

default-information-originate

When configured on the ABR, this parameter injects a Type 7 default route into the NSSA area. As a result, the other NSSA routers install the default route through the advertising NSSA ABR. By default the NSSA ABR does not originate a default route to the NSSA.

metric-type

Specifies how the cost of a neighbor metric is determined.

type1

The metric of a neighbor is the cost between itself and the router plus the cost of using this router for routing to the rest of the world.

type2

The metric of a neighbor is the total cost from the redistributing routing to the rest of the world.

no-redistribution

The no-redistribution parameter prevents an NSSA ABR from generating external (type-7) LSA into a NSSA area. This is used in the case where an ASBR should generate type-5 LSA into normal areas and should not generate type-7 LSA into a NSSA area. By default, redistribution is enabled in a NSSA.

no-summary

When configured on the NSSA area border router (ABR), this parameter prevents any Type 3 and Type 4 summary link-state advertisement (LSA) from being injected into the area. The only exception is that a default route is injected into the NSSA by the ABR, and strictly as a Type 3 LSA (not a Type 7, because that could cause intra-AS traffic to get routed out the AS). This makes the NSSA a NSSA totally stubby area, which can only have Type 1, 2 and 7 LSAs. **Note:** This parameter is disabled by default, which means the default route must use a Type 7 LSA.

translator-always

Configures the translator-role. When configured on an ABR, this causes the router to unconditionally assume the role of a NSSA translator. By default, translator-always is not set, the translator role by default is candidate.

translator-interval *interval*

Configures the time interval for which an elected NSSA translator continues to perform its duties even after its NSSA translator role has been disposed by another router. Valid values range from 10 through 60 seconds. By default the stability-interval is 40 seconds.

Modes

OSPFv3 router configuration mode

OSPFv3 router VRF configuration mode

Usage Guidelines

NSSAs are typically needed when one-way transmission of Type-5 LSAs (out of the area) is desired but injection of the same LSAs into the area is not acceptable.

Once created, the type of the area cannot be changed. The only exception to this rule is that a NSSA or stub area can be changed to a totally NSSA or a totally stub area, respectively.

The **no** form of the command deletes a NSSA.

Examples

The following example sets an additional cost of 4 on a NSSA identified as 8 (in decimal format), and prevents any Type 3 or Type 4 summary LSAs from being injected into the area.

```
device# configure terminal
device(config)# ipv6 router ospf
device(config-ospf6-router)# area 8 nssa 4 no-summary
```

area range (OSPFv2)

Specifies area range parameters on an area border router (ABR).

Syntax

```
area { A.B.C.D | decimal } range E.F.G.H I.J.K.L  
area { A.B.C.D | decimal } range E.F.G.H I.J.K.L advertise [ cost cost_value ]  
area { A.B.C.D | decimal } range E.F.G.H I.J.K.L cost cost_value  
area { A.B.C.D | decimal } range E.F.G.H I.J.K.L not-advertise [ cost cost_value ]  
no area range
```

Command Default

The address range is advertised.

Parameters

A.B.C.D

Area address in IP address format.

decimal

Area address in decimal format.

E.F.G.H I.J.K.L

Specifies the IP address and mask portion of the range. All network addresses that match this network are summarized in a single route and advertised by the ABR.

advertise

Sets the address range status to *advertise* and generates a Type 3 summary LSA.

cost *cost_value*

Sets the cost value for the area range. This value is used as the generated summary LSA cost. The range for *cost_value* is 1 to 6777214. If this value is not specified, the cost value is the default range metric calculation for the generated summary LSA cost.

not-advertise

Sets the address range status to DoNotAdvertise; the Type 3 LSA is suppressed, and the component networks remain hidden from other networks. This setting is used to temporarily pause route summarization from the area.

Modes

OSPF router configuration mode

OSPF router VRF configuration mode

Usage Guidelines

Use this command only on ABRs to specify route summarization for an existing area. The result is that a single summary route is advertised to other areas by the ABR, in the form of a Type 3 LSA. Routing information is condensed at area boundaries and external to the area, and only a single route is advertised for each address range.

An example of when you might want to use this command is if you have many small networks advertised from area 0 to any other area, or from any non-backbone area into the backbone. This command gives you a summary route instead of many smaller routes. In an area, the OSPF database on each router must be an exact copy of the databases of the other routers. This means that no summarization is allowed within the area.

The **no** form of the command disables the specification of range parameters on an ABR.

Examples

The following example advertises to Area 3 all the addresses on the network 10.1.1.0 10.255.255.0 in the ABR you are signed into.

```
device# configure terminal
device(config)# router ospf
device(config-ospf-router)# area 3 range 10.1.1.0 10.255.255.0 advertise
```

area range (OSPFv3)

Specifies area range parameters on an area border router (ABR).

Syntax

```
area { ip-addr | decimal } range ipv6 address/mask [ advertise | not-advertise ] [ cost cost_value ]  
no area range
```

Parameters

ip-addr

Area address in IP address format.

decimal

Area address in decimal format.

ipv6 address/mask

Specifies the IPv6 address in dotted-decimal notation and the IPv6 mask in CIDR notation. All network addresses that match this network are summarized in a single route and advertised by the ABR.

advertise

Sets the address range status to *advertise* and generates a Type 3 summary LSA.

cost *cost_value*

Sets the cost value for the area range. This value is used as the generated summary LSA cost. The range for *cost_value* is 1 to 6777214. If this value is not specified, the cost value is the default range metric calculation for the generated summary LSA cost.

not-advertise

Sets the address range status to DoNotAdvertise; the Type 3 LSA is suppressed, and the component networks remain hidden from other networks. This setting is used to temporarily pause route summarization from the area.

Modes

OSPFv3 router configuration mode

OSPFv3 router VRF configuration mode

Usage Guidelines

Use this command only on ABRs to specify route summarization for an existing area. The result is that a single summary route is advertised to other areas by the ABR, in the form of a Type 3 LSA. Routing information is condensed at area boundaries and external to the area, and only a single route is advertised for each address range.

An example of when you might want to use this command is if you have many small networks advertised from area 0 to any other area, or from any non-backbone area into the backbone. This command gives you a summary route instead of many smaller routes. In an area, the OSPF database on each router must be an exact copy of the databases of the other routers. This means that no summarization is allowed within the area.

The **no** form of the command disables the specification of range parameters on an ABR.

Examples

The following example advertises to Area 3 all the addresses on the network 2001:db8:8::/45 in the ABR you are signed into.

```
device# configure terminal
device(config)# ipv6 router ospf
device(config-ospf6-router)# area 3 range 2001:db8:8::/45 advertise
```

area stub (OSPFv2)

Creates or deletes a stub area or modifies its parameters.

Syntax

```
area { ip-addr | decimal } stub metric [ no-summary ]  
no area stub
```

Command Default

No areas are created.

Parameters

A.B.C.D

Area address in IP address format.

decimal

Area address in decimal format.

metric

Additional cost for using a route to or from this area. Valid values range from 1 through 6777215.

no-summary

When configured on the ABR, this parameter prevents any Type 3 and Type 4 summary LSAs from being injected into the area. The only exception is that a default route is injected into the stub/totally stubby area by the ABR as a Type 3 LSA. Enabling this parameter makes the area a so-called totally stubby area, which can only have Types 1 and 2. This parameter is disabled by default.

Modes

OSPF router configuration mode

OSPF router VRF configuration mode

Usage Guidelines

Once created, the type of the area cannot be changed. The only exception to this rule is that a NSSA or stub area can be changed to a totally NSSA or a totally stub area, respectively.

The **no** form of the command deletes a stub area.

Examples

The following example sets an additional cost of 5 on a stub area called 2.

```
device# configure terminal  
device(config)# router ospf  
device(config-ospf-router)# area 2 stub 5
```

area stub (OSPFv3)

Creates or deletes a stub area or modifies its parameters.

Syntax

```
area { ip-addr | decimal } stub metric [ no-summary ]  
no area stub
```

Command Default

No areas are created.

Parameters

ip-addr

Area address in IP address format.

decimal

Area address in decimal format.

metric

Additional cost for using a route to or from this area. Valid values range from 3 through 1048575.

no-summary

When configured on the ABR, this parameter prevents any Type 3 and Type 4 summary LSAs from being injected into the area. The only exception is that a default route is injected into the stub/totally stubby area by the ABR as a Type 3 LSA. Enabling this parameter makes the area a so-called totally stubby area, which can only have Types 1 and 2. This parameter is disabled by default.

Modes

OSPFv3 router configuration mode

OSPFv3 router VRF configuration mode

Usage Guidelines

Once created, the type of the area cannot be changed. The only exception to this rule is that a NSSA or stub area can be changed to a totally NSSA or a totally stub area, respectively.

The **no** form of the command deletes a stub area.

Examples

The following example sets an additional cost of 5 on a stub area called 2.

```
device# configure terminal  
device(config)# ipv6 router ospf  
device(config-ospf6-router)# area 2 stub 5
```

area virtual-link (OSPFv2)

Creates or modifies virtual links for an area.

Syntax

```
area { ip-addr | decimal } virtual-link E.F.G.H [ authentication-key { 0 | 1 } password ] [ dead-interval time ] [ hello-interval time ] [ md5-authentication { key-activation-wait-time time | key-id num key } ] [ retransmit-interval time ] [ transmit-delay time ]
```

no area virtual-link

Command Default

No virtual links are created.

Parameters

ip-addr

Area address in IP address format.

decimal

Area address in decimal format.

E.F.G.H

ID of the OSPF router at the remote end of the virtual link.

authentication-key

Sets the password and encryption method. Only one encryption method can be active on an interface at a time. All OSPF packets transmitted on the interface contain this password. All OSPF packets received on the interface are checked for this password. If the password is not present, then the packet is dropped.

0

Does not encrypt the password you enter.

1

The key string uses proprietary simple cryptographic 2-way algorithm.

password

OSPF password. The password can be up to eight alphanumeric characters.

dead-interval *time*

How long a neighbor router waits for a hello packet from the current router before declaring the router down. This value must be the same for all routers and access servers that are attached to a common network. Valid values range from 3 through 65535 seconds. The default is 40 seconds.

hello-interval *time*

Time between hello packets that the router sends on an interface. The value must be the same for all routers and access servers that are attached to a common network. Valid values range from 1 through 65535 seconds. The default is 10 seconds.

md5-authentication

Sets either MD5 key-activation wait time or key identifier.

key-activation-wait-time *time*

Time before a newly configured MD5 authentication key is valid. This parameter provides a graceful transition from one MD5 key to another without disturbing the network. All new packets transmitted after the wait time ends will use the newly configured MD5 Key. OSPF packets that contain the old MD5 key are accepted for up to five minutes (300 seconds) after the new MD5 key is in operation. Valid values range from 0 through 14400 seconds. The default is 300 seconds.

key-id *num key*

The *num* is a number between 1 and 255 which identifies the MD5 key being used. This parameter is required to differentiate among multiple keys defined on a device. When MD5 is enabled, the key is an alphanumeric password of up to 16 characters that is later encrypted and included in each OSPF packet transmitted. You must enter a password in this field when the system is configured to operate with either simple or MD5 authentication. By default, the MD5 authentication key is encrypted.

retransmit-interval *time*

Time between Link State Advertisement (LSA) retransmissions for adjacencies belonging to the interface. Set this interval to a value larger than the expected round-trip delay between any two routers on the attached network. Valid values range from 0 through 3600 seconds. The default is 5 seconds.

transmit-delay *time*

Estimated time required to send an LSA on the interface. This value must be an integer greater than zero. The age of each LSA in the update packet is incremented by the value of this parameter before transmission occurs. Valid values range from 0 through 3600 seconds. The default is 1 second.

Modes

OSPF router configuration mode

OSPF router VRF configuration mode

Usage Guidelines

The **no** form of the command removes a virtual link.

Examples

The following example creates a virtual link for an area whose decimal address is 1, and where the ID of the OSPFv2 device at the remote end of the virtual link is 10.1.2.3.

```
device# configure terminal
device(config)# router ospf
device(config-ospf-router)# area 1 virtual-link 10.1.2.3
```

area virtual-link (OSPFv3)

Creates or modifies virtual links for an area.

Syntax

```
area { ip-addr | decimal } virtual-link A.B.C.D [ dead-interval time | hello-interval time | hello-jitter interval | retransmit-interval time | transmit-delay time ]
```

```
no area virtual-link
```

Command Default

No virtual links are created.

Parameters

ip-addr

Area address in IP address format.

decimal

Area address in decimal format.

A.B.C.D

ID of the OSPFv3 device at the remote end of the virtual link.

dead-interval *time*

How long a neighbor device waits for a hello packet from the current device before declaring the device down. This value must be the same for all devices and access servers that are attached to a common network. Valid values range from 3 through 65535 seconds. The default is 40 seconds.

hello-interval *time*

Time between hello packets that the device sends on an interface. The value must be the same for all devices and access servers that are attached to a common network. Valid values range from 1 through 65535 seconds. The default is 10 seconds.

hello-jitter *interval*

Sets the allowed jitter between hello packets. Valid values range from 1 through 50 percent (%). The default value is 10%.

retransmit-interval *time*

Time between Link State Advertisement (LSA) retransmissions for adjacencies belonging to the interface. Set this interval to a value larger than the expected round-trip delay between any two devices on the attached network. Valid values range from 0 through 3600 seconds. The default is 5 seconds.

transmit-delay *time*

Estimated time required to send an LSA on the interface. This value must be an integer greater than zero. The age of each LSA in the update packet is incremented by the value of this parameter before transmission occurs. Valid values range from 0 through 3600 seconds. The default is 1 second.

Modes

- OSPFv3 router configuration mode
- OSPFv3 router VRF configuration mode

Usage Guidelines

The values of the **dead-interval** and **hello-interval** parameters must be the same at both ends of a virtual link. Therefore, if you modify the values of these parameters at one end of a virtual link, you must make the same modifications on the other end of the link. The values of the other virtual link parameters do not require synchronization.

The **no** form of the command removes a virtual link.

Examples

The following example creates a virtual link for an area whose decimal address is 1, and where the ID of the OSPFv3 device at the remote end of the virtual link is 209.157.22.1.

```
device# configure terminal
device(config)# ipv6 router ospf
device(config-ospf6-router)# area 1 virtual-link 209.157.22.1
```

area virtual-link authentication (OSPFv3)

Enables authentication for virtual links in an OSPFv3 area.

Syntax

```
area { ip-addr | decimal } virtual-link E.F.G.H authentication ipsec spi value esp sha1 key [ no-encrypt ] key  
no area { IPv6 address | decimal } virtual-link E.F.G.H authentication ipsec spi spi
```

Command Default

Authentication is not enabled on a virtual-link.

The 40 hexadecimal character key is encrypted by default. Use the **no-encrypt** parameter to disable encryption.

Parameters

ip-addr

Area address in IP address format.

decimal

Area address in decimal format.

E.F.G.H

ID of the OSPFv3 device at the remote end of the virtual link.

ipsec

Specifies that IP security (IPsec) is the protocol that authenticates the packets.

spi

Specifies the Security Policy Index (SPI).

value

Specifies the SPI value. Valid values range from decimal numbers 256 through 4294967295. The near-end and far-end values must be the same.

esp

Specifies Encapsulating Security Payload (ESP) as the protocol to provide packet-level security. This is the only option currently available.

sha1

Enables Hashed Message Authentication Code (HMAC) Secure Hash Algorithm 1 (SHA-1) authentication on the OSPFv3 area.

key

Number used in the calculation of the message digest. The 40 hexadecimal character key is stored in encrypted format by default.

no-encrypt

The 40-character key is not encrypted upon either its entry or its display.

key

The 40 hexadecimal character key.

Modes

- OSPFv3 router configuration mode
- OSPFv3 router VRF configuration mode

Usage Guidelines

Currently certain keyword parameters must be entered though only one keyword choice is possible for that parameter. For example, the only authentication algorithm is HMAC-SHA1-96, but you must nevertheless enter the **sha1** keyword for this algorithm. Also, although ESP is currently the only authentication protocol, you must enter the **esp** keyword.

The **no** form of the command removes authentication from the virtual-links in the area.

Examples

The following example configures IPsec on a virtual link in an OSPFv3 area, and encryption is disabled.

```
device# configure terminal
device(config)# ip router-id 10.1.2.2
device(config)# ipv6 router ospf
device(config-ospf6-router)# area 2 virtual-link 10.1.2.2 authentication ipsec spi 600 esp sha1 no-
encrypt 1134567890223456789012345678901234567890
```

arp

Creates static ARP entry.

Syntax

arp *ip-address mac-address ethernet stack/slot/port*
no arp *ip-address mac-address ethernet stack/slot/port*

Command Default

Static ARP entries are not configured.

Parameters

ip-address

Specifies the IP address of the device that has the MAC address of the entry.

mac-address

Specifies the MAC address of the entry.

ethernet *stack/slot/port*

Specifies the Ethernet interface.

Modes

Global configuration mode

Usage Guidelines

Brocade Layer 3 switches have a static ARP table, in addition to the regular ARP cache. The static ARP table contains entries that you configure.

Static entries are useful in cases where you want to pre-configure an entry for a device that is not connected to the Layer 3 switch, or you want to prevent a particular entry from aging out. The software removes a dynamic entry from the ARP cache if the ARP aging interval expires before the entry is refreshed. Static entries do not age out, regardless of whether the Brocade device receives an ARP request from the device that has the entry address.

NOTE

You cannot create static ARP entries on a Layer 2 switch.

The maximum number of static ARP entries you can configure depends on the software version running on the device.

The **no** form of the command removes the configured static ARP entry.

Examples

The following example creates a static ARP entry.

```
device(config)# arp 10.53.4.2 0000.0054.2348 ethernet 1/1/2
```

arp-internal-priority

Configures the priority of ingress ARP packets.

Syntax

arp-internal-priority *priority-value*

Command Default

The default priority of ingress ARP packets is 4.

Parameters

priority-value

Specifies the priority value of the ingress ARP packets. It can take a value in the inclusive range of 0 to 7, where 7 is the highest priority.

Modes

Global configuration mode

Usage Guidelines

High traffic volume or non-ARP packets with a higher priority may cause ARP packets to be dropped, thus causing devices to become temporarily unreachable. You can use this command to increase the priority of ingress ARP packets. However, if the priority of ARP traffic is increased, a high volume of ARP traffic might cause drops in control traffic, possibly causing traffic loops in the network.

Stacking packets have a priority value of 7 and have higher precedence over ARP packets. If the ARP packets have priority value 7 in a stack system, they will be treated as priority value 6 packets when compared to stacking packets.

This command does not affect the priority of egress ARP packets.

You cannot change the priority of ingress ARP packets on the management port.

Examples

The following example sets the priority of ingress ARP packets to a value of 7.

```
Brocade(config)# arp-internal-priority 7
```

History

Release version	Command history
FastIron 08.0.01	This command was introduced.

as-path-ignore

Disables the comparison of the autonomous system (AS) path lengths of otherwise equal paths.

Syntax

as-path-ignore

no as-path-ignore

Command Default

The comparison of the AS path lengths of otherwise equal paths is enabled.

Modes

BGP configuration mode

Usage Guidelines

The **no** form of the command restores default behavior.

Examples

The following example configures the device to always disable the comparison of AS path lengths.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# as-path-ignore
```

atalk-proto

Configures the AppleTalk protocol-based VLAN.

Syntax

atalk-proto [**name** *string*]

no atalk-proto [**name** *string*]

Command Default

An AppleTalk protocol-based VLAN is not configured.

Parameters

name *string*

Specifies the name of the AppleTalk protocol you want to configure on a VLAN. The name can be up to 32 characters in length.

Modes

VLAN configuration mode

Usage Guidelines

The device sends AppleTalk broadcasts to all ports within the AppleTalk protocol-based VLAN.

The **no** form of the command disables the AppleTalk protocol-based VLAN.

Examples

The following example shows how to configure an AppleTalk protocol-based VLAN.

```
device(config)# vlan 10 by port
device(config-vlan-10)# untagged ethernet 1/1/1 to 1/1/6
added untagged port ethe 1/1/1 to 1/1/6 to port-vlan 30.
device(config-vlan-10)# atalk-proto name Atalk_Prot_VLAN
```

attempt-max-num

Configures the number of times a user can enter an invalid username and password; that is, the number of Web Authentication attempts during the specified cycle time.

Syntax

attempt-max-num *number*
no attempt-max-num *number*

Command Default

The default number of Web Authentication attempts allowed is five.

Parameters

number

Specifies the number of Web Authentication attempts. Valid values are from 0 through 64. If you configure 0, there is no limit on the number of attempts. The default is five attempts.

Modes

Web Authentication configuration mode

Usage Guidelines

You can set a limit on the number of times a user enters an invalid username and password during the specified cycle time. If the user exceeds the limit, the user is blocked for a duration of time, which is defined by the **block duration** command. Also, the Web browser will be redirected to the Exceeded Allowable Attempts web page.

The **no** form of the command sets the number of Web Authentication attempts to the default.

Examples

The following example limits the number of Web Authentication attempts to 10.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# attempt-max-num 10
```

auth-default-vlan

Specifies the auth-default VLAN globally.

Syntax

auth-default-vlan *vlan-id*

no auth-default-vlan *vlan-id*

Command Default

The auth-default VLAN is not specified.

Parameters

vlan-id

Specifies the VLAN ID of the auth-default VLAN.

Modes

Authentication configuration mode

Usage Guidelines

The auth-default VLAN must be configured to enable authentication.

A VLAN must be configured as auth-default VLAN to enable authentication. When any port is enabled for 802.1X authentication or MAC authentication, the client is moved to this VLAN by default.

The auth-default VLAN is also used in the following scenarios:

- When the RADIUS server does not return VLAN information upon authentication, the client is authenticated and remains in the auth-default VLAN.
- If RADIUS timeout happens during the first authentication attempt and the timeout action is configured as "Success", the client is authenticated in the auth-default VLAN. If the RADIUS server is not available during reauthentication of a previously authenticated client, the client is retained in the previously authenticated VLAN.

The **no** form of the command disables the auth-default VLAN.

Examples

The following example creates an auth-default VLAN with VLAN 2.

```
device(config)# authentication
device(config-authen)# auth-default-vlan 2
```

History

Release version	Command history
08.0.20	This command was introduced.

authenticate

Enables Network Time Protocol (NTP) strict authentication.

Syntax

authenticate

no authenticate

Command Default

Authentication is disabled.

Modes

NTP configuration mode

Usage Guidelines

If authentication is enabled, NTP packets that do not have a valid MAC address are dropped.

The **no** form of the command disables NTP strict authentication.

Examples

The following example enables NTP strict authentication.

```
device(config)# ntp  
device(config-ntp)# authenticate
```

authenticated-mac-age-time

Configures the time duration after which the user-associated MAC address is aged out and reauthentication is enforced.

Syntax

authenticated-mac-age-time *time*
no authenticated-mac-age-time *time*

Command Default

The default time is 3600 seconds.

Parameters

time

Specifies the time duration after which the user-associated MAC address is aged out and reauthentication is enforced. Valid values are 0 seconds to the reauthentication time configured using the **reauth-time** command. The default value is 3600 seconds.

Modes

Web Authentication configuration mode

Usage Guidelines

You can force Web Authenticated hosts to be reauthenticated if they have been inactive for a period of time. The inactive duration is calculated by adding the **mac-age-time** that has been configured for the device and the configured **authenticated-mac-age-time**. The **mac-age-time** command defines how long a port address remains active in the address table. If the authenticated host is inactive for the sum of these two values, the host is forced to be reauthenticated.

The **no** form of the command sets the time to the default of 3600 seconds.

Examples

The following example configures the time duration after which the user-associated MAC address is aged out and reauthentication is enforced.

```
device(config)# mac-age-time 600
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# reauth-time 303
device(config-vlan-10-webauth)# authenticated-mac-age-time 300
```

authentication

Enters the authentication mode.

Syntax

authentication

no authentication

Command Default

Authentication mode is not enabled.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command will disable the authentication functionality.

Use this command to enter the authentication mode from global configuration mode. After entering authentication mode, you can configure additional authentication functionality that applies globally. Authentication functionality is also available for configuration at the interface configuration mode using different commands that apply only to the specified interface.

Examples

The following example enables authentication.

```
device(config)#authentication
device(config-authen)#
```

History

Release version	Command history
08.0.20	This command was introduced.

authentication (IKEv2)

Configures an authentication proposal for an Internet Key Exchange version 2 (IKEv2) profile.

Syntax

authentication *authentication-proposal-name*
no authentication *authentication-proposal-name*

Command Default

The default authentication proposal is def-ike-auth-prop.

Parameters

authentication-proposal-name
Specifies the name of an authentication proposal.

Modes

IKEv2 profile configuration mode

Usage Guidelines

When an IKEv2 profile is created, it uses the default authentication proposal (def-ike-auth-prop). The def-ike-auth-prop proposal has the following settings:

- Method for local device authentication: pre_shared
- Method for local device authentication: pre_shared
- Pre-shared key: \$QG5HTT1EbK1TVW5NLWihVW5ATVMhLS0rc1VA

Use this command to configure an alternate authentication proposal for the IKEv2 profile.

The **no** form of the command restores the default configuration.

Examples

The following example shows how to configure an authentication proposal named auth_test1 for an IKEv2 profile named ikev2_profile.

```
device# configure terminal
device(config)# ikev2 profile ikev2_profile
device(config-ikev2-profile-ikev2_profile)# authentication auth_test1
```

History

Release version	Command history
8.0.50	This command was introduced.

authentication auth-default-vlan

Specifies the authentication default VLAN at the interface level.

Syntax

authentication auth-default-vlan *vlan-id*

no authentication auth-default-vlan *vlan-id*

Command Default

The auth-default VLAN is not specified.

Parameters

vlan-id

Specifies the VLAN ID of the auth-default VLAN.

Modes

Interface configuration mode

Usage Guidelines

The auth-default VLAN specified at the interface level overrides the auth-default VLAN configured using the **auth-default-vlan** command at the global level. The configured auth-default VLAN configured at the global level will still be applicable to other ports that don't have auth-default VLAN configured at the interface level.

The local auth-default VLAN must be configured to enable authentication.

A VLAN must be configured as auth-default VLAN to enable authentication. When any port is enabled for 802.1X authentication or MAC authentication, the client is moved to this VLAN by default.

The auth-default VLAN is also used in the following scenarios:

- When the RADIUS server does not return VLAN information upon authentication, the client is authenticated and remains in the auth-default VLAN.
- If RADIUS timeout happens during the first authentication attempt and the timeout action is configured as "Success", the client is authenticated in the auth-default VLAN. If the RADIUS server is not available during reauthentication of a previously authenticated client, the client is retained in the previously authenticated VLAN.

The **no** form of the command disables the auth-default VLAN.

Examples

The following example creates a default VLAN with VLAN 3.

```
device(config)# authentication
device(config-Authen)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# authentication auth-default-vlan 3
```

History

Release version	Command history
08.0.20	This command was introduced.

authentication auth-order

Specifies the sequence of authentication methods, 802.1X authentication and MAC authentication, on a specific interface.

Syntax

```
authentication auth-order {dot1x mac-auth | mac-auth dot1x }
```

```
no authentication auth-order {dot1x mac-auth | mac-auth dot1x }
```

Command Default

The authentication sequence is set to perform 802.1X authentication method followed by MAC authentication.

Parameters

dot1x mac-auth

Specifies 802.1X authentication followed by MAC authentication as the order of authentication methods on the interface.

mac-auth dot1x

Specifies MAC authentication followed by 802.1X authentication as the order of authentication methods on the interface.

Modes

Interface configuration mode

Usage Guidelines

If 802.1X authentication and MAC authentication methods are enabled on the same port, by default the authentication sequence is set to perform 802.1X authentication followed by MAC authentication.

Configuring the authentication order at the interface level overrides the configuration at the global level for that particular interface. The configured global authentication order will still be applicable to other ports that don't have a per port authentication order configured.

For authentication order 802.1X authentication followed by MAC authentication: When 802.1X authentication succeeds, the client is authenticated and the policies returned by the RADIUS server are applied. MAC authentication is not performed in this case. If 802.1X authentication fails, the failure action is carried out and MAC authentication is not attempted. On the other hand, if the client does not respond to dot1x messages, then MAC authentication is attempted. Upon successful MAC authentication, the client is authenticated and the policies returned by the RADIUS server are applied and on authentication failure, the configured failure action is applied.

For authentication order MAC authentication followed by 802.1X authentication: By default, 802.1X authentication is performed even if MAC authentication is successful. Upon successful 802.1X authentication, the client is authenticated and the policies returned by the RADIUS server are applied and on authentication failure, the configured failure action is applied. The default behavior can be changed by specifying the RADIUS attribute, to prevent the 802.1X authentication from being performed after successful MAC authentication. In this case, the client is authenticated and the policies

returned by the RADIUS server are applied after successful MAC authentication. If MAC authentication method fails, 802.1X port security authentication is not attempted and the configured failure action is applied. However, if the **mac-authentication dot1x-override** command is configured, the clients that failed MAC authentication undergoes 802.1X authentication if the failure action is configured as restricted VLAN. If 802.1X authentication is successful, the policies returned by the RADIUS server are applied to the port.

The **no** form of the command disables the authentication order functionality.

Examples

The following example specifies 802.1X authentication followed by MAC authentication as the order of authentication methods on Ethernet interface 1/1/3.

```
device(config)# authentication
device(config-authen)# interface ethernet 1/1/3
device(config-if-e1/1/3)# authentication auth-order dot1x mac-auth
```

The following example specifies MAC authentication followed by 802.1X authentication as the order of authentication methods on Ethernet interface 1/1/3.

```
device(config)# authentication
device(config-authen)# interface ethernet 1/1/3
device(config-if-e1/1/3)# authentication auth-order mac-auth dot1x
```

History

Release version	Command history
08.0.20	This command was introduced.

authentication auth-vlan-mode

Enables multiple-untagged mode on a specific Flexible authentication-enabled port and allows it to be member of multiple untagged VLANs.

Syntax

```
authentication auth-vlan-mode { multiple-untagged }
no authentication auth-vlan-mode { multiple-untagged }
```

Command Default

Flexible authentication-enabled port can be member of only one untagged VLAN.

Parameters

multiple-untagged

Allows the client to be assigned to multiple untagged VLANs on authentication.

Modes

Interface configuration mode

Usage Guidelines

Reload is not required to change the VLAN mode. However, existing sessions will be cleared if the command is applied to an individual interface.

The VLAN mode specified at the interface level overrides the VLAN mode configured using the **auth-vlan-mode** command at the global level. The configured VLAN mode configured at the global level will still be applicable to other ports that don't have the VLAN mode configured at the interface level.

Single untagged mode is only applicable to untagged VLANs returned by RADIUS.

The **no** form of the command returns the VLAN mode to single untagged. Port can be assigned to only one untagged VLAN on authentication.

Examples

The following example configures multiple untagged VLAN mode on interface 1/1/1.

```
device# configure terminal
device(config)# interface ethernet 1/1/1
(config-if-e1000-1/1/1)# authentication auth-vlan-mode multiple-untagged
```

The following example clears all sessions on a Flexible authentication enabled interface and restores the single untagged VLAN mode.

```
device# configure terminal
device(config)# interface ethernet 1/1/1
(config-if-e1000-1/1/1)# no authentication auth-vlan-mode multiple-untagged
```

History

Release version	Command history
08.0.30b	This command was introduced.

authentication disable-aging

Disables aging of MAC sessions at the interface level.

Syntax

authentication disable-aging { permitted-mac-only | denied-mac-only }

no authentication disable-aging { permitted-mac-only | denied-mac-only }

Command Default

Aging of MAC sessions is not disabled.

Parameters

permitted-mac-only

Prevents permitted (authenticated and restricted) sessions from being aged out and ages denied sessions.

denied-mac-only

Prevents denied sessions from being aged out, but ages out permitted sessions.

Modes

Interface configuration mode

Usage Guidelines

Use this command to disable the aging of MAC sessions. Use the **authentication disable-aging** command at the interface level and the **disable-aging** command in the authentication configuration mode. Entered at the interface level, this command overrides the command entered at the authentication global level. However, the global configuration to disable aging of MAC sessions will still be applicable to other ports that don't have configuration at the interface level.

The **no** form of the command does not disable aging.

Examples

The following example disables aging for permitted MAC addresses.

```
device(config)# authentication
device(config-authen)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# authentication disable-aging permitted-mac-only
```

History

Release version	Command history
08.0.20	This command was introduced.

authentication dos-protection

Enables denial of service (DoS) authentication protection on the interface.

Syntax

authentication dos-protection { **enable** | **mac-limit** *mac-limit-value* }

no authentication dos-protection { **enable** | **mac-limit** *mac-limit-value* }

Command Default

Denial of service is disabled by default.

Parameters

enable

Specifies to enable DoS protection.

mac-limit

Specifies the maximum number MAC-authentication attempts allowed per second.

mac-limit-value

Specifies the rate limit for DoS protection. You can specify a rate from 1 - 65535 authentication attempts per second. The default is a rate of 512 authentication attempts per second.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of the command disables DoS protection.

To limit the susceptibility of the Brocade device to DoS attacks, you can configure the device to use multiple RADIUS servers, which can share the load when there are a large number of MAC addresses that need to be authenticated. The Brocade device can run a maximum of 10 RADIUS clients per server and will attempt to authenticate with a new RADIUS server if current one times out.

In addition, you can configure the Brocade device to limit the rate of authentication attempts sent to the RADIUS server. When MAC authentication is enabled, the number of RADIUS authentication attempts made per second is tracked. When you also enable the DoS protection feature, if the number of RADIUS authentication attempts for MAC addresses learned on an interface per second exceeds a configurable rate (by default 512 authentication attempts per second), the device considers this a possible DoS attack and disables the port. You must then manually re-enable the port.

Examples

The example specifies the DoS protection count as 256.

```
device(config)# authentication
device(config-authen)# interface ethernet 1/3/1
device(config-if-e1000-1/3/1)# authentication dos-protection mac-limit 256
```

History

Release version	Command history
08.0.20	This command was introduced.

authentication fail-action

Specifies the authentication failure action to move the client port to the restricted VLAN after authentication failure for both MAC authentication and 802.1X authentication on an interface.

Syntax

authentication fail-action restricted-vlan *vlan-id*

no authentication fail-action restricted-vlan

Command Default

The default action is to block the MAC address of the client.

Parameters

restricted-vlan

Specifies the failure action to move the client port to the restricted VLAN after authentication failure.

vlan-id

Specifies the ID of the VLAN to be configured as restricted VLAN.

Modes

Interface configuration mode

Usage Guidelines

If the authentication failure action is not configured, the client's MAC address is blocked in the hardware (default action) when the authentication fails.

The restricted VLAN specified at the interface level overrides the restricted VLAN configured using the **restricted-vlan** command at the global level. The configured restricted VLAN configured at the global level will still be applicable to other ports that don't have restricted VLAN configured at the interface level.

The client ports that were placed in the RADIUS-specified VLAN upon successful authentication are not placed in the restricted VLAN if the subsequent authentication fails. Instead, the non-authenticated client is blocked.

The **no** form of the command disables the authentication failure action.

Examples

The following example specifies authentication failure action to move the client port to the restricted VLAN (VLAN 4 is configured as restricted VLAN) after authentication failure.

```
device(config)# authentication
device(config-authen)# restricted-vlan 4
device(config-authen)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# authentication fail-action restricted-vlan 5
```

History

Release version	Command history
08.0.20	This command was introduced.

authentication filter-strict-security

Enables or disables strict filter security for 802.1X and MAC-authentication enabled interfaces.

Syntax

authentication filter-strict-security

no authentication filter-strict-security

Command Default

Strict filter security is enabled.

Modes

Interface configuration mode

Usage Guidelines

When strict security mode is enabled, authentication for a port fails if the Filter-Id attribute contains invalid information, or if insufficient system resources are available to implement the IP ACLs.

When strict security mode is enabled:

- If the Filter-Id attribute in the Access-Accept message contains a value that does not refer to an existing filter (that is, IP ACL configured on the device), then the client will not be authorized, regardless of any other information in the message (for example, if the Tunnel-Private-Group-ID attribute specifies a VLAN on which to assign the port).
- If the device does not have the system resources available to dynamically apply a filter to a port, then the client will not be authenticated.

When strict filter security is disabled:

- If the Filter-Id attribute in the Access-Accept message contains a value that does not refer to an existing filter (that is, a MAC address filter or IP ACL configured on the device), then the client remains authorized and no filter is dynamically applied to it.
- By default, strict security mode is enabled for all MAC authentication and 802.1X-enabled interfaces, but you can manually disable or enable it using the **filter-strict-security** command from the authentication configuration mode or using the **authentication filter-strict-security** command from the interface configuration mode.

The **no** form of the command disables strict filter security.

Examples

The following example enables strict filter security.

```
device(config)# authentication
device(config-authen)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# authentication filter-strict-security
```

History

Release version	Command history
08.0.20	This command was introduced.
08.0.30mb	This command was modified.

authentication max-sessions

Specifies the maximum number of MAC sessions that can be authenticated per port for MAC authentication and 802.1X authentication.

Syntax

authentication max-sessions *count*
no authentication max-sessions *count*

Command Default

The default number of MAC sessions that can be authenticated on a single interface is 2.

Parameters

count
Specifies the maximum number of authenticated MAC sessions per port.

Modes

Interface configuration mode

Usage Guidelines

The maximum number of authenticated mac-sessions on an interface depends on the Brocade device and dynamic ACL assignments.

If RADIUS assigns dynamic ACL to at least one client on the interface, the maximum number of MAC sessions that can be authenticated is limited to 32 in all Brocade devices.

If dynamic ACL is not assigned to any of the clients on the interface, the maximum number of MAC addresses that can be authenticated varies depending on the Brocade device as specified in [Table 4](#).

System reload is not required for the changes to take effect. However, existing sessions on the interface are cleared for the changes to take effect.

TABLE 4 Maximum number of authenticated MAC sessions per port on various platforms

Supported platforms	Maximum number of MAC sessions per port when none of the Clients has dynamic ACL	Maximum number of MAC sessions per port when at least one User has Dynamic ACL
ICX 7750	1024	32
ICX 7450	1024	32
ICX 7250	1024	32

The system limit for authenticated MAC sessions also varies and depends on the Brocade device and dynamic ACL assignments.

TABLE 5 Maximum number of authenticated MAC sessions per system (standalone or stack) on various platforms

Supported platforms	Maximum number of MAC sessions per system when none of the clients has dynamic ACL	Maximum number of MAC sessions per system when at least one client has dynamic ACL
ICX 7750	1536	512
ICX 7450	1536	512
ICX 7250	1536	512

The **no** form of the command reinstates the maximum authenticated MAC sessions allowed per port to the default value of 2.

Examples

The example specifies the maximum number of authenticated MAC sessions.

```
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# authentication max-sessions 30
```

History

Release version	Command history
08.0.20	This command was introduced.
08.0.30b	The command was made available on Brocade ICX 7250, Brocade ICX 7450, and Brocade ICX 7750. The maximum number of authenticated MAC sessions per port was increased from 32 to 256 and 1024, depending on the platforms.

authentication reauth-timeout

Sets the time to wait before reauthenticating a client after a timeout-action (critical-vlan) is applied. This command is applicable for MAC authentication and 802.1X authentication.

Syntax

authentication reauth-timeout *seconds*
no authentication reauth-timeout *seconds*

Command Default

The default re-authentication timeout is 60 seconds.

Parameters

seconds
Sets the re-authentication timeout, in seconds. The range is from 60 to 4294967295.

Modes

Interface configuration mode

Usage Guidelines

The **no** form disables re-authentication timeout.

This command sets the re-authentication timeout at the interface level after the timeout action is specified as critical VLAN.

Examples

The example shows specifying a re-authentication timeout of 100 seconds.

```
device(config)# authentication
device(config-authen)# interface ethernet 1/1/2
device(config-if-e1000-1/1/2)# authentication reauth-timeout 100
```

History

Release version	Command history
08.0.20	This command was introduced.

authentication source-guard-protection enable

Enables Source Guard Protection along with authentication on a specified interface.

Syntax

authentication source-guard-protection enable

no authentication source-guard-protection enable

Command Default

Source Guard Protection is not enabled.

Modes

Interface configuration mode

Usage Guidelines

When a new Flexible authentication session begins on a port that has Source Guard Protection enabled, the session either applies a dynamically created Source Guard ACL entry or it uses the dynamic IP ACL assigned by the RADIUS server. If a dynamic IP ACL is not assigned, the session uses the Source Guard ACL entry. The Source Guard ACL entry is **permit ip *secure-ip* any**, where *secure-ip* is obtained from the ARP Inspection table or from the DHCP Secure table. The DHCP Secure table is comprised of DHCP Snooping and Static ARP Inspection entries. The Source Guard ACL permit entry is added to the hardware table after all of the following events occur:

- The MAC address is authenticated
- The IP address is learned
- The MAC-to-IP mapping is checked against the Static ARP Inspection table or the DHCP Secure table

NOTE

In Flexible authentication, IP Source guard is applicable only for IPv4 traffic.

The Source Guard ACL entry is not written to the running configuration file. However, you can view the configuration using the **show mac-authentication sessions** command or the **show dot1x sessions** command at the global level or for a specific interface.

NOTE

The secure MAC-to-IP mapping is assigned at the time of authentication and remains in effect as long as the session is active. The existing session doesn't get affected if the DHCP Secure table is updated after the session is authenticated and while the session is still active.

The Source Guard ACL permit entry is removed when the session expires or is cleared.

The **no** form of the command disables source guard protection.

Commands A - E

authentication source-guard-protection enable

Examples

The following example enables source guard protection on an interface.

```
device(config)# authentication
device(config-authen)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# authentication source-guard-protection enable
```

History

Release version	Command history
08.0.20	This command was introduced.
8.0.40a	IP Source guard was supported for 802.1X authentication-enabled port.

authentication timeout-action

Configures the authentication timeout actions to specify the action for the RADIUS server if an authentication timeout occurs.

Syntax

```
authentication timeout-action { success | failure | critical-vlan }
no authentication timeout-action { success | failure | critical-vlan vlan-id}
```

Command Default

The default authentication timeout action is failure.

Parameters

success

Considers the client as authenticated after RADIUS timeout. After the timeout action is enabled as success, use the **no** form of the command to set the RADIUS timeout behavior to retry.

failure

Specifies the RADIUS timeout action to carry out the configured failure action. If the failure action is not configured, the client's MAC address is blocked in the hardware. Once the failure timeout action is enabled, use the **no** form of the command to reset the RADIUS timeout behavior to retry.

critical-vlan

Specifies to move the client to the specified critical VLAN after authentication timeout. This command applies only to data traffic.

vlan-id

Specifies the ID of the VLAN to be configured as critical VLAN.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of this command will disable this functionality.

If the timeout is configured as success, client will be authenticated in the auth-default VLAN.

If the authentication failure action is configured as restricted VLAN using the **authentication fail-action** command, the client is placed in the restricted VLAN. A restricted VLAN must be configured using the **restricted-vlan** command at the global level or using the **authentication fail-action restricted-vlan** command at the interface level.

The critical VLAN specified at the interface level overrides the critical VLAN configured using the **critical-vlan** command at the global level. The configured critical VLAN configured at the global level will still be applicable to other ports that don't have critical VLAN configured at the interface level.

Examples

The following example sets the **authentication timeout-action** command to success.

```
device(config)# authentication
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# authentication timeout-action success
```

History

Release version	Command history
08.0.20	This command was introduced.

authentication-key

Defines an authentication key for Network Time Protocol (NTP).

Syntax

authentication-key **key-id** *key-id* { **md5** | **sha1** } *key-string*

no authentication-key **key-id** *key-id* [**md5** | **sha1**] *key-string*

Command Default

Authentication keys are not configured.

Parameters

key-id *key-id*

Specifies a valid key ID. The value can range from 1 through 65535.

md5

Message authentication support is provided using the Message Digest 5 algorithm.

sha1

The SHA1 keyed hash algorithm is used for NTP authentication.

key-string

The value of the MD5 or SHA1 key. The length of the key string may be up to 16 characters. Up to 32 keys may be defined.

Modes

NTP configuration mode

Usage Guidelines

If Joint Interoperability Test Command (JITC) is enabled, only the **sha1** option is available.

If the NTP server or peer is configured without authentication keys, the NTP request is not sent to the configured server or peer.

The same set or subset of key ID and key string should be installed on all NTP devices.

The **no** form of the command removes the authentication key.

Examples

The following example shows how to configure an authentication key.

```
device(config)# ntp
device(config-ntp)# authentication-key key-id 1 md5 moof
```

auth-fail-action (Flexible authentication)

Specifies to move the client port to the restricted VLAN after authentication failure for both MAC authentication and 802.1X authentication globally.

Syntax

auth-fail-action restricted-vlan

no auth-fail-action restricted-vlan

Command Default

The MAC address of the client is blocked in the hardware.

Parameters

restricted-vlan

Specifies the failure action to move the client port to the restricted VLAN after authentication failure.

Modes

Authentication configuration mode

Usage Guidelines

A restricted VLAN must be configured using the **restricted-vlan** command before setting the fail action as restricted-vlan to move the client port to the restricted VLAN.

If the authentication failure action is not configured, the client's MAC address is blocked in the hardware (default action) when the authentication fails.

In single untagged mode, the client ports that were placed in the RADIUS-specified VLAN upon successful authentication are not placed in the restricted VLAN if the subsequent authentication fails. Instead, the non-authenticated client is blocked.

The **no** form of the command disables the authentication failure action.

Examples

The following example specifies authentication failure action to move the client port to the restricted VLAN (VLAN 4 is configured as restricted VLAN) after authentication failure.

```
device(config)# authentication
device(config-authen)# restricted-vlan 4
device(config-authen)# auth-fail-action restricted-vlan
```

History

Release version	Command history
08.0.20	This command was introduced.

auth-mode captive-portal

Authenticates the users in a VLAN through external Web Authentication (Captive Portal user authentication mode).

Syntax

auth-mode captive-portal

no auth-mode captive-portal

Command Default

External Web Authentication mode is not enabled by default.

Modes

Web Authentication configuration mode

Usage Guidelines

External Web Authentication uses RADIUS as the authentication method.

The **no** form of the command removes the external Web Authentication mode as the configured authentication mode.

Examples

The following example configures the authentication mode as external Web Authentication to authenticate the users in a VLAN.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# auth-mode captive-portal
```

History

Release version	Command history
8.0.40	This command was introduced.

auth-mode none

Enables automatic Web Authentication.

Syntax

auth-mode none
no auth-mode none

Command Default

By default, if Web Authentication is enabled, hosts need to login and enter authentication credentials to gain access to the network.

Modes

Web Authentication configuration mode

Usage Guidelines

If a reauthentication period is configured, the host will be asked to re-enter authentication credentials once the reauthentication period ends.

You can configure Web Authentication to authenticate a host when the user clicks the **Login** button. When a host enters a valid URL address, Web Authentication checks the list of blocked MAC addresses. If the host's MAC address is not on the list and the number of allowable hosts has not been reached, after clicking the **Login** button, the host is automatically authenticated for the duration of the configured reauthentication period, if one is configured. Once the reauthentication period ends, the host is logged out and must enter the URL address again. If automatic authentication is enabled and a host address is not in the blocked MAC address list, Web Authentication authenticates the host and displays the Login page without user credentials, and then provides a hyperlink to the requested URL site.

NOTE

Automatic authentication is not the same as permanent authentication. You must still specify devices that are to be permanently authenticated even if automatic authentication is enabled.

Use the **show webauth vlan** command in VLAN configuration mode to determine if automatic authentication is enabled.

The **no** form of the command removes the automatic Web Authentication configuration.

Examples

The following example enables automatic Web Authentication.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# auth-mode none
```

auth-mode passcode

Enables Web Authentication to use dynamically created passcodes to authenticate users in the VLAN.

Syntax

```
auth-mode passcode [ flush-expired | generate | grace-period time | length passcode-length | log { snmp-trap |  
syslog } | refresh-type { duration time | time [ time-string | delete-all ] } | resend-log | static ]  
no auth-mode passcode [ flush-expired | generate | grace-period time | length passcode-length | log { snmp-trap |  
syslog } | refresh-type { duration time | time [ time-string | delete-all ] } | resend-log | static ]
```

Command Default

Passcode authentication is not enabled.

Parameters

flush-expired

Deletes old passcodes that have expired but are still valid because they are in the grace period.

generate

Refreshes the passcode instead of waiting for the system to automatically generate one.

grace-period *time*

Configures a grace period for an expired passcode.

length *passcode-length*

Configures the passcode length. Valid values are from 4 through 16 digits. The default is 4 digits.

log

Enables the generation of syslog messages and SNMP trap messages every time a new passcode is generated and passcode authentication is attempted. By default, the syslog and SNMP trap messages are enabled.

snmp-trap

Generates SNMP trap messages every time a new passcode is generated and passcode authentication is attempted.

syslog

Generates syslog messages every time a new passcode is generated and passcode authentication is attempted.

refresh-type

Configures the passcode refresh type as one of the following:

duration *time*

Configures the duration of time after which passcodes are refreshed. By default, dynamically created passcodes are refreshed every 1440 minutes (24 hours).

time *time-string*

Configures the time of the day when the passcode should be refreshed. When initially enabled, the time of day method will cause passcodes to be refreshed at 00:00 (12:00 midnight). You can add up to 24 refresh periods in a 24-hour period.

delete-all

Deletes all of the configured passcode refresh times and reverts back to the default time of 00:00 (12:00 midnight).

resend-log

Retransmits the current passcode to a syslog message or SNMP trap if passcode logging is enabled.

static

Creates a static passcode.

Modes

Web Authentication configuration mode

Usage Guidelines

You can delete old passcodes that have expired but are still valid because they are in the grace period using the **auth-mode passcode flush-expired** command. This is useful in situations where the old passcodes have been compromised but are still valid because of the grace period. This command does not affect current valid passcodes or passcodes that newly expire.

When manually refreshed using the **auth-mode passcode generate** command, the old passcode will no longer work, even if a grace period is configured. Also, if the passcode refresh method duration of time is used, the duration counter is reset when the passcode is manually refreshed. The passcode refresh method time of day is not affected when the passcode is manually refreshed.

If the grace period is reconfigured using the **auth-mode passcode grace-period** command while a passcode is already in the grace period, the passcode is not affected by the configuration change. The new grace period will apply only to passcodes that expire after the new grace period is set.

If you change the passcode refresh value using the **auth-mode passcode refresh-type**, the configuration is immediately applied to the current passcode. If both the duration of time and time of day passcode refresh values are configured, they are saved to the configuration file. You can switch back and forth between the passcode refresh methods, but only one method can be enabled at a time.

Passcodes are not stateful, meaning a software reset or reload will cause the system to erase the passcode. When the device comes back up, a new passcode will be generated.

When the **auth-mode passcode resend-log** command is configured, the switch retransmits the current passcode only. Passcodes that are in the grace period are not sent.

Static passcodes can be used for troubleshooting purposes, or for networks that want to use passcode authentication, but do not have the ability to support automatically generated passcodes (for example, the network does not fully support the use of SNMP traps or syslog messages with passcodes). Manually created passcodes are used in conjunction with dynamic passcodes. You can configure up to four static passcodes that never expire. Unlike dynamically created passcodes, static passcodes are saved to flash memory. By default, there are no static passcodes configured on the switch. Static passcodes do not have to be the same length as passcodes that are automatically generated.

Use the **show webauth vlan *vlan-id* passcode** command to view the current passcodes.

The **no** form of the command removes or disables the configured settings.

Examples

The following example flushes out all expired passcodes that are currently in the grace period.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# auth-mode passcode flush-expired
```

The following example refreshes the passcode immediately.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# auth-mode passcode generate
```

The following example configures the grace period for an expired passcode.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# auth-mode passcode grace-period 5
```

The following example increases the passcode length to 10 digits.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# auth-mode passcode length 10
```

The following example shows how to re-enable syslog messages for passcodes after they have been disabled.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# auth-mode passcode log syslog
```

The following example changes the duration of time after which passcodes are refreshed to 4320 minutes (72 hours).

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# auth-mode passcode refresh-type duration 4320
```

The following example configures the switch to refresh passcodes at a certain time of day.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# auth-mode passcode refresh-type time 14:30
```

The following example deletes all of the configured passcode refresh times and reverts back to the default time of 00:00 (12:00 midnight).

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# auth-mode passcode refresh-type time delete-all
```

The following example retransmits the current passcode to a syslog message or SNMP trap if passcode logging is enabled.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# auth-mode passcode resend-log
```

The following example creates static passcodes.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# auth-mode passcode static 3267345
```

auth-mode username-password

Enables the username and password Web Authentication mode.

Syntax

auth-mode username-password [**auth-methods** {**radius** [**local**] | **local** [**radius**] } | **local-user-database** *database-name*]

no auth-mode username-password [**auth-methods** {**radius** [**local**] | **local** [**radius**] } | **local-user-database** *database-name*]

Command Default

Username password authentication is not enabled.

Parameters

auth-methods

Configures the authentication method.

radius

Uses the RADIUS server to authenticate.

local

Uses the local user database to authenticate.

local-user-database *database-name*

Uses the usernames and passwords in the specified database to authenticate.

Modes

Web Authentication configuration mode

Usage Guidelines

You can optionally specify a failover sequence for RADIUS and local user database authentication methods. For example, you can configure Web Authentication to first use a local user database to authenticate users in a VLAN. If the local user database is not available, it will use a RADIUS server. You can specify the **local** and **radius** options one after the other in the required sequence to configure the failover sequence.

The **no** form of the command removes the username password authentication.

Examples

The following example uses a local user database to authenticate users in a VLAN.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# auth-mode username-password auth-methods local
```

Commands A - E

auth-mode username-password

The following example uses the usernames and passwords in the specified database to authenticate.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# auth-mode username-password local-user-database
```

The following example configures a failover sequence for RADIUS and local user database authentication methods. In this example, Web Authentication first uses a local user database to authenticate users in a VLAN. If the local user database is not available, it will use a RADIUS server.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# auth-mode username-password auth-methods local radius
```

auth-order

Specifies the sequence of authentication methods, 802.1X authentication and MAC authentication at the global level.

Syntax

```
auth-order {dot1x mac-auth | mac-auth dot1x }
```

```
no auth-order {dot1x mac-auth | mac-auth dot1x }
```

Command Default

The authentication sequence is set to perform 802.1X authentication method followed by MAC authentication.

Parameters

dot1x mac-auth

Specifies 802.1X authentication followed by MAC authentication as the order of authentication methods on the interface.

mac-auth dot1x

Specifies MAC authentication followed by 802.1X authentication as the order of authentication methods on the interface.

Modes

Authentication configuration mode

Usage Guidelines

If 802.1X authentication and MAC authentication methods are enabled on the same port, by default the authentication sequence is set to perform 802.1X authentication followed by MAC authentication.

For authentication order 802.1X authentication followed by MAC authentication: When 802.1X authentication succeeds, the client is authenticated and the policies returned by the RADIUS server are applied. MAC authentication is not performed in this case. If 802.1X authentication fails, the failure action is carried out and MAC authentication is not attempted. On the other hand, if the client does not respond to 802.1X messages, then MAC authentication is attempted. Upon successful MAC authentication, the client is authenticated and the policies returned by the RADIUS server are applied and on authentication failure, the configured failure action is applied.

For authentication order MAC authentication followed by 802.1X authentication: By default, 802.1X authentication is performed even if MAC authentication is successful. Upon successful 802.1X authentication, the client is authenticated and the policies returned by the RADIUS server are applied and on authentication failure, the configured failure action is applied. The default behavior can be changed by specifying the RADIUS attribute, to prevent the 802.1X authentication from being performed after successful MAC authentication. In this case, the client is authenticated and the policies returned by the RADIUS server are applied after successful MAC authentication. If MAC authentication method fails, 802.1X port security authentication is not attempted and the configured failure action is applied. However, if the **mac-authentication dot1x-override** command is configured, the clients that failed MAC authentication undergoes 802.1X

authentication if the failure action is configured as restricted VLAN. If 802.1X authentication is successful, the policies returned by the RADIUS server are applied to the port.

The **no** form of the command disables the authentication order functionality.

Examples

The following example specifies 802.1X authentication followed by MAC authentication as the order of authentication methods at the global level.

```
device(config)# authentication
device(config-authen)# auth-order dot1x mac-auth
```

The following example specifies MAC authentication followed by 802.1X authentication as the order of authentication methods at the global level.

```
device(config)# authentication
device(config-authen)# auth-order mac-auth dot1x
```

History

Release version	Command history
08.0.20	This command was introduced.

auth-vlan-mode

Enables the Flexible authentication-enabled ports to be member of multiple untagged VLANs.

Syntax

```
auth-vlan-mode { multiple-untagged }  
no auth-vlan-mode { multiple-untagged }
```

Command Default

Flexible authentication-enabled port can be member of only one untagged VLAN.

Parameters

multiple-untagged

Allows the client to be assigned to multiple untagged VLANs on authentication.

Modes

Authentication configuration mode

Usage Guidelines

Reload is not required to change the VLAN mode. If the command is applied globally, all sessions will be cleared on all interfaces that have Flexible authentication enabled. However, existing sessions will be cleared if the command is applied on an individual interface using the **authentication auth-vlan-mode** command from the interface configuration mode.

Single untagged mode is only applicable to untagged VLANs returned by RADIUS.

The **no** form of the command returns the VLAN mode to single untagged. Port can be assigned to only one untagged VLAN on authentication.

Examples

The following example configures multiple untagged VLAN at the global level.

```
device# configure terminal  
device(config)# authentication  
device(config-authen)# auth-vlan-mode multiple-untagged
```

The following example clears all sessions on interfaces with Flexible authentication enabled and restores the single untagged VLAN mode default on all new sessions established on those interfaces.

```
device# configure terminal  
device(config)# authentication  
device(config-authen)# no auth-vlan-mode multiple-untagged
```

History

Release version	Command history
08.0.30b	This command was introduced.

auto-cost reference-bandwidth (OSPFv2)

Configures reference bandwidth.

Syntax

```
auto-cost reference-bandwidth { value | use-active-ports }  
no auto-cost reference-bandwidth
```

Command Default

Reference bandwidth is 100 Mbps.

Parameters

value

Reference bandwidth in Mbps. Valid values range from 1 through 4294967.

use-active-ports

Specifies that any dynamic change in bandwidth immediately affects the cost of OSPF routes. This parameter enables cost calculation for currently active ports only.

Modes

OSPF router configuration mode

OSPF router VRF configuration mode

Usage Guidelines

Use this command to configure the cost of an interface that a device advertises to its OSPF neighbors. OSPF calculates the cost of a route as the ratio of the reference bandwidth to the bandwidth of the egress interface. An increase in the reference bandwidth results in an increased cost. If the resulting cost is less than 1, the software rounds the cost up to 1.

The bandwidth for interfaces that consist of more than one physical port is calculated as follows:

- LAG group — The combined bandwidth of all the ports.
- Virtual interface — The combined bandwidth of all the ports in the port-based VLAN that contains the virtual interface.

If a change to the reference bandwidth results in a cost change to an interface, the device sends a link-state update to update the costs of interfaces advertised by the device.

NOTE

If you specify the cost for an individual interface (by using the **ip ospf cost** command), the cost you specify overrides the cost calculated by the software.

The **no** form of the command disables bandwidth configuration.

Examples

The following example configures a reference bandwidth of 500.

```
device# configure terminal
device(config)# router ospf
device(config-ospf-router)# auto-cost reference-bandwidth 500
```

The reference bandwidth specified in this example results in the following costs:

- 10 Mbps port's cost = $500/10 = 50$.
- 100 Mbps port's cost = $500/100 = 5$.
- 1000 Mbps port's cost = $500/1000 = 0.5$, which is rounded up to 1.

The costs for 10 Mbps and 100 Mbps ports change as a result of the changed reference bandwidth. Costs for higher-speed interfaces remain the same.

auto-cost reference-bandwidth (OSPFv3)

Configures reference bandwidth.

Syntax

auto-cost reference-bandwidth *value*
no auto-cost reference-bandwidth

Command Default

Reference bandwidth is 100 Mbps.

Parameters

value

Reference bandwidth in Mbps. Valid values range from 1 through 4294967. The default is 100 Mbps.

Modes

OSPFv3 router configuration mode

OSPFv3 router VRF configuration mode

Usage Guidelines

Use this command to configure the cost of an interface that a device advertises to its OSPF neighbors. OSPFv3 calculates the cost of a route as the ratio of the reference bandwidth to the bandwidth of the egress interface. An increase in the reference bandwidth results in an increased cost. If the resulting cost is less than 1, the software rounds the cost up to 1.

The bandwidth for interfaces that consist of more than one physical port is calculated as follows:

- LAG group — The combined bandwidth of all the ports.
- Virtual (Ethernet) interface — The combined bandwidth of all the ports in the port-based VLAN that contains the virtual interface.

If a change to the reference bandwidth results in a cost change to an interface, the device sends a link-state update to update the costs of interfaces advertised by the device.

NOTE

If you specify the cost for an individual interface using the **ipv6 ospf cost** command, the cost you specify overrides the cost calculated by the software.

Some interface types are not affected by the reference bandwidth and always have the same cost regardless of the reference bandwidth in use:

- The cost of a loopback interface is always 1.
- The cost of a virtual link is calculated using the Shortest Path First (SPF) algorithm and is not affected by the auto-cost feature.

Commands A - E

auto-cost reference-bandwidth (OSPFv3)

- The bandwidth for tunnel interfaces is 9 Kbps and is subject to the auto-cost feature.

The **no** form of the command restores the reference bandwidth to its default value and, thus, restores the default costs of the interfaces to their default values.

Examples

The following example configures a reference bandwidth of 500.

```
device# configure terminal
device(config)# ipv6 router ospf
device(config-ospf6-router)# auto-cost reference-bandwidth 500
```

The reference bandwidth specified in this example results in the following costs:

- 10 Mbps port's cost = $500/10 = 50$.
- 100 Mbps port's cost = $500/100 = 5$.
- 1000 Mbps port's cost = $500/1000 = 0.5$, which is rounded up to 1.
- 155 Mbps port cost = $500/155 = 3.23$, which is rounded up to 4
- 622 Mbps port cost = $500/622 = 0.80$, which is rounded up to 1
- 2488 Mbps port cost = $500/2488 = 0.20$, which is rounded up to 1

The costs for 10 Mbps, 100 Mbps, and 155 Mbps ports change as a result of the changed reference bandwidth. Costs for higher-speed interfaces remain the same.

auto-lacp

Configures the auto-LACP (Link Aggregation Control Protocol) deployment for a specific port or a range of ports.

Syntax

auto-lacp ethernet *stack-id/slot/port* [**ethernet** *stack-id/slot/port* | **to** *stack-id/slot/port*]

no auto-lacp ethernet *stack-id/slot/port* [**ethernet** *stack-id/slot/port* | **to** *stack-id/slot/port*]

Command Default

Auto-LACP is not deployed on any ports in the system.

Parameters

ethernet *stack-id/slot/port*

Specifies the Ethernet port or the beginning range of the port list in terms of stack ID, slot number, or port number.

to *stack-id/slot/port*

Specifies the end range of the port list in terms of stack ID, slot number, or port number.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command removes the auto-LACP configuration for a specific port or range of ports.

Examples

The following example configures the auto-LACP deployment on the ports 1/1/7 and 2/1/11 to 2/1/12.

```
device(config)# auto-lacp ethernet 1/1/7 ethernet 2/1/11 to 2/1/12
```

History

Release version	Command history
8.0.40	This command was introduced.

autosave

Automatically saves learned secure MAC addresses to the startup configuration at specified intervals.

Syntax

autosave *time*
no autosave *time*

Command Default

By default, secure MAC addresses are not autosaved to the startup-config file.

Parameters

time

The interval between two autosaves, in minutes. The valid range is from 15 to 1440 minutes.

Modes

Port security configuration mode
Port security interface configuration mode

Usage Guidelines

The autosave feature saves learned MAC addresses by copying the running configuration to the startup configuration.

If you change the autosave interval, the next save occurs according to the old interval, and then the new interval takes effect. To change the interval immediately, disable autosave by entering the **no autosave** command, and then configure the new autosave interval using the **autosave** command.

The **no** form of the command disables autosave.

Examples

The following example saves learned secure MAC addresses every 20 minutes automatically.

```
device(config)# port security
device(config-port-security)# autosave 20
```

The following example saves learned secure MAC addresses every 20 minutes automatically on an interface.

```
device(config)# port security
device(config-port-security)# interface ethernet 1/1/1
device(config-port-security-e1000-1/1/1)# autosave 20
```

backup

Designates a virtual router as a Virtual Router Redundancy Protocol (VRRP) or VRRP Extended (VRRP-E) backup device and configures priority and track values.

Syntax

backup [**priority** *value*] [**track-priority** *value*]

no backup [**priority** *value*] [**track-priority** *value*]

Command Default

No virtual routers are designated as a VRRP or VRRP-E backup device.

Parameters

priority *value*

Sets a priority value for a backup device. Values are from 8 through 254. In VRRP, the default backup device priority is 100, and the owner device has a default priority of 255. In VRRP-E, the default backup device priority is 100.

track-priority *value*

Sets the new priority value if the interface goes down. Values are from 1 through 254. Default is 2 for VRRP, and default is 5 for VRRP-E.

Modes

VRID interface configuration mode

Usage Guidelines

In VRRP, the backup device with the highest priority assumes the role of VRRP master device if the owner device fails. The interface on which the Virtual Routing ID (VRID) is configured must be in the same subnet (but not be the same address) as the IP address associated with the VRID by the owner device.

In VRRP-E, all devices are configured as backup devices and the backup device with the highest priority becomes the master device. If the master device fails, the backup device with the highest priority at that time assumes the role of VRRP master device. The IP address assigned to the interface of any device in the same virtual router must be in the same IP subnet. The IP address assigned to the VRID must not be configured on any of the Brocade devices.

This command must be entered before the **ip-address** command can be configured for a VRRP or VRRP-E virtual routing ID.

The **no** form of this command removes the virtual router configuration.

Examples

The following example configures the device as a VRRP backup device and assigns it a priority of 110.

```
device# configure terminal
device(config)# router vrrp
device(config)# interface ethernet 1/1/5
device(config-if-e1000-1/1/5)# ip address 10.53.5.3/24
device(config-if-e1000-1/1/5)# ip vrrp vrid 1
device(config-if-e1000-1/1/5-vrid-1)# backup priority 110
device(config-if-e1000-1/1/5-vrid-1)# advertise backup
device(config-if-e1000-1/1/5-vrid-1)# ip-address 10.53.5.254
device(config-if-e1000-1/1/5-vrid-1)# activate
```

The following example configures the device as a VRRP-E backup device and assigns it a priority of 50 and a track priority of 10.

```
device# configure terminal
device(config)# router vrrp-extended
device(config-vrrpe-router)# interface ethernet 1/1/5
device(config-if-e1000-1/1/5)# ip address 10.53.10.4/24
device(config-if-e1000-1/1/5)# ip vrrp vrid 2
device(config-if-e1000-1/1/5-vrid-2)# backup priority 50 track-priority 10
device(config-if-e1000-1/1/5-vrid-2)# ip-address 10.53.10.254
device(config-if-e1000-1/1/5-vrid-2)# activate
```

backup (VSRP)

Configures the device as a VSRP backup for the VRID or changes the backup priority and the track priority.

Syntax

backup [**priority** *priority-number* [**track-priority** *track-number*]]

no backup [**priority** *priority-number* [**track-priority** *track-number*]]

Command Default

The default backup priority for the VSRP VRID is 100.

The default track priority for all track ports is 5.

Parameters

priority *priority-number*

Configures the backup priority for the VSRP VRID. The range is from 6 through 255. The default value is 100.

track-priority *track-number*

Configures the track priority for the VSRP VRID. The range is from 1 through 254. The default value is 5.

Modes

VSRP VRID configuration mode

Usage Guidelines

This configuration is important because in VSRP, all devices on which a VRID are configured are backups. The master is then elected based on the VSRP priority of each device. There is no "owner" device as there is in VRRP.

The backup priority is used for election of the master. The VSRP backup with the highest priority value for the VRID is elected as the master for that VRID. If two or more backups are tied with the highest priority, the backup with the highest IP address becomes the master for the VRID.

The track priority is used with the track port feature. When you configure a VRID to track the link state of other interfaces, if one of the tracked interface goes down, the software changes the VSRP priority of the VRID interface. The software reduces the VRID priority by the amount of the priority of the tracked interface that went down. For example, if the VSRP interface priority is 100 and a tracked interface with track priority 60 goes down, the software changes the VSRP interface priority to 40. If another tracked interface goes down, the software reduces the VRID priority again, by the amount of the tracked interface track priority.

The **no** form of the command without any options removes the device as the backup. The **no** form of the command with the options resets the backup priority value and the track priority value to the default values.

Examples

The following example configures the backup priority as 75.

```
device(config)# vlan 200
device(config-vlan-200)# tagged ethernet 1/1/1 to 1/1/8
device(config-vlan-200)# vsrp vrid 1
device(config-vlan-200-vrid-1)# backup priority 75
device(config-vlan-200-vrid-1)# activate
```

The following example configures the backup priority as 100 and the track priority as 2.

```
device(config)# vlan 200
device(config-vlan-200)# tagged ethernet 1/1/1 to 1/1/8
device(config-vlan-200)# vsrp vrid 1
device(config-vlan-200-vrid-1)# backup priority 100 track-priority 2
device(config-vlan-200-vrid-1)# activate
```

backup-hello-interval

Configures the interval at which backup Virtual Router Redundancy Protocol (VRRP) routers advertise their existence to the master router.

Syntax

backup-hello-interval *seconds*

no backup-hello-interval *seconds*

Command Default

The default backup hello interval is 60 seconds.

Parameters

seconds

The interval, in seconds, at which a backup VRRP router advertises its existence to the master router. Valid values range from 60 through 3600.

Modes

VRID interface configuration mode

Usage Guidelines

The interval is the length of time, in seconds, between each advertisement sent from the backup routers to the master router. The advertisement notifies the master router that the backup is still active. If the master router does not receive an advertisement from the backup router within a designated amount of time, the backup router with the highest priority can assume the role of master.

The **backup-hello-interval** command is configured only on VRRP backup routers and is supported by VRRP and VRRP Extended (VRRP-E).

The **no** form disables the advertisement of a VRRP backup router to a VRRP master router.

Examples

The following example enables advertisements from the VRRP backup router and sets the hello message interval to 80 seconds.

```
device# configure terminal
device(config)# router vrrp
device(config)# interface ethernet 1/1/6
device(config-if-e1000-1/1/6)# ip address 10.53.5.1/24
device(config-if-e1000-1/1/6)# ip vrrp vrid 1
device(config-if-e1000-1/1/6-vrid-1)# backup priority 90
device(config-if-e1000-1/1/6-vrid-1)# advertise backup
device(config-if-e1000-1/1/6-vrid-1)# backup-hello-interval 80
```

backup-hello-interval (vsrp)

Configures the time interval during which Hello messages are sent by the backup.

Syntax

backup-hello-interval *number*
no backup-hello-interval *number*

Command Default

The backup sends a Hello message to the master every 60 seconds by default.

Parameters

number
Specifies the time interval for the backup to send the Hello messages. The time range is from 60 through 3600 seconds.

Modes

VSRP VRID configuration mode

Usage Guidelines

The **no** form of the command resets the time interval to the default value.

Examples

The following example changes the Hello message time interval.

```
device(config)# vlan 200
device(config-vlan-200)# tagged ethernet 1/1/1 to 1/1/8
device(config-vlan-200)# vsrp vrid 1
device(config-vlan-200-vrid-1)# backup
device(config-vlan-200-vrid-1)# activate
device(config-vlan-200-vrid-1)# backup-hello-interval 180
```

bandwidth (interface)

Sets and communicates bandwidth value for an interface to higher-level protocols such as OSPFv2 and OSPFv3, so this setting can be used to influence the routing cost for routes learnt on these interfaces.

Syntax

bandwidth { *kilobits* }

no bandwidth { *kilobits* }

Command Default

For physical ports, the port speed is the default bandwidth. For VE interfaces and Link aggregation (LAG) groups, the sum of port speeds of individual physical ports is the default bandwidth.

Parameters

kilobits

Intended bandwidth, in kilobits per second. There is no default value for this parameter. The range is from 1 to 1000000000 kbps (100 Gbps).

Modes

Interface configuration mode.

Usage Guidelines

Use the **no bandwidth** command to remove the bandwidth value.

This command is supported on all Brocade FastIron platforms.

You cannot adjust the actual bandwidth of an interface with this command. When you configure the interface bandwidth for virtual Ethernet that is associated with multiple physical interfaces, OSPF does not adjust its metric cost if one of those associated interfaces is down, and does not generate network and router link state advertisement.

This command is

Examples

This example sets the bandwidth to 2000 kbps on a specific Ethernet interface.

```
device# configure terminal
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1) bandwidth 2000
```

This example sets the bandwidth to 2000 kbps on a specific virtual Ethernet (VE) interface.

```
device# configure terminal
device(config)# vlan 10
device(config-vlan-10)# interface ve 10
device(config-vif-10) bandwidth 2000
```

Commands A - E

bandwidth (interface)

This example sets the bandwidth to 2000 kbps on a specific tunnel interface.

```
device# configure terminal
device(config)# interface tunnel 2
device(config-tunif-2) bandwidth 2000
```

History

Release version	Command history
8.0.30	This command was introduced.

banner

Defines a login banner.

Syntax

banner [**exec** | **incoming**] *banner-string*

no banner [**exec** | **incoming**] *banner-string*

banner motd { *banner-string* | **require-enter-key** }

no banner motd { *banner-string* | **require-enter-key** }

Command Default

A banner is not configured.

Parameters

exec

Sets the EXEC process creation banner; that is, the message to be displayed when you enter the Privileged EXEC mode.

incoming

Sets the incoming terminal line banner; that is, the message to be displayed on the console when a user establishes a Telnet session.

banner-string

The ASCII string indicating the banner string in the format "c banner text c" where "c" is the delimiting character.

motd

Sets the message of the day (MOTD) banner; that is, the message to be displayed on a user terminal when a Telnet CLI session is established.

require-enter-key

Requires pressing of the Enter key after the MOTD message is displayed. This requirement is disabled by default. Unless configured, you do not have to press Enter after the MOTD banner is displayed.

Modes

Global configuration mode

Usage Guidelines

The *banner-string* includes a delimiting character. You begin and end the message with this delimiting character. The delimiting character can be any character except a double-quotation mark (") and cannot appear in the banner text. The banner text can be up to 4000 characters long, and can consist of multiple lines.

The **no** form of the command removes the banner. Use the **no banner motd require-enter-key** command to remove the requirement of pressing the Enter key once the banner text is displayed.

Examples

The following example shows how to set a banner with "c" as the delimiting character.

```
device(config)# banner c Good Morning! c
```

The following example shows how to set a MOTD banner with "\$" as the delimiting character.

```
device(config)# banner motd $ Welcome!!! $
```

The following example shows how to configure the requirement to press the Enter key after the banner message is displayed.

```
device(config)# banner motd require-enter-key
```

The following example shows the message displayed when the requirement to press the Enter key is enabled upon accessing the switch from Telnet.

```
Authorized Access Only ...  
Press <Enter> to accept and continue the login process....
```

batch buffer

Creates a group of CLI commands per batch ID that is used in the automatic execution of commands in batches.

Syntax

batch buffer *batch-id delimiting-character command-list delimiting-character*

no batch buffer *batch-id*

Command Default

CLI commands are not grouped per batch.

Parameters

batch-id

Specifies the unique batch buffer ID. The value range is from 1 through 4.

delimiting-character

Enables an onboard editor on which the list of CLI commands is added. The second occurrence of the delimiting character closes the onboard editor.

command-list

Specifies the list of commands that you want to add in the batch buffer. A maximum of 10 commands can be added in a batch buffer.

Modes

Global configuration mode

Usage Guidelines

You can create only up to 4 batches and each batch can have a maximum of 10 commands.

The commands that are present at the user EXEC mode, privileged EXEC mode, global configuration mode, and sub-level commands can be added to a batch.

The commands that are saved in the batch buffer are applied on the device only if the **execute batch** command is issued.

The following list of commands cannot be issued using the batch process:

- At the privileged EXEC level:
 - **exit**
 - **ping**
 - **reload**
 - **telnet**
 - **quit**
 - **traceroute**

- **ssh**
- At the global configuration level:
 - **quit**
 - **relative-utilization**
 - **batch**

Any command that requires user intervention will fail during batch execution.

The **no** form of the command removes the configured batch.

Examples

The following example creates a batch buffer containing two CLI commands.

```
device# configure terminal
device(config)# batch buffer 1 &
configure terminal
hostname brocade &
```

bgp-redistribute-internal

Causes the device to allow the redistribution of IBGP routes from BGP into OSPF for non-default VRF instances.

Syntax

bgp-redistribute-internal
no bgp-redistribute-internal

Command Default

This feature is disabled.

Modes

BGP configuration mode
 BGP address-family IPv6 unicast configuration mode
 BGP address-family IPv4 unicast VRF configuration mode
 BGP address-family IPv6 unicast VRF configuration mode

Usage Guidelines

Use the **no** form of the command to restore the defaults.

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

Examples

This example enables BGP4 route redistribution.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# bgp-redistribute-internal
```

This example enables BGP4+ route redistribution in BGP address-family IPv6 unicast configuration mode.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast
device(config-bgp-ipv6u)# bgp-redistribute-internal
```

History

Release version	Command history
8.0.30	Support was added for the BGP address-family IPv6 unicast VRF configuration mode.

block

Configures the time users must wait before the next cycle of Web Authentication begins after they have exceeded the limit for Web Authentication attempts.

Syntax

block [**mac** *mac-address*] **duration** *time*
no block [**mac** *mac-address*] **duration** *time*

Command Default

The default is 90 seconds.

Parameters

mac *mac-address*

Configures the host with the specified MAC address to be temporarily or permanently blocked from attempting Web Authentication.

duration *time*

Configures the time duration users must wait before the next cycle of Web Authentication attempts is allowed. Valid values are from 0 through 128,000 seconds. The default is 90 seconds, and entering 0 means the user is infinitely blocked.

Modes

Web Authentication configuration mode

Usage Guidelines

To unblock the MAC address, wait until the block duration timer expires or enter the **clear webauth vlan *vlan-id* block-mac** command.

The **no** form of the command resets the duration time to the default.

Examples

The following example configures the block duration to 1000 seconds.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# block duration 1000
```

The following example configures the block duration for a specific host.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# block mac 1111.2222.3333 duration 1000
```

block-applicant

Disables the VLAN advertising on a GVRP-enabled port.

Syntax

block-applicant { **all** | **ethernet** *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port to stackid/slot/port* | **ethernet** *stackid/slot/port*]...] }

no block-applicant { **all** | **ethernet** *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port to stackid/slot/port* | **ethernet** *stackid/slot/port*]...] }

Command Default

VLANs are advertised on GVRP-enabled ports.

Parameters

all

Disables VLAN advertising on all GVRP-enabled ports.

ethernet *stackid/slot/port*

Disables VLAN advertisement on the specified GVRP-enabled Ethernet port.

to *stackid/slot/port*

Specifies the range of GVRP-enabled Ethernet ports on which you want to disable VLAN advertising.

Modes

GVRP configuration mode

Usage Guidelines

NOTE

Even when VLAN advertising is disabled, Leaveall messages are still sent on the GVRP ports.

The **no** form of the command allows the VLAN advertising on GVRP-enabled ports.

Examples

The following example shows how to disable VLAN advertising on all ports.

```
device(config)# gvrp-enable
device(config-gvrp)# block-applicant all
```

The following example shows how to disable VLAN advertising on specific ports.

```
device(config)# gvrp-enable
device(config-gvrp)# block-applicant ethernet 1/1/24 ethernet 1/6/24 ethernet 1/8/17
```

Commands A - E

block-applicant

The following example shows how to disable VLAN advertising on a range of ports.

```
device(config)# gvrp-enable
device(config-gvrp)# block-applicant ethernet 1/1/1 to 1/1/8
```

The following example shows how to disable VLAN advertising on a list of specific ports as well as on a range of ports.

```
device(config)# gvrp-enable
device(config-gvrp)# block-applicant ethernet 1/1/1 to 1/1/8 ethernet 1/1/24 ethernet 1/6/24 ethernet
1/8/17
```

block-learning

Disables the VLAN learning on GVRP-enabled ports.

Syntax

block-learning { **all** | **ethernet** *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*]...] }

no block-learning { **all** | **ethernet** *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*]...] }

Command Default

VLAN learning is enabled.

Parameters

all

Disables VLAN learning on all GVRP-enabled ports.

ethernet *stackid/slot/port*

Disables VLAN learning on the specified Ethernet interface.

to *stackid/slot/port*

Specifies a range of GVRP-enabled Ethernet ports on which you want to disable VLAN learning.

Modes

GVRP configuration mode

Usage Guidelines

NOTE

The port still advertises VLAN information unless you also disable VLAN advertising.

The **no** form of the command re-enables VLAN learning.

Examples

The following example shows how to disable VLAN learning on all GVRP-enabled ports.

```
device(config)# gvrp-enable
device(config-gvrp)# block-learning all
```

The following example shows how to disable VLAN learning on a list of specific GVRP-enabled ports.

```
device(config)# gvrp-enable
device(config-gvrp)# block-learning ethernet 1/1/24 ethernet 1/6/22 ethernet 1/8/17
```

Commands A - E

block-learning

The following example shows how to disable VLAN learning on a range of GVRP-enabled ports.

```
device(config)# gvrp-enable
device(config-gvrp)# block-learning ethernet 1/1/1 to 1/1/8
```

The following example shows how to disable VLAN learning on a list of ports along with a range of GVRP-enabled ports.

```
device(config)# gvrp-enable
device(config-gvrp)# block-learning ethernet 1/1/1 to 1/1/8 ethernet 1/1/24 ethernet 1/6/24 ethernet
1/8/17
```

bootfile

Specifies the boot image to be used by the client.

Syntax

bootfile *name*

Parameters

name

Specifies the name of the bootfile to be used by the client.

Modes

DHCP server pool configuration mode

Examples

The following example specifies the bootfile name.

```
device(config)# ip dhcp-server-pool cabo  
device(config-dhcp-cabo)# bootfile foxhound
```

bootp-relay-max-hops

Modifies the maximum number of BootP or DHCP hops.

Syntax

bootp-relay-max-hops *max-hop*

no bootp-relay-max-hops *max-hop*

Command Default

By default, a Brocade Layer 3 switch forwards a BootP or DHCP request if its hop count is four or less, but discards the request if the hop count is greater than four.

Parameters

max-hop

Specifies the maximum number of hops. The parameter value can be from 1 through 15.

Modes

Global configuration mode

Usage Guidelines

This command allows the Layer 3 switch to forward BootP or DHCP requests that have passed through 10 previous hops before reaching the Layer 3 switch. Requests that have traversed 11 hops before reaching the switch are dropped. Because the hop count value initializes at zero, the hop count value of an ingressing DHCP Request packet is the number of Layer 3 routers that the packet has already traversed.

Examples

The following example modifies the maximum number of BootP or DHCP hops to 10.

```
device(config)# bootp-relay-max-hops 10
```

boot system flash

Configures the device to boot from the image stored in the flash memory.

Syntax

boot system flash { **primary** | **secondary** } [**yes**]

no boot system flash { **primary** | **secondary** } [**yes**]

Command Default

By default, the device first attempts to boot from the image stored in its primary flash, then its secondary flash, and then from a TFTP server.

Parameters

primary

Configures to boot from the image stored in its primary flash.

secondary

Configures to boot from the image stored in its secondary flash.

yes

Confirms the system boot preference settings. This option is equivalent to using the **write memory** command. This option is available only in Privileged EXEC mode.

Modes

Privileged EXEC mode

Global configuration mode

Usage Guidelines

You can use boot commands to immediately initiate software boots from a software image stored in the primary or secondary flash on a Brocade device.

It is very important that you verify a successful transfer of the boot code before you reset the system. If the boot code is not transferred successfully but you try to reset the system, the system will not have the boot code with which to successfully boot.

You can modify the default booting sequence in the global configuration mode using the **boot system** command.

Execute the **write memory** command to save the boot preferences to the startup configuration. If you are executing the **boot system flash** command from the Privileged EXEC mode, you can use the **yes** option to save the boot preference to the startup configuration. Executing the **write memory** command is not required in this case.

You can use the **show boot-preference** command to view the boot sequence preference.

The **no** form of the command resets the boot preference to the default.

Examples

The following example shows how to set the system to boot the image from the secondary flash.

```
device(config)# boot system flash secondary
```

The following example shows how to set the system to boot the image from the primary flash and save the preference to the startup configuration.

```
device# boot system flash primary yes
```

boot system tftp

Configures the device to boot from the image stored on a TFTP server.

Syntax

boot system tftp *server-ip file-name* [**fiber-port**]

no boot system tftp *server-ip file-name* [**fiber-port**]

Command Default

By default, the device first attempts to boot from the image stored in its primary flash, then its secondary flash, and then from a TFTP server.

Parameters

server-ip

The IP address of the TFTP server. The IP address of the device and the TFTP server should be in the same subnet.

file-name

The boot code file name.

fiber-port

Configures to boot the device from a TFTP server through the fiber connection. This option is available only in devices running router images and in Privilege EXEC mode.

Modes

Privileged EXEC mode

Global configuration mode

Usage Guidelines

It is very important that you verify a successful transfer of the boot code before you reset the system. If the boot code is not transferred successfully but you try to reset the system, the system will not have the boot code with which to successfully boot.

The **boot system tftp** command is not supported in a stacking environment.

The **no** form of the command resets the boot preference to the default.

Examples

The following example shows how to configure the device to boot from the image stored on a TFTP server.

```
device# boot system tftp 192.168.10.1 SPS08040.bin
```

bpdu-flood-enable

Configures the MCT cluster devices to flood the SSTP or MSTP BPDUs in the SSTP or MSTP domain.

Syntax

bpdu-flood-enable

no bpdu-flood-enable

Command Default

BPDU flooding is not enabled.

Modes

Global configuration mode

Usage Guidelines

When **bpdu-flood-enable** is configured, there should not be any links other than the ICL connecting the two MCT cluster devices. If there is an additional link, then the flooded BPDU will cause a loop and high CPU utilization.

NOTE

The **bpdu-flood-enable** command is not supported on the Brocade ICX 7750.

The **no** form of the command disables the BPDU flooding.

Examples

The following example shows how to configure BPDU flooding on the device.

```
device(config)# bpdu-flood-enable  
Warning - Any received untagged BPDUs will now be flooded to all the ports.
```

breakout ethernet

Configures sub-ports from 40 Gbps ports.

Syntax

breakout ethernet *unit/slot/port*

breakout ethernet *unit/slot/port* **to ethernet** *unit/slot/port*

breakout ethernet *unit/slot/port* **ethernet** *unit/slot/port*

no breakout ethernet *unit/slot/port*

no breakout ethernet *unit/slot/port* **to ethernet** *unit/slot/port*

no breakout ethernet *unit/slot/port* **ethernet** *unit/slot/port*

Command Default

By default, ports that can be broken out are configured as 40 Gbps ports.

Parameters

ethernet

Specifies the connection as ethernet.

unit/slot/port

Specifies the port to be broken into 10 Gbps sub-ports. If there are two port identifiers in the command line, the first port designates the beginning port in a range of ports to be broken out, and the second port indicates the end of the breakout range. When a range is specified, the 10 Gbps sub-ports within the range are implicitly included.

to

Designates a range of ports to be configured when followed by an ending port identifier. This is an optional keyword.

Modes

Global configuration mode.

Usage Guidelines

Use the **no** form of the command to remove breakout configuration from the designated port or range of ports.

No configuration may be present on a port for which the **breakout ethernet** command is issued. When the command is issued on a port with pre-existing configuration, an error message is returned. The existing configuration must be removed before the **breakout ethernet** command is re-issued.

The **breakout ethernet** command is available only on certain ICX 7750 40 Gbps ports. Refer to the *FastIron Ethernet Switch Administration Guide* for a table of available breakout ports. Refer to the *ICX 7750 Ethernet Switch Hardware Installation Guide* for detailed information on breakout cables.

The **breakout ethernet** command can be issued on stand-alone units only. Stacking cannot be enabled on a port configured for breakout. An error is returned if you try to enable stacking on a unit that has any breakout ports configured. The breakout configuration must be removed manually before stacking can be enabled. Use the **show breakout** command to display the breakout configuration for a unit.

The **breakout ethernet** and **no breakout ethernet** commands must be followed by a **write memory** command and a **reload** command for the port configuration changes to take effect.

Examples

The following example configures breakout on port 1/1/5, after existing configuration on the port is removed.

```
Device# configure terminal
Device(config)# breakout ethernet 1/1/5
Error: Port 1/1/5 has sflow forwarding
Device(config)# interface ethernet 1/1/5
Device(config-if-e40000-1/1/5)# no sflow forwarding
Device(config-if-e40000-1/1/5)# end
Device# write memory
Write startup-config done.
Device# configure terminal
Device(config)# breakout ethernet 1/1/5
Reload required. Please write memory and then reload or power cycle.
Device(config)# write memory
Write startup-config done.
Device(config)# Flash Memory Write (8192 bytes per dot) .
Copy Done.
Device(config)# end
Device# reload
```

The following example checks for ports with active breakout configuration and then removes breakout from ports 1/3/1 through 1/3/6.

```
Device# show breakout

Unit-Id: 1

Port      Module Exist  Module Conf  breakout_conf  breakout_oper
1/1/5     Yes           No           Yes            Yes
1/1/6     Yes           No           Yes            Yes
1/1/7     Yes           No           Yes            Yes
1/1/8     Yes           No           Yes            Yes
1/1/9     Yes           No           Yes            Yes
1/1/10    Yes           No           Yes            Yes
1/1/11    Yes           No           Yes            Yes
1/1/12    Yes           No           Yes            Yes
1/1/13    Yes           No           Yes            Yes
1/1/14    Yes           No           Yes            Yes
1/1/15    Yes           No           Yes            Yes
1/1/16    Yes           No           Yes            Yes
1/2/1     Yes           No           Yes            Yes
1/2/2     Yes           No           Yes            Yes
1/2/3     Yes           No           Yes            Yes
1/2/4     Yes           No           Yes            Yes
1/2/5     Yes           No           Yes            Yes
1/2/6     Yes           No           Yes            Yes
1/3/1     Yes           No           Yes            Yes
1/3/2     Yes           No           Yes            Yes
1/3/3     Yes           No           Yes            Yes
1/3/4     Yes           No           Yes            Yes
1/3/5     Yes           No           Yes            Yes
1/3/6     Yes           No           Yes            Yes
```

```
Device# configure terminal
Device(config)# no breakout ethernet 1/3/1 to 1/3/6
Reload required. Please write memory and then reload or power cycle.
Device(config)# write memory
Write startup-config done.

Device(config)# Flash Memory Write (8192 bytes per dot) .
Copy Done.
Device(config)# end
Device# reload
```

NOTE

If there had been any configuration on any sub-ports (1/3/1:1 to 1/3/6:4), the **no breakout** command would have returned an error. The configuration would then have to be removed from the sub-ports before breakout configuration could be removed.

History

Release version	Command history
FastIron Release 08.0.30	This command was introduced.

broadcast client

Configures a device to receive Network Time Protocol (NTP) broadcast messages on a specified interface.

Syntax

broadcast client

no broadcast client

Command Default

The broadcast mode is not enabled.

Modes

NTP interface configuration mode

Usage Guidelines

An NTP broadcast client can be enabled on a maximum of 16 Ethernet interfaces. If the interface is operationally down or if NTP is disabled, the NTP broadcast server packets are not received.

The **no** form of the command disables the capability of a device to receive NTP broadcast messages.

Examples

The following example configures a device to receive NTP broadcast messages on a specified interface.

```
device(config)# ntp
device(config-ntp)# ntp-interface management 1
Brocade(config-ntp-mgmt-1)# broadcast client
```

broadcast destination

Configures Network Time Protocol (NTP) broadcast destination options.

Syntax

broadcast destination *ip-address* [**key** *key-id*] [**version** *version-number*]

no broadcast destination *ip-address* [**key** *key-id*] [**version** *version-number*]

Command Default

The broadcast mode is not enabled.

Parameters

ip-address

Specifies the IPv4 subnet address of the device to send NTP broadcast messages.

key *key-id*

Specifies the authentication key ID. By default, no authentication key is configured. Valid values are from 1 through 65535.

version *version-number*

Specifies the NTP version number. The version options are 3 and 4. The default value is 4.

Modes

NTP interface configuration mode

Usage Guidelines

The NTP broadcast server can be enabled on a maximum 16 Ethernet interfaces and four subnet addresses per interface. If the interface is operationally down or there is no IP address configured for the subnet address, the NTP broadcast server packets are not sent.

NOTE

This command is not effective if the NTP server is disabled.

The **no** form of the command disables the broadcast option.

Examples

The following example configures NTP broadcast destination options.

```
device(config)# ntp
device(config-ntp)# ntp-interface management 1
device(config-ntp-mgmt-1)# broadcast destination 10.20.99.0 key 2 version 3
```

broadcast limit (enable)

Configures the maximum number of broadcast packets allowed per second.

Syntax

broadcast limit *num* **kbps**

no broadcast limit *num* **kbps**

Command Default

Broadcast rate limiting is disabled.

Parameters

num

Specifies the maximum number of broadcast packets per second. The value can be 1 to 8388607.

kbps

Enables byte-based limiting. The value can be 1 to Max Port Speed.

Modes

Interface configuration mode

Usage Guidelines

Use 0 or the **no** form of the command to disable broadcast rate limiting.

Examples

The following example enables a broadcast rate limit of 131072 kbps.

```
device(config)# interface ethernet 9/1/1  
device(config-if-e1000-9/1/1)# broadcast limit 131072 kbps
```

History

Release version	Command history
8.0.10	The command was introduced.

broadcast limit (logging)

Enables Syslog logging of broadcast packets.

Syntax

broadcast limit *num* **kbps** [**log**]

no broadcast limit *num* **kbps** [**log**]

Command Default

Broadcast rate logging is disabled.

Parameters

num

Specifies the maximum number of broadcast packets per second. The value can be 1 to 8388607.

kbps

Enables byte-based limiting. The value can be 1 to Max Port Speed.

log

Enables Syslog logging when the multicast limit exceeds *num* **kbps** .

Modes

Interface configuration mode

Usage Guidelines

Use 0 or the **no** form of the command to disable broadcast rate logging.

Examples

The following example enables broadcast limit logging when the configured broadcast limit exceeds 100 Kbps.

```
device(config)# interface ethernet 1/2/1
device(config-if-e10000-1/2/1)# broadcast limit 100 kbps log
```

History

Release version	Command history
8.0.10	The command was introduced.
8.0.40a	The command was modified to include the keyword log .

bsr-candidate

Configures a bootstrap router (BSR) as a candidate to distribute rendezvous point (RP) information to the other PIM Sparse devices within a PIM Sparse domain.

Syntax

bsr-candidate ethernet *stackid/slot/portnum hash-mask-length [priority]*

bsr-candidate loopback *num hash-mask-length [priority]*

bsr-candidate ve *num hash-mask-length [priority]*

bsr-candidate tunnel *num hash-mask-length [priority]*

no bsr-candidate

Command Default

The PIM router does not participate in BSR election.

Parameters

ethernet *stackid/slot/portnum*

Specifies the physical interface for the candidate BSR. On standalone devices specify the interface ID in the format slot/port-id; on stacked devices you must also specify the stack ID, in the format stack-id/slot/port-id.

loopback *num*

Specifies the loopback interface for the candidate BSR.

ve *num*

Specifies the virtual interface for the candidate BSR.

tunnel *num*

Specifies a GRE tunnel interface.

hash-mask-length

Specifies the number of bits in a group address that are significant when calculating the group-to-RP mapping. The range is 1 to 32.

NOTE

It is recommended that you specify 30 for IPv4 networks.

priority

Specifies the BSR priority. The range is from 0 to 255, from low to high. The default is 0.

Modes

Router configuration mode

Usage Guidelines

The **no** form of this command makes the PIM router cease to act as a candidate BSR.

Each PIM Sparse domain has one active BSR. For redundancy, you can configure ports on multiple devices as candidate BSRs. The PIM Sparse protocol uses an election process to select one of the candidate BSRs as the BSR for the domain. The BSR with the highest BSR priority is elected. If the priorities result in a tie, the candidate BSR interface with the highest IP address is elected.

Although you can configure the device as only a candidate BSR or an RP, it is recommended that you configure the same interface on the same device as both a BSR and an RP.

Examples

The following example uses a physical interface to configure a device as a candidate BSR.

```
Device(config)# router pim
Device(config-pim-router)# bsr-candidate ethernet 2/2 30 255
```

The following example uses a loopback interface to configure a device as a candidate BSR.

```
Device(config)# router pim
Device(config-pim-router)# bsr-candidate loopback 1 30 240
```

The following example uses a virtual interface to configure a device as a candidate BSR.

```
Device(config)# router pim
Device(config-pim-router)# bsr-candidate ve 120 30 250
```

History

Release version	Command history
8.0.20	This command was modified to add the tunnel keyword.

bsr-msg-interval

Sets the PIM BSR message interval timer.

Syntax

bsr-msg-interval *time*
no bsr-msg-interval *time*

Command Default

The default IPv6 PIM BSR message interval timer is 60 seconds.

Parameters

time

Defines the interval at which the BSR sends RP candidate data to all IPv6-enabled routers within the IPv6 PIM Sparse domain. Valid values are 10 to 65535 seconds. The default is 60 seconds.

Modes

IPv6 router PIM configuration

Usage Guidelines

The BSR message interval timer defines the interval at which the BSR sends RP candidate data to all IPv6-enabled routers within the IPv6 PIM Sparse domain

The **no** form of the command resets the IPv6 PIM BSR message interval timer to the default value of 60 seconds.

Examples

The following example sets the IPv6 PIM BSR message interval timer to 16 seconds.

```
device(config)# ipv6 router pim  
device(config-ipv6-pim-router)# bsr-msg-interval 16
```

The following example sets the IPv6 PIM BSR message interval timer to 16 seconds for a specified VRF.

```
device(config)# ipv6 router pim vrf blue  
device(config-ipv6-pim-router-vrf-blue)# bsr-msg-interval 16
```

buffer-profile port-region

Configures a buffer profile on a device.

Syntax

buffer-profile port-region *port-region* **qd-buffer-profile** *user-profile-name*

no buffer-profile port-region *port-region* **qd-buffer-profile** *user-profile-name*

buffer-profile port-region *port-region* **scheduler-profile** *user-profile-name*

no buffer-profile port-region *port-region* **scheduler-profile** *user-profile-name*

buffer-profile port-region *port-region* **voip downlink 100 uplink 1000**

no buffer-profile port-region *port-region* **voip downlink 100 uplink 1000**

Command Default

Buffer profiles are not configured.

Parameters

port-region

Specifies the device number on which the user-configurable buffer profile is applied. The port-region number can be 0 through 15.

qd-buffer-profile *user-profile-name*

Applies the user-defined buffer profile.

scheduler-profile *user-profile-name*

Configures a defined scheduler profile.

voip

Configures a VoIP buffer profile.

downlink 1000

Configures the downlink ports as 1000 Megabits.

uplink 100

Configures the uplink ports as 100 Megabits.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command deletes the buffer profile configuration.

Commands A - E
buffer-profile port-region

Examples

The following example applies the buffer profile named profile1 to a device.

```
device(config)# buffer-profile port-region 0 qd-buffer-profile profile1
```

buffer-sharing-full

Removes the buffer allocation limits on all ports and all traffic classes globally.

Syntax

buffer-sharing-full

Modes

Global configuration mode

Usage Guidelines

The **buffer-sharing-full** command sets the total transmit queue depth limit and the transmit queue depth limits for each traffic class to 4095 for all ports of the device. The command overrides any existing individually configured queue depth limits. The command permits all available buffers in a port region to be used on a first-come, first-served basis by any of its ports, regardless of priority.

NOTE

The **buffer-sharing-full** command should be used carefully. By entering this command, there is no limit on the number of buffers a port or a specific priority on a port can use. One port could potentially use up all the available buffers of its port region and cause starvation on other ports of the port region. The command can create unpredictable behavior during traffic congestion or a blocking scenario, compromising network stability (by losing control packets), QoS, and stacking.

Examples

The following example removes the buffer allocation limits on all ports and all traffic classes globally.

```
device(config)# buffer-sharing-full
```

capability as4

Enables 4-byte autonomous system number (ASN) capability at the BGP global level.

Syntax

```
capability as4 { disable | enable }  
no capability as4 { disable | enable }
```

Command Default

This feature is disabled.

Parameters

- disable**
Disables 4-byte ASN capability at the BGP global level.
- enable**
Enables 4-byte ASN capability at the BGP global level.

Modes

BGP configuration mode

Usage Guidelines

Use the **no** form of this command to disable this functionality.

Examples

To enable 4-byte ASN capability:

```
device# configure terminal  
device(config)# router bgp  
device(config-bgp-router)# capability as4 enable
```

captive-portal

Creates a user-defined Captive Portal profile.

Syntax

captive-portal *profile-name*

no captive-portal *profile-name*

Parameters

profile-name

Specifies the name of the user-defined Captive Portal profile.

Modes

Global configuration mode

Usage Guidelines

The Captive Portal profile serves as a template that includes configuration details specific to the Aruba ClearPass server, such as virtual IP address, HTTP or HTTPS protocol port number, and login-page details hosted on the Aruba ClearPass server.

The details configured in the Captive Portal profile enable the switch to handle HTTP redirection mechanism and redirects the client to the login page hosted on the Aruba ClearPass server.

The Captive Portal profile can be attached to an external Web Authentication-enabled VLAN using the **captive-portal profile** command.

The **no** form of the command removes the Captive Portal profile.

Examples

The following example creates the user-defined Captive Portal profile cp_brocade.

```
device(config)# captive-portal cp_brocade
```

History

Release version	Command history
8.0.40	This command was introduced.

captive-portal profile

Applies a configured Captive Portal profile on a Web Authentication-enabled VLAN.

Syntax

captive-portal profile *profile-name*
no captive-portal profile *profile-name*

Command Default

A Captive Portal profile is not applied on a Web Authentication-enabled VLAN.

Parameters

profile-name
Specifies the Captive Portal profile to be applied on a Web Authentication-enabled VLAN.

Modes

Web Authentication configuration mode

Usage Guidelines

The **no** form of the command removes the Captive Portal profile from the Web Authentication-enabled VLAN.

Examples

The following example binds the Captive Portal profile cp_brocade on Web Authentication-enabled VLAN 10.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# captive-portal profile cp_brocade
```

History

Release version	Command history
8.0.40	This command was introduced.

cdp enable

Enables Cisco Discovery Protocol (CDP) at the interface level.

Syntax

cdp enable
no cdp enable

Command Default

CDP is not enabled. CDP is enabled on an interface once CDP is enabled on the device.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of the command disables CDP on an interface.

Examples

The following example enables CDP on an interface.

```
device(config)# interface ethernet 1/1/1  
device(config-if-e1000-1/1/1)# cdp enable
```

cdp run

Enables the device to intercept and display Cisco Discovery Protocol (CDP) messages.

Syntax

cdp run

no cdp run

Command Default

CDP is disabled by default.

Modes

Global configuration mode

Usage Guidelines

This command also enables the device to detect CDP power requirements.

The **no** form of the command disables the device from intercepting and displaying CDP messages.

Examples

The following example enables the device to intercept and display CDP messages.

```
device(config)# cdp run
```

chassis name

Configures a chassis name.

Syntax

chassis name *name*

no chassis name *name*

Command Default

A chassis name is not configured.

Parameters

name

Specifies the name of the chassis.

Modes

Global configuration mode

Usage Guidelines

This command does not change the CLI prompt. Instead, the command assigns an administrative ID to the device.

The **no** form of the command removes the chassis name.

Examples

The following example configures a chassis name.

```
device(config)# chassis name ch_2
```

clear access-list

Clears ACL counters.

Syntax

```
clear access-list { all | std-acl-num | ext-acl-num }
```

Parameters

all

Clears all ACL counters.

std-acl-num

Clears the counter for the specified standard ACL. Valid values are from 1 through 99.

extd-acl-num

Clears the counter for the specified extended ACL. Valid values are from 100 through 199.

Modes

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Examples

The following example clears all the ACL counters.

```
device# clear access-list all
```

The following example clears the counter for the standard ACL 10.

```
device# clear access-list 10
```

clear access-list accounting

Clears Access Control List (ACL) accounting statistics for IPv4 ACLs, IPv6 ACLs, and Layer 2 MAC filters.

Syntax

clear access-list accounting all

clear access-list accounting *interface-type interface-name* **in**

clear access-list accounting traffic-policy { **all** | *name* }

Parameters

all

Clears all statistics for all ACLs.

interface-type interface-name

Specifies the ID of the Ethernet or virtual interface. Clears the accounting statistics for ACLs bound to a physical port or clears statistics for all ACLs bound to ports that are members of a virtual routing interface.

in

Clears statistics of the inbound ACLs.

traffic-policy

Clears traffic-policy statistics.

all

Clears all traffic-policy statistics.

name

Clears statistics of a specific traffic-policy.

Modes

Privileged EXEC mode

Usage Guidelines

To clear accounting statistics for all configured ACLs, use the **all** keyword.

Examples

The following example clears ACL accounting statistics for all configured ACLs.

```
device# clear access-list accounting all
```

The following example clears ACL accounting statistics for a specific port.

```
device# clear access-list accounting ethernet 1/5 in
```

The following example clears all traffic-policy statistics.

```
device#clear access-list accounting traffic-policy all
```

Commands A - E
clear access-list accounting

History

Release version	Command history
08.0.10	This command was introduced.

clear acl-on-arp

Clears the count of how many ARP packets have been dropped on the interface.

Syntax

clear acl-on-arp

Modes

Privileged EXEC mode

Global configuration mode

Usage Guidelines

The Filter Count column in the output of the **show acl-on-arp** command shows how many ARP packets have been dropped on the interface since the last time the count was cleared. The **clear acl-on-arp** command resets the filter count on all interfaces in a device back to zero.

Examples

The following example clears the count of how many ARP packets have been dropped on the interface.

```
device# clear acl-on-arp
```

clear cable diagnostics tdr

Clears the results of Virtual Cable Test (VCT) TDR testing (if any) conducted on the specified port

Syntax

clear cable-diagnostics tdr *stackid/slot/port*

Command Default

By default, the results of the previous test (if any) are present and are displayed in response to the **show cable-diagnostics tdr** command for the specified port.

Parameters

stackid/slot/port

Identifies the specific interface (port), by device, slot, and port number in the format shown.

Modes

Privileged EXEC mode

Usage Guidelines

Use this command to clear TDR test registers before every TDR cable diagnostic test. Most Brocade devices support VCT technology. VCT technology enables the diagnosis of a conductor (wire or cable) by sending a pulsed signal into the conductor, then examining the reflection of that pulse. This method of cable analysis is referred to as Time Domain Reflectometry (TDR). By examining the reflection, the Brocade device can detect and report cable statistics such as local and remote link pair, cable length, and link status.

Use the command in conjunction with the **phy cable-diagnostics tdr stackid/slot/port** command to test the interface.

Show diagnostic test results using the **show cable-diagnostics tdr stackid/slot/port** command.

Examples

In the following example, results from the previous test are cleared from the third interface on the second slot of the first device in the stack.

```
device# clear cable-diagnostics tdr 1/2/3
```

History

Release version	Command history
08.0.20	This command was introduced.

clear cli-command-history

Clears the allocated logging memory and removes the command log history.

Syntax

clear cli-command-history

Modes

Privileged EXEC mode

Global configuration mode

Examples

The following example clears the command log history.

```
device(config)# clear cli-command-history
```

History

Release version	Command history
8.0.40	This command was introduced.

clear dhcp

Clears the DHCP binding database.

Syntax

clear dhcp *ip-address*

Parameters

ip-address

The IP address of the client.

Modes

User EXEC mode

Usage Guidelines

You can remove all entries in the database or remove entries for a specific IP address only.

Examples

The following example removes all entries from the DHCP binding database.

```
device# clear dhcp
```

The following example clears entries for a specific IP address.

```
device# clear dhcp 10.10.102.4
```

clear dot1x sessions

Clears 802.1X authentication sessions.

Syntax

```
clear dot1x sessions { mac-address | ethernet device/slot/port }
```

Parameters

mac-address

Specifies the MAC address from which the 802.1X authentication sessions are to be cleared.

ethernet *device/slot/port*

Specifies the interface from which the 802.1X authentication sessions are to be cleared.

Modes

Privileged EXEC mode

Usage Guidelines

Use this command to clear the 802.1X authentication sessions.

Examples

The following example clears the 802.1X authentication session for the specified MAC address.

```
device(config)# clear dot1x sessions 0000.0034.abd4
```

History

Release version	Command history
08.0.20	This command was introduced.

clear dot1x statistics

Clears 802.1X authentication statistics.

Syntax

```
clear dot1x statistics [ ethernet unit/slot/port ]
```

Parameters

ethernet *unit/slot/port*

Specifies the interface on which the 802.1X authentication statistics are to be cleared.

Modes

Privileged EXEC mode

Examples

The following example clears 802.1X authentication statistics.

```
device(config)# clear dot1x statistics
```

The following example clears 802.1X authentication statistics on a specific interface.

```
device(config)# clear dot1x statistics ethernet 1/1/1
```

History

Release version	Command history
08.0.20	The all option was removed from Brocade ICX 6430, Brocade ICX 6450, Brocade ICX 6610, Brocade FCX, and Brocade ICX 7750.
8.0.40	The all option was removed as it is not supported on ICX 7750, ICX 7450, and ICX 7250.

clear dot1x-mka statistics

Clears current MACsec Key Agreement (MKA) statistics.

Syntax

```
clear dot1x-mka statistics ethernet device/slot/port
```

Parameters

ethernet *device/slot/port*

Specifies an Ethernet interface by device position in stack, slot on the device, and interface on the slot.

Modes

User EXEC mode

Usage Guidelines

MACsec commands are supported only on the ICX 7450.

Examples

In the following example, MKA statistics are cleared for Ethernet interface 1/3/3 (port 3 of slot 3 on the first device in the stack).

```
device# clear dot1x-mka statistics ethernet 1/3/3
```

History

Release version	Command history
08.0.20	This command was introduced.
08.0.30	Support for this command was added on ICX 7450.

clear fdp counters

Clears Foundry Discovery Protocol (FDP) and Cisco Discovery Protocol (CDP) statistics.

Syntax

clear fdp counters

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Examples

The following example clears FDP and CDP statistics.

```
device(config)# clear fdp counters
```

clear fdp table

Clears the information received in Foundry Discovery Protocol (FDP) and Cisco Discovery Protocol (CDP) updates from neighboring devices.

Syntax

clear fdp table

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Usage Guidelines

This command clears all updates for FDP and CDP.

Examples

The following example clears FDP and CDP updates from neighboring devices.

```
device(config)# clear fdp table
```

clear gvrp statistics

Clears statistics of the GVRP counters.

Syntax

```
clear gvrp statistics { all | ethernet stackid/slot/port }
```

Parameters

all

Clears the counters for all ports.

ethernet *stackid/slot/port*

Clears the counters for a specific Ethernet port.

Modes

Privileged EXEC mode

Global configuration mode

GVRP configuration mode

Examples

The following example shows how to clear statistics for all GVRP counters.

```
device# clear gvrp statistics all
```

The following example shows how to clear statistics for a specific port.

```
device# clear gvrp statistics ethernet 1/2/1
```

clear ikev2 sa

Clears Internet Key Exchange version 2 security associations (IKEv2 SAs).

Syntax

```
clear ikev2 sa [ fvrf vrf-name | ipv4 | local ip-address | remote ip-address ]
```

Parameters

fvrf *vrf-name*

Specifies the front-door VRF (FVRF) for the SAs.

ipv4

Specifies clearing IPv4 connections.

local *ip-address*

Specifies the local IPv4 address for the SAs.

remote *ip-address*

Specifies the remote IPv4 address for the SAs.

Modes

Privileged EXEC mode

Usage Guidelines

The clearing process deletes and re-establishes the SAs (including any child SAs).

When optional parameters are not specified, the command clears all IKEv2 SAs on the device.

NOTE

Clearing all IKEv2 SAs is a costly operation. Therefore, the unqualified version of the command should be used with caution. Issuing multiple unqualified versions of the command within a short time frame is not recommended.

Examples

The following example clears the IKEv2 SAs for local interface 10.10.20.1.

```
device# clear ikev2 sa local 10.10.20.1
```

The following example clears the IKE SAs for remote interface 10.0.10.1.

```
device# clear ikev2 sa remote 10.0.10.1
```

History

Release version	Command history
8.0.50	This command was introduced.

clear ikev2 statistics

Clears Internet Key Exchange version 2 (IKEv2) statistics by resetting the various IKEv2 counters to zero.

Syntax

clear ikev2 statistics

Modes

Privileged EXEC mode

Examples

The following example clears IKEv2 statistics from the device.

```
device# clear ikev2 statistics
```

History

Release version	Command history
8.0.50	This command was introduced.

clear ip bgp dampening

Reactivates suppressed BGP4 routes.

Syntax

```
clear ip bgp dampening [ ip-addr { / mask } ]
```

Parameters

ip-addr

IPv4 address of a specified route in dotted-decimal notation.

mask

IPv4 mask of a specified route in CIDR notation.

Modes

Privileged EXEC mode

Examples

The following example unsuppresses all suppressed BGP4 routes.

```
device# clear ip bgp dampening
```

clear ip bgp flap-statistics

Clears the dampening statistics for a BGP4 route without changing the dampening status of the route.

Syntax

```
clear ip bgp flap-statistics [ ip-addr { / mask } | neighbor ip-addr | regular-expression string ]
```

Parameters

ip-addr

Specifies the IPv4 address of a specified route in dotted-decimal notation.

mask

Specifies the IPv4 mask of a specified route in CIDR notation.

neighbor

Clears dampening statistics only for routes learned from the specified neighbor.

ip-addr

Specifies the IPv4 address of the neighbor.

regular-expression

Specifies a regular expression.

string

Regular expression.

Modes

Privileged EXEC mode

Examples

The following example clears the dampening statistics for a BGP4 route.

```
device# clear ip bgp flap-statistics 10.0.0.0/16
```

clear ip bgp local routes

Clears BGP4 local routes from the IP route table and resets the routes.

Syntax

clear ip bgp local routes

Modes

Privileged EXEC mode

Examples

The following example clears all BGP4 local routes.

```
device# clear ip bgp local routes
```

clear ip bgp neighbor

Requests a dynamic refresh of BGP4 connections or routes from a neighbor, with a variety of options.

Syntax

```
clear ip bgp neighbor { all | as-num | peer-group-name | ip-addr } [ last-packet-with-error ] [ notification-errors ]
[ soft [ in | out ] ] [ soft-outbound ] [ traffic ]
```

Parameters

all

Resets and clears all BGP4 connections to all neighbors.

as-num

Clears all BGP4 connections within this autonomous system. Range is from 1 through 4294967295.

peer-group-name

Clears all BGP4 connections in this peer group. Range is from 1 through 63 characters.

ip-addr

Clears all BGP4 connections with this IPv4 address, in dotted-decimal notation.

last-packet-with-error

Clears all BGP4 connections identified as having the last packet received with an error.

notification-errors

Clears all BGP4 connections identified as having notification errors.

soft

Refreshes routes received from or sent to the neighbor.

in

Refreshes received routes.

out

Refreshes sent routes.

soft-outbound

Refreshes all outbound routes by applying new or changed filters, but sends only the existing routes affected by the new or changed filters to the neighbor.

NOTE

Use **soft-outbound** only if the outbound policy is changed. This operand updates all outbound routes by applying the new or changed filters. However, the device sends to the neighbor only the existing routes that are affected by the new or changed filters. The **soft out** operand updates all outbound routes and then sends the entire BGP4 route table on the device to the neighbor after the device changes or excludes the routes affected by the filters.

traffic

Clears the counters (resets them to 0) for BGP4 messages.

Commands A - E
clear ip bgp neighbor

Modes

Privileged EXEC mode

Examples

The following example refreshes all BGP4 neighbor connections.

```
device# clear ip bgp neighbor all
```

clear ip bgp routes

Clears BGP4 routes from the IP route table and resets the routes.

Syntax

```
clear ip bgp routes [ ip-addr [ / mask ] ]
```

Parameters

ip-addr

Specifies the IPv4 address of a specified route in dotted-decimal notation.

mask

Specifies the IPv4 mask of a specified route in CIDR notation.

Modes

Privileged EXEC mode

Examples

The following example clears all BGP4 routes.

```
device# clear ip bgp routes 10.0.0.0/16
```

clear ip bgp traffic

Clears the BGP4 message counter for all neighbors.

Syntax

clear ip bgp traffic

Modes

Privileged EXEC mode

Examples

The following example clears the BGP4 message counters:

```
device# clear ip bgp traffic
```

clear ip bgp vrf

Clears BGP4 information for a virtual routing and forwarding (VRF) instance.

Syntax

```
clear ip bgp vrf vrf-name
```

Parameters

vrf *vrf-name*

Specifies the name of a VRF instance.

Modes

Privileged EXEC mode

Examples

The following example clears BGP4 information for VRF red.

```
device# clear ip bgp vrf red
```

clear ip dhcp-server binding

Clears the leases from the lease binding database.

Syntax

```
clear ip dhcp-server binding { address | * }
```

Parameters

address

The IP address to be deleted.

*

Wildcard clears all lease entries.

Modes

Global configuration mode.

Usage Guidelines

Use this command to delete to delete a specific lease, or all lease entries from the lease binding database.

Examples

The following example clears all lease entries.

```
device(config)# clear ip dhcp-server binding *
```

clear ip igmp cache

Clears the IGMP group membership table from a VRF instance or from all interfaces on the device.

Syntax

```
clear ip igmp [ vrf vrf-name ] cache
```

Parameters

vrf *vrf-name*

Specifies the name of a VRF instance. When this parameter is specified, the command is executed only on the specified VRF instance.

cache

Clears the IGMP group membership table from a specified VRF instance or from all interfaces.

Modes

Privileged EXEC mode

Usage Guidelines

When entered without the **vrf** keyword, this command clears information for all VRF instances.

Examples

The following example clears the IGMP group membership table for the device.

```
device# clear ip igmp cache
```

The following example clears the IGMP membership information on a single virtual routing interface, vpn1.

```
device# clear ip igmp vrf vpn1 cache
```

clear ip igmp traffic

Clears statistics for IGMP traffic from a VRF instance or from all interfaces on the device.

Syntax

```
clear ip igmp [ vrf vrf-name ] traffic
```

Parameters

vrf *vrf-name*

Specifies the name of a VRF instance. When this parameter is specified, the command is executed only on the specified VRF instance.

traffic

Clears multicast traffic statistics from a specified VRF instance or from all interfaces.

Modes

Privileged EXEC mode

Usage Guidelines

When entered without the **vrf** keyword, this command clears information for all VRF instances.

Examples

The following example clears all multicast statistics on the device.

```
device# clear ip igmp traffic
```

The following example clears the multicast statistics on the virtual routing interface, vpn1.

```
device# clear ip igmp vrf vpn1 traffic
```

clear ip mroute

Removes multicast routes from the IP multicast routing table .

Syntax

```
clear ip mroute [ vrf vrf-name ] [ ip-address {ip-mask | mask-bits } ]
```

Parameters

vrf *vrf-name*

Specifies a VRF.

ip-address

Specifies an IP address.

ip-mask

Specifies an IP subnet mask.

mask-bits

Specifies a subnet mask in bits.

Modes

Global configuration mode

Usage Guidelines

After multicast routes are cleared from an IP multicast routing table, the best static multicast routes are added back to the routing table.

When used without specifying a **vrf** *vrf-name* this command clears multicast routes from the multicast routing table.

Examples

The following example removes all mroutes from the IP multicast routing table:

```
Device# configure terminal
Device(config)# clear ip mroute
```

The following example removes all mroutes from the vrf green IP multicast routing table:

```
Device# configure terminal
Device(config)# clear ip mroute vrf green
```

The following example removes mroute 10.0.0.2/24 from the IP multicast routing table:

```
Device# configure terminal
Device(config)# clear ip mroute 10.0.0.2/24
```

Commands A - E
clear ip mroute

History

Release version	Command history
8.0.10a	This command was introduced.

clear ip msdp peer

Clears multicast source discovery protocol (MSDP) peer information.

Syntax

```
clear ip msdp [ vrf vrf-name ] peer [ ip-addr ]
```

Parameters

vrf *vrf-name*

Specifies a VRF instance.

peer

Clears MSDP peer information.

ip-addr

Specifies a VRF peer. If you do not specify a peer, MSDP information for all peers is cleared.

Modes

Privileged EXEC mode

Usage Guidelines

When entered without the **vrf** keyword, this command clears information for all VRF instances.

A message is displayed when the connection is closed.

Examples

The following example clears the MSDP peer connection with MSDP router 192.168.162.1.

```
device# clear ip msdp peer 192.168.162.1
```

clear ip msdp sa-cache

Clears the multicast source discovery protocol (MSDP) source active (SA) cache.

Syntax

```
clear ip msdp [ vrf vrf-name ] sa-cache [ ip-addr ]
```

Parameters

vrf *vrf-name*

Specifies a VRF instance.

sa-cache

Clears MSDP source active cache information.

ip-addr

Specifies a source or a group to clear. If you do not specify a source or group, all SA cache entries are cleared.

Modes

Privileged EXEC mode

Usage Guidelines

When entered without the **vrf** keyword, this command clears the SA cache for all VRF instances.

Examples

The following example clears the MSDP SA cache.

```
device# clear ip msdp sa-cache
```

clear ip msdp statistics

Clears multicast source discovery protocol (MSDP) statistics.

Syntax

```
clear ip msdp [ vrf vrf-name ] statistics [ ip-addr ]
```

Parameters

vrf *vrf-name*

Specifies a VRF instance.

statistics

Clears MSDP statistics information.

ip-addr

Specifies a VRF peer.

Modes

Privileged EXEC mode

Usage Guidelines

When entered without the **vrf** keyword, this command clears information for all VRF instances.

Examples

The following example clears MSDP statistics.

```
device# clear ip msdp statistics
```

clear ip multicast counters

Clears IGMP snooping on error and traffic counters for all VLANs.

Syntax

clear ip multicast counters

Modes

Privileged EXEC mode

Examples

The following example clears IGMP snooping on error and traffic counters for all VLANs.

```
device# clear ip multicast counters
```

clear ip multicast mcache

Clears the mcache on a specific VLAN or on all VLANs.

Syntax

```
clear ip multicast [ vlan vlan-id ] mcache [ ip-addr ]
```

Parameters

vlan *vlan-id*

Specifies a VLAN.

mcache

Clears the mcache on the specified VLANs.

ip-addr

Specifies a source or a group to clear. If you do not specify a source or group, all cache entries are cleared.

Modes

Privileged EXEC mode

Usage Guidelines

When entered without the **vlan** keyword, this command clears the mcache for all VLANs.

Examples

The following example clears the mcache on all VLANs:

```
device# clear ip multicast mcache
```

The following example clears the mcache on VLAN 20.

```
device# clear ip multicast vlan 20 mcache
```

clear ip multicast traffic

Clears traffic counters on a specific VLAN or on all VLANs.

Syntax

```
clear ip multicast [ vlan vlan-id ] traffic
```

Parameters

vlan *vlan-id*
Specifies a VLAN.

traffic
Clears traffic counters on the specified VLANs.

Modes

Privileged EXEC mode

Usage Guidelines

When entered without the **vlan** keyword, this command clears information for all VLANs.

Examples

The following example clears traffic counters on VLAN 20.

```
device# clear ip multicast vlan 20 traffic
```

The following example clears the traffic counters on all on VLANs.

```
device# clear ip multicast traffic
```

clear ip ospf

Clears OSPF process, counters, neighbors, or routes.

Syntax

clear ip ospf all

clear ip ospf neighbor { *A.B.C.D* | **all** } [**ethernet** *unit/slot/port* | **tunnel** *number* | **ve** *vlan_id*]

clear ip ospf routes { *A.B.C.D/L* | **all** }

clear ip ospf traffic

Parameters

all

Globally resets (disables then re-enables) OSPF without deleting the OSPF configuration information.

neighbor

Clears the specified neighbor, or clears all neighbors.

A.B.C.D

Specifies the IP address of the neighbor to clear.

all

Clears all neighbors.

ethernet *unit/slot/port*

Specifies the Ethernet interface and the interface ID in the format *unit/slot/port*.

tunnel *number*

Specifies a tunnel.

ve *vlan_id*

Specifies a virtual Ethernet (VE) interface.

routes

Clears matching routes or clears all routes.

A.B.C.D

Clears all routes that match the prefix and mask that you specify.

all

Clears all routes.

traffic

Clears OSPF counters and errors.

Modes

User EXEC mode

Commands A - E
clear ip ospf

Examples

The following example resets OSPF without deleting the OSPF configuration.

```
device# clear ip ospf all
```

clear ip pim cache

Clears the PIM forwarding cache on a specific VRF instance or on all VRFs.

Syntax

```
clear ip pim [ vrf vrf-name ] cache [ ip-address ]
```

Parameters

vrf *vrf-name*

Specifies a VRF instance.

cache

Specifies the PIM forwarding cache.

ip-address

Specifies the source or group address of the entry to clear.

Modes

Privileged EXEC mode

Usage Guidelines

When entered without the **vrf** keyword, this command clears the PIM forwarding cache for all VRFs.

Examples

The following example clears the PIM forwarding cache on a VRF instance named blue.

```
device# clear ip pim vrf blue cache
```

clear ip pim counters

Clears PIM message counters.

Syntax

```
clear ip pim [ vrf vrf-name ] counters
```

Parameters

vrf *vrf-name*

Specifies a VRF instance.

counters

Specifies PIM message counters.

Modes

Privileged EXEC mode

Usage Guidelines

When entered without the **vrf** keyword, this command clears the PIM message counters for all VRFs.

Examples

The following example clears the PIM message counters.

```
Device# clear ip pim counters
```

The following example clears the PIM message counters on a VRF named blue.

```
Device# clear ip pim vrf blue counters
```

clear ip pim hw-resource

Clears the PIM hardware resource fail count for a specific VRF instance or for all VRFs.

Syntax

```
clear ip pim [ vrf vrf-name ] hw-resource
```

Parameters

vrf *vrf-name*

Specifies a VRF instance.

hw-resource

Specifies hardware resource fail count.

Modes

Privileged EXEC mode

Usage Guidelines

When entered without the **vrf** keyword, this command clears the PIM hardware resource fail count for all VRFs.

Examples

The following example clears the PIM hardware resource fail count.

```
Device# clear ip pim hw-resource
```

clear ip pim rp-map

Updates the entries in the static multicast forwarding table for a specific VRF instance or for all VRFs.

Syntax

```
clear ip pim [ vrf vrf-name ] rp-map
```

Parameters

vrf *vrf-name*

Specifies a VRF instance.

rp-map

Specifies the entries in a PIM sparse static multicast forwarding table.

Modes

Privileged EXEC mode

Usage Guidelines

When entered without the **vrf** keyword, this command clears the PIM forwarding cache for all VRFs.

Configure this command to update the entries in the static multicast forwarding table immediately after making rendezvous point (RP) configuration changes. This command is meant to be used with the **rp-address** command.

Examples

The following example clears the entries in a PIM sparse static multicast forwarding table on a VRF instance named blue.

```
Device# clear ip pim vrf blue rp-map
```

clear ip pim traffic

Clears PIM traffic for a specific VRF instance or on all VRFs.

Syntax

```
clear ip pim [ vrf vrf-name ] traffic
```

Parameters

vrf *vrf-name*
Specifies a VRF instance.

traffic
Specifies PIM traffic.

Modes

Privileged EXEC mode

Usage Guidelines

When entered without the **vrf** keyword, this command clears PIM traffic for all VRFs.

Examples

The following example clears PIM traffic on a VRF instance named blue.

```
device# clear ip pim vrf blue traffic
```

clear ip pimsm-snoop

Clears PIM sparse mode (SM) information.

Syntax

```
clear ip pimsm-snoop [ vlanvlan-id ] { cache [ ip-address ] | stats }
```

Parameters

vlanvlan-id

Specifies clearing information on a specific VLAN.

cache

Specifies clearing the PIM SM snooping cache.

ip-address

Specifies clearing PIM SM snooping-cache information on a specific source or group.

stats

Specifies clearing traffic and error counters.

Modes

Global configuration mode

Examples

The following example clears PIM SM information from all VLANs.

```
Device(config)#clear ip pimsm-snoop cache
```

The following example clears PIM SM information from a specific VLAN.

```
Device(config)#clear ip pimsm-snoop vlan 10 cache
```

The following example clears PIM SM information from a specific source.

```
Device(config)#clear ip pimsm-snoop cache 10.1.1.1
```

The following example clears traffic and error counters from all VLANs.

```
Device(config)#clear ip pimsm-snoop stats
```

History

Release version	Command history
8.0.20	This command was introduced.

clear ip route

Clears entire IP route table or specific routes.

Syntax

```
clear ip route [ vrf vrf-name ] [ ip-address ]
```

Parameters

vrf *vrf-name*

Specifies the VPN Routing and Forwarding instance.

ip-address

Specifies the route entry to be cleared from the IP route table. The IP address can be specified in the format A.B.C.D/L where L is the mask bits or as A.B.C.D followed by network mask.

Modes

Privileged EXEC mode

Usage Guidelines

The command, when used without any parameters, clears the entire IP route table.

When an interface subnet route with an interface address that directly matches a host route learned from a neighboring device is configured and subsequently removed, the **clear ip route** command should be used so that the learned route is updated in the Routing and Hardware Forwarding table.

NOTE

The L2 and L3 protocols might flap in case the number of L3 routes are more.

Examples

The following example clears the IP route 10.157.22.0/24 from the IP routing table.

```
device# clear ip route 10.157.22.0/24
```

clear ip tunnel

Clears statistics (reset all fields to zero) for all IP tunnels or for a specific tunnel interface.

Syntax

```
clear ip tunnel { pmtud tunnel-id | stat [ tunnel-id ] }
```

Parameters

pmtud *tunnel-id*

Resets a dynamically-configured MTU on a tunnel interface back to the configured value.

stat

Clears statistics of all tunnels.

tunnel-id

Clears statistics of the specified tunnel.

Modes

Privileged EXEC mode

Usage Guidelines

You can also use the **clear statistics tunnel** command to clear tunnel statistics.

Examples

The following example clears statistics for all IP tunnels.

```
device# clear ip tunnel stat
```

The following example clears the statistics for a specific tunnel interface.

```
device# clear ip tunnel stat 2
```

The following example resets a dynamically-configured MTU on a tunnel interface.

```
device# clear ip tunnel pmtud 1
```

clear ip vrrp statistics

Clears IPv4 Virtual Router Redundancy Protocol (VRRP) statistics.

Syntax

```
clear ip vrrp statistics
```

Modes

Privileged EXEC mode

Usage Guidelines

This command can be entered in privileged EXEC mode and in any configuration mode. Entering the command in a configuration mode can be useful if you are configuring VRRP options, for example, and want to clear existing statistics.

Examples

The following example clears IPv4 VRRP statistics when entered in privileged EXEC mode.

```
device# clear ip vrrp statistics
```

The following example clears IPv4 VRRP statistics when entered in VRID interface configuration mode.

```
device(config)# router vrrp
device(config)# interface ethernet 1/1/6
device(config-if-e1000-1/1/6)# ip address 10.53.5.1/24
device(config-if-e1000-1/1/6)# ip vrrp vrid 1
device(config-if-e1000-1/1/6-vrid-1)# clear ip vrrp statistics
```

clear ip vrrp-extended statistics

Clears IPv4 Virtual Router Redundancy Protocol (VRRP) Extended (VRRP-E) statistics.

Syntax

clear ip vrrp-extended statistics

Modes

Privileged EXEC mode

Usage Guidelines

This command can be entered in privileged EXEC mode and in any configuration mode. Entering the command in a configuration mode can be useful if you are configuring VRRP-E options, for example, and want to clear existing statistics.

Examples

The following example clears IPv4 VRRP-E statistics when entered in privileged EXEC mode.

```
device# clear ip vrrp-extended statistics
```

The following example clears IPv4 VRRP-E statistics when entered in VRID interface configuration mode.

```
device(config)# router vrrp-extended
device(config-vrrpe-router)# interface ethernet 1/1/5
device(config-if-e1000-1/1/5)# ip address 10.53.4.1/24
device(config-if-e1000-1/1/5)# ip vrrp-extended vrid 2
device(config-if-e1000-1/1/5-vrid-2)# clear ip vrrp-extended statistics
```

clear ipsec sa

Clears IPsec security associations (SAs).

Syntax

clear ipsec sa [**fvr**f *vrf-name* | **ipv4** | **peer** *ip-address*]

Parameters

fvrf *vrf-name*

Specifies the front-door VRF (FVRF) for the SAs.

ipv4

Specifies clearing IPv4 associations.

peer *ip-address*

Specifies clearing associations for the IPv4 address of a peer.

Modes

Privileged EXEC mode

Usage Guidelines

The clearing process deletes and re-establishes IPsec SAs. The SAs remain unchanged.

When optional parameters are not specified, this command clears all IPsec SAs on the device.

NOTE

Clearing all IPsec SAs is a costly operation. Therefore, the unqualified version of the command should be used with caution. Issuing multiple unqualified versions of the command within a short time frame is not recommended.

Examples

The following example clears all IPsec SAs on the device.

```
device# clear ipsec sa
```

History

Release version	Command history
8.0.50	This command was introduced.

clear ipv6 bgp dampening

Reactivates suppressed BGP4+ routes.

Syntax

```
clear ipv6 bgp dampening [ ipv6-addr { / mask } ]
```

Parameters

ipv6-addr

IPv6 address of a specified route in dotted-decimal notation.

mask

IPv6mask of a specified route in CIDR notation.

Modes

Privileged EXEC mode

Examples

The following example unsuppresses all suppressed BGP4+ routes.

```
device# clear ipv6 bgp dampening
```

clear ipv6 bgp flap-statistics

Clears the dampening statistics for a BGP4+ route without changing the dampening status of the route.

Syntax

```
clear ipv6 bgp flap-statistics [ ipv6-addr { / mask } | neighbor ipv6-addr | regular-expression string ]
```

Parameters

ipv6-addr

Specifies the IPv6 address of a specified route in dotted-decimal notation.

mask

Specifies the IPv6 mask of a specified route in CIDR notation.

neighbor

Clears dampening statistics only for routes learned from the specified neighbor.

ipv6-addr

Specifies the IPv6 address of the neighbor.

regular-expression

Specifies a regular expression.

string

Regular expression.

Modes

Privileged EXEC mode

Examples

The following example clears the dampening statistics for a BGP4+ route.

```
device# clear ipv6 bgp flap-statistics 2001:2002::23:61
```

Commands A - E
clear ipv6 bgp local routes

clear ipv6 bgp local routes

Clears BGP4+ local routes from the IP route table and resets the routes.

Syntax

clear ipv6 bgp local routes

Modes

Privileged EXEC mode

Examples

The following example clears all BGP4+ local routes.

```
device> clear ipv6 bgp local routes
```

clear ipv6 bgp neighbor

Requests a dynamic refresh of BGP4+ connections or routes from a neighbor, with a variety of options.

Syntax

```
clear ipv6 bgp neighbor { all | as-num | peer-group-name | ipv6-addr } [ last-packet-with-error ] [ notification-errors ] [ soft [ in | out ] ] [ soft-outbound ] [ traffic ]
```

Parameters

all

Resets and clears all BGP4+ connections to all neighbors.

as-num

Clears all BGP4+ connections within this autonomous system. Range is from 1 through 4294967295.

peer-group-name

Clears all BGP4+ connections in this peer group. Range is from 1 through 63 characters.

ipv6-addr

Clears all BGP4+ connections with this IPv6 address, in dotted-decimal notation.

last-packet-with-error

Clears all BGP4+ connections identified as having the last packet received with an error.

notification-errors

Clears all BGP4+ connections identified as having notification errors.

soft

Refreshes routes received from or sent to the neighbor.

in

Refreshes received routes.

out

Refreshes sent routes.

soft-outbound

Refreshes all outbound routes by applying new or changed filters, but sends only the existing routes affected by the new or changed filters to the neighbor.

NOTE

Use **soft-outbound** only if the outbound policy is changed. This operand updates all outbound routes by applying the new or changed filters. However, the device sends to the neighbor only the existing routes that are affected by the new or changed filters. The **soft out** operand updates all outbound routes and then sends the entire BGP4+ route table on the device to the neighbor after the device changes or excludes the routes affected by the filters.

traffic

Clears the counters (resets them to 0) for BGP4+ messages.

Commands A - E
clear ipv6 bgp neighbor

Modes

Privileged EXEC mode

Examples

The following example refreshes all BGP4+ neighbor connections.

```
device# clear ipv6 bgp neighbor all
```

clear ipv6 bgp routes

Clears BGP4+ routes from the route table and resets the routes.

Syntax

```
clear ipv6 bgp routes [ ipv6-addr { / mask } ]
```

Parameters

ipv6-addr

Specifies the IPv6 address of a specified route in dotted-decimal notation.

mask

Specifies the IPv6 mask of a specified route in CIDR notation.

Modes

Privileged EXEC mode

Examples

The following example clears all BGP4+ routes.

```
device> clear ipv6 bgp routes
```

Commands A - E
clear ipv6 bgp traffic

clear ipv6 bgp traffic

Clears the BGP4+ message counter for all neighbors.

Syntax

```
clear ipv6 bgp traffic
```

Modes

Privileged EXEC mode

Examples

The following example clears the BGP4+ message counters.

```
device# clear ipv6 bgp traffic
```

clear ipv6 cache

Deletes all entries in the dynamic host IPv6 cache.

Syntax

```
clear ipv6 cache [ vrf vrf-name ] [ ipv6-address | ipv6-prefix/prefix-length | ethernet stack/slot/port | tunnel tunnel-id |
ve ve-number ]
```

Parameters

vrf *vrf-name*

Removes cache entries for the specified VPN Routing/Forwarding (VRF) instance.

ipv6-address

Removes cache entries for the specified IPv6 address.

ipv6-prefix/prefix-length

Removes cache entries for the specified IPv6 prefix.

ethernet *stack/slot/port*

Removes cache entries for the specified Ethernet interface.

tunnel *tunnel-id*

Removes cache entries for the specified tunnel interface.

ve *ve-number*

Removes cache entries for the specified Virtual Ethernet (VE) interface.

Modes

Privileged EXEC mode

Usage Guidelines

You can remove all entries from the IPv6 cache or specify an entry based on the IPv6 prefix, IPv6 address, or interface type.

You must specify the *ipv6-prefix* parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373. You must specify the *prefix-length* parameter as a decimal value. A slash mark (/) must follow the *ipv6-prefix* parameter and precede the *prefix-length* parameter.

You must specify the *ipv6-address* parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373.

Examples

The following example removes entries for IPv6 address 2000:e0ff::1.

```
device# clear ipv6 cache 2000:e0ff::1
```

clear ipv6 dhcp6 snooping

Clears the IPv6 DHCP snooping database.

Syntax

```
clear ipv6 dhcp6 snooping vlan
```

Parameters

vlan

Specifies the VLAN.

Modes

Global configuration mode

User EXEC mode

Usage Guidelines

You can remove all entries in the database, or remove entries for a specific IP address only.

Examples

The following command clears the IPv6 entries in the database.

```
device# clear ipv6 dhcp6 snooping
```

clear ipv6 dhcp-relay delegated-prefixes

Clears the IPv6 DHCP relay delegated prefixes.

Syntax

clear ipv6 dhcp-relay delegated-prefixes { *vrf* *vrf-name* | *X:X::X:X/M* | **all** | **interface** *interface-id* }

Parameters

vrf *vrf-name*

Clears the DHCPv6 delegated prefixes for a specific VRF. If this parameter is not provided, then the information for the default VRF is cleared

X:X::X:X/M

Clears the specified delegated prefix and removes the corresponding route permanently from the router.

all

Clear all the delegated prefixes and remove the corresponding routes permanently from the router for the VRF

interface *interface-id*

Clears all the delegated prefixes and removes the corresponding routes permanently from the router for the specified outgoing interface.

Modes

Privileged EXEC mode.

Examples

The following example clears the IPv6 DHCP relay delegated prefixes from VRF1.

```
device# clear ipv6 dhcp-relay delegated-prefixes vrf VRF1
```

History

Release version	Command history
08.0.10d	This command was introduced.
08.0.30	Support for this command was added in 08.0.30 and later releases.

clear ipv6 dhcp-relay statistics

Clears the IPv6 DHCP packet counters.

Syntax

clear ipv6 dhcp-relay statistics

Modes

Privileged EXEC mode

Examples

The following example clears the IPv6 DHCP packet counters.

```
device# clear ipv6 dhcp-relay statistics
```

History

Release version	Command history
08.0.10d	This command was introduced.
08.0.30	Support for this command was added in 08.0.30 and later releases.

clear ipv6 mld traffic

Clears the counters on IPv6 multicast listening discovery (MLD) traffic.

Syntax

```
clear ipv6 mld [ vrf vrf-name ] traffic
```

Parameters

vrf *vrf-name*
Specifies a VRF instance.

traffic
Clears the traffic counters.

Modes

Privileged EXEC mode

Usage Guidelines

When entered without the **vrf** keyword, this command clears traffic counters for all VRF instances.

Examples

The following example clears counters on IPv6 PIM traffic.

```
device# clear ipv6 mld traffic
```

clear ipv6 mroute

Removes IPv6 multicast routes from the IPv6 multicast routing table.

Syntax

```
clear ipv6 mroute [ vrf vrf-name ] [ ipv6-address-prefix/prefix-length ]
```

Parameters

vrf *vrf-name*

Specifies a VRF route.

ipv6-address-prefix/prefix-length

Specifies an IPv6 address prefix in hexadecimal using 16-bit values between colons as documented in RFC 2373 and a prefix length as a decimal value.

Modes

Privileged EXEC mode

Usage Guidelines

After mroutes are removed from an IPv6 multicast routing table, the best static mroutes are added back to it.

Examples

The following example removes all mroutes from the IPv6 multicast routing table:

```
Device(config)# clear ipv6 mroute
```

The following example removes all mroutes from the vrf green IPv6 multicast routing table:

```
Device(config)# clear ipv6 mroute vrf green
```

The following example removes mroute 2000:7838::/32 from the IPv6 multicast routing table:

```
Device(config)# clear ipv6 mroute 2000:7838::/32
```

History

Release version	Command history
8.0.10a	This command was introduced.

clear ipv6 multicast counters

Clears multicast listening discovery (MLD) snooping error and traffic counters on all VLANs.

Syntax

clear ipv6 multicast counters

Modes

Privileged EXEC mode

Examples

The following example clears MLD snooping on error and traffic counters for all VLANs.

```
device# clear ipv6 multicast counters
```

clear ipv6 multicast mcache

Clears the multicast listening discovery (MLD) mcache on a specific VLAN or on all VLANs.

Syntax

```
clear ipv6 multicast [ vlan vlan-id ] mcache [ ipv6-addr ]
```

Parameters

vlan *vlan-id*

Specifies a VLAN.

mcache

Clears the mcache on the specified VLANs.

ipv6-addr

Specifies a source or a group to clear. If you do not specify a source or group, all cache entries are cleared.

Modes

Privileged EXEC mode

Usage Guidelines

When entered without the **vlan** keyword, this command clears information for all VLANs.

Examples

The following example clears the mcache on VLAN 20.

```
device# clear ipv6 multicast vlan 20 mcache
```

clear ipv6 multicast traffic

Clears multicast listening discovery (MLD) traffic counters on a specific VLAN or on all VLANs.

Syntax

```
clear ipv6 multicast [ vlan vlan-id ] traffic
```

Parameters

vlan *vlan-id*
Specifies a VLAN.

traffic
Clears traffic counters on the specified VLANs.

Modes

Privileged EXEC mode

Usage Guidelines

When entered without the **vlan** keyword, this command clears information for all VLANs.

Examples

The following example clears traffic counters on VLAN 20.

```
device# clear ipv6 multicast vlan 20 traffic
```

clear ipv6 neighbor

Removes entries from the IPv6 neighbor table.

Syntax

```
clear ipv6 neighbor [ vrf vrf-name ] [ ipv6-address | ipv6-prefix/prefix-length | ve ve-number ]  
clear ipv6 neighbor ethernet stack/slot/port
```

Parameters

vrf *vrf-name*

Removes entries from the IPv6 neighbor table for the specified VPN Routing/Forwarding (VRF) instance.

ipv6-address

Removes cache entries for the specified IPv6 address.

ipv6-prefix/prefix-length

Removes cache entries for the specified IPv6 prefix.

ethernet *stack/slot/port*

Removes cache entries for the specified Ethernet interface.

ve *ve-number*

Removes cache entries for the specified Virtual Ethernet (VE) interface.

Modes

Privileged EXEC mode

Usage Guidelines

You must specify the *ipv6-prefix* parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373. You must specify the *prefix-length* parameter as a decimal value. A slash mark (/) must follow the *ipv6-prefix* parameter and precede the *prefix-length* parameter.

You must specify the *ipv6-address* parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373.

Examples

The following example removes neighbor entries for Ethernet interface 1/3/1.

```
device#clear ipv6 neighbor ethernet 1/3/1
```

clear ipv6 neighbor inspection

Clears the static neighbor discovery (ND) inspect entries and ND inspection statistics.

Syntax

```
clear ipv6 neighbor [ vrf vrf-name ] inspection [ static-entry | statistics ]
```

Parameters

vrf

Specifies the VRF instance (optional).

vrf-name

Specifies the ID of the VRF instance required with **vrf**.

inspection

Specifies that the neighbor discovery messages are verified against the static ND inspection entries or dynamically learned DHCPv6 snoop entries.

static-entry

Clears the manually configured static ND inspect entries that are used to validate the packets received on untrusted ports.

statistics

Clears the total number of neighbor discovery messages received and the number of packets discarded after ND inspection.

Modes

Privileged EXEC mode

Global configuration mode

VRF configuration mode

Usage Guidelines

This command can be used in three different modes as shown in the examples. If used without specifying a VRF, this command clears data from the default VRF.

Examples

The following example removes the manually configured static ND inspect entries.

```
device# clear ipv6 neighbor inspection static-entry
```

The following example removes the manually configured static ND inspect entries on a VRF.

```
device# configure terminal
device(config)# vrf vrf2
device(config-vrf-vrf2)# clear ipv6 neighbor vrf vrf2 inspection static-entry
```

Commands A - E

clear ipv6 neighbor inspection

The following example deletes the ND inspection statistics.

```
device# configure terminal
device(config)# clear ipv6 neighbor inspection statistics
```

The following example deletes the ND inspection statistics on a VRF.

```
device# configure terminal
device(config)# clear ipv6 neighbor vrf vrf2 inspection statistics
```

History

Release version	Command history
08.0.20	This command was introduced.

clear ipv6 pim cache

Clears the IPv6 PIM forwarding cache.

Syntax

```
clear ipv6 pim [ vrf vrf-name ] cache ipv6-address
```

Parameters

vrf *vrf-name*

Specifies a VRF instance.

cache *ipv6-address*

Specifies group or address of the PIM forwarding cache to clear.

Modes

Privileged EXEC mode

Usage Guidelines

When entered without the **vrf** keyword, this command clears information for all VRF instances.

Examples

This example shows how to clear the IPv6 PIM forwarding cache:

```
Device#clear ipv6 pim cache 2001:0DB8:0:1::1/120 5100::192:1:1:1
```

clear ipv6 pim counters

Clears IPv6 PIM message counters.

Syntax

```
clear ipv6 pim [ vrf vrf-name ] counters
```

Parameters

vrf *vrf-name*

Specifies a VRF instance.

counters

Specifies the IPv6 PIM message counters.

Modes

Privileged EXEC mode

Usage Guidelines

When entered without the **vrf** keyword, this command clears information for all VRF instances.

Examples

This example shows how to clear the IPv6 PIM message counters:

```
Device#clear ipv6 pim counters
```

clear ipv6 pim hw-resource

Clears the IPv6 PIM hardware resource fail count for a specific VRF instance or for all VRFs.

Syntax

```
clear ipv6 pim hw-resource
```

Parameters

vrf *vrf-name*

Specifies a VRF instance.

hw-resource

Specifies hardware resource fail count.

Modes

Privileged EXEC mode

Usage Guidelines

When entered without the **vrf** keyword, this command clears the PIM hardware resource fail count for all VRFs.

Examples

The following example clears the IPv6 PIM hardware resource fail count.

```
Device# clear ipv6 pim hw-resource
```

clear ipv6 pim rp-map

Clears the entries in an IPv6 PIM Sparse static multicast forwarding table, allowing a new rendezvous point (RP) configuration to be effective immediately.

Syntax

```
clear ipv6 pim [ vrf vrf-name ] rp-map
```

Parameters

vrf *vrf-name*

Specifies a VRF instance.

rp-map

Specifies the entries in a PIM sparse static multicast forwarding table.

Modes

Privileged EXEC mode

Usage Guidelines

Configuring this command clears and overwrites the static RP configuration. If you change the static RP configuration, the entries in the IPv6 PIM Sparse multicast forwarding table continue to use the old RP configuration until they are aged out. You can configure the **clear ipv6 pim rp-map** command to update the entries in the static multicast forwarding table immediately after making RP configuration changes.

This command is meant to be used with the **rp-address** command.

Examples

This example shows how to clear the entries in an IPv6 PIM Sparse static multicast forwarding table after you change the RP configuration:

```
Device#clear ipv6 pim rp-map
```

clear ipv6 pim traffic

Clears counters on IPv6 PIM traffic.

Syntax

```
clear ipv6 pim [ vrf vrf-name ] traffic
```

Parameters

vrf *vrf-name*

Specifies a VRF instance.

traffic

Specifies counters on IPv6 PIM traffic.

Modes

Privileged EXEC mode

Usage Guidelines

When entered without the **vrf** keyword, this command clears counters for all VRF instances.

Examples

This example shows how to clear IPv6 PIM traffic counters on all VRF instances:

```
Device#clear ipv6 pim traffic
```

clear ipv6 pimsm-snoop

Clears PIM sparse mode (SM) information.

Syntax

```
clear ipv6 pimsm-snoop [ vlanvlan-id ] { cache [ ipv6-address ] | stats }
```

Parameters

vlanvlan-id

Specifies clearing information on a specific VLAN.

cache

Specifies clearing the PIM SM snooping cache.

ipv6-address

Specifies clearing PIM SM snooping-cache information on a specific source or group.

stats

Specifies clearing traffic and error counters.

Modes

Global configuration mode

Examples

The following example clears PIM SM information from all VLANs.

```
Device(config)#clear ipv6 pimsm-snoop cache
```

The following example clears PIM SM information from a specific VLAN.

```
Device(config)#clear ipv6 pimsm-snoop vlan 10 cache
```

The following example clears PIM SM information from a specific source.

```
Device(config)#clear ipv6 pimsm-snoop cache ff05::100
```

The following example clears traffic and error counters from all VLANs.

```
Device(config)#clear ipv6 pimsm-snoop stats
```

History

Release version	Command history
8.0.20	This command was introduced.

clear ipv6 raguard

Resets the drop or permit packet counters for Router Advertisement (RA) guard policies.

Syntax

```
clear ipv6 raguard { name | all }
```

Parameters

name

An ASCII string indicating the name of the RA guard policy of which the packet counters must be cleared.

all

Clears the packet counters of all RA guard policies.

Modes

Global configuration mode

Usage Guidelines

To clear RA guard packet counters for all RA guard policies, use the **all** keyword. To clear the RA guard packet counters for a specific RA guard policy, specify the *name* of the policy.

Examples

The following example clears the packet count for an RA guard policy:

```
Brocade(config)# clear ipv6 raguard policy1
```

The following example clears the packet counters for all RA guard policies:

```
Brocade(config)# clear ipv6 raguard all
```

clear ipv6 rip route

Clears all RIPng routes from the RIPng route table and the IPv6 main route table and resets the routes.

Syntax

```
clear ipv6 rip route
```

Modes

Privileged EXEC mode or any configuration mode.

Examples

The following example clears all RIPng routes.

```
device# clear ipv6 rip route
```

clear ipv6 route

Clears IPv6 routes.

Syntax

```
clear ipv6 route [ vrf vrf-name] [ ipv6-prefix/prefix-length ]
```

Parameters

vrf *vrf-name*

Removes IPv6 routes for the specified VPN Routing/Forwarding (VRF) instance.

ipv6-prefix/prefix-length

Removes IPv6 routes for the specified IPv6 prefix.

Modes

Privileged EXEC mode

Usage Guidelines

The *ipv6-prefix/prefix-length* parameter clears routes associated with a particular IPv6 prefix. You must specify the *ipv6-prefix* parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373. You must specify the *prefix-length* parameter as a decimal value. A slash mark (/) must follow the *ipv6-prefix* parameter and precede the *prefix-length* parameter.

NOTE

The L2 and L3 protocols might flap in case the number of L3 routes are more.

Examples

The following example clears IPv6 routes associated with the prefix 2000:7838::/32.

```
device# clear ipv6 route 2000:7838::/32
```

clear ipv6 traffic

Clears IPv6 traffic statistics (resets all fields to zero).

Syntax

clear ipv6 traffic

Modes

Privileged EXEC mode

Examples

The following example clears the IPv6 traffic statistics.

```
device# clear ipv6 traffic
```

clear ipv6 tunnel

Clears statistics (resets all fields to zero) for all IPv6 tunnels or for a specific tunnel.

Syntax

```
clear ipv6 tunnel [ number ]
```

Parameters

number

Specifies the tunnel number.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Usage Guidelines

You can use the **show ipv6 tunnel** command to verify the results of issuing the **clear ipv6 tunnel** command.

Examples

The following example clears statistics for tunnel 1.

```
device(config)# clear ipv6 tunnel 1
```

clear ipv6 vrrp statistics

Clears IPv6 Virtual Router Redundancy Protocol (VRRP) statistics.

Syntax

clear ipv6 vrrp statistics

Modes

Privileged EXEC mode

Usage Guidelines

This command can be entered in privileged EXEC mode and in any configuration mode. Entering the command in a configuration mode can be useful if you are configuring IPv6 VRRP options, for example, and want to clear existing VRRP statistics.

Examples

The following example clears IPv6 VRRP statistics when entered in privileged EXEC mode.

```
device# clear ipv6 vrrp statistics
```

The following example clears IPv6 VRRP statistics when entered in VRID interface configuration mode.

```
device(config)# interface ethernet 1/1/6  
device(config-if-e1000-1/1/6)# ipv6 vrrp vrid 1  
device(config-if-e1000-1/1/6-vrid-1)# clear ipv6 vrrp statistics
```

clear ipv6 vrrp-extended statistics

Clears IPv6 Virtual Router Redundancy Protocol (VRRP) Extended (VRRP-E) statistics.

Syntax

```
clear ipv6 vrrp-extended statistics
```

Modes

Privileged EXEC mode

Usage Guidelines

This command can be entered in privileged EXEC mode and in any configuration mode. Entering the command in a configuration mode can be useful if you are configuring IPv6 VRRP-E options, for example, and want to clear existing VRRP-E statistics.

Examples

The following example clears IPv6 VRRP-E statistics when entered in privileged EXEC mode.

```
device# clear ipv6 vrrp-extended statistics
```

The following example clears IPv6 VRRP-E statistics when entered in VRID interface configuration mode.

```
device(config)# interface ethernet 1/1/5  
device(config-if-e1000-1/1/5)# ipv6 2001:DB8::2/24  
device(config-if-e1000-1/1/5)# ipv6 vrrp-extended vrid 2  
device(config-if-e1000-1/1/5-vrid-2)# clear ipv6 vrrp-extended statistics
```

clear link-keepalive statistics

Clears the UDLD statistics.

Syntax

clear link-keepalive statistics

Modes

Privileged EXEC mode

Global configuration mode

Usage Guidelines

This command clears the Packets sent, Packets received, and Transitions counters in the **show link-keepalive ethernet** command output.

Examples

The following example shows how to clear the UDLD port statistics.

```
device# clear link-keepalive statistics
```

clear link-oam statistics

Clears EFM-OAM statistics from all EFM-OAM-enabled interfaces.

Syntax

clear link-oam statistics

Modes

Privileged EXEC mode

Global configuration mode

EFM-OAM protocol configuration mode

Examples

The following example clears EFM-OAM statistics from all EFM-OAM-enabled interfaces.

```
device(config)# clear link-oam statistics
```

History

Release version	Command history
08.0.30	This command was introduced.

clear lldp neighbors

Clears cached Link Layer Discovery Protocol (LLDP) neighbor information.

Syntax

```
clear lldp neighbors [ ports { all | ethernet stack-id/slot/port [ to stack-id/slot/port | [ ethernet stack-id/slot/port to stack-id/slot/port | ethernet stack-id/slot/port ]... ] } ]
```

Parameters

ports

Clears LLDP neighbor information for the specified ports.

all

Clears LLDP neighbor information for all LLDP-capable ports.

ethernet stack-id/slot/port

Clears LLDP neighbor information for the specified Ethernet interface.

to stack-id/slot/port

Clears LLDP neighbor information for a range of Ethernet interfaces.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Usage Guidelines

The device clears cached LLDP neighbor information after a port becomes disabled and the LLDP neighbor information ages out. However, if a port is disabled and then re-enabled before the neighbor information ages out, the device clears the cached LLDP neighbor information when the port is re-enabled.

Examples

The following example clears the cached LLDP neighbor information for a specific port.

```
device# clear lldp neighbors ports ethernet 1/1/10
```

The following example clears the cached LLDP neighbor information for all ports.

```
device# clear lldp neighbors ports all
```

clear lldp statistics

Clears the global and per-port LLDP neighbor statistics on the device.

Syntax

```
clear lldp statistics [ all | ports { all | ethernet stack-id/slot/port [ to stack-id/slot/port | [ ethernet stack-id/slot/port to stack-id/slot/port | ethernet stack-id/slot/port ]... } ] ]
```

Parameters

all

Clears LLDP neighbor statistics for all LLDP-capable ports.

ports

Clears LLDP neighbor statistics for ports.

all

Clears LLDP neighbor statistics for all Ethernet interfaces.

ethernet stack-id/slot/port

Clears LLDP neighbor statistics for the specified Ethernet interface.

to stack-id/slot/port

Clears LLDP neighbor statistics for a range of Ethernet interfaces.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Examples

The following example clears the LLDP neighbor statistics for all ports.

```
device# clear lldp statistics ports all
```

clear logging

Clears the log entries from the dynamic buffer, the static buffer, or the local buffer.

Syntax

```
clear logging [ dynamic-buffer | static-buffer ]
```

Parameters

dynamic-buffer

Clears log entries from the dynamic buffer.

static-buffer

Clears log entries from the static buffer.

Modes

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Examples

The following example clears the syslog messages stored in the local buffer.

```
device# clear logging
```

The following example clears the log entries from the dynamic buffer.

```
device# clear logging dynamic-buffer
```

clear loop-detection

Clears loop detection statistics and enables all Err-Disabled ports.

Syntax

clear loop-detection

Modes

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Examples

The following example clears loop detection statistics and enables all Err-Disabled ports.

```
device(config)# clear loop-detection
```

clear mac-address

Clears the MAC addresses.

Syntax

clear mac-address [*mac-address* | **ethernet** *stack/slot/port* | **vlan** *vlan-id*]

Parameters

mac-address

Clears entries in all VLANs with the specified MAC address.

ethernet *stack/slot/port*

Clears the entries on the specified port.

vlan *vlan-id*

Clears all entries in a VLAN.

Modes

Privileged EXEC mode

Global configuration mode

Cluster configuration mode

Examples

The following example shows how to clear the MAC address of a specific VLAN.

```
device# clear mac-address vlan 2
```

The following example shows how to clear all MAC addresses in the system.

```
device# clear mac-address
```

History

Release version	Command history
8.0.40	The mdup-stats option was removed as it was supported only on FSX devices.

clear mac-address cluster

Clears cluster-specific MAC addresses.

Syntax

```
clear mac-address cluster { cluster-name | cluster-id } [ vlan vlan-id ] [ client [ client-name ] ] [ local | remote ]
```

Parameters

cluster-name

Clears the cluster MAC address entries for the cluster identified by the cluster name.

cluster-id

Clears the cluster MAC address entries for the cluster identified by the cluster ID.

vlan *vlan-id*

Clears the VLAN ID for which you want to clear the MAC address.

client *client-name*

Clears cluster client MAC address entries.

local

Clears the MAC addresses local to the cluster.

remote

Clears the MAC addresses remote to the cluster.

Modes

Privileged EXEC mode

Global configuration mode

Cluster configuration mode

Examples

The following example shows how to clear cluster-specific MAC addresses.

```
device# clear mac-address cluster AGG-1 local
```

The following example shows how to clear a MAC address for cluster client for a specific VLAN ID.

```
device# clear mac-address cluster AGG-1 vlan 1 local
```

The following example shows how to clear MAC address for cluster client.

```
device# clear mac-address cluster AGG-1 vlan 2 client 1 local
```

clear mac-authentication sessions

Clears MAC authentication sessions.

Syntax

clear mac-authentication sessions { **mac-address** *mac-address* | **ethernet** *device/slot/port* }

Parameters

mac-address

Specifies the mac-address from which the MAC authentication sessions are to be cleared.

ethernet *device/slot/port*

Specifies the interface from which the MAC authentication sessions are to be cleared.

Modes

Privileged EXEC mode

Usage Guidelines

Use this command to clear the MAC authentication sessions for either a specified MAC address or an ethernet interface.

Examples

The following example clears the MAC authentication session for the specified MAC address.

```
device# clear mac-authentication sessions 0000.0034.abd4
```

The following example clears the MAC authentication session sessions on an interface.

```
device# clear mac-authentication sessions ethernet 1/1/1
```

The following example clears the MAC authentication sessions.

```
device# clear mac-authentication sessions
```

History

Release version	Command history
08.0.20	This command was introduced.

clear macsec ethernet

Clears the MACsec traffic statistics for the specified interface.

Syntax

clear macsec ethernet *device/slot/port*

Parameters

device/slot/port

Specifies an interface by device position in stack, slot on the device, and interface on the slot.

Modes

Privileged EXEC mode.

Usage Guidelines

MACsec commands are supported only on the ICX 7450.

Examples

In the following example, MACsec traffic statistics are cleared for interface 1/3/3 (port 3 of slot 3 on the first device in the stack).

```
device(config-dot1x-mka-1/3/3)# clear macsec ethernet 1/3/3
```

History

Release version	Command history
08.0.20	This command was introduced.
08.0.30	Support for this command was added on ICX 7450.

clear management-vrf-stats

Clears the management Virtual Routing and Forwarding (VRF) rejection statistics.

Syntax

clear management-vrf-stats

Modes

- User EXEC mode
- Privileged EXEC mode
- Global configuration mode
- Interface management configuration mode

Usage Guidelines

You can use the **show management-vrf** command to verify the result of issuing the **clear management-vrf-stats** command.

Examples

The following example clears the management VRF rejection statistics.

```
device(config)# clear management-vrf-stats
```

clear notification-mac statistics

Clears the MAC-notification statistics, such as the number of trap messages and number of MAC notification events sent.

Syntax

clear notification-mac statistics

Command Default

The MAC-notification statistics are available on the device.

Modes

Global configuration

Privileged EXEC

Usage Guidelines

MAC notification statistics can be viewed using the **show notification-mac** display command.

Examples

The following example clears the MAC notification statistics:

```
device(config)# clear notification-mac statistics
```

History

Release version	Command history
08.0.10	This command was introduced.

clear openflow

Clears flows from the flow table.

Syntax

```
clear openflow { flowid flow-id | all }
```

Parameters

flowid *flow-id*

Clears the given flow ID that you want to delete from the flow table.

all

Deletes all flows from the flow table.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Usage Guidelines

When an OpenFlow rule or all flows in the flow table need to be deleted you can use the **clear openflow** command with the **all** option. To delete a single OpenFlow rule based on a flow-id, use the **clear openflow** command with the **flowid** *flow-id* options.

Examples

The following example clears the flow with an ID of 6.

```
device# clear openflow flowid 6
```

The following example clears all flows in the flow table.

```
device# clear openflow all
```

History

Release	Command History
08.0.20	This command was introduced.

clear port security

Clears port security data.

Syntax

```
clear port security { restricted-macs | statistics } { all | ethernet stack/slot/port }
```

Parameters

restricted-macs

Clears all restricted MAC addresses globally.

statistics

Clears violation statistics globally.

all

Clears information for all ports.

ethernet *stack/slot/port*

Clears information for the specified Ethernet port.

Modes

Privileged EXEC mode

Global configuration mode

Port security configuration mode

Port security interface configuration mode

Examples

The following example clears all restricted MAC addresses globally.

```
device# clear port security restricted-macs all
```

The following example clears restricted MAC addresses on a specific port.

```
device# clear port security restricted-macs ethernet 1/1/1
```

The following example clears violation statistics globally.

```
device# clear port security statistics all
```

The following example clears violation statistics on a specific port.

```
device# clear port security statistics ethernet 1/1/1
```

clear public-key

Clears the authorized client public key from the buffer.

Syntax

clear public-key

Modes

Privileged EXEC mode

Global configuration mode

Examples

The following example clears the client public key from the buffer.

```
device# clear public-key
```

clear stack ipc

Clears stack traffic statistics.

Syntax

clear stack ipc

Command Default

Stack traffic statistics are collected and retained.

Modes

Privileged EXEC mode

Usage Guidelines

Use the **clear stack ipc** command before issuing the **show stack ipc** command. This helps to ensure that the data are the most recent traffic statistics for the stack.

This command must be executed from the active stack controller.

Examples

The following example clears stack traffic statistics prior to using the **show stack ipc** command to display current stack traffic statistics.

```
device# clear stack ipc
device# show stack ipc
V15, G1, Recv: SkP0:3749372, P1:3756064, MAIL:184291175, sum:191796611, t=457152.2

clear statistics

Clears all counters and statistics.

Syntax

clear statistics [**dos-attack** | **traffic-policy** *traffic-policy-name*]

clear statistics [**rate-counters**] [**ethernet** *stackid/slot/port* | **management** *number* | **tunnel** [*number*] | **unit** *number*]

Parameters

dos-attack

Clears statistics about ICMP and TCP SYN packets dropped because burst thresholds were exceeded.

traffic-policy *traffic-policy-name*

Clears traffic policy counters (access list and rate limit counters).

rate-counters

Clears the rate counters.

ethernet *stackid/slot/port*

Clears egress queue statistics (resets the statistics to zero).

management *number*

Clears all statistics on a management port.

tunnel

Clears all GRE tunnel statistics.

number

Clears GRE tunnel statistics for the specified tunnel.

unit *number*

Clears a stack unit statistics.

Modes

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Examples

The following example clears the statistics for a specific Ethernet interface.

```
device(config)# clear statistics ethernet 1/1/1
```

The following example clears the rate counters for a tunnel interface.

```
device(config)# clear statistics rate-counters tunnel 2
```

Commands A - E

clear statistics

The following example clears the statistics about ICMP and TCP SYN packets dropped.

```
device(config)# clear statistics dos-attack
```

The following example clears access list and rate limit counters.

```
device(config)# clear statistics traffic-policy counttwo
```

clear statistics openflow

Clears OpenFlow statistics.

Syntax

```
clear statistics openflow { group | meter | controller }
```

Parameters

group

Clears statistics for all groups.

meter

Clears statistics for all meters.

controller

Clears statistics for all controllers.

Modes

EXEC and Privileged EXEC mode

Global configuration mode

Usage Guidelines

This command can be entered in three configuration modes as shown in the examples below.

Examples

The following example, entered in User EXEC mode, clears statistics for all groups in User EXEC mode.

```
device> clear statistics openflow group
```

The following example, entered in Privileged EXEC mode, clears statistics for all meters in Privileged EXEC mode.

```
device> enable
device# clear statistics openflow meter
```

The following examples, entered in global configuration mode, clears statistics for all controllers.

```
device# configure terminal
device(config) # clear statistics openflow controller
```

History

Release	Command History
08.0.20	This command was introduced.

clear webauth vlan

Clears the authenticated hosts or the blocked hosts.

Syntax

```
clear webauth vlan vlan-id{ authenticated-mac | block-mac } [ mac-address ]
```

Parameters

vlan-id

Specifies the VLAN ID.

authenticated-mac

Clears authenticated hosts in a Web Authentication VLAN. If a MAC address is specified, then only that host is cleared. If a MAC address is not specified, then all the authenticated hosts are cleared.

block-mac

Clears the configured time duration users must wait before the next cycle of Web Authentication attempts is allowed. If a MAC address is specified, then only that host is unblocked. If no MAC address is specified, then all the hosts are unblocked.

mac-address

Specifies the MAC address of the host. When used with **authenticated-mac** keyword, this is the dynamically authenticated host MAC address and when used with the **block-mac** keyword, this is the blocked host MAC address.

Modes

Privileged EXEC mode

Global configuration mode

VLAN configuration mode

Web Authentication configuration mode

Examples

The following example clears all the authenticated hosts.

```
device# clear webauth vlan 10 authenticated-mac
```

The following example clears the host with MAC address 1111.2222.3333.

```
device# clear webauth vlan 10 authenticated-mac 1111.2222.3333
```

The following example unblocks an authenticated host.

```
device# clear webauth vlan 20 block-mac 1111.2222.3333
```

clear web-connection

Clears all web management sessions.

Syntax

clear web-connection

Modes

Privileged EXEC mode

Global configuration mode

Examples

The following example shows how to clear all the web management sessions.

```
device# clear web-connection
```

clear stp-protect-statistics

Clears the BPDU drop counters for all ports on the device that have STP Protection enabled.

Syntax

```
clear stp-protect-statistics [ ethernet stackid/slot/port ]
```

Parameters

ethernet *stackid/slot/port*

Specifies the Ethernet interface on which to clear the BPDU drop counters.

Modes

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Usage Guidelines

For each port that has STP Protection enabled, the Brocade device counts and records the number of dropped BPDUs. You can use this command to clear the BPDU drop counters for all ports on the device, or for a specific port on the device.

Examples

The following example shows how to clear the BPDU drop counters on all ports.

```
device(config)# clear stp-protect-statistics
```

The following example shows how to clear the BPDU drop counter on a specific port.

```
device(config)# clear stp-protect-statistics ethernet 1/1/1
```

client

Configures cluster clients manually.

Syntax

client *client-name*

no client *client-name*

Command Default

Cluster clients are not configured.

Parameters

client-name

Specifies the name of the client. The client name is an ASCII string and can be up to 64 characters in length.

Modes

Cluster configuration mode

Usage Guidelines

Client configuration requires *client-name*, RBridge ID, and Cluster Client Edge Port (CCEP). The client name can be different on the different cluster devices.

The **no** form of the command removes the manually configured cluster client.

Examples

The following example shows how to configure the client manually.

```
device(config)# cluster SX 10
device(config-cluster-SX)# client client-2
device(config-cluster-SX-client-2)# rbridge-id 200
device(config-cluster-SX-client-2)# client-interface ethernet 1/2/8
device(config-cluster-SX-client-2)# deploy
```

client-auto-detect config

Configures the automatically detected cluster clients into the running configuration and deploys all of the automatically detected clients.

Syntax

client-auto-detect config [deploy-all]

no client-auto-detect config [deploy-all]

Command Default

The cluster clients are not automatically detected and deployed.

Parameters

deploy-all

Deploys all automatically detected cluster clients.

Modes

Cluster configuration mode

Usage Guidelines

The **no** form of the command removes the configured and deployed automatically detected cluster clients.

Examples

The following example shows how to configure the automatically detected clients into the running configuration.

```
device(config)# cluster SX 400
device(config-cluster-SX)# client-auto-detect config
```

client-auto-detect ethernet

Enables cluster client automatic configuration on a specific port or range of ports.

Syntax

client-auto-detect ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]

no client-auto-detect ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]

Command Default

Cluster client automatic configuration is not enabled on the ports.

Parameters

ethernet *stackid/slot/port*

Specifies the Ethernet port on which you want to enable the cluster client automatic configuration.

to *stackid/slot/port*

Specifies the range of ports on which you want to enable the cluster client automatic configuration.

Modes

Cluster configuration mode

Usage Guidelines

The **no** form of the command disables the cluster client automatic configuration on the ports.

Examples

The following example shows how to enable cluster client automatic configuration on an Ethernet port.

```
device(config)# cluster SX 400
device(config-cluster-SX)# client-auto-detect ethernet 1/1/15
```

The following example shows how to enable cluster client automatic configuration on a range of ports.

```
device(config)# cluster SX 400
device(config-cluster-SX)# client-auto-detect ethernet 1/1/15 to 1/1/18
```

client-auto-detect start

Starts the cluster client automatic configuration.

Syntax

client-auto-detect start [**config-deploy-all**]

Command Default

The client automatic detection process is not enabled.

Parameters

config-deploy-all

Configures and deploys all automatically detected clients.

Modes

Cluster configuration mode

Usage Guidelines

Make sure that the network connection and configuration are in place before using this command. Within one minute of the time that each client is discovered, the client is automatically configured and deployed into the running configuration.

Within one minute of configuring this command, the system reports information and errors (if there are mismatches, such as an LACP configuration mismatch). You can fix a mismatch while the process is running.

Use the **config-deploy-all** option as an alternative to the **client-auto-detect config** command. The **client-auto-detect config** command also configures automatically detected clients into the running configuration and deploys all of the automatically detected clients.

Examples

The following example shows how to start the client automatic configuration process.

```
device(config)# cluster SX 400
device(config-cluster-SX)# client-auto-detect start
```

client-auto-detect stop

Stops the automatic configuration process of the running cluster client.

Syntax

client-auto-detect stop

Command Default

The automatic configuration process of the running cluster client is not stopped if the client automatic detection process is enabled using the **client-auto-detect ethernet** command.

Modes

Cluster configuration mode

Usage Guidelines

All auto-detected but unconfigured clients will be removed.

Examples

The following example shows how to stop the automatic configuration process of the running cluster client.

```
device(config)# cluster SX 400
device(config-cluster-SX)# client-auto-detect stop
```

client-interface

Configures the physical port or static LAG port as the Cluster Client Edge Port (CCEP).

Syntax

client-interface ethernet *stackid/slot/port*

no client-interface ethernet *stackid/slot/port*

Command Default

A port is not configured as the CCEP.

Parameters

ethernet *slot/port*

Configures the specified Ethernet port as the client CCEP.

Modes

Cluster configuration mode

Cluster client configuration mode

Usage Guidelines

The **no** form of the command removes the port as the CCEP.

Examples

The following example shows how to configure a port as the CCEP.

```
device(config)# cluster SX 400
device(config-cluster-SX)# client 1
device(config-cluster-SX-client-1)# rbridge-id 200
device(config-cluster-SX-client-1)# client-interface ethernet 1/1/5
device(config-cluster-SX-client-1)# deploy
```

client-interfaces shutdown

Shuts down all the local client interfaces in the cluster.

Syntax

client-interfaces shutdown

no client-interfaces shutdown

Command Default

Client interfaces are active.

Modes

Cluster configuration mode

Usage Guidelines

Use the **client-interfaces shutdown** command when performing a hitless upgrade operation. This command can be used to shut down all the local client interfaces in the cluster, resulting in fail-over of traffic to the peer device.

The **no** form of the command removes the client interface shutdown.

Examples

The following example shows how to shut down all the client interfaces in the cluster.

```
device(config)# cluster SX 4000
device(config-cluster-SX)# client-interfaces shutdown
```

client-isolation

Isolates the client from the network when Cluster Communication Protocol (CCP) is not operational.

Syntax

client-isolation strict
no client-isolation strict

Command Default

Client isolation is in loose mode.

Parameters

strict
Specifies the strict isolation mode.

Modes

Cluster configuration mode

Usage Guidelines

In strict mode, when the CCP goes down, the interfaces on both the cluster devices are administratively shut down. In strict mode, the client is completely isolated from the network if the CCP is not operational.

In loose mode (default), when the CCP goes down, the peer device performs the master/slave negotiation. After negotiation, the slave shuts down its peer ports, whereas the master peer ports continue to forward the traffic (keep-alive VLAN configured).

MCT cluster devices can operate in two modes. Both peer devices must be configured in the same mode.

NOTE

The CLI allows modification of the client isolation mode on MCT cluster devices even when the cluster is deployed. You must create the same isolation mode on both cluster devices.

The **no** form of the command sets client isolation mode back to loose mode.

Examples

The following example shows how to configure the client isolation strict mode.

```
device(config)# cluster SX 4000  
device(config-cluster-SX)# client-isolation strict
```

client-to-client-reflection

Enables routes from one client to be reflected to other clients by the host device on which it is configured.

Syntax

client-to-client-reflection

no client-to-client-reflection

Command Default

This feature is enabled.

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

BGP address-family L2VPN EVPN configuration mode

Usage Guidelines

Use the **no** form of this command to restore the default.

The host device on which it is configured becomes the route-reflector server.

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

Examples

This example configures client-to-client reflection on the BGP4 host device.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# client-to-client-reflection
```

This example disables client-to-client reflection on the BGP4+ host device.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast
device(config-bgp-ipv6u)# no client-to-client-reflection
```

clock set

Sets the local clock time and date.

Syntax

clock set *hh:mm:ss mm-dd-yy/yyyy*

Parameters

hh:mm:ss

Specifies the local clock time in hours, minutes, and seconds.

mm-dd-yy/yyyy

Specifies the local clock date in month, day, and year format. Year may be specified with two or four numbers.

Modes

Privileged EXEC mode

Usage Guidelines

Valid date and time settings range from January 1, 1970 to December 31, 2035.

An active NTP server, if configured, automatically updates and overrides the local clock time.

Examples

The following example sets the time and date to 31 minutes past 4pm in the afternoon on July 28, 2016, for the local device:

```
device# clock set 16:31:35 07-28-16
```

clock summer-time

Sets the device clock summer-time and time zone options.

Syntax

clock summer-time

clock summer-time [**zone** { **australia** *australia-time* | **europe** *europe-time* | **gmt** *gmt-time* | **us** *us-time* } **start** *mm-dd-yy hh:mm:ss* **end** *mm-dd-yy hh:mm:ss*] [**offset** *offset-value*]

no clock summer-time

no clock summer-time [**zone** { **australia** *australia-time* | **europe** *europe-time* | **gmt** *gmt-time* | **us** *us-time* } **start** *mm-dd-yy hh:mm:ss* **end** *mm-dd-yy hh:mm:ss*] [**offset** *offset-value*]

Command Default

The default start and end time of day light savings will depend on the longitude of the country. See the Usage Guidelines section for details.

Parameters

australia *australia-time*

Specifies the Australia time zone. The value can be one of the following: cst (UTC+9.5), est (UTC+10), wst (UTC+8).

europe *europe-time*

Specifies the Europe time zone. The value can be one of the following: gmt (UTC), bst (UTC+1), ist (UTC+8), wet (UTC), west (UTC+1), cet (UTC+1), cest (UTC+2), eet (UTC+2), eest (UTC+3), msk (UTC+3), msd (UTC+4).

gmt *gmt-time*

Specifies the GMT time zone. The value can be one of the following: gmt+00 (United Kingdom), gmt+01 (France, Germany), gmt+02 (Eastern Europe, South Africa), gmt+03, gmt+03:30, gmt+04, gmt+04:30, gmt+05, gmt+05:30 (India), gmt+06, gmt+06:30, gmt+07, gmt+08 (China, Hong Kong, Taiwan), gmt+09 (Japan, Korea), gmt+09:30, gmt+10 (Australia), gmt+10:30, gmt+11, gmt+11:30, gmt+12, gmt-01, gmt-02, gmt-03, gmt-03:30, gmt-04, gmt-05, gmt-06, gmt-07, gmt-08, gmt-08:30, gmt-09, gmt-09:30, gmt-10, gmt-11, gmt-12.

us *us-time*

Specifies the US time zone. The value can be one of the following: alaska, aleutian, arizona, central, east-indiana, eastern, hawaii, michigan, mountain, pacific, samoa.

start *mm-dd-yy hh:mm:ss*

Specifies the summer-time start date and time for the local clock time in month, day, and year and hours, minutes, and seconds.

end *mm-dd-yy hh:mm:ss*

Specifies the summer-time end date and time for the local clock time in month, day, and year and hours, minutes, and seconds.

offset *offset-value*

Specifies the summer-time offset, in minutes.

Modes

Global configuration mode

Usage Guidelines

The **clock summer-time** command without any parameters sets the default daylight savings time for the corresponding time zone. Use this command with specific parameters if you need to manually configure the local clock summer-time and time zones values. Use the **clock timezone** command to set the device clock time zone with a default daylight savings time.

By default, daylight savings are implemented according to time zone in three sets of dates and times:

- USA—Summer time starts at 2:00am on the second Sunday of March and ends at 2:00am on the first Sunday of November.
- Europe—Summer time starts at 2:00am on the last Sunday of March and ends at 2:00am on the last Sunday of October.
- Rest of the world—Summer time starts at 2:00am on the last Sunday of March and ends at 2:00am on the last Sunday of October, but some countries have different start and end dates depending on the longitude.

When the configured time zone is different from the existing time zone due to a configuration of the time zone using the **clock summer-time** command, a y/n option appears.

The **no** form of this command disables daylight savings.

Examples

The following example sets the local device clock that resides in the US Central time zone to the US Mountain standard time zone, and you are reminded of this change with a y/n prompt. The daylight savings times are also different than the default for any US time zone.

```
device# configure terminal
Router(config)# clock summer-time zone us mountain start 10-30-16 02:00:00 end 02-27-17 02:00:00 offset
30
You are about to change the timezone config do you want to continue yes or no
(enter 'y' or 'n'): y
```

The following example removes the daylight savings set for the local device clock.

```
device# configure terminal
device(config)# no clock summer-time
```

History

Release version	Command history
8.0.50	This command was modified to add subsets of time zones specific to Australia and Europe.

clock timezone

Sets the device system clock time zone options using either Greenwich Mean time (GMT) or a specified global region with a subzone that uses Universal Time Coordinated (UTC) plus or minus a number of hours.

Syntax

clock timezone { **australia** *australia-time* | **europe** *europe-time* | **gmt** *gmt-time* | **us** *us-time* }

no clock timezone { **australia** *australia-time* | **europe** *europe-time* | **gmt** *gmt-time* | **us** *us-time* }

Parameters

australia *australia-time*

Specifies the Australia time zone. The value can be one of the following: cst (UTC+9.5), est (UTC+10), wst (UTC+8).

europe *europe-time*

Specifies the Europe time zone. The value can be one of the following: gmt (UTC), bst (UTC+1), ist (UTC+8), wet (UTC), west (UTC+1), cet (UTC+!), cest (UTC+2), eet (UTC+2), eest (UTC+3), msk (UTC+3), msd (UTC+4).

gmt *gmt-time*

Specifies the GMT time zone. The value can be one of the following: gmt+00 (United Kingdom), gmt+01 (France, Germany), gmt+02 (Eastern Europe, South Africa), gmt+03, gmt+03:30, gmt+04, gmt+04:30, gmt+05, gmt+05:30 (India), gmt+06, gmt+06:30, gmt+07, gmt+08 (China, Hong Kong, Taiwan), gmt+09 (Japan, Korea), gmt+09:30, gmt+10 (Australia), gmt+10:30, gmt+11, gmt+11:30, gmt+12, gmt-01, gmt-02, gmt-03, gmt-03:30, gmt-04, gmt-05, gmt-06, gmt-07, gmt-08, gmt-08:30, gmt-09, gmt-09:30, gmt-10, gmt-11, gmt-12.

us *us-time*

Specifies the US time zone. The value can be one of the following: alaska, aleutian, arizona, central, east-indiana, eastern, hawaii, michigan, mountain, pacific, samoa.

Modes

Global configuration mode

Usage Guidelines

Use this command if you need to manually configure the local clock summer-time and time zones values. Use the **clock timezone** command to set only the clock time zone.

The **no** form of this command resets the default summer-time and zone values.

Examples

The following example sets the device clock to the Australia western standard time zone.

```
device# configure terminal
device(config)# clock timezone australia wst
```

Commands A - E

clock timezone

The following example sets the device clock to the US Mountain time zone.

```
device# configure terminal
device(config)# clock timezone us mountain
```

History

Release version	Command history
8.0.50	This command was modified to add subsets of time zones specific to Australia and Europe.

cluster

Configures a Multi-Chassis Trunking (MCT) cluster.

Syntax

cluster [*cluster-name*] *cluster-id*

no cluster [*cluster-name*] *cluster-id*

Command Default

An MCT cluster is not configured.

Parameters

cluster-name

Specifies the cluster name as an ASCII string. The cluster name can be up to 64 characters in length.

cluster-id

Specifies the cluster ID. The ID value range can be from 1 through 4095.

Modes

Global configuration mode

Usage Guidelines

The *cluster-name* variable is optional; the device auto-generates *cluster-name* as CLUSTER-X when only the cluster ID is specified.

NOTE

The *cluster-id* variable must be the same on both cluster devices.

The **no** form of the command removes the MCT cluster configuration.

Examples

The following example configures an MCT cluster.

```
device(config)# cluster SX 4000
device(config-cluster-SX)# rbridge-id 3
```

cluster-id

Configures a cluster ID for the route reflector.

Syntax

cluster-id { *num* | *ip-addr* }

no cluster-id { *num* | *ip-addr* }

Command Default

The default cluster ID is the device ID.

Parameters

num

Integer value for cluster ID. Range is from 1 through 65535.

ip-addr

IPv4 address in dotted-decimal notation.

Modes

BGP configuration mode

Usage Guidelines

When configuring multiple route reflectors in a cluster, use the same cluster ID to avoid loops within the cluster.

The **no** form of the command restores the default.

Examples

The following example configures a cluster ID for the route reflector.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# cluster-id 1234
```

compare-routerid

Enables comparison of device IDs, so that the path-comparison algorithm compares the device IDs of neighbors that sent otherwise equal-length paths.

Syntax

compare-routerid
no compare-routerid

Modes

BGP configuration mode

Examples

The following example configures the device always to compare device IDs.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# compare-routerid
```

confederation identifier

Configures a BGP confederation identifier.

Syntax

confederation identifier *autonomous-system number*
no confederation identifier

Command Default

No BGP confederation identifier is identified.

Parameters

autonomous-system number

Specifies an autonomous system number (ASN). The configurable range of values is from 1 through 4294967295.

Modes

BGP configuration mode

Usage Guidelines

The **no** form of the command removes a BGP confederation identifier.

Examples

The following example specifies that confederation 65220 belongs to autonomous system 100.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# local-as 65220
device(config-bgp-router)# confederation identifier 100
```

confederation peers

Configures subautonomous systems to belong to a single confederation.

Syntax

confederation peers *autonomous-system number* [...*autonomous-system number*]
no confederation peers

Command Default

No BGP peers are configured to be members of a BGP confederation.

Parameters

autonomous-system number

Autonomous system (AS) numbers for BGP peers that will belong to the confederation. The configurable range of values is from 1 through 4294967295.

Modes

BGP configuration mode

Usage Guidelines

The **no** form of the command removes an autonomous system from the confederation.

Examples

The following example configures autonomous systems 65520, 65521, and 65522 to belong to a single confederation under the identifier 100.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# local-as 65020
device(config-bgp-router)# confederation identifier 100
device(config-bgp-router)# confederation peers 65520 65521 65522
```

console timeout

Configures the idle time for a serial console session.

Syntax

console timeout *time*

no console timeout *time*

Command Default

By default, a Brocade device does not time out serial console sessions.

Parameters

time

The time a serial session can remain idle before it is timed out, in minutes. The valid range is from 0 through 240. The default value is 0 (no timeout).

Modes

Global configuration mode

Stacking configuration mode

Usage Guidelines

A serial session remains open indefinitely until you close it. You can define how many minutes a serial management session can remain idle before it is timed out.

NOTE

You must enable AAA support for console commands, AAA authentication, and EXEC authorization to set the console idle time.

NOTE

In RADIUS, the standard attribute Idle-Timeout is used to define the console session timeout value. The attribute Idle-Timeout value is specified in seconds. Within the switch, the idle-Timeout value is truncated to the nearest minute, because the switch configuration is defined in minutes.

You can also configure the console timeout (in minutes) on all stack units (including the Active Controller).

The **no** form of the command removes the timeout settings.

Examples

The following example shows how to configure the console session timeout as 10 minutes.

```
device(config)# console timeout 10
```

The following example shows how to configure the console timeout on a stack unit.

```
device(config)# stack unit 3  
device(config-unit-3)# console timeout 5
```

copy disk0

Copies the license, running configuration, and startup configuration from disk0 to flash.

Syntax

```
copy disk0 [ license | running-config | startup-config ] filename
```

Parameters

license

Copies the software license from disk0 to flash.

running-config

Copies the running configuration from disk0 to flash.

startup-config

Copies the startup-configuration from disk0 to flash.

Modes

Privileged EXEC mode.

Usage Guidelines

Use the **show files** command to verify if the running configuration and startup configuration are copied to flash correctly. Use the **show license** command to verify if the license is copied correctly.

Examples

The following example shows copying the license from disk0 to flash.

```
device# copy disk0 license 20140611132829945ICX7450-PREM-LIC-SW.XML unit 1
Copy Software License from disk0 to Flash
```

The following example shows copying the running configuration from disk0 to flash.

```
device# copy disk0 running-config running-config
```

The following example shows copying the log file.

```
device# copy flash disk0 file ./logs/pid-log.txt pid-log-brocade
Done.
```

History

Release version	Command history
08.0.30	This command was introduced.

History

Release version	Command history
08.0.30	This command was introduced.

copy flash scp

Uploads a copy of an OS image file from a FastIron device's primary or secondary flash memory to an SCP server. The syntax for copying an image between two devices under test (DUTs) is different from the syntax for uploading from a Brocade device to a Linux or a Windows server.

Syntax

Syntax for copying an image between two DUTs:

```
copy flash scp { ipv4-address- | ipv4-hostname- | ipv6 { ipv6-address-prefix/prefix-length | ipv6-hostname- } } outgoing-  
interface { ethernet stackid/slot/port | ve ve-number } } [ public-key { dsa | rsa } ] [ remote-port ] remote-filename  
{ flash:primary | secondary }
```

Syntax for uploading from a Brocade device to a Linux or a Windows server:

```
copy flash scp { ipv4-address- | ipv4-hostname- | ipv6 { ipv6-address-prefix/prefix-length | ipv6-hostname- } } outgoing-  
interface { ethernet stackid/slot/port | ve ve-number } } [ public-key { dsa | rsa } ] [ remote-port ] remote-filename  
{ primary | secondary }
```

Parameters

ipv4-address-

Specifies the IPV4 address of the SCP server.

ipv4-hostname-

Specifies the IP hostname of the SCP server.

ipv6

Specifies the IPV6 address method for SCP file transfer.

ipv6-address-prefix/prefix-length

Specifies the IPV6 address of the SCP server. You must specify this address in hexadecimal using 16-bit values between colons, as documented in RFC 2373.

ipv6-hostname-

Specifies the IPv6 hostname of the SCP server.

outgoing-interface

Specifies the interface to be used to reach the remote host.

ethernet *stackid/slot/port*

Configures an Ethernet interface as the outgoing interface.

ve *ve-number*

Configures a virtual interface (VE) as the outgoing interface.

public-key

Specifies the type of public key authentication to use for the connection, either digital signature algorithm (DSA) or Rivest, Shamir, and Adelman (RSA) . If you do not configure this parameter, the default authentication type is password.

dsa

Specifies DSA as the public key authentication.

rsa

Specifies RSA as the public key authentication.

remote-port

Specifies the remote port number for the TCP connection.

remote-filename

Specifies the name of the file in the SCP server that is to be transferred. You can specify up to 127 characters for the filename.

flash:primary

Specifies the binary image in primary flash memory. Configure the **flash:primary** keyword when transferring files between DUTs. See the usage note regarding using this keyword when transferring files between DUTs.

primary

Specifies the binary image in primary flash memory.

secondary

Specifies the binary image in secondary flash memory.

Modes

Privileged EXEC mode

Usage Guidelines

You are prompted for username and password when you configure this command.

NOTE

When transferring files between DUTs, you should configure the **flash:primary** keyword instead of the **primary** keyword because the SCP server does not support remote-filename aliases.

Examples

The following example uploads a copy of an OS image file from the primary flash memory on a Brocade device to the SCP server:

```
device# copy flash scp 10.20.1.1 SPS08040-scp.bin primary  
device# copy flash scp 10.20.1.1 SPS08040-scp.bin secondary
```

The following example uploads a copy of an OS image file from the primary flash memory on a Brocade device to an SCP server with the IP address of 172.26.51.180 :

```
device# copy flash scp 172.26.51.180 filename primary
```

The following example specifies that the SCP connection is established using SSH public key authentication:

```
device# copy flash scp 172.26.51.180 public-key dsa filename primary
```

History

Release version	Command history
08.0.20	This command was introduced.

copy flash tftp

Copies contents on the device flash memory to a TFTP server.

Syntax

```
copy flash tftp { ipv4-address | ipv6-address } file-name { file | primary | secondary }
```

Parameters

ipv4-address

Specifies the IPv4 address of the TFTP server.

ipv6-address

Specifies the IPv6 address of the TFTP server.

file-name

Specifies the name of the file that must be copied from the flash memory to the TFTP server.

file

Copies a file from flash memory to the TFTP server.

primary

Copies the primary code image to the TFTP server.

secondary

Copies the secondary code image to the TFTP server.

Modes

Privileged EXEC mode

Examples

The following example copies the primary code image from the device flash to the TFTP server.

```
device# copy flash tftp 192.168.10.1 kxz10100.bin primary
```

copy running-config disk0

Copies the running configuration from internal flash to external USB flash drive.

Syntax

```
copy running-config disk0 {filename}
```

Parameters

filename

Specifies the system's running configuration file.

Modes

Privileged EXEC.

Usage Guidelines

Use the **show files** command to verify the running configuration is copied.

Examples

The following example shows copying the running configuration from the internal flash to the external USB flash drive.

```
device# copy running-config disk0 running-config7750
```

History

Release version	Command history
08.0.30	This command was introduced.

copy running-config scp

Uploads a copy of the running configuration file from a FastIron device to an SCP server.

Syntax

```
copy running-config scp { ipv4-address | ipv4-hostname | ipv6 { ipv6-address | ipv6-hostname } } outgoing-interface  
{ ethernet stackid/slot/port | ve ve-number } } [ public-key { dsa | rsa } ] [ remote-port ] remote-filename
```

Parameters

ipv4-address

Specifies the IPV4 address of the SCP server.

ipv4-hostname

Specifies the IP hostname of the SCP server.

ipv6

Specifies the IPV6 address method for SCP file transfer.

ipv6-address

Specifies the IPV6 address of the SCP server. You must specify this address in hexadecimal using 16-bit values between colons, as documented in RFC 2373.

ipv6-hostname

Specifies the IPv6 hostname of the SCP server.

outgoing-interface

Specifies the interface to be used to reach the remote host.

ethernet *stackid/slot/port*

Configures an Ethernet interface as the outgoing interface.

ve *ve-number*

Configures a virtual interface (VE) as the outgoing interface.

public-key

Specifies the type of public key authentication to use for the connection, either digital signature algorithm (DSA) or Rivest, Shamir, and Adelman (RSA) . If you do not configure this parameter, the default authentication type is password.

dsa

Specifies DSA as the public key authentication.

rsa

Specifies RSA as the public key authentication.

remote-port

Specifies the remote port number for the TCP connection.

remote-filename

Specifies the name of the file in the SCP server that is going to be uploaded. You can specify up to 127 characters for the filename.

Modes

Privileged EXEC mode

Usage Guidelines

You are prompted for username and password when you configure this command.

Examples

The following example uploads a copy of the running configuration file from a FastIron device to a 172.26.51.180 SCP server:

```
device# copy running-config scp 172.26.51.180 runConfig
```

History

Release version	Command history
08.0.20	This command was introduced.

copy running-config tftp

Uploads a copy of the running configuration file from a Layer 2 or Layer 3 switch to a Trivial File Transfer Protocol (TFTP) server.

Syntax

```
copy running-config tftp tftp-ip-addr file-name
```

Parameters

tftp-ip-addr

The IPv4 or IPv6 address of the TFTP server.

file-name

Specifies the file name.

Modes

Privileged EXEC mode

Examples

The following example uploads a copy of the running configuration file to a TFTP server.

```
device# copy running-config tftp 192.168.14.26 copyrun
```

copy scp flash

Downloads from an SCP server a copy of the OS image file to a FastIron's device's primary or secondary flash memory or a copy of the boot file or the signature file to the FastIron device. The syntax for copying an image between two devices under test (DUTs) is different from the syntax for downloading from a DUT to a Linux or a Windows server.

Syntax

Syntax for copying an image between two DUTs:

```
copy scp flash { ipv4-address | ipv4-hostname | ipv6 { ipv6-address | ipv6-hostname } outgoing-interface { ethernet stackid/slot/port | ve ve-number } } [ public-key { dsa | rsa } ] [ remote-port ] remote-filename { { flash:primary | secondary } | bootrom | { fips-primary-sig | fips-secondary-sig | fips-bootrom-sig } }
```

Syntax for downloading from a DUT to a Linux or a Windows server:

```
copy scp flash { ipv4-address | ipv4-hostname | ipv6 { ipv6-address | ipv6-hostname- } outgoing-interface { ethernet stackid/slot/port | ve ve-number } } [ public-key { dsa | rsa } ] [ remote-port ] remote-filename { { primary | secondary } | bootrom | { fips-primary-sig | fips-secondary-sig | fips-bootrom-sig } }
```

Parameters

ipv4-address

Specifies the IPV4 address of the SCP server.

ipv4-hostname

Specifies the IP hostname of the SCP server.

ipv6

Specifies the IPV6 address method for SCP file transfer.

ipv6-address

Specifies the IPV6 address of the SCP server.

ipv6-hostname

Specifies the IPv6 hostname of the SCP server.

outgoing-interface

Specifies the interface to be used to reach the remote host.

ethernet *stackid/slot/port*

Configures an Ethernet interface as the outgoing interface.

ve *ve-number*

Configures a virtual interface (VE) as the outgoing interface.

public-key

Specifies the type of public key authentication to use for the connection, either digital signature algorithm (DSA) or Rivest, Shamir, and Adelman (RSA) . If you do not configure this parameter, the default authentication type is password.

dsa

Specifies DSA as the public key authentication.

rsa

Specifies RSA as the public key authentication.

remote-port

Specifies the remote port number for the TCP connection.

remote-filename

Specifies the name of the file in the SCP server that is to be transferred. You can specify up to 127 characters for the filename.

flash:primary

Specifies the binary image in primary flash memory. Configure the **flash:primary** keyword when transferring files between DUTs. See the usage note regarding using this keyword when transferring files between DUTs.

primary

Specifies the binary image in primary flash memory. Configure the **primary** keyword when transferring files between DUTs. See the usage note regarding using this keyword when transferring files between DUTs.

secondary

Specifies the binary image in secondary flash memory.

bootrom

Specifies the boot file image in the SCP server.

fips-primary-sig

Specifies the signature filename in SCP server.

fips-secondary-sig

Specifies the signature filename in SCP server.

fips-bootrom-sig

Specifies the signature filename in SCP server.

Modes

Privileged EXEC mode

Usage Guidelines

You are prompted for username and password when you configure this command.

NOTE

When transferring files between DUTs, you should configure the **flash:primary** keyword instead of the **primary** keyword because the SCP server does not support remote-filename aliases.

Examples

The following example copies an image from an SCP server to a Brocade device:

```
device# copy scp flash 10.20.1.1 SPR08030.bin primary
device# copy scp flash 10.20.1.1 SPR08030.bin secondary
```

The following example downloads a copy of the signature file from a 172.26.51.180 SCP server to a Brocade device:

```
device# copy scp flash 172.26.51.180 /tftboot/ICX7450.sig fips-primary-sig
```

History

Release version	Command history
08.0.20	This command was introduced.
8.0.40	The icx6450 and icx6610 options were removed as they are supported only on ICX 6450 and ICX 6610 devices respectively.

copy scp license

Downloads a copy of the license file from an SCP server to the FastIron device.

Syntax

```
copy scp license { ipv4-address- | ipv4-hostname- | ipv6 { ipv6-address- | ipv6-hostname- } } outgoing-interface { ethernet stackid/slot/port | ve ve-number } } [ public-key { dsa | rsa } ] [ remote-port ] remote-filename [ unit unit-id ]
```

Parameters

ipv4-address-

Specifies the IPV4 address of the SCP server, using 8-bit values in dotted decimal notation.

ipv4-hostname-

Specifies the IP hostname of the SCP server.

ipv6

Specifies the IPV6 address method for SCP file transfer.

ipv6-address-prefix/prefix-length

Specifies the IPV6 address of the SCP server. You must specify this address in hexadecimal using 16-bit values between colons, as documented in RFC 2373.

ipv6-hostname-

Specifies the IPv6 hostname of the SCP server.

outgoing-interface

Specifies the interface to be used to reach the remote host.

ethernet *stackid/slot/port*

Configures an Ethernet interface as the outgoing interface.

ve *ve-number*

Configures a virtual interface (VE) as the outgoing interface.

public-key

Specifies the type of public key authentication to use for the connection, either digital signature algorithm (DSA) or Rivest, Shamir, and Adelman (RSA) . If you do not configure this parameter, the default authentication type is password.

dsa

Specifies DSA as the public key authentication.

rsa

Specifies RSA as the public key authentication.

remote-port

Specifies the local port number for the TCP connection.

remote-filename

Specifies the name of the file in the SCP server that is to be transferred. You can specify up to 127 characters for the filename.

unit *unit-id*

Specifies the unit ID of the device in the stack. If two or more pizza-box devices are connected and acting as a single device, a single management ID is assigned to the stack.

Modes

Privileged EXEC mode

Usage Guidelines

You are prompted for username and password when you configure this command.

Examples

The following example downloads a copy of the license file from an SCP server to a FastIron device:

```
Device# copy scp license 172.26.21.180 /tftpboot/abc.xml unit 1  
Device#
```

History

Release version	Command history
08.0.20	This command was introduced.

copy scp running-config

Downloads a copy of the running configuration file from an SCP server to a FastIron device.

Syntax

```
copy scp running-config { ipv4-address | ipv4-hostname | ipv6 { ipv6-address | ipv6-hostname } [ outgoing-interface
{ ethernet stackid/slot/port | ve ve-number } ] } [ public-key { dsa | rsa } ] [ remote-port ] remote-filename overwrite
```

Parameters

ipv4-address

Specifies the IPV4 address of the SCP server.

ipv4-hostname

Specifies the IP hostname of the SCP server.

ipv6

Specifies the IPV6 address method for SCP file transfer.

ipv6-address-prefix

Specifies the IPV6 address of the SCP server. You must specify this address in hexadecimal using 16-bit values between colons, as documented in RFC 2373.

ipv6-hostname

Specifies the IPv6 hostname of the SCP server.

outgoing-interface

Specifies the interface to be used to reach the remote host.

ethernet *stackid/slot/port*

Configures an Ethernet interface as the outgoing interface.

ve *ve-number*

Configures a virtual interface (VE) as the outgoing interface.

public-key

Specifies the type of public key authentication to use for the connection, either digital signature algorithm (DSA) or Rivest, Shamir, and Adelman (RSA) . If you do not configure this parameter, the default authentication type is password.

dsa

Specifies DSA as the public key authentication.

rsa

Specifies RSA as the public key authentication.

remote-port

Specifies the remote port number for the TCP connection.

remote-filename

Specifies the name of the file in the SCP server that is to be transferred. You can specify up to 127 characters for the filename.

overwrite

Specifies that the FastIron device should overwrite the current configuration file with the copied file. If you do not specify the **overwrite** keyword, the device copies the downloaded file into the current running or startup configuration but does not overwrite the current configuration.

Modes

Privileged EXEC mode

Usage Guidelines

You are prompted for username and password when you configure this command.

Examples

The following example downloads a copy of the running configuration file from an SCP server to a FastIron device:

```
device# copy scp running-config 172.26.51.180 abc.cfg
```

The following example downloads a copy of the running configuration file from an SCP server to a FastIron device and overwrite the current configuration file with the copied file:

```
device# copy scp running-config 172.26.51.180 abc.cfg overwrite
```

History

Release version	Command history
08.0.20	This command was introduced.

copy scp startup-config

Downloads a copy of the startup configuration file from an SCP server to a FastIron device.

Syntax

```
copy scp startup-config { ipv4-address | ipv4-hostname | ipv6 { ipv6-address | ipv6-hostname } } outgoing-interface
{ ethernet stackid/slot/port | ve ve-number } } [ public-key { dsa | rsa } ] [ remote-port ] remote-filename
```

Parameters

ipv4-address

Specifies the IPV4 address of the SCP server, using 8-bit values in dotted decimal notation.

ipv4-hostname

Specifies the IP hostname of the SCP server.

ipv6

Specifies the IPV6 address method for SCP file transfer.

ipv6-address

Specifies the IPV6 address of the SCP server. You must specify this address in hexadecimal using 16-bit values between colons, as documented in RFC 2373.

ipv6-hostname

Specifies the IPv6 hostname of the SCP server.

outgoing-interface

Specifies the interface to be used to reach the remote host.

ethernet *stackid/slot/port*

Configures an Ethernet interface as the outgoing interface.

ve *ve-number*

Configures a virtual interface (VE) as the outgoing interface.

public-key

Specifies the type of public key authentication to use for the connection, either digital signature algorithm (DSA) or Rivest, Shamir, and Adelman (RSA) . If you do not configure this parameter, the default authentication type is password.

dsa

Specifies DSA as the public key authentication.

rsa

Specifies RSA as the public key authentication.

remote-port

Specifies the remote port number for the TCP connection.

remote-filename

Specifies the name of the file in the SCP server that is to be transferred. You can specify up to 127 characters for the filename.

Commands A - E
copy scp startup-config

Modes

Privileged EXEC mode

Usage Guidelines

You are prompted for username and password when you configure this command.

Examples

The following example downloads a copy of the startup configuration file from an SCP server to a FastIron device:

```
device# copy scp startup-config 172.26.51.180 abc.cfg
```

History

Release version	Command history
08.0.20	This command was introduced.

copy startup-config disk0

Copies the configuration file present on the external USB to the systems startup configuration file.

Syntax

copy startup-config disk0 { filename }

Parameters

filename

The system's startup configuration file.

Modes

Privileged EXEC.

Usage Guidelines

Use the **show files** command to verify the startup configuration is copied.

Examples

The following example shows copying the configuration file from the external USB to the system's startup configuration file.

```
device# copy startup-config disk0 startup-config7750
SYNCING IMAGE TO FLASH. DO NOT SWITCH OVER OR POWER DOWN THE UNIT(8192 bytes per dot)...

Done.

Copy Done.
```

History

Release version	Command history
08.0.30	This command was introduced.

copy startup-config scp

Uploads a copy of the startup configuration file from a FastIron device to an SCP server.

Syntax

```
copy startup-config scp { ipv4-address- | ipv4-hostname- | ipv6 { ipv6-address- | ipv6-hostname- } } outgoing-interface  
{ ethernet stackid/slot/port | ve ve-number } } [ public-key { dsa | rsa } ] [ remote-port ] remote-filename
```

Parameters

ipv4-address-

Specifies the IPV4 address of the SCP server, using 8-bit values in dotted decimal notation.

ipv4-hostname-

Specifies the IP hostname of the SCP server.

ipv6

Specifies the IPV6 address method for SCP file transfer.

ipv6-address-prefix/prefix-length

Specifies the IPV6 address of the SCP server. You must specify this address in hexadecimal using 16-bit values between colons, as documented in RFC 2373.

ipv6-hostname-

Specifies the IPv6 hostname of the SCP server.

outgoing-interface

Specifies the interface to be used to reach the remote host.

ethernet *stackid/slot/port*

Configures an Ethernet interface as the outgoing interface.

ve *ve-number*

Configures a virtual interface (VE) as the outgoing interface.

public-key

Specifies the type of public key authentication to use for the connection, either digital signature algorithm (DSA) or Rivest, Shamir, and Adelman (RSA) . If you do not configure this parameter, the default authentication type is password.

dsa

Specifies DSA as the public key authentication.

rsa

Specifies RSA as the public key authentication.

remote-port

Specifies the remote port number for the TCP connection.

remote-filename

Specifies the name of the file in the SCP server that is to be transferred. You can specify up to 127 characters for the filename.

Modes

Privileged EXEC mode

Usage Guidelines

You are prompted for username and password when you configure this command.

Examples

The following example uploads a copy of the startup configuration file from a FastIron device to a 172.26.51.180 SCP server:

```
device# copy startup-config scp 172.26.51.180 my_startup_file
```

History

Release version	Command history
08.0.20	This command was introduced.

copy startup-config tftp

Uploads a copy of the startup configuration file from a Layer 2 or Layer 3 switch to a TFTP server.

Syntax

```
copy startup-config tftp tftp-ip-addr file-name
```

Parameters

tftp-ip-addr

The IPv4 or IPv6 address of the TFTP server.

file-name

Specifies the file name.

Modes

Privileged EXEC mode

Examples

The following example uploads a copy of the startup configuration file to a TFTP server.

```
device# copy startup-config tftp 2001:db8::12:14 file4
```

copy tftp flash

Downloads files from a TFTP server to the flash memory of a device.

Syntax

```
copy tftp flash { ipv4-address | ipv6-address } file-name { bootrom | client-certificate | client-private-key | fips-  
bootrom-sig | fips-primary-sig | fips-secondary-sig | primary | secondary | trust-certificate }
```

Parameters

ipv4-address

Specifies the IPv4 address of the TFTP server from where the file must be copied to the device.

ipv6-address

Specifies the IPv6 address of the TFTP server from where the file must be copied to the device.

file-name

Specifies the name of the file that must be copied from the TFTP server.

bootrom

Specifies that the file being copied is a boot ROM image.

client-certificate

Specifies that the file being copied is a RSA client certificate file.

client-private-key

Specifies that the file being copied is a client RSA private key file.

fips-bootrom-sig

Specifies that the file being copied is a FIPS boot signature file.

fips-primary-sig

Specifies that the file being copied is a FIPS primary signature file.

fips-secondary-sig

Specifies that the file being copied is a FIPS secondary signature file.

primary

Specifies that the file being copied is a primary image file.

secondary

Specifies that the file being copied is a secondary image file.

trust-certificate

Specifies that the file being copied is an SSL trust certificate.

Modes

Privileged EXEC mode

Usage Guidelines

If the device has 8 MB of flash memory, you must delete the primary and secondary image.

Brocade recommends that you use the **copy tftp flash** command to copy the boot code to the device during a maintenance window. Attempting to do so during normal networking operations may cause disruption to the network.

Examples

The following example shows how to copy a boot image from the TFTP server.

```
device# copy tftp flash 192.168.10.1 spz10105.bin bootrom
```

The following example shows how to copy an OS image to the primary flash.

```
device# copy tftp flash 192.168.10.1 SPS08030.bin primary
```

copy tftp license

Copies the license file from the TFTP server to the license database of the Brocade device.

Syntax

```
copy tftp license { ip_address | ipv6_address } license_filename_on_host unit unit_id
```

Command Default

By default, the command is not enabled.

Parameters

ip_address

Specifies the address of the IPv4 TFTP server.

ipv6_address

Specifies the address of the IPv6 TFTP server.

license_filename_on_host

Specifies the filename of the license file.

unit *unit_id*

Indicates the specific unit you want to copy the license file to. The *unit_id* can be from 1 through 12 on Ruckus ICX devices.

Modes

Privileged EXEC level.

Usage Guidelines

To remove a license file, use the **license delete** command.

The **unit** *unit_id* parameter is used only on Ruckus ICX 7450 devices when copying a license file to a specific unit id.

If you attempt to download the same license twice on the device, the following error message is displayed on the console.

```
Can't add the license string - 93 (DUPLICATE_LICENSE)
```

Examples

The following example copies a license file from the active unit to all other member units in the system.

```
device# copy tftp license 10.120.54.185 ICX7450_LIC_PERP.xml unit 2
```

History

Release version	Command history
07.1.00	This command was introduced.
05.0.00	This command was introduced.

copy tftp running-config

Downloads configuration information from a TFTP server into the device's running configuration.

Syntax

```
copy tftp running-config ip-addr file-name [ overwrite ]
```

Parameters

ip-addr

The IPv4 or IPv6 address of the TFTP server.

file-name

Specifies the file name on the TFTP server.

overwrite

Overwrites the current running configuration.

Modes

Privileged EXEC mode

Examples

The following example downloads configuration information into the running configuration.

```
device# copy tftp running-config 2001:db8::12:13 runningfile
```

copy tftp startup-config

Downloads a copy of the startup configuration file from a TFTP server to a Layer 2 or Layer 3 switch.

Syntax

```
copy tftp startup-config tftp-ip-addr filename
```

Parameters

tftp-ip-addr

The IPv4 or IPv6 address of the TFTP server.

file-name

Specifies the file name of the TFTP server.

Modes

Privileged EXEC mode

Examples

The following example downloads a copy of the startup configuration file from the specified TFTP server.

```
device# copy tftp startup-config 2001:db8::12:13 configfile
```

copy tftp system-manifest

Simplifies the software upgrade process into a single command.

Syntax

```
copy tftp system-manifest { ipv4-address | ipv6-address } file-name { all-images-primary | all-images-secondary |
primary | secondary }
```

Parameters

ipv4-address

Specifies the IPv4 address of the TFTP server from where the file must be copied to the device.

ipv6-address

Specifies the IPv6 address of the TFTP server from where the file must be copied to the device.

file-name

Specifies the name of the file that must be copied from the TFTP server.

all-images-primary

Specifies that the file being copied is a primary signature file.

all-images-secondary

Specifies that the file being copied is a secondary signature file.

primary

Specifies that the file being copied is a primary image file.

secondary

Specifies that the file being copied is a secondary image file.

Modes

Privileged EXEC mode

Usage Guidelines

The **all-images-primary** and **all-images-secondary** options upgrade the boot and application images in a single step.

This command only accepts manifest files with a .txt extension. Before starting any download, the file is checked for the correct keywords and extracts the image name and location.

The manifest file consists of images of both router and switch type. Commands in the file check if the system is running a router or a switch image and then installs the appropriate images.

In an 802.1br SPX system, the command can be entered from the master active controller of the control bridge (CB) or from a standalone Brocade ICX 7750 acting as the CB. The manifest file download installs the ICX 7750 image on all the CB units in the CB stack first, then installs the correct ICX 7450 router image on all PE units in the SPX system.

After the relevant images have been installed on the system, the user is notified that the upgrade is complete and is prompted to reload the system for the new images to take effect.

Examples

The following example downloads all boot and application images for FastIron 8.0.40 from the specified TFTP server location.

```
device# copy tftp system-manifest 10.70.42.172 stage/FI08040_Manifest.txt
all-images-secondary
You are about to download boot image and boot signature image as well, ARE YOU SURE?
(enter 'y' or 'n'): y

UNIT...
Copy ICX7450 from TFTP to Flash Done.
Manifest file upgrade done, please reload the system
```

NOTE

In these examples the device is an ICX 7750.

History

Release version	Command history
FastIron 8.0.00a	This command was introduced.

cpu-limit

Configures a rate limit to control the number of CPU address messages.

Syntax

cpu-limit addr-msgs *number*

no cpu-limit addr-msgs *number*

Parameters

addr-msgs *number*

The number of address messages the CPU handles per second. The range for this rate limit is from 200 through 50,000 address messages per second.

Modes

Global configuration mode

Interface configuration mode

Usage Guidelines

The address learning rate limit applies to each packet processor, which means that for a system with two packet processors, each processor can send address messages to the CPU at the established rate limit.

NOTE

Actual rates of address messages in hardware may have a variance of +200 or -100.

The **no** form of the command clears the rate limit for the address messages.

Examples

The following example sets the CPU address rate limit to 200.

```
device(config)# cpu-limit addr-msgs 200
```

critical-vlan

Specifies the VLAN into which the client should be placed when the RADIUS server times out while authenticating or re-authenticating users.

Syntax

critical-vlan *vlan-id*

no critical-vlan *vlan-id*

Command Default

The client is not part of the critical VLAN.

Parameters

vlan-id

Specifies the VLAN ID of the specific critical VLAN.

Modes

Authentication configuration mode

Usage Guidelines

When critical VLAN is configured and the authentication time out action is specified as critical VLAN under the port using the **authentication timeout-action critical-vlan** command at the interface level and if RADIUS timeout happens, the client is moved to the critical VLAN and any access policies applied to the critical VLAN is applied to the client.

The VLAN which is configured as a critical VLAN must be a valid VLAN configured on the device.

The **no** form of the command disables the critical VLAN by removing the client from the VLAN.

Examples

The following example configures VLAN 20 as critical VLAN.

```
device(config)# authentication
device(config-authen)# critical-vlan 20
```

History

Release version	Command history
08.0.20	This command was introduced.

crypto key client generate

Generates the crypto client key to enable SSH2.

Syntax

```
crypto key client generate { dsa | rsa [ modulus key-size ] }
```

Command Default

The crypto client key is not generated and SSH2 is not enabled.

Parameters

dsa

Generates a DSA client key pair.

rsa

Generates an RSA client key pair.

modulus *key-size*

Specifies the modulus size of the RSA key pair, in bits. The valid values for the modulus size are from 1024 through 2048. The default value is 1024.

Modes

Global configuration mode

Usage Guidelines

The **dsa** keyword is optional. If you do not enter the dsa keyword, the crypto key generate command generates a DSA key pair by default.

To use the SSH client for public key authentication, you must generate SSH client authentication keys and export the public key to the SSH servers to which you want to connect.

To disable SSH, you delete all of the client keys from the device. When a client key is deleted, it is deleted from the flash memory of all management modules.

Examples

The following example shows how to generate the DSA client key pair.

```
device(config)# crypto key client generate dsa
```

The following example shows how to generate the RSA key pair.

```
device(config)# crypto key client generate rsa modulus 2048
```

crypto key client zeroize

Deletes the crypto client key pair from the flash memory.

Syntax

```
crypto key client zeroize { dsa | rsa }
```

Parameters

dsa

Deletes a DSA client key pair.

rsa

Deletes an RSA client key pair.

Modes

Global configuration mode

Usage Guidelines

To disable SSH, you delete all of the client keys from the device. When a client key is deleted, it is deleted from the flash memory of all management modules.

Examples

The following example shows how to delete the DSA client key pair.

```
device(config)# crypto key client zeroize dsa
```

The following example shows how to delete the RSA client key pair.

```
device(config)# crypto key client zeroize rsa
```

The following example shows how to delete DSA and RSA client key pairs from flash memory.

```
device(config)# crypto key client zeroize
```

crypto key generate

Generates the crypto key to enable SSH.

Syntax

crypto key generate [**dsa** | **rsa** [**modulus** *key-size*]]

Command Default

A crypto key is not generated and SSH is not enabled.

Parameters

dsa

Generates the DSA host key pair.

rsa

Generates the RSA host key pair.

modulus *key-size*

Specifies the modulus size of the RSA key pair, in bits. The valid values for the modulus size are from 1024 through 2048. The default value is 1024.

Modes

Global configuration mode

Usage Guidelines

The **dsa** keyword is optional. If you do not enter the **dsa** keyword, the **crypto key generate** command generates a DSA key pair by default.

To enable SSH, you generate a DSA or RSA host key on the device. The SSH server on the Brocade device uses this host DSA or RSA key, along with a dynamically generated server DSA or RSA key pair, to negotiate a session key and encryption method with the client trying to connect to it. While the SSH listener exists at all times, sessions cannot be started from clients until a host key is generated. After a host key is generated, clients can start sessions. When a host key is generated, it is saved to the flash memory of all management modules. The time to initially generate SSH keys varies depending on the configuration, and can be from a under a minute to several minutes.

To disable SSH, you delete all of the host keys from the device. When a host key is deleted, it is deleted from the flash memory of all management modules.

Examples

The following example shows how to generate the DSA host key pair.

```
device(config)# crypto key generate dsa
```

The following example shows how to generate the RSA key pair.

```
device(config)# crypto key generate rsa modulus 2048
```

crypto key zeroize

Deletes the crypto host key pair from the flash memory.

Syntax

crypto key zeroize [dsa | rsa]

Command Default

SSH is not enabled and the host key pair is saved in the flash memory.

Parameters

dsa
Deletes the DSA host key pair.

rsa
Deletes the RSA host key pair.

Modes

Global configuration mode

Usage Guidelines

When a host key is generated, it is saved to the flash memory of all management modules. The time to initially generate SSH keys varies depending on the configuration, and can be from a under a minute to several minutes. To disable SSH, you delete all of the host keys from the device. When a host key is deleted, it is deleted from the flash memory of all management modules.

Examples

The following example shows how to delete the DSA key pair.

```
device(config)# crypto key zeroize dsa
```

The following example shows how to delete the RSA key pair.

```
device(config)# crypto key zeroize rsa
```

The following example shows how to delete DSA and RSA key pairs from flash memory.

```
device(config)# crypto key zeroize
```

History

Release version	Command history
5.9.00	This command was modified. The cr option was removed.

crypto-ssl certificate

Generates or deletes a crypto SSL certificate.

Syntax

```
crypto-ssl certificate { generate | zeroize }
```

Parameters

generate

Generates an SSL certificate.

zeroize

Deletes the currently operative SSL certificate.

Modes

Global configuration mode

Usage Guidelines

To allow web management access through HTTPS, you must generate the SSL certificate in addition to enabling web management.

Examples

The following example shows how to generate a crypto SSL certificate.

```
device(config)# crypto-ssl certificate generate
```

The following example shows how to delete a crypto SSL certificate.

```
device(config)# crypto-ssl certificate zeroize
```

cycle-time

Sets a limit as to how many seconds users have to be authenticated by Web Authentication.

Syntax

cycle-time *seconds*

no cycle-time *seconds*

Command Default

The default is 600 seconds.

Parameters

seconds

Specifies the authentication cycle time. Valid values are from 0 through 3600 seconds. If the value is set to 0, then there is no limit.

Modes

Web Authentication configuration mode

Usage Guidelines

You can set a limit as to how many seconds users have to be authenticated by the Web Authentication by defining a cycle time. This time begins upon the first Login attempt by the user on the Login page. If the user has not been authenticated successfully when this time expires, the user must enter a valid URL again to display the Web Authentication Welcome page.

The **no** form of the command resets the time to the default.

Examples

The following example sets the cycle time to 100 seconds.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# cycle-time 100
```

dampening

Sets dampening parameters for the route in BGP address-family mode.

Syntax

dampening { *half-life reuse suppress max-suppress-time* | **route-map** *route-map* }
no dampening

Parameters

half-life

Number of minutes after which the route penalty becomes half its value. Range is from 1 through 45. Default is 15.

reuse

Minimum penalty below which the route becomes usable again. Range is from 1 through 20000. Default is 750.

suppress

Maximum penalty above which the route is suppressed by the device. Range is from 1 through 20000. Default is 2000.

max-suppress-time

Maximum number of minutes a route can be suppressed by the device. Default is 40.

route-map

Enables selection of dampening values established in a route map by means of the **route-map** command.

route-map

Name of the configured route map.

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

Usage Guidelines

Use the **no** form of this command to disable dampening.

Use **dampening** without operands to set default values for all dampening parameters.

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

To use the dampening values established in a route map, configure the route map first, and then enter the **route-map** command, followed by the name of the configured route map.

A full range of dampening values (*half-life, reuse, suppress, max-suppress-time*) can also be set by means of the **set as-path prepend** command.

Examples

This example enables default dampening as an IPv4 address-family function.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# dampening
```

This example changes all the dampening values as an IPv6 address-family function.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast
device(config-bgp-ipv6u)# dampening 20 200 2500 40
```

This example applies the dampening half-life established in a route map, configures the route map using the **set dampening** command.

```
device# configure terminal
device(config)# route-map myroutemap permit 1
device(config-route-map myroutemap)# set dampening 20
```

database-overflow-interval (OSPFv2)

Configures frequency for monitoring database overflow.

Syntax

database-overflow-interval *interval*
no database-overflow-interval

Command Default

0 seconds. If the device enters OverflowState, you must reboot before the device leaves this state.

Parameters

interval

Time interval at which the device checks to see if the overflow condition has been eliminated. Valid values range from 0 through 86400 seconds.

Modes

OSPF router configuration mode

OSPF router VRF configuration mode

Usage Guidelines

This command specifies how long a device that has entered the OverflowState waits before resuming normal operation of external LSAs. However, if the external link state database (LSDB) is still full, the device lapses back into OverflowState. If the configured value of the database overflow interval is zero, then the device never leaves the database overflow condition.

When the maximum size of the LSDB is reached (this is a configurable value in the *external-lsdb-limit* CLI), the device enters OverflowState. In this state, the device flushes all non-default AS-external-LSAs that the device had originated. The device also stops originating any non-default external LSAs. Non-default external LSAs are still accepted if there is space in the database after flushing. If no space exists, the Non-default external LSAs are dropped and not acknowledged.

The **no** form of the command disables the overflow interval configuration.

Examples

The following example configures a database-overflow interval of 60 seconds.

```
device# configure terminal
device(config)# router ospf
device(config-ospf-router)# database-overflow-interval 60
```

database-overflow-interval (OSPFv3)

Configures frequency for monitoring database overflow.

Syntax

database-overflow-interval *interval*
no database-overflow-interval

Command Default

10 seconds. If the router enters OverflowState, you must reboot before the router leaves this state.

Parameters

interval

Time interval at which the device checks to see if the overflow condition has been eliminated. Valid values range from 0 through 86400 seconds (24 hours).

Modes

OSPFv3 router configuration mode
OSPFv3 router VRF configuration mode

Usage Guidelines

This command specifies how long after a router that has entered the OverflowState before it can resume normal operation of external LSAs. However, if the external link state database (LSDB) is still full, the router lapses back into OverflowState.

When the maximum size of the LSDB is reached (this is a configurable value in the *external-lsdb-limit* CLI), the router enters OverflowState. In this state, the router flushes all non-default AS-external-LSAs that the router had originated. The router also stops originating any non-default external LSAs. Non-default external LSAs are still accepted if there is space in the database after flushing. If no space exists, the Non-default external LSAs are dropped and not acknowledged.

If the configured value of the database overflow interval is 0, then the device never leaves the database overflow condition.

The **no** form of the command disables the overflow interval configuration.

Examples

The following example configures a database-overflow interval of 120 seconds.

```
device# configure terminal
device(config)# ipv6 router ospf
device(config-ospf6-router)# database-overflow-interval 120
```

dead-interval

Configures the interval for which a Virtual Router Redundancy Protocol (VRRP) backup router waits for a hello message from the VRRP master router before determining that the master is offline. When backup routers determine that the master is offline, the backup router with the highest priority becomes the new VRRP master router.

Syntax

dead-interval [msec] *interval*

no dead-interval [msec] *interval*

Command Default

The default dead interval is internally derived from the hello interval. It is equal to 3 times the hello interval plus the skew time, where the skew time is equal to (256 minus the priority) divided by 256.

Parameters

msec *interval*

Sets the interval, in milliseconds, for which a VRRP backup router waits for a hello message from the VRRP master router before determining that the master is offline. Valid values range from 100 through 84000. The default value is 1000. VRRP-E does not support the dead interval in milliseconds.

interval

Sets the interval, in seconds, for which a VRRP backup router waits for a hello message from the VRRP master router before determining that the master is offline. Valid values range from 1 through 84. The default value is 1.

Modes

VRID interface configuration mode

Usage Guidelines

By default, the dead interval is internally derived from the hello interval. It is equal to 3 times the hello interval plus the skew time, where the skew time is equal to (256 minus the priority) divided by 256. Generally, if you change the hello interval on the VRRP master device using the **hello-interval** command, you should also change the dead interval on the VRRP backup devices using the **dead-interval** command.

A VRRP master router periodically sends hello messages to the backup routers. The backup routers use the hello messages as verification that the master is still online. If the backup routers stop receiving the hello messages for the period of time specified by the dead interval, the backup routers determine that the master router is offline. At that point, the backup router with the highest priority becomes the new master router.

The **dead-interval** command is configured only on VRRP backup routers and is supported by VRRP and VRRP-E.

The **no** form resets the dead interval to its default value of 1000 milliseconds (1 second).

NOTE

VRRP-E does not support the hello message interval in milliseconds.

Examples

The following example sets a waiting period of 25000 milliseconds before a VRRP backup router determines that a VRRP master router is offline.

```
device# configure terminal
device(config)# router vrrp
device(config)# interface ethernet 1/1/6
device(config-if-e1000-1/1/6)# ip address 10.53.5.1/24
device(config-if-e1000-1/1/6)# ip vrrp vrid 1
device(config-if-e1000-1/1/6-vrid-1)# backup priority 40 track-priority 10
device(config-if-e1000-1/1/6-vrid-1)# ip-address 10.53.5.99
device(config-if-e1000-1/1/6-vrid-1)# dead-interval msec 25000
device(config-if-e1000-1/1/6-vrid-1)# activate
```

The following example sets a waiting period of 25 seconds before a VRRP-E backup router determines that a VRRP master router is offline.

```
device# configure terminal
device(config)# router vrrp-extended
device(config-vrrpe-router)# interface ethernet 1/1/5
device(conf-if-e1000-1/1/5)# ip address 10.53.5.3/24
device(conf-if-e1000-1/1/5)# ip vrrp-extended vrid 2
device(conf-if-e1000-1/1/5-vrid-2)# backup priority 50 track-priority 10
device(conf-if-e1000-1/1/5-vrid-2)# ip-address 10.53.5.1
device(conf-if-e1000-1/1/5-vrid-2)# dead-interval 25
device(conf-if-e1000-1/1/5-vrid-2)# activate
```

dead-interval (vsrp)

Configures the number of seconds a backup waits for a Hello message from the master before determining that the master is dead.

Syntax

dead-interval *number*

no dead-interval *number*

Command Default

The default time interval for the backup to wait for the Hello message from the master is 3 seconds.

Parameters

number

Specifies the time interval for which the backup waits for the Hello message from the master. The time interval range is from 1 through 84 seconds.

Modes

VSRP VRID configuration mode

Usage Guidelines

The **no** form of the command resets the time interval to the default value.

Examples

The following example shows how to change the dead interval.

```
device(config)# vlan 200
device(config-vlan-200)# tagged ethernet 1/1/1 to 1/1/8
device(config-vlan-200)# vsrp vrid 1
device(config-vlan-200-vrid-1)# dead-interval 30
```

decnet-proto

Configures the DECnet protocol VLAN.

Syntax

decnet-proto [*name string*]

no decnet-proto [*name string*]

Command Default

The DECnet protocol VLAN is not configured.

Parameters

name *string*

Specifies the name of the DECnet protocol VLAN that you want to configure. The name can be up to 32 characters in length.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of the command removes the DECnet protocol VLAN.

Examples

The following example shows how to configure a DECnet protocol VLAN.

```
device(config)# vlan 2
device(config-vlan-2)# decnet-proto name Red
device(config-vlan-decnet-2)# no dynamic
```

default-gateway

Configures the default gateway for a VLAN.

Syntax

default-gateway *ip-address metric*

no default-gateway *ip-address metric*

Command Default

The default gateway is not configured.

Parameters

ip-address

Specifies the IP address of the gateway router.

metric

Specifies the metric (cost) of the gateway. You can specify a value from 1 through 5. There is no default. The gateway with the lowest metric is used.

Modes

VLAN configuration mode

Usage Guidelines

You can configure up to five default gateways for the designated VLAN, and associate a metric with each one. The software uses the gateway with the lowest metric. The other gateways reside in the configuration but are not used. To use one of the other gateways, modify the configuration so that the gateway you want to use has the lowest metric. If more than one gateway has the lowest metric, the gateway that appears first in the running-config is used.

If you have already configured a default gateway globally using the **ip default-gateway** command and you do not configure a gateway in the VLAN, the software uses the globally configured gateway and gives the gateway a metric value of 1.

The **no** form of the command removes the gateway configuration for a VLAN.

Examples

The following example shows how to set the default gateway for a management VLAN. Because the 10.10.10.1 gateway has a lower metric, the software uses this gateway. The other gateway remains in the configuration, but is not used. You can use the other one by changing the metrics so that the 10.20.20.1 gateway has the lower metric.

```
device(config)# vlan 10
device(config-vlan-10)# default-gateway 10.10.10.1 1
device(config-vlan-10)# default-gateway 10.20.20.1 2
```

default-information-originate (BGP)

Configures the device to originate and advertise a default BGP4 or BGP4+ route.

Syntax

default-information-originate
no default-information-originate

Modes

BGP configuration mode
BGP address-family IPv6 unicast configuration mode
BGP address-family IPv4 unicast VRF configuration mode
BGP address-family IPv6 unicast VRF configuration mode

Usage Guidelines

Use the **no** form of this command to restore the default.

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

Examples

This example originates and advertises a default BGP4 route for the default VRF.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# default-information-originate
```

This example originates and advertises a default BGP4 route for VRF "red"

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv4 unicast vrf red
device(config-bgp-ipv4u-vrf)# default-information-originate
```

History

Release version	Command history
8.0.30	Support was added for the BGP address-family IPv6 unicast VRF configuration mode.

default-information-originate (OSPFv2)

Controls distribution of default information to an OSPFv2 device.

Syntax

```
default-information-originate [ always ] [ metric metric ] [ metric-type { type1 | type2 } ] [ route-map name ]  
no default-information-originate
```

Command Default

The default route is not advertised into the OSPFv2 domain.

Parameters

always

Always advertises the default route. If the route table manager does not have a default route, the router advertises the route as pointing to itself.

metric *metric*

specifies the cost for reaching the rest of the world through this route. If you omit this parameter and do not specify a value using the *default-metric* router configuration command, a default metric value of 1 is used. Valid values range from 1 through 65535. The default is 10.

metric-type

Specifies how the cost of a neighbor metric is determined. The default is **type1**. However, this default can be changed with the **metric-type** command.

type1

Type 1 external route.

type2

Type 2 external route.

route-map *name*

Specifies that the default route is generated if the route map is satisfied. This parameter overrides other options. If the **set metric** and **set metric-type** commands are specified in the route-map, the command-line values of metric and metric-type if specified, are "ignored" for clarification.

Modes

OSPF router configuration mode

OSPF router VRF configuration mode

Usage Guidelines

This configuration provides criteria for the redistribution of any default routes found in the route table manager (RTM), whether static or learned from another protocol, to its neighbors.

Commands A - E

default-information-originate (OSPFv2)

The corresponding route-map should be created before configuring the **route-map** option, along with the **default-information-originate** command. If the corresponding route-map is not created beforehand, an error message is displayed stating that the route-map must be created.

The route-map option cannot be used with a non-default address in the match conditions. The default route LSA is not generated if a default route is not present in the routing table and a **match ip address** condition for an existing non-default route is configured in the route-map. The **match ip address** command in the route-map is a no-op operation for the default information originate command.

A device does not inject the default route into an NSSA by default and this command does not cause the device to inject the default route into the NSSA. To inject the default route into an NSSA, use the **area nssa default-information-originate** command.

The **no** form of the command disables default route origination.

Examples

The following example creates and advertises a default route with a metric of 30 and a type 1 external route.

```
device# configure terminal
device(config)# router ospf
device(config-ospf-router)# default-information-originate metric 30 metric-type type1
```

default-information-originate (OSPFv3)

Controls distribution of default information to an OSPFv3 device.

Syntax

```
default-information-originate [ always ] [ metric metric ] [ metric-type { type1 | type2 } ]  
no default-information-originate
```

Command Default

The default route is not advertised into the OSPFv3 domain.

Parameters

always

Always advertises the default route. If the route table manager (RTM) does not have a default route, the router advertises the route as pointing to itself.

metric *metric*

Used for generating the default route, this parameter specifies the cost for reaching the rest of the world through this route. If you omit this parameter, the value of the **default-metric** command is used for the route. Valid values range from 1 through 65535.

metric-type

Specifies the external link type associated with the default route advertised into the OSPF routing domain.

type1

The metric of a neighbor is the cost between itself and the router plus the cost of using this router for routing to the rest of the world.

If you do not use this option, the default redistribution metric type is used for the route type.

type2

The metric of a neighbor is the total cost from the redistributing routing to the rest of the world.

Modes

OSPFv3 router configuration mode

OSPFv3 router VRF configuration mode

Usage Guidelines

This configuration provides criteria for the redistribution of any default routes found in the RTM (whether static or learned from another protocol) to its neighbors.

If you specify a metric and metric type, the values are used even if you do not use the **always** option.

The **no** form of the command disables default route origination.

Commands A - E

default-information-originate (OSPFv3)

Examples

The following example specifies a metric of 20 for the default route redistributed into the OSPFv3 routing domain and an external metric type of Type 2.

```
device# configure terminal
device(config)# ipv6 router ospf
device(config-ospf6-router)# default-information-originate metric 20 metric-type type2
```

default-ipv6-gateway

Configures the IPv6 address of the default gateway on a VLAN.

Syntax

default-ipv6-gateway *ipv6-address* [*metric*]
no default-ipv6-gateway

Parameters

ipv6-address
IPv6 address of the default gateway.

metric
A decimal value from 1 through 5.

Modes

VLAN configuration mode

Usage Guidelines

A device should have a default gateway, for the following reasons:

- Although IPv6 discovers neighbors and routes dynamically, in some cases Router Advertisement (RA) and Router Solicitation (RS) operations are disabled and a default gateway is required to send traffic. RA and RS are not suppressed if a default gateway is configured.
- Management devices (for example, TFTP servers, Telnet or SSH clients) are not members of the same subnet as the management IPv6 address.

If a management VLAN is not configured, the device can have only one IPv6 default gateway in the global configuration.

If a management VLAN is configured, the device can have a maximum of 5 IPv6 default gateways, with an optional metric (1 through 5), under the management VLAN. Multiple gateways can have the same metric value.

Configured gateway addresses and the default gateway address must be in same subnet.

The best default gateway is first chosen as the device whose neighbors are reachable (in the REACH state), in the sequence of metric values. Otherwise, the gateway with the highest priority (the lowest metric value) is chosen.

If a static default gateway is configured, that gateway takes precedence over the best default gateway configured by means of RA. If the static default-gateway configuration is removed, the best default gateway learned by RA is restored.

Use the **no** form of the command to remove the IPv6 address and disable the default gateway.

Selection of the best default router among configured IPv6 routers occurs under the following conditions:

- Disabling an interface
- Processing of an NA message receipt
- Adding or deleting an IPv6 neighbor to or from the neighbor list
- Configuring the IPv6 static default gateway by means of the CLI

The process of resolving the link layer for the IPv6 default gateway by sending NS occurs during the following conditions:

- Configuration of the default gateway configured by means of the CLI
- Addition or deletion of a management VLAN configuration

Examples

The following example configures the maximum of 5 IPv6 default gateways with the management VLAN configuration, and specifies metrics for each.

```
device# configure terminal
device(config)# vlan 66
device(config-vlan-66)# default-ipv6-gateway 2620:100:c:fe23:10:37:65:129 3
device(config-vlan-66)# default-ipv6-gateway 2620:100:c:fe23:10:37:65:129 2
device(config-vlan-66)# default-ipv6-gateway 2620:100:c:fe23:10:37:65:130 2
device(config-vlan-66)# default-ipv6-gateway 2620:100:c:fe23:10:37:65:131 1
device(config-vlan-66)# default-ipv6-gateway 2620:100:c:fe23:10:37:65:132 5
```

Use the **show ipv6** command to confirm the configuration and view the best default gateway (router).

```
device(config)# show ipv6
Global Settings
  IPv6 is enabled
  Link-local address(es):
    fe80::768e:f8ff:fe23:10:37:65:129 [Preferred]
  Global unicast address(es):
    2620:100:c:fe23:768e:f8ff:fe23:10:37:65:129 [Preferred], subnet is 2620:100:c:fe23::/64
  Joined group address(es):
    ff02::1:fff9:6d80
    ff02::1
Best Default Router : 2620:100:c:fe23:10:37:65:129 PMTUS : 0
  MTU is 1500 bytes
  ND DAD is enabled, number of DAD attempts: 3
  ND reachable time is 30000 milliseconds
  ND retransmit interval is 1000 milliseconds
  Current Hop Limit is 64
  Hosts use stateless autoconfig for addresses
  No Inbound Access List Set
  No Outbound Access List Set
  No IPv6 Domain Name Set
  No IPv6 DNS Server Address set
```

History

Release version	Command history
8.0.50	This command was introduced.

default-local-preference

Enables setting of a local preference value to indicate a degree of preference for a route relative to that of other routes.

Syntax

default-local-preference *num*
no default-local-preference

Parameters

num

Local preference value. Range is from 0 through 65535. The default is 100.

Modes

BGP configuration mode

Usage Guidelines

Local preference indicates a degree of preference for a route relative to that of other routes. BGP4 neighbors can send the local preference value as an attribute of a route in an UPDATE message.

Examples

The following example sets the local preference value to 200.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# default-local-preference 200
```

default-metric (BGP)

Changes the default metric used for redistribution.

Syntax

default-metric *value*
no default-metric

Command Default

The default metric value is 1.

Parameters

value

Metric value. Range is from 0 through 65535. The default metric value is 1.

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

Usage Guidelines

Use the **no** form of this command to restore the default.

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

Examples

This example changes the default metric used for redistribution to 100.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# default-metric 100
```

default-metric (OSPF)

Sets the default metric value for the OSPFv2 or OSPFv3 routing protocol.

Syntax

default-metric *metric*
no default-metric

Parameters

metric

OSPF routing protocol metric value. Valid values range from 1 through 65535. The default is 10.

Modes

OSPF router configuration mode
OSPFv3 router configuration mode
OSPF router VRF configuration mode
OSPFv3 router VRF configuration mode

Usage Guidelines

This command overwrites any incompatible metrics that may exist when OSPFv2 or OSPFv3 redistributes routes. Therefore, setting the default metric ensures that neighbors will use correct cost and router computation.

The **no** form of the command restores the default setting.

Examples

The following example sets the default metric to 20 for OSPF.

```
device# configure terminal
device(config)# router ospf
device(config-ospf-router)# default-metric 20
```

default-metric (RIP)

Changes the RIP metric the router assigns by default to redistributed routes.

Syntax

default-metric *value*

no default-metric *value*

Command Default

By default, a metric of 1 is assigned to each route that is redistributed into RIP.

Parameters

value

Specifies a numeric value from 1 through 15 that is assigned to each route redistributed into RIP.

Modes

RIP router configuration mode.

Usage Guidelines

The **no** form of the command returns the value of the default-metric to 1.

As its default-metric increases, the less likely a route is to be used.

Examples

The following example sets the default metric for all RIP routes on the device to 10.

```
device# configure terminal
device(config)# router rip
device(config-rip-router)# default-metric 10
```

The following example returns the default metric set in the previous example to the system default (1).

```
device# configure terminal
device(config)# router rip
device(config-rip-router)# no redistribute connected metric 10
```

default-passive-interface

Marks all OSPFv2 and OSPFv3 interfaces passive by default.

Syntax

default-passive-interface

no default-passive-interface

Modes

OSPF router configuration mode

OSPFv3 router configuration mode

OSPF router VRF configuration mode

OSPFv3 router VRF configuration mode

Usage Guidelines

When you configure the interfaces as passive, the interfaces drop all the OSPFv2 and OSPFv3 control packets.

You can use the **ip ospf active** and **ip ospf passive** commands in interface subconfiguration mode to change active/passive state on specific OSPFv2 interfaces. You can use the **ipv6 ospf active** and **ipv6 ospf passive** commands in interface subconfiguration mode to change the active and passive state on specific OSPFv3 interfaces.

The **no** form of the command disables the passive state.

Examples

The following example marks all OSPFv2 interfaces as passive.

```
device# configure terminal
device(config)# router ospf
device(config-ospf-router)# default-passive-interface
```

The following example marks all OSPFv3 interfaces as passive for VRF "red".

```
device# configure terminal
device(config)# ipv6 router ospf vrf red
device(config-ospf6-router-vrf-red)# default-passive-interface
```

default-ports

Assigns ports (interfaces) other than the factory-assigned ports as the default stacking ports.

Syntax

default-ports *unit/slot/ port*
no default-ports

Command Default

The factory-assigned default stacking ports are the only default stacking ports on the device.

Parameters

unit
Stack unit ID for the device on which the interface resides.

slot
Stack unit slot or module on which the interface resides.

port
Interface to be used as a default stacking port.

Modes

Stack unit configuration mode

Usage Guidelines

The **no** form of the command restores the factory-assigned default stacking ports. Any ports you previously assigned as the default stacking ports using the **default-ports** command are overwritten.

When you use the **default-ports** command, the factory-assigned default stacking ports are no longer the default stacking ports.

Only valid stacking ports can be assigned as default stacking ports. Valid ports vary depending on the type of FastIron device.

Tagged ports cannot be assigned as default stacking ports.

The number of ports you can assign as default stacking ports varies depending on the type of FastIron device. Some devices allow you to assign two ports as the default stacking ports, and some devices allow you to assign a single port as the default stacking port.

Examples

The following example assigns the stacking ports on Module 3 on the rear panel of an ICX 7750 as the default stacking ports.

```
device# configure terminal
device(config)# stack unit 1
device;(config-unit-1)# default-ports 1/3/1 1/3/4
```

default-timers

Resets the GVRP Join, Leave, and Leaveall timers to the default values.

Syntax

default-timers

Command Default

The default value for the Join timer is 200 ms. The default value for the Leave timer is 600 ms. The default value for the Leaveall timer is 10,000 ms.

Modes

GVRP configuration mode

Usage Guidelines

You can use the **join-timer** command to change the values of these timers.

Examples

The following example shows how to reset the timers to the default values.

```
device(config)# gvrp-enable  
device(config-gvrp)# default-timers
```

default-vlan-id

Changes the default VLAN ID.

Syntax

default-vlan-id *vlan-id*

no default-vlan-id *vlan-id*

Command Default

The default VLAN ID is 1.

Parameters

vlan-id

Specifies the VLAN ID that you want to configure as the default. Valid VLAN ID values are from 1 through 4095.

Modes

Global configuration mode

Usage Guidelines

You must specify a valid VLAN ID that is not already in use. For example, if you have already defined VLAN 10, you cannot use "10" as the new VLAN ID for the default VLAN.

NOTE

This command does not change the properties of the default VLAN. Changing the name allows you to use the VLAN ID "1" as a configurable VLAN.

The **no** form of the command resets the VLAN ID to the default.

Examples

The following example shows how to change the default VLAN ID.

```
device(config)# default-vlan-id 4095
```

delay-notifications

Configures the delay time for notifying the Layer 3 protocols of the VE down event.

Syntax

delay-notifications *value*

no delay-notifications *value*

Command Default

The delay time is not configured.

Parameters

value

The time to delay the notification of the VE down event. The value can range from 1 through 60 seconds.

Modes

VE interface configuration mode

Usage Guidelines

When all the ports in the VLAN go into the non-forwarding state, the device waits for the configured time before notifying the Layer 3 protocols of the VE down event. Once the timer expires, if the ports remain in the non-forwarding state, the device notifies the Layer 3 protocols of the VE down event.

If any of the ports comes into the forwarding state before the timer expires, the device cancels the existing timer for the VE down event.

The **no** form of the command removes the configured delay time.

Examples

The following example shows configuring the delay time on interface 50 to 20 seconds.

```
device(config)# interface ve 50
device(config-vif-50)# delay-notifications 20
```

History

Release version	Command history
08.0.30b	This command was introduced.

delete-all

Deletes all user records from a local user database.

Syntax

delete-all

Modes

Local user database configuration mode

Examples

The following example deletes all user records from the local user database "localdb1".

```
device(config)# local-userdb localdb1  
device(config-localuserdb-localdb1)# delete-all
```

deploy

Deploys the LAG.

Syntax

```
deploy [ passive ]  
no deploy [ passive ]
```

Command Default

The LAG is not deployed.

Parameters

passive

Configures Link Aggregation Control Protocol (LACP) as passive. This option is applicable only to dynamic LAGs and LACP is active by default.

Modes

LAG configuration mode

Usage Guidelines

A LAG must be created before being deployed. After configuring a LAG, you must explicitly enable it before it begins aggregating traffic. This task is accomplished by executing the **deploy** command within the LAG configuration. After the **deploy** command runs, the LAG is in the aggregating mode.

To deploy a LAG, at least one port must be in the LAG and the primary port must be specified for non-keep-alive LAGs. After a non-keep-alive LAG is deployed, a LAG is formed. If there is only one port in the LAG, a single port LAG is formed. For a dynamic LAG, LACP is started for each LAG port. For a keep-alive LAG, no LAG is formed and LACP is started on the LAG port.

When activating LACP, LACP is activated as active if the **passive** keyword is not specified. If you need to configure LACP as passive, use the **passive** keyword. Once the **deploy** command is issued, all LAG ports will behave like a single port. For dynamic LAGs, LACP is activated on all of the LAG ports.

The **no** form of the command undeploys the LAG. Once the LAG is undeployed, all the secondary ports are disabled automatically and there will be no changes to the primary port. Also, for dynamic LAGs, LACP is deactivated on all ports.

Examples

The following example shows how to deploy a LAG.

```
device(config)# lag blue static  
device(config-lag-blue)# deploy
```

The following example shows how to deploy a dynamic LAG as passive.

```
device(config)# lag test2 dynamic
device(config-lag-test2)# deploy passive
```

description (IKEv2)

Describes an Internet Key Exchange version 2 (IKEv2) profile.

Syntax

description *text-string*

no description

Command Default

An IKEv2 profile description is not configured.

Parameters

text-string

Specifies the IKEv2 profile description. The string must be from 1 through 64 ASCII characters in length.

Modes

IKEv2 profile configuration mode

Usage Guidelines

Configuring a profile description is optional, but in a complex network configuration with a number of IKEv2 profiles, a profile description can help to identify a specific profile.

The **no** form of the command removes the IKEv2 profile description.

Examples

The following example shows how to configure a description for an IKEv2 profile named prof-dept1.

```
device(config)# ikev2 profile prof_dept1
device(config-ike-profile-prof_dept1)# description PersonnelDepartmentUSA
```

History

Release version	Command history
8.0.50	This command was introduced.

description (IPsec)

Describes an IP security (IPsec) profile.

Syntax

description *text-string*
no description

Command Default

An IPsec profile description is not configured.

Parameters

text-string
Specifies the IPsec profile description. The string must be from 1 through 64 ASCII characters in length.

Modes

IPsec profile configuration mode

Usage Guidelines

Configuring a profile description is optional, but in a complex network configuration with a number of IPsec profiles, a profile description can help to identify a specific profile.

The **no** form of the command removes the IPsec profile description.

Examples

The following example shows how to configure a description for an IPsec profile named prof-dept2.

```
device(config)# ipsec profile prof-dept2
device(config-ipsec-profile-prof-dept2)# description FinanceDepartmentCanada
```

History

Release version	Command history
8.0.50	This command was introduced.

destination-ip

Sets the destination IP address of an ERSPAN mirror.

Syntax

destination-ip *ip-addr*

no destination-ip *ip-addr*

Command Default

A destination IP is not configured for the ERSPAN profile.

Parameters

ip-addr

Specifies the IP address in the format A.B.C.D.

Modes

Monitor profile mode

Usage Guidelines

The destination IP address is the IP address for the remote host that is collecting the mirrored traffic, not the switch.

The **no** form of the command removes the IP address from the monitor profile.

Examples

The following example sets the destination IP address in ERSPAN profile 3.

```
device(config)# monitor-profile 3 type ERSPAN
device(config-monitor-profile 3)# destination-ip 1.1.1.1
device(config-monitor-profile 3)# exit
```

History

Release version	Command history
8.0.40	This command was introduced.

dhcp-default-router

Specifies the IP addresses of the default routers for a client.

Syntax

dhcp-default-router *address*

Parameters

address

Specifies the IP address of the default router.

Modes

DHCP server pool configuration mode

Examples

The following example specifies the IP address of the default router for a client.

```
device(config)# ip dhcp-server-pool cabo  
device(config-dhcp-cabo)# dhcp-default-router 10.2.1.143
```

dhcp-gateway-list

Configures a gateway list when DHCP Assist is enabled on a Layer 2 switch.

Syntax

dhcp-gateway-list *num ip-address*

Parameters

num

Specifies the number of the gateway list.

ip-address

Specifies the gateway IP address.

Modes

Global configuration mode

Interface configuration mode

Usage Guidelines

Up to eight addresses can be defined for each gateway list in support of ports that are multi-homed. When multiple IP addresses are configured for a gateway list, the Layer 2 switch inserts the addresses into the discovery packet in a round-robin fashion. Up to 32 gateway lists can be defined for each Layer 2 switch.

Examples

The following commands configure a gateway list.

```
device(config)# dhcp-gateway-list 1 10.95.5.1
device(config)# dhcp-gateway-list 2 10.95.6.1
device(config)# dhcp-gateway-list 3 10.95.1.1 10.95.5.1
device(config)# interface ethernet 2
device(config-if-e1000-2)# dhcp-gateway-list 1
device(config-if-e1000-2)# interface ethernet 8
device(config-if-e1000-8)# dhcp-gateway-list 3
device(config-if-e1000-8)# interface ethernet 14
device(config-if-e1000-14)# dhcp-gateway-list 2
```

dhcp snooping client-learning disable

Disables DHCP client learning on an individual port or range of ports.

Syntax

dhcp snooping client-learning disable
no dhcp snooping client-learning disable

Modes

Interface configuration mode.

Usage Guidelines

Use the **no** form of the command to re-enable DHCP client learning on a port once it has been disabled.

Examples

The following example disables DHCP client learning on an individual port.

```
device(config)# interface ethernet 1/1
device(config-if-e10000-1/1)# dhcp snooping client-learning disable
```

The following example disables DHCP client learning on a range of ports.

```
device(config)# interface ethernet 1/1/1 to 1/1/5
device(config-mif-1/1/1-1/1/5)# dhcp snooping client-learning disable
```

History

Release version	Command history
8.0.40	This command was modified to include enabling DHCP client learning on a range of ports.

dhcp snooping relay information circuit-id

Configures a unique circuit ID per port.

Syntax

dhcp snooping relay information circuit-id *ASCII-string*

no dhcp snooping relay information circuit-id *ASCII-string*

Parameters

ASCII-string

Specifies the ASCII-string. The string can be up to 63 characters in length.

Modes

Interface configuration mode

Usage Guidelines

noshow interfaces ethernet

Examples

The following example enables the circuit ID per port.

```
device(config)# ip dhcp snooping vlan 1
device(config)# interface ethernet 1/1/4
device(config-if-e1000-1/1/4)# dhcp snooping relay information circuit-id Brcd01
```

History

Release version	Command history
08.0.50	This command was introduced.

dhcp snooping relay information remote-id

Configures a unique remote ID per port.

Syntax

dhcp snooping relay information remote-id *ASCII-string*

no dhcp snooping relay information remote-id *ASCII-string*

Parameters

ASCII-string

Specifies the ASCII-string. The string can be up to 63 characters in length.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of the command disables the remote ID processing once it is enabled.

Use the **show interfaces ethernet** command to view the remote ID configured on a port.

Examples

The following example enables the remote ID per port.

```
device(config)# ip dhcp snooping vlan 1
device(config)# interface ethernet 1/1/4
device(config-if-e1000-1/1/4)# dhcp snooping relay information remote-id remote01
```

History

Release version	Command history
08.0.50	This command was introduced.

dhcp snooping relay information subscriber-id

Configures a unique subscriber ID per port or on a range of ports.

Syntax

dhcp snooping relay information subscriber-id *ASCII-string*

no dhcp snooping relay information subscriber-id *ASCII-string*

Parameters

ASCII-string

Specifies the ASCII-string. The string can be up to 50 alphanumeric characters in length.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of the command disables SID processing once it is enabled.

Use the **show interfaces ethernet** command to view the subscriber ID configured on a port or a range of ports.

Examples

The following example enables a unique subscriber ID per port.

```
device(config)# ip dhcp snooping vlan 1
device(config)# interface ethernet 1/1/4
device(config-if-e1000-1/1/4)# dhcp snooping relay information subscriber-id Brcd01
```

The following example enables a unique subscriber ID on a range of ports.

```
device(config)# interface ethernet 1/1/1 to 1/1/5
device(config-mif-1/1/1-1/1/5)# dhcp snooping relay information subscriber-id Brcd01
```

History

Release version	Command history
08.0.40	This command was modified to include enabling a unique subscriber ID on a range of ports.

dhcp snooping trust

Enables trust on a port connected to a DHCP server.

Syntax

dhcp snooping trust

no dhcp snooping trust

Command Default

The default trust setting for a port is untrusted.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of the command disables the trust setting.

Examples

The following example sets the trust setting of port 1/1/1 to trusted.

```
device(config)# interface ethernet 1/1/1
device(config-if-e10000-1/1/1)# dhcp snooping trust
```

dhcp6 snooping trust

Enables trust on a port connected to a DHCPv6 server.

Syntax

dhcp6 snooping trust

no dhcp6 snooping trust

Command Default

The default trust setting for a port is untrusted

Modes

Interface configuration mode.

Usage Guidelines

The no form of the command disables trust on the port.

Examples

The following example enables trust on a port connected to a DHCPv6 server.

```
device(config)# interface ethernet 1/1/1  
device(config-if-e10000-1/1/1)# dhcp6 snooping trust
```

dhgroup

Configures a Diffie-Hellman (DH) group for an Internet Key Exchange version 2 (IKEv2) proposal.

Syntax

```
dhgroup { 14 | 19 | 20 }  
no dhgroup { 14 | 19 | 20 }
```

Command Default

The default DH group is 20.

Parameters

- 14** Specifies the 2048-bit modular exponential (MODP) DH group.
- 19** Specifies the 256-bit elliptical curve DH (ECDH) group.
- 20** Specifies the 384-bit ECDH group.

Modes

IKEv2 proposal configuration mode

Usage Guidelines

Diffie-Hellman negotiations are a part of the IKEv2 negotiations used to establish a secure communications channel.

Multiple DH groups may be configured for an IKEv2 proposal.

When only one DH group is configured for an IKEv2 proposal, removing it restores the default configuration.

The **no** form of the command removes the specified DH group configuration.

Examples

The following example configures the 2048-bit MODP DH group (14) for an IKEv2 proposal named ikev2_proposal.

```
device(config)# ikev2 proposal ikev2_proposal  
device(config-ikev2-proposal-ikev2_proposal)# dhgroup 14
```

History

Release version	Command history
8.0.50	This command was introduced.

diagnostics (MRP)

Enables diagnostics on a metro ring.

Syntax

diagnostics

no diagnostics

Command Default

Diagnostics are disabled by default.

Modes

Metro ring configuration mode

Usage Guidelines

This command is valid only on the master node.

When you enable Metro Ring Protocol (MRP) diagnostics, the software tracks Ring Health Packets (RHPs) according to their sequence numbers and calculates how long it takes an RHP to travel one time through the entire ring. The calculated results have a granularity of 1 microsecond. When you display the diagnostics, the output shows the average round-trip time for the RHPs sent since you enabled diagnostics.

The **no** form of the command disables the diagnostics for the ring.

Examples

The following example enables the diagnostics for metro ring 1.

```
device(config)# vlan 2
device(config-vlan-2)# metro-ring 1
device(config-vlan-2-mrp-1)# diagnostics
```

disable-aging

Disables aging of MAC sessions at the global level.

Syntax

disable-aging [**permitted-mac-only** | **denied-mac-only**]
no disable-aging [**permitted-mac-only** | **denied-mac-only**]

Command Default

Aging of MAC sessions is not disabled.

Parameters

permitted-mac-only

Prevents permitted (authenticated and restricted) sessions from being aged out and ages denied sessions.

denied-mac-only

Prevents denied sessions from being aged out, but ages out permitted sessions.

Modes

Authentication mode

Usage Guidelines

The **no** form of the command does not disable aging.

Use this command to disable the aging of MAC sessions. Use the **disable-aging** command in the authentication mode and the **authentication disable-aging** command at the interface level. The command entered at the interface level overrides the command entered at the authentication level.

Examples

The example disables aging for permitted MAC addresses.

```
device(config)# authentication
device(config-authen)# disable-aging permitted-mac-only
```

History

Release version	Command history
08.0.20	This command was introduced.

disable (LAG)

Disables the individual ports within a LAG.

Syntax

disable port-name *name*

disable ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port to stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]

Command Default

LAG ports are not enabled.

Parameters

port-name *name*

Disables a named port within a LAG.

ethernet *stackid/slot/port*

Disables the Ethernet port within a LAG.

to *stackid/slot/port*

Disables a range of ports within a LAG.

Modes

LAG configuration mode

Usage Guidelines

To disable a port belonging to a keep-alive LAG, you must configure the **enable** command from the interface configuration mode.

NOTE

You cannot disable a LAG Ethernet port unless it is deployed.

Examples

The following example shows how to disable a port within a LAG.

```
device(config)# lag blue static
device(config-lag-blue)# deploy
device(config-lag-blue)# disable ethernet 1/3/1
```

The following example shows how to disable a port within a keep-alive LAG.

```
device(config)# lag test keep-alive
device(config-lag-test)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# disable
```

disable (NTP)

Disables NTP client and server mode.

Syntax

disable [serve]

no disable serve

Command Default

NTP is not enabled.

Parameters

serve

Disables serving the time to clients.

Modes

NTP configuration mode

Usage Guidelines

To enable client mode, use the **no disable** command. To enable the client and server mode, use the **no disable serve** command. The **no disable serve** command enables both the client and the server. If the client is already enabled and server is disabled, the **no disable server** enables the server.

If the **serve** keyword is specified, NTP does not serve the time to downstream devices. The **serve** keyword disables the NTP server mode functionalities. If the **serve** keyword is not specified, both NTP client mode and NTP server mode are disabled.

NOTE

The **disable** command disables NTP client and server mode; it does not remove the NTP configuration.

The **no** form of the command enables NTP client and server mode.

Examples

The following example disables the NTP server.

```
device(config)# ntp
device(config-ntp)# disable serve
```

disable (Port)

Disables a port.

Syntax

disable

Command Default

A port is enabled (active).

Modes

Interface configuration mode

Usage Guidelines

A port can be deactivated (disabled) or activated (enabled) using the **enable** command by selecting the appropriate status.

Examples

The following example disables or inactivate a port.

```
device(config)# interface ethernet 1/1/1  
device(config-if-e1000-1/1/1)# disable
```

disable (VSRP)

Disables the VSRP VRID for a port-based VLAN.

Syntax

disable

Command Default

The VSRP VRID is disabled by default.

Modes

VSRP VRID configuration mode

Examples

The following example shows how to disable the VSRP VRID on a VLAN.

```
device(config)# vlan 200
device(config-vlan-200)# tagged ethernet 1/1/1 to 1/1/8
device(config-vlan-200)# vsrp vrid 1
device(config-vlan-200-vrid-1)# backup
device(config-vlan-200-vrid-1)# disable
```

disable authentication md5

Disables the MD5 authentication scheme for Network Time Protocol (NTP).

Syntax

disable authentication md5
no disable authentication md5

Command Default

If JITC is enabled, the MD5 authentication scheme is disabled. In the standard mode, the MD5 authentication scheme is enabled.

Modes

Global configuration mode

Usage Guidelines

In the standard mode, both SHA1 and MD5 authentication schemes are supported. If JITC is enabled, The MD5 authentication for Network Time Protocol (NTP) is disabled by default and the **disable authentication md5** command can be seen in the running configuration. In the JITC mode, only the SHA1 option is available. The SHA1 authentication scheme must be enabled manually to define the authentication key for NTP using the **authentication-key key-id** command.

The **no** form of the command enables the MD5 authentication scheme.

Examples

The following example disables the MD5 authentication scheme.

```
device(config)# disable authentication md5
```

History

Release version	Command history
08.0.20a	This command was introduced.

distance (BGP)

Changes the default administrative distances for eBGP, iBGP, and local BGP.

Syntax

distance *external-distance internal-distance local-distance*
no distance

Parameters

external-distance

eBGP distance. Range is from 1 through 255.

internal-distance

iBGP distance. Range is from 1 through 255.

local-distance

Local BGP4 and BGP4+ distance. Range is from 1 through 255.

Modes

BGP configuration mode

Usage Guidelines

To select one route over another according to the source of the route information, the device can use the administrative distances assigned to the sources. The administrative distance is a protocol-independent metric that IP devices use to compare routes from different sources. Lower administrative distances are preferred over higher ones.

Examples

The following example configures the device to change the administrative distance.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# distance 100 150 200
```

distance (OSPF)

Configures an administrative distance value for OSPFv2 and OSPFv3 routes.

Syntax

distance { **external** | **inter-area** | **intra-area** } *distance*
no distance

Command Default

The administrative distance value for OSPFv2 and OSPFv3 routes is 110.

Parameters

external

Sets the distance for routes learned by redistribution from other routing domains.

inter-area

Sets the distance for all routes from one area to another area.

intra-area

Sets the distance for all routes within an area.

distance

Administrative distance value assigned to OSPF routes. Valid values range from 1 through 255. The default is 110.

Modes

OSPF router configuration mode
OSPFv3 router configuration mode
OSPF router VRF configuration mode
OSPFv3 router VRF configuration mode

Usage Guidelines

You can configure a unique administrative distance for each type of OSPF route.

The distances you specify influence the choice of routes when the device has multiple routes from different protocols for the same network. The device prefers the route with the lower administrative distance. However, an OSPFv2 or OSPFv3 intra-area route is always preferred over an OSPFv2 or OSPFv3 inter-area route, even if the intra-area route's distance is greater than the inter-area route's distance.

The **no** form of the commands reverts to the default setting.

Examples

The following example sets the distance value for all external routes to 125.

```
device# configure terminal
device(config)# router ospf
device(config-ospf-router)# distance external 125
```

The following example sets the distance value for intra-area routes to 80.

```
device# configure terminal
device(config)# ipv6 router ospf
device(config-ospf6-router)# distance intra-area 80
```

The following example sets the distance value for inter-area routes to 90.

```
device# configure terminal
device(config)# ipv6 router ospf
device(config-ospf6-router)# distance inter-area 90
```

distance (RIP)

Increases the administrative distance that the RIP router adds to routes.

Syntax

distance *num*

no distance *num*

Command Default

The default RIP administrative distance is 120.

Parameters

num

A decimal value from 1 through 255 that designates the administrative distance for all RIP routes.

Modes

RIP router configuration mode.

Usage Guidelines

The **no** form of the command returns the administrative distance to the default value of 120.

Routes with lower administrative distance are more likely to be used when administrative distance is used for route comparison.

Examples

The following example sets the administrative distance for RIP routes to 140.

```
device# configure terminal
device(config)# router rip
device(config-rip-router)# distance 140
```

The following example returns the administrative distance for RIP routes set in the previous example to the default of 120.

```
device# configure terminal
device(config)# router rip
device(config-rip-router)# no distance 140
```

distribute-list prefix-list (OSPFv3)

Applies a prefix list to OSPF for IPv6 routing updates. Only routes permitted by the prefix-list can go into the routing table.

Syntax

distribute-list prefix-list *list-name* **in** [**ethernet** *slot/port* | **loopback** *number* | **tunnel** *number* | **ve** *virtual port number*]

no distribute-list prefix-list

Command Default

Prefix lists are not applied to OSPFv3 for IPv6 routing updates.

Parameters

list-name

Name of a prefix-list. The list defines which OSPFv3 networks are to be accepted in incoming routing updates.

in

Applies the prefix list to incoming routing updates on the specified interface.

ethernet

Specifies an Ethernet interface.

slot

Specifies a valid slot number.

port

Specifies a valid port number.

loopback *number*

Specifies a loopback interface and port number.

tunnel *number*

Specifies a tunnel.

ve *virtual port number*

Specifies a virtual Ethernet (VE) interface.

Modes

OSPFv3 router configuration mode

OSPFv3 VRF router configuration mode

Usage Guidelines

The **no** form of the command removes the prefix list.

Commands A - E

distribute-list prefix-list (OSPFv3)

Examples

The following example configures a distribution list that applies the filterOspfRoutes prefix list globally.

```
device# configure terminal
device(config)# ipv6 router ospf
device(config-ospf6-router)# distribute-list prefix-list filterOspfRoutes in
```

distribute-list prefix-list (RIPng)

Applies a prefix list to RIPng to control routing updates that are received or sent.

Syntax

distribute-list prefix-list *list-name* { **in** | **out** }

no distribute-list prefix-list *list-name* { **in** | **out** }

Command Default

Prefix lists are not applied to RIPng routing updates.

Parameters

list-name

Specifies the prefix list to be applied.

in

Applies the prefix list to incoming routing updates.

out

Applies the prefix to outgoing routing updates.

Modes

RIPng router configuration mode.

Usage Guidelines

Use the **no** form of the command to remove the distribution list.

Examples

The first prefix list in the following example denies routes with the prefix beginning with 2001:db8:: if the prefix is longer than 64 bits. The second prefix list allows all other routes received.

```
device# configure terminal
device(config)# ipv6 prefix-list 2001routes deny 2001:db8::/64 le 128
device(config)# ipv6 prefix-list 2001routes permit ::/0 ge 0 le 128
device(config)# ipv6 router rip
device(config-ripng-router)# distribute-list prefix-list 2001routes in
```

distribute-list route-map

Creates a route-map distribution list.

Syntax

```
distribute-list route-map map in  
no distribute-list route-map
```

Parameters

map
Specifies a route map.

in
Creates a distribution list for an inbound route map.

Modes

OSPF router configuration mode
OSPFv3 router configuration mode
OSPF router VRF configuration mode
OSPFv3 router VRF configuration mode

Usage Guidelines

The distribution list can filter Link State Advertisements (LSAs) received from other OSPF devices before adding the corresponding routes to the routing table.

The **no** form of the command removes the distribution list.

Examples

The following example creates a distribution list using a route map named filter1 that has already been configured.

```
device# configure terminal  
device(config)# router ospf  
device(config-ospf-router)# distribute-list route-map filter1 in
```

dlb-internal-trunk-hash

Changes the hashing method for inter-packet-processor (inter-pp) HiGig links that are used to connect master and slave units in ICX 7450-48 devices.

Syntax

```
dlb-internal-trunk-hash { inactivity-mode | spray-mode }  
no dlb-internal-trunk-hash { inactivity-mode | spray-mode }
```

Command Default

The hashing method is inactivity mode.

Parameters

inactivity-mode

Specifies that the flow is set by the inactivity of traffic loading.

spray-mode

Specifies that the flow is set to receive new member assignments for every packet arrival in accordance with the traffic loading of each aggregate member.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the default hashing method.

NOTE

This command is supported only on ICX 7450-48 devices that have master and slave units.

Dynamic load balancing (DLB) enhances hash-based load balancing by taking into account the traffic loading in the network. The inter-pp HiGig links in ICX7450-48 devices use hash-based load balancing to distribute traffic evenly. You can configure the **dlb-internal-trunk-hash** command to change the hashing method.

NOTE

Spray mode may introduce out-of-order packet delivery.

Examples

The following example globally enables spray mode as the inter-pp links hashing method.

```
ICX7450-48P Router (config) #dlb-internal-trunk-hash spray-mode
```

History

Release version	Command history
08.0.20	This command was introduced.
08.0.50	Added a note about spray mode.

dns-filter

Defines Domain Name System (DNS) filters that will restrict DNS queries from unauthenticated hosts to be forwarded explicitly to defined servers.

Syntax

dns-filter *filter-id ip-address wildcard-bits*

no dns-filter *filter-id ip-address wildcard-bits*

Command Default

DNS filters are not defined.

Parameters

filter-id

Defines the number to identify a DNS filter. The valid values are from 1 through 4.

ip-address

Specifies the IP address (A.B.C.D) or IP address along with the prefix length (A.B.C.D/n) of unauthenticated hosts.

wildcard-bits

Specifies a wildcard for the filter. The wildcard is in dotted-decimal notation (IP address format).

Modes

Web Authentication configuration mode

Usage Guidelines

Many of the Web Authentication solutions allow DNS queries to be forwarded from unauthenticated hosts. To eliminate the threat of forwarding DNS queries from unauthenticated hosts to unknown or untrusted servers (also known as domain-casting), you can restrict DNS queries from unauthenticated hosts to be forwarded explicitly to defined servers by defining DNS filters. Any DNS query from an unauthenticated host to a server that is not defined in a DNS filter is dropped. Only DNS queries from unauthenticated hosts are affected by DNS filters; authenticated hosts are not. If the DNS filters are not defined, then any DNS queries can be made to any server.

The wildcard is in dotted-decimal notation (IP address format). It is a four-part value, where each part is 8 bits (one byte) separated by dots, and each bit is a one or a zero. Each part is a number ranging from 0 to 255, for example 0.0.0.255. Zeros in the mask mean the packet source address must match the IP address. Ones mean any value matches. For example, the IP address and subnet-mask values 10.157.22.26 0.0.0.255 mean that all hosts in the Class C subnet 10.157.22.x match the policy.

The **no** form of the command removes the defined DNS filters.

Examples

The following example defines a DNS filter.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# dns-filter 2 192.168.10.1/24 0.0.0.255
```

domain-name

Configures the domain name for the DHCP client.

Syntax

domain-name *domain-name*

Parameters

domain-name

Specifies the name of the domain.

Modes

DHCP server pool configuration mode

Examples

The following example specifies the domain name for the DHCP client.

```
device(config)# ip dhcp-server-pool cabo  
device(config-dhcp-cabo)# domain-name sierra
```

dot1x auth-filter

Applies the specified filter on the interface and the MAC addresses defined in the filter (MAC filter) do not have to go through authentication.

Syntax

```
dot1x auth-filter filter-id vlan-id  
no dot1x auth-filter filter-id vlan-id
```

Command Default

There are no filters applied on the interface.

Parameters

filter-id
Specifies the filter ID to be applied on the interface.

vlan-id
Specifies the VLAN ID.

Modes

Interface configuration mode

Usage Guidelines

A client can be authenticated in an untagged VLAN or tagged VLAN using the MAC address filter for 802.1X authentication.

If auth-filter has tagged VLAN configuration, the clients are authenticated in auth-default VLAN and tagged VLAN provided in auth-filter. The clients authorized in auth-default VLAN allow both untagged and tagged traffic.

The following rules apply when using the **dot1x auth-filter** command:

- The maximum number of filters that can be bound to a port is limited by the mac-filter-port default or a configured value.
- The filters must be applied as a group. For example, if you want to apply four filters to an interface, they must all appear on the same command line.
- You cannot add or remove individual filters in the group. To add or remove a filter on an interface, apply the filter group again containing all the filters you want to apply to the port.
- If you apply a filter group to a port that already has a filter group applied, the older filter group is replaced by the new filter group.
- If you add filters to or modify the 802.1X authentication filter, the system clears all 802.1X sessions on the port. Consequently, all users that are logged in will need to be re-authenticated.

The **no** form of the command disable the dot1x auth-filter functionality. If the VLAN is not specified, the auth-default-vlan is used.

Examples

The following example applies the dot1x filter on a specific VLAN.

```
device(config)# authentication
device(config-authen)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# dot1x auth-filter 1 2
```

History

Release version	Command history
08.0.20	This command was introduced.

dot1x enable

Enables 802.1X authentication.

Syntax

dot1x enable

dot1x enable all

dot1x enable ethernet *stackid/slot/port*

no dot1x enable [**all** | **ethernet** *stackid/slot/port*]

Command Default

802.1X authentication is not enabled.

Parameters

all

Enables 802.1X authentication on all interfaces.

ethernet *stackid/slot/port*

Enables 802.1X authentication on the specified interface.

Modes

Authentication configuration mode

Usage Guidelines

The **dot1x enable** command without any options initializes 802.1X authentication feature globally. The **dot1x enable** command with the **all** or **ethernet** options, enables 802.1X authentication on all or a specific interface respectively. After initializing 802.1X authentication feature using the **dot1x enable** command, you must enable 802.1X authentication on all or a specific interface.

Port control must be configured to activate authentication on an 802.1X-enabled interface using the **dot1x port-control** command from the interface configuration mode.

The **no** form of the command disables 802.1X authentication.

Examples

The following example enables 802.1X authentication on all interfaces.

```
device(config)# authentication
device(config-authen)# dot1x enable
device(config-authen)# dot1x enable all
```

The following example shows enabling 802.1X authentication on ethernet interface 1/1/1.

```
device(config)# authentication
device(config-authen)# dot1x enable
device(config-authen)# dot1x enable ethernet 1/1/1
```

History

Release version	Command history
08.0.20	This command was introduced.

dot1x guest-vlan

Specifies the VLAN into which the port should be placed when the client's response to the dot1x requests for authentication times out.

Syntax

dot1x guest-vlan *vlan-id*

no dot1x guest-vlan *vlan-id*

Command Default

The guest VLAN ID is not specified.

Parameters

vlan-id

Specifies the VLAN ID of the guest VLAN.

Modes

dot1x configuration mode.

Usage Guidelines

The **no** form of this command disables the functionality.

Use this command when the client does not support the 802.1X authentication, so that the client can access default privileges.

If there is no response from dot1x client for EAP-packets and if guest VLAN is not configured, authentication is considered as failed and the configured failure action is performed.

Examples

The following example specifies the guest VLAN.

```
device(config)# authentication
device(config-authen)# dot1x guest-vlan 7
```

History

Release version	Command history
08.0.20	This command was introduced.

dot1x initialize

Initializes 802.1X authentication on a port.

Syntax

```
dot1x initialize ethernet slot/port
```

Parameters

ethernet *slot/port*

Specifies the details of the interface on which 802.1x authentication is to be initialized.

Modes

Privileged EXEC mode

Examples

The following example initializes dot1x authentication on a port.

```
device# dot1x initialize ethernet 3/1
```

dot1x max-reauth-req

Configure the maximum number of times (attempts) EAP-request/identity frames are sent for reauthentication after the first authentication attempt.

Syntax

dot1x max-reauth-req *count*
no dot1x max-reauth-req *count*

Command Default

The device sends the EAP-request/identity frames for reauthentication twice.

Parameters

count

Specifies the number of EAP frame re-transmissions. This is a number from 1 through 10. The default is 2.

Modes

Authentication configuration mode

Usage Guidelines

The **no** form of this command will disable this functionality.

The Brocade device retransmits the EAP-request/identity frame a maximum of two times. If no EAP response/identity frame is received from the client after two EAP-request/identity frame re-transmissions (or the amount of time specified with the max-reauth-req command), the device restarts the authentication process with the client.

You can optionally change the number of times the Brocade device should retransmit the EAP request/identity frame.

Examples

The following example configures the device to retransmit an EAP-request/identity frame to a client a maximum of three times.

```
device(config)# authentication  
device(config-authen)# dot1x max-reauth-req 3
```

History

Release version	Command history
08.0.20	This command was introduced.

dot1x max-req

Configures the maximum number of times EAP request/challenge frames are retransmitted when EAP response/identity frame is not received from the client.

Syntax

dot1x max-req *count*

no dot1x max-req *count*

Command Default

The device retransmits the EAP-request/challenge twice.

Parameters

count

Specifies the number of EAP frame re-transmissions. This is a number from 1 through 10. The default is 2.

Modes

Authentication configuration mode

Usage Guidelines

The **no** form of this command will disable this functionality.

Examples

The following example configures the device to retransmit an EAP-request/challenge frame to a client a maximum of three times.

```
device(config)# authentication
device(config-authen)# dot1x max-req 3
```

History

Release version	Command history
08.0.20	This command was introduced.

dot1x-mka-enable

Enables MACsec Key Agreement (MKA) capabilities on a licensed device and enters dot1x-mka configuration mode.

Syntax

dot1x-mka-enable
no dot1x-mka-enable

Command Default

No MACsec capability is available.

Modes

Global configuration

Usage Guidelines

MACsec commands are supported only on the ICX 7450.

The **no** form of this command disables the MKA and MACsec functionality on all ports. This may require the already authenticated hosts to re-authenticate.

Use the **dot1x-mka-enable** command to enable MACsec on an already licensed device. Commands may be visible, but they do not work on a non-licensed device.

Examples

The following example enables MACsec capabilities on the device.

```
device(config)# dot1x-mka-enable  
device(config-dot1x-mka)#
```

History

Release version	Command history
08.0.20	This command was introduced.
08.0.30	Support for this command was added on ICX 7450 device.

Related Commands

[enable-mka](#), [mka-cfg-group](#)

dot1x port-control

Configures the port control type to activate authentication on an 802.1X-enabled interface.

Syntax

```
dot1x port-control { auto | force-authorized | force-unauthorized }
```

```
no dot1x port-control { auto | force-authorized | force-unauthorized }
```

Command Default

All controlled ports on the device are in the authorized state, allowing all traffic.

Parameters

auto

Places the controlled port in the unauthorized state until authentication takes place between the client and authentication server. Once the client passes authentication, the port becomes authorized. This activates authentication on an 802.1X-enabled interface. The controlled port remains in the authorized state until the Client logs off.

force-authorized

Places the controlled port unconditionally in the authorized state, allowing all traffic to pass between the client and the authenticator. This is the default state for ports on the Brocade device.

force-unauthorized

Places the controlled port unconditionally in the unauthorized state, denying any traffic to pass between the client and the authenticator.

Modes

Interface configuration mode

Usage Guidelines

Before activating the authentication using the **dot1x port-control auto** command on an untagged port, you must remove configured static ACL, if any, from the port.

You cannot enable 802.1X authentication on ports that have any of the following features enabled:

- Link aggregation
- Metro Ring Protocol (MRP)
- Mirror port
- LAG port
- DHCP snooping
- ARP inspection

The **no** form of the command resets the port control type to the default state (force-authorized) allowing all traffic to pass between the client and the authenticator.

Examples

The following example configures the interface to place its controlled port in the authorized state when a client is authenticated by an authentication server.

```
device(config)# interface ethernet 3/1/1
device(config-if-e100-3/1/1)# dot1x port-control auto
```

The following example configures the interface to place the controlled port unconditionally in the authorized state.

```
device(config)# interface ethernet 3/1/1
device(config-if-e100-3/1/1)# dot1x port-control force-authorized
```

The following example configures the interface to place the controlled port unconditionally in the unauthorized state.

```
device(config)# interface ethernet 3/1/1
device(config-if-e100-3/1/1)# dot1x port-control force-unauthorized
```

dot1x timeout

Configures the timeout parameters that determine the time interval for client reauthentication and EAP retransmissions.

Syntax

dot1x timeout {**quiet-period** *seconds* | **supplicant** *seconds* | **tx-period** *seconds* }

no dot1x timeout {**quiet-period** *seconds* | **supplicant** *seconds* | **tx-period** *seconds* }

Command Default

The timeout parameters are not applied to the device.

Parameters

quiet-period *seconds*

Specifies the time, in seconds, the device waits before trying to re-authenticate the client. The quiet period can be from 1 through 4294967295 seconds. The default is 60 seconds. If the Brocade device is unable to authenticate the client, the Brocade device waits a specified amount of time before trying again. The amount of time the Brocade device waits is specified with the quiet period parameter.

supplicant *seconds*

By default, when the Brocade device relays an EAP-Request frame from the RADIUS server to the client, it expects to receive a response from the client within 30 seconds. You can optionally specify the wait interval using the **supplicant** *seconds* parameters. The value is 1 through 4294967295.

tx-period *seconds*

Specifies the EAP request retransmission interval, in seconds, with the client. By default, if the Brocade device does not receive an EAP-response/identity frame from a client, the device waits 30 seconds, then retransmits the EAP-request/identity frame. You can optionally change the amount of time the Brocade device waits before re-transmitting the EAP-request/identity frame to the client. If the client does not send back an EAP-response/identity frame within 60 seconds, the device will transmit another EAP-request/identity frame. The tx-period is a value from 1 through 4294967295. The default is 30 seconds.

Modes

Authentication configuration mode

Usage Guidelines

The **no** form of the command disables dot1x timeout.

Examples

The following example specifies the quiet period as 30 seconds.

```
device(config)# authentication
device(config-authen)# dot1x enable
device(config-authen)# dot1x timeout quiet-period 30
```

History

Release version	Command history
08.0.20	This command was introduced.

dual-mode

Configures a tagged port to accept and transmit both tagged and untagged traffic at the same time.

Syntax

dual-mode [*vlan-id*]

no dual-mode [*vlan-id*]

Command Default

Dual mode is disabled.

Parameters

vlan-id

Specifies the default VLAN ID for the dual-mode port.

Modes

Interface configuration mode

Usage Guidelines

If you do not specify a VLAN ID, the port default VLAN is set to 1. The port transmits untagged traffic on the default VLAN.

A dual-mode port accepts and transmits frames belonging to VLANs configured for the port, as well as frames belonging to the default VLAN (that is, untagged traffic). You can configure a dual-mode port to transmit traffic for a specified VLAN (other than the default VLAN) as untagged, while transmitting traffic for other VLANs as tagged. Only tagged ports can be configured as dual-mode ports.

In a LAG, either all of the ports must be in dual-mode, or none of them can be.

You can configure multiple ports to be in dual mode.

NOTE

An error message is displayed while attempting to configure an existing dual mode on a port range.

The **no** form of the command disables the dual mode.

Examples

The following example shows how to configure dual mode, allowing traffic for VLAN 20 and untagged traffic to go through port 2/11 at the same time.

```
device(config)# vlan 20
device(config-vlan-20)# tagged ethernet 2/11
device(config-vlan-20)# tagged ethernet 2/9
device(config-vlan-20)# interface ethernet 2/11
device(config-if-e1000-2/11)# dual-mode
device(config-if-e1000-2/11)# exit
```

The following example shows configuring a dual-mode port to transmit traffic for a specified VLAN (other than the default VLAN) as untagged, while transmitting traffic for other VLANs as tagged. Tagged port 2/11 is added to VLANs 10 and 20, and then designated a dual-mode port whose specified default VLAN is 10.

```
device(config)# vlan 10 by port
device(config-vlan-10)# untagged ethernet 2/10
device(config-vlan-10)# tagged ethernet 2/11
device(config-vlan-10)# exit
device(config)# vlan 20 by port
device(config-vlan-20)# tagged ethernet 2/9
device(config-vlan-20)# tagged ethernet 2/11
device(config-vlan-20)# exit
device(config)# interface ethernet 2/11
device(config-if-e1000-2/11)# dual-mode 10
device(config-if-e1000-2/11)# exit
```

The following example shows how to configure multiple ports.

```
device# interface ethernet 1/1/6 to 1/1/9
device (config-mif-1/1/6-1/1/9)# dual-mode
```

dynamic

Configures dynamic ports.

Syntax

dynamic

no dynamic

Command Default

Ports are static.

Modes

Protocol VLAN configuration mode

Usage Guidelines

Dynamic ports within any protocol VLAN age out after 10 minutes if no member protocol traffic is received on a port within the VLAN. Once you dynamically add a port to a protocol VLAN, you cannot configure routing parameters on the port. You cannot dynamically add a port to a protocol VLAN if the port has any routing configuration parameters.

NOTE

Dynamic addition and removal of ports is not applicable for an AppleTalk protocol VLAN. You cannot route to or from protocol VLANs with dynamically added ports. In the switch image, all the ports are dynamic ports by default.

The **no** form of the command removes the dynamic setting.

Examples

The following example shows the IP protocol VLAN configured with dynamic ports.

```
device(config)# vlan 10
device(config-vlan-10)# ip-proto name IP_Prot_VLAN
device(config-vlan-ip-proto)# dynamic
```

The following example shows configuring port-based VLAN 10, and then configuring an IP subnet VLAN within the port-based VLAN with dynamic ports.

```
device(config)# vlan 10 name IP_VLAN by port
device(config-vlan-10)# untagged ethernet 1/1/1 to 1/1/6
added untagged port ethernet 1/1/1 to 1/1/6 to port-vlan 10.
device(config-vlan-10)# ip-subnet 10.1.1.0/24 name Mktg-LAN
device(config-vlan-ip-subnet)# dynamic
```

Commands A - E

dynamic

The following example shows configuring port-based VLAN 20, and then configuring an IPX network VLAN within the port-based VLAN with dynamic ports. These commands create a port-based VLAN on chassis ports 1/2/1 through 1/2/6 named "Eng-LAN", configure an IPX network VLAN within the port-based VLAN, and then add ports from the port-based VLAN dynamically.

```
device(config)# vlan 20 name IPX_VLAN by port
device(config-vlan-10)# untagged ethernet 1/2/1 to 1/2/6
added untagged port ethernet 1/2/1 to 1/2/6 to port-vlan 20.
device(config-vlan-10)# ipx-network abcd ethernet_ii name Eng-LAN
device(config-vlan-ipx-network)# dynamic
```

eee

Enables Energy Efficient Ethernet (EEE) globally, per port or on a range of ports.

Syntax

eee

no eee

Command Default

Energy Efficient Ethernet is not enabled.

Modes

Global configuration mode

Interface configuration mode

Usage Guidelines

The **no** form of the command disables Energy Efficient Ethernet.

Examples

The following example enables Energy Efficient Ethernet globally.

```
device(config)# eee
EEE Feature Enabled
```

The following example enables Energy Efficient Ethernet on multiple ports.

```
device(config)# interface ethernet 1/1/1 to 1/1/12
device(config-mif-1/1/1-1/1/12)# eee
EEE Feature Enabled
EEE Feature Enabled on port 1/1/1
EEE Feature Enabled on port 1/1/2
EEE Feature Enabled on port 1/1/3
EEE Feature Enabled on port 1/1/4
EEE Feature Enabled on port 1/1/5
EEE Feature Enabled on port 1/1/6
EEE Feature Enabled on port 1/1/7
EEE Feature Enabled on port 1/1/8
EEE Feature Enabled on port 1/1/9
EEE Feature Enabled on port 1/1/10
EEE Feature Enabled on port 1/1/11
EEE Feature Enabled on port 1/1/12
```

The following example enables Energy Efficient Ethernet per port.

```
device(config)# interface ethernet e1000-1/1/1
device(config-if-e1000-1/1/1)# eee
EEE Feature Enabled EEE on port 1/1/1
```

History

Release version	Command history
08.0.30	This command was introduced.

egress-buffer-profile

Attaches a user-configured egress buffer profile to one or more ports.

Syntax

egress-buffer-profile *profile-name*

no egress-buffer-profile *profile-name*

Command Default

If a port is not attached to a user-configured egress buffer profile, it uses the default egress buffer profile.

Parameters

profile-name

Specifies the name of the egress buffer profile to be attached to the port.

Modes

Interface mode

Multiple-interface mode

Usage Guidelines

The **no** form of this command removes a user-configured egress buffer profile from the port and the port uses the default egress buffer profile.

You must configure an egress buffer profile before you can attach it to a port.

Only one egress buffer profile at a time can be attached to any port. You can attach an egress buffer profile to more than one port.

Examples

The following example attaches an egress buffer profile named `egress1` to a port:

```
Device(config-if-e10000-1/1/1)# egress-buffer-profile egress1
```

The following example attaches an egress buffer profile named `egress2` to multiple ports:

```
Device(config-mif-1/1/2-1/1/16)# egress-buffer-profile egress2
```

The following example removes an egress buffer profile named `egress2` from multiple ports:

```
Device(config-mif-1/1/2-1/1/16)# no egress-buffer-profile egress2
```

History

Release version	Command history
8.0.10	This command was introduced.

enable aaa console

Enables AAA support for commands entered at the console.

Syntax

enable aaa console

no enable aaa console

Command Default

Command authorization and command accounting for console commands are not enabled.

Modes

Global configuration mode

Usage Guidelines

The Brocade device supports command authorization and command accounting for CLI commands entered at the console.

AAA support for commands entered at the console includes the following:

- The login prompt that uses AAA authentication, using authentication method lists
- EXEC authorization
- EXEC accounting
- Command authorization
- Command accounting
- System accounting

The **no** form of the command disables the support for AAA commands entered at the console.

NOTE

If you have previously configured the device to perform command authorization using a RADIUS server, entering the **enable aaa console** command may prevent the execution of any subsequent commands entered on the console. This happens because RADIUS command authorization requires a list of allowable commands from the RADIUS server. This list is obtained during RADIUS authentication. For console sessions, RADIUS authentication is performed only if you have configured **aaa authentication enable** and specified RADIUS as the authentication method (for example, with the **aaa authentication enable default radius** command). If RADIUS authentication is never performed, the list of allowable commands is never obtained from the RADIUS server. Consequently, there would be no allowable commands on the console.

Commands A - E
enable aaa console

Examples

The following example shows how to configure command authorization and command accounting for console commands.

```
device(config)# enable aaa console
```

enable-accounting

Enables Access Control List (ACL) accounting for IPv4 and IPv6 named ACLs.

Syntax

enable-accounting
no enable-accounting

Command Default

This option is disabled.

Modes

IPv4 and IPv6 access-list configuration modes

Usage Guidelines

This is only applicable to named ACLs. The **no** form of this command disables ACL accounting on the associated ACL interface.

Examples

The following example enables IPv6 ACL accounting. The named access-list must be configured before enabling the ACL accounting.

```
device(config)# ipv6 access-list v6
device(config-ipv6-access-list-v6)# enable-accounting
```

The following example enables ACL accounting for an IPv4 named ACL.

```
device(config)# ip access-list standard std
device(config-std-nacl)# permit 10.10.10.0/24
device(config-std-nacl)# deny 10.20.20.0/24
device(config-std-nacl)# enable-accounting
```

History

Release version	Command history
08.0.10	This command was introduced.

enable acl-per-port-per-vlan

Applies an inbound IPv4 ACL to specific VLAN members on a port (Layer 2 devices only) or to specific ports on a virtual interface (VE) (Layer 3 devices only).

Syntax

enable acl-per-port-per-vlan
no enable acl-per-port-per-vlan

Command Default

By default, an inbound IPv4 ACL is not applied to specific VLAN members on a port.

Modes

Global configuration mode

Usage Guidelines

This command is applicable to IPv4 ACLs only. IPv6 ACLs do not support ACL filtering based on VLAN membership or VE port membership. This command is not applicable to outbound traffic.

IPv4 ACLs that filter based on VLAN membership or VE port membership (ACL per port per VLAN), are supported together with IPv6 ACLs on the same device, as long as they are not bound to the same port or virtual interface.

The **enable acl-per-port-per-vlan** command must be followed by the **write-memory** and **reload** commands to place the change into effect.

The **no** form of the command disables the application of an inbound IPv4 ACL to a specific VLAN.

Examples

The following example applies an inbound IPv4 ACL to specific VLAN members on a port.

```
device(config)# enable acl-per-port-per-vlan
device(config)# write memory
device(config)# exit
device# reload
```

enable egress-acl-on-control-traffic

Enables applying outbound ACLs to traffic generated by the CPU.

Syntax

enable egress-acl-on-control-traffic

no enable egress-acl-on-control-traffic

Command Default

By default, outbound ACLs are not applied to traffic generated by the CPU.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command resets to the default; that is, outbound ACLs are not applied to traffic generated by the CPU.

Examples

The following example shows how to apply outbound ACLs to traffic generated by the CPU.

```
device(config)# enable egress-acl-on-control-traffic
```

enable (GVRP)

Enables GVRP on ports.

Syntax

```
enable { all | ethernet stackid/slot/port [ to stackid/slot/port | [ ethernet stackid/slot/port to stackid/slot/port | ethernet stackid/slot/port ]... ] }
```

```
no enable { all | ethernet stackid/slot/port [ to stackid/slot/port | [ ethernet stackid/slot/port to stackid/slot/port | ethernet stackid/slot/port ]... ] }
```

Command Default

GVRP is not enabled on ports.

Parameters

all

Enables GVRP on all ports.

ethernet *stackid/slot/port*

Enables GVRP on the specified port.

to *stackid/slot/port*

Specifies the range of ports upon which to enable GVRP.

Modes

GVRP configuration mode

Usage Guidelines

The **no** form of the command disables GVRP.

Examples

The following example shows how to enable GVRP on all ports.

```
device(config)# gvrp-enable  
device(config-gvrp)# enable all
```

The following example shows how to enable GVRP on a list of specific ports.

```
device(config)# gvrp-enable  
device(config-gvrp)# enable ethernet 1/1/24 ethernet 1/2/24 ethernet 1/4/17
```

The following example shows how to enable GVRP on a range of ports.

```
device(config)# gvrp-enable  
device(config-gvrp)# enable ethernet 1/1/1 to 1/1/8
```

The following example shows how to enable GVRP on a range of ports and a list of ports.

```
device(config)# gvrp-enable  
device(config-gvrp)# enable ethernet 1/1/1 to 1/1/8 ethernet 1/1/24 ethernet 1/6/24 ethernet 1/8/17
```

enable (LAG)

Enables an individual port within a LAG.

Syntax

enable port-name *name*

enable ethernet *stackid/slot/port* [**to** *stackid/slot/port*] [**ethernet** *stackid/slot/port to stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]

Command Default

Ports within a LAG are not enabled.

Parameters

port-name *name*

Enables a named port within a LAG.

ethernet *stackid/slot/port*

Enables the specified Ethernet port within the LAG.

to *stackid/slot/port*

Enables a range of ports within the LAG.

Modes

LAG configuration mode

Usage Guidelines

To enable a port belonging to a keep-alive LAG, you must use the **enable** command from the interface configuration mode.

Examples

The following example shows how to enable a port within a LAG configuration.

```
device(config)# lag blue static
device(config-lag-blue)# deploy
device(config-lag-blue)# enable ethernet 1/3/1
```

The following example shows how to enable a port within a LAG configuration.

```
device(config)# lag blue static
device(config-lag-blue)# deploy
device(config-lag-blue)# enable port-name port1
```

The following example shows how to enable a port belonging to a keep-alive LAG.

```
device(config)# lag test keep-alive
device(config-lag-test)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# enable
```

enable (MRP)

Enables the metro ring.

Syntax

enable
no enable

Command Default

The metro ring is disabled by default.

Modes

Metro ring configuration mode

Usage Guidelines

The **no** form of the command disables the metro ring.

Examples

The following example enables the metro ring.

```
device(config)# vlan 2
device(config-vlan-2)# metro-ring 1
device(config-vlan-2-mrp-1)# enable
```

enable-mka

Enables MACsec Key Agreement (MKA) to support MACSec licensing functionality on a specified interface, and changes the mode to dot1x-mka-interface mode to enable related parameters to be configured.

Syntax

enable-mka ethernet *device/slot/port*

no enable-mka ethernet *device/slot/port*

Command Default

MKA is not enabled on an interface.

Parameters

ethernet *device/slot/port*

Specifies an Ethernet interface and the number of the device, the slot on the device, and the port on that slot.

Modes

dot1x-mka-interface mode

Usage Guidelines

When the **no** version of the command is executed, MACSec is removed from the port.

MACsec commands are supported only on the ICX 7450.

For a MACsec channel to be created between two ports, both ports and devices designated must have MACsec enabled and configured.

The **enable-mka ethernet** command enables MACSec licensing on the specified interface. If the command is not enabled, MACSec licensing functionality is not supported.

Examples

The following example enables MACsec on port 2, slot 3 of the first device in the stack.

```
device(config)# dot1x-mka-enable
device(config-dot1x-mka)# enable-mka ethernet 1/3/2
device(config-dot1x-mka-1/3/2)#
```

The following error message is displayed when the MACSec license is not purchased for the device.

```
device(config)# dot1x-mka-enable
device (config-dot1x-mka)# enable-mka ethernet 2/2/1
Error: No MACsec License available for the port 2/2/1. Cannot enable MACsec !!!
Error: MKA cannot be enabled on port 2/2/1
device(config-dot1x-mka)#
```

History

Release version	Command history
08.0.20	This command was introduced.
08.0.30	Support for this command was added on the ICX 7450 device.

enable (Port)

Enables a port.

Syntax

enable

Command Default

A port is enabled (active).

Modes

Interface configuration mode

Usage Guidelines

A port can be deactivated (disabled) or activated (enabled) by selecting the appropriate status.

Examples

The following example enables a disabled port.

```
device(config)# interface ethernet 1/1/1  
device(config-if-e1000-1/1/1)# enable
```

enable (MAC Port Security)

Enables MAC port security.

Syntax

enable
no enable

Command Default

By default, MAC port security is disabled on all interfaces.

Modes

Port security configuration mode
Port security interface configuration mode

Usage Guidelines

The **no** form of the command disables the MAC port security.

Examples

The following example enables MAC port security on all interfaces.

```
device(config)# port security  
device(config-port-security)# enable
```

The following example enables MAC port security on a specific interface.

```
device(config)# interface ethernet 1/1/1  
device(config-if-e1000-1/1/1)# port security  
device(config-port-security-e1000-1/1/1)# enable
```

enable (VSRP)

Enables the VSRP VRID for a port-based VLAN.

Syntax

enable

disable

Command Default

The VSRP VRID is disabled by default.

Modes

VSRP VRID configuration mode

Usage Guidelines

The device must be set as a backup. Because VSRP does not have an owner, all VSRP devices are backups. The active device for a VRID is elected based on the VRID priority.

The **disable** command deactivates VSRP.

Examples

The following example shows how to enable the VSRP VRID on a VLAN.

```
device(config)# vlan 200
device(config-vlan-200)# tagged ethernet 1/1/1 to 1/1/8
device(config-vlan-200)# vsrp vrid 1
device(config-vlan-200-vrid-1)# backup
device(config-vlan-200-vrid-1)# enable
```

enable password-display

Enables the display of the community string.

Syntax

enable password-display
no enable password-display

Command Default

The display of the community string is not enabled.

Modes

Global configuration mode

Usage Guidelines

The **enable password-display** command enables display of the community string in the output of the **show snmp server** command. Display of the community string remains encrypted in the startup-config and running-config files. When the **enable password-display** command is configured, the user password and SNMP community string are encrypted in the **show run** command output.

The **no** form of the command disables the display of the community string in the output of the **show snmp server** command.

Examples

The following example shows how to enable the display of the community string.

```
device(config)# enable password-display
```

enable password-min-length

Configures the minimum length on the Line (Telnet), Enable, or Local passwords.

Syntax

enable password-min-length *length*

no enable password-min-length *length*

Command Default

The password length is one character.

Parameters

length

The number of characters or the length of the password. The range is from 1 through 48. The default is 1.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command resets the password length to the default.

Examples

The following example shows how to specify that the Line, Enable, and Local passwords be at least 8 characters.

```
device(config)# enable password-min-length 8
```

enable port-config-password

Allows read-and-write access for specific ports but not for global (systemwide) parameters.

Syntax

enable port-config-password [*password*]

no enable port-config-password [*password*]

Command Default

Read-write access for specific ports is not configured.

Parameters

password

Alphanumeric password string.

Modes

Global configuration mode

Usage Guidelines

You can set one password for each of the management privilege levels: Super User level, Port Configuration level, and Read Only level.

You also can configure up to 16 user accounts consisting of a username and password, and assign each user account to one of the three privilege levels.

NOTE

You must set the Super User level password before you can set other types of passwords.

NOTE

You must use the CLI to assign a password for management privilege levels. You cannot assign a password using the Web Management Interface.

The **no** form of the command removes the configured password access.

Examples

The following example shows how to set Port Configuration level password.

```
device(config)# enable port-config-password password1
```

enable read-only-password

Allows access to the Privileged EXEC mode and User EXEC mode of the CLI, but only with read access.

Syntax

enable read-only-password [*password*]

no enable read-only-password [*password*]

Command Default

Read access for the Privileged EXEC and User EXEC modes of the CLI is not configured.

Parameters

password

Alphanumeric password string.

Modes

Global configuration mode

Usage Guidelines

You can set one password for each of the management privilege levels: Super User level, Port Configuration level, and Read Only level.

You also can configure up to 16 user accounts consisting of a username and password, and assign each user account to one of the three privilege levels.

NOTE

You must set the Super User level password before you can set other types of passwords.

NOTE

You must use the CLI to assign a password for management privilege levels. You cannot assign a password using the Web Management Interface.

The **no** form of the command removes the configured password access.

Examples

The following example shows how to set Read Only level password.

```
device(config)# enable read-only-password password1
```

enable snmp

Enables SNMP access modes.

Syntax

enable snmp { **config-tacacs** | **config-radius** | **ve-statistics** }

no enable snmp { **config-tacacs** | **config-radius** | **ve-statistics** }

Command Default

The SNMP access modes for TACACS and RADIUS are disabled.

Parameters

config-tacacs

Enables TACACS configuration access mode.

config-radius

Enables RADIUS configuration access mode.

ve-statistics

Enables the display of virtual port statistics.

Modes

Global configuration mode

Usage Guidelines

To configure TACACS, TACACS+ or RADIUS authentication parameters, you must enable the corresponding SNMP access mode.

The **no** form of the command disables the SNMP access modes.

Examples

The following example shows how to enable the SNMP access mode for TACACS.

```
device(config)# enable snmp config-tacacs
```

The following example shows how to enable the SNMP access mode for RADIUS.

```
device(config)# enable snmp config-radius
```

The following example shows how to enable the display of virtual port statistics.

```
device(config)# enable snmp ve-statistics
```

enable strict-password-enforcement

Enables the password security feature.

Syntax

enable strict-password-enforcement

no enable strict-password-enforcement

Command Default

Strict password is not enforced.

Modes

Global configuration mode

Usage Guidelines

When strict password enforcement is enabled on the Brocade device, you must enter a minimum of eight characters containing the following combinations when you create an enable and a user password:

- At least two uppercase characters
- At least two lowercase characters
- At least two numeric characters
- At least two special characters

NOTE

Password minimum character and combination requirements are strictly enforced.

Passwords must not share four or more concurrent characters with any other password configured on the router. If the you try to create a password with four or more concurrent characters, an error message will be returned.

If you try to configure a password that was previously used, the Local User Account configuration will not be allowed and an error message will be displayed.

The **no** form of the command disables strict password enforcement.

Examples

The following example shows how to enable strict password enforcement.

```
device(config)# enable strict-password-enforcement
```

enable super-user-password

Allows complete read-and-write access to the system.

Syntax

enable super-user-password [*password*]

no enable super-user-password [*password*]

Command Default

Complete read-write access to the system is not configured.

Parameters

password

Alphanumeric password string.

Modes

Global configuration mode

Usage Guidelines

You can set one password for each of the management privilege levels: Super User level, Port Configuration level, and Read Only level. The **enable super-user-password** command is generally for system administrators only. The Super User privilege level allows you to configure passwords.

You also can configure up to 16 user accounts consisting of a username and password, and assign each user account to one of the three privilege levels.

You must set the Super User level password before you can set other types of passwords.

NOTE

You must use the CLI to assign a password for management privilege levels. You cannot assign a password using the Web Management Interface.

The **no** form of the command removes the configured password access.

Examples

The following example shows how to set the Super User level password.

```
device(config)# enable super-user-password password1
```

enable telnet

Configures Telnet access control parameters.

Syntax

enable telnet { **authentication** | **password** *password* }

no enable telnet { **authentication** | **password** *password* }

Command Default

Telnet authentication is not enabled and the Telnet password is not set.

Parameters

authentication

Enables Telnet authentication.

password *password*

Sets a password for Telnet access.

Modes

Global configuration mode

Usage Guidelines

To authenticate Telnet access to the CLI, you also must enable the authentication by entering the **enable telnet authentication** command. You cannot enable Telnet authentication using the Web Management Interface.

The **no** form of the command removes the Telnet authentication or Telnet password.

Examples

The following example shows how to enable Telnet authentication.

```
device(config)# enable telnet authentication
```

The following example shows how to set the password for Telnet access.

```
device(config)# enable telnet password pass1
```

enable user

Configures login and password parameters specific to a user.

Syntax

enable user { **disable-on-login-failure** [*invalid-attempts* **login-recovery-time** *recovery-time*] | **password-aging** | **password-history** [*previous-passwords*] | **password-masking** }

no enable user { **disable-on-login-failure** [*invalid-attempts* **login-recovery-time** *recovery-time*] | **password-aging** | **password-history** [*previous-passwords*] | **password-masking** }

Command Default

Three login attempts are allowed.

Three minutes of recovery time for re-enabling user accounts.

The Brocade device stores the last five user passwords for each user.

Parameters

disable-on-login-failure *invalid-attempts*

Specifies the number of login attempts before a user is locked out (disabled). The range is from 1 through 10. The default is 3.

login-recovery-time *recovery-time*

Specifies the recovery time in minutes after which the locked-out user accounts are re-enabled automatically. The range is from 3 through 60 minutes. The default is 3 minutes.

password-aging

Enables password aging.

password-history *previous-passwords*

Specifies how many previous passwords should be stored. The range is from 1 through 15. The default is 5.

password-masking

Enables password masking.

Modes

Global configuration mode

Usage Guidelines

When password masking is enabled, the CLI displays an asterisk (*) on the console instead of the actual password character entered.

When password aging is enabled, the software records the system time that each user password was configured or last changed. After 180 days, the CLI automatically prompts users to change their passwords when they attempt to sign on. The time displays in the output of the **show running configuration** command, indicated by set-time.

When changing a user password, the user cannot use any of the five previously configured passwords. You can configure the Brocade device to store up to 15 passwords for each user, so that users do not use the same password multiple times. If a user attempts to use a password that is stored, the system prompts the user to choose a different password.

If a user fails to log in after three attempts, that user is locked out. You can increase or decrease the number of login attempts before the user is locked-out.

The **no** form of **enable user disable-on-login-failure** disables both the maximum number of login attempts and recovery time configurations. To disable only the recovery time configuration, use the **no enable user { disable-on-login-failure [invalid-attempts login-recovery-time recovery-time] }** command.

The **no** form of the command removes the login and password configurations.

Examples

The following example sets the number of login attempts for a user to 10.

```
device(config)# enable user disable-on-login-failure 10
```

The following example configures the user account to automatically re-enable the locked-out users after 5 minutes of the lockout .

```
device(config)# enable user disable-on-login-failure 4 login-recovery-time 5
```

The following example shows enables password aging.

```
device(config)# enable user password-aging
```

The following example enables password masking. The following example shows how the CLI displays an asterisk (*) on the console instead of the actual password character entered.

```
device(config)# enable user password-masking
```

```
device(config)# username xyz password
Enter Password: *****
```

The following example configures the device to store up to 10 previous passwords.

```
device(config)# enable user password-history 10
```

History

Release version	Command history
8.0.40	The command was modified to include login-recovery-time <i>recovery-time</i> option was introduced.

enable (Web Authentication)

Enables Web Authentication.

Syntax

enable
no enable

Command Default

Web Authentication is disabled.

Modes

Web Authentication configuration mode

Usage Guidelines

The **no** form of the command disables Web Authentication.

Examples

The following example enables Web Authentication on VLAN 10.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# enable
```

encapsulation-mode

Specifies the encapsulation mode for an IPsec proposal.

Syntax

encapsulation-mode *encapsulation-mode*

Command Default

The default encapsulation mode is tunnel mode.

Parameters

encapsulation-mode

Specifies the encapsulation mode. Only tunnel mode is currently supported.

Modes

IPsec proposal configuration mode

Usage Guidelines

Because tunnel mode is configured by default and is the only mode that is currently supported, you do not need to configure the encapsulation mode for an IPsec proposal.

Examples

The following example shows how to configure tunnel mode as the encapsulation mode for an IPsec proposal named ipsec_proposal.

```
device(config)# ipsec proposal ipsec_proposal
device(config-ipsec-proposal-ipsec_proposal)# encapsulation-mode tunnel
```

History

Release version	Command history
8.0.50	This command was introduced.

encryption

Configures an encryption algorithm for an Internet Key Exchange version 2 (IKEv2) proposal.

Syntax

encryption { **aes-cbc-128** | **aes-cbc-256** }

no encryption { **aes-cbc-128** | **aes-cbc-256** }

Command Default

The default encryption algorithm is AES-CBC-256.

Parameters

aes-cbc-128

Specifies the 128-bit advanced encryption standard algorithm in cipher block chaining mode.

aes-cbc-256

Specifies the 256-bit advanced encryption standard algorithm in cipher block chaining mode.

Modes

IKEv2 proposal configuration mode

Usage Guidelines

Multiple encryption algorithms may be configured for an IKEv2 proposal.

When only one encryption algorithm is configured for an IKEv2 proposal, removing it restores the default configuration.

The **no** form of the command removes the specified encryption algorithm configuration.

Examples

The following example shows how to configure the AES-CBC-128 encryption algorithm for an IKEv2 proposal named `ikev2_proposal`.

```
device(config)# ikev2 proposal ikev2_proposal
device(config-ikev2-proposal-ikev2_proposal)# encryption aes-cbc-128
```

History

Release version	Command history
8.0.50	This command was introduced.

encryption-algorithm

Configures an encryption algorithm to protect data traffic for an IPsec proposal.

Syntax

```
encryption-algorithm { aes-gcm-256 | aes-gcm-128 }  
no encryption-algorithm { aes-gcm-256 | aes-gcm-128 }
```

Command Default

The default encryption algorithm for an IPsec proposal is AES-GCM-256.

Parameters

aes-gcm-256

Specifies that the 256-bit advanced encryption standard algorithm in Galois counter mode is supported for Encapsulating Security Payload (ESP) encryption.

aes-gcm-128

Specifies that the 128-bit advanced encryption standard algorithm in Galois counter mode is supported for ESP encryption.

Modes

IPsec proposal configuration mode

Usage Guidelines

Multiple encryption algorithms may be configured for an IPsec proposal.

For an IPsec tunnel to come up successfully, IPsec peer devices must be configured with a common encryption algorithm.

Ruckus ICX 7450 supports dual mode for encryption and decryption. Dual mode is set when both the AES-GCM-128 and AES-GCM-256 algorithms are set for the same IPsec proposal (no further configuration is needed to establish dual mode).

When dual mode is configured on both the local and remote peers, AES-GCM-256 is automatically selected for encryption and decryption.

When dual mode is not configured on both the local and remote peers, the algorithm that is configured on both peers is automatically selected for encryption and decryption.

When only one encryption algorithm is configured for an IPsec proposal, removing it restores the default configuration.

The **no** form of the command removes the specified encryption algorithm configuration.

Examples

The following example shows how to configure the AES-GCM-128 encryption algorithm for an IPsec proposal named ipsec_prop.

```
device(config)# ipsec proposal ipsec_prop  
device(config-ipsec-proposal-ipsec_prop)# encryption-algorithm aes-gcm-128
```

History

Release version	Command history
8.0.50	This command was introduced.

enforce-first-as

Enforces the use of the first autonomous system (AS) path for external BGP (eBGP) routes.

Syntax

enforce-first-as
no enforce-first-as

Modes

BGP configuration mode

Usage Guidelines

This command causes the router to discard updates received from eBGP peers that do not list their AS number as the first AS path segment in the AS_PATH attribute of the incoming route.

The **no** form of the command disables this feature.

Examples

The following example configures the device to enforce the use of the first AS path.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# enforce-first-as
```

erase flash

Erases an image stored in the system flash.

Syntax

```
erase flash { primary | secondary | unit-id-pri string | unit-id-sec string }
```

Parameters

primary

Erases the primary code image.

secondary

Erases the secondary code image.

unit-id-pri *string*

Erases the primary code image from the specified stack members. You can specify **all** or a member list without blank spaces (2,3,5-7).

unit-id-sec *string*

Erases the secondary code image from the specified stack members. You can specify **all** or a member list without blank spaces (2,3,5-7).

Modes

Privileged EXEC mode

Usage Guidelines

Use this command to erase the files stored in the primary or secondary flash or on the stack units.

Examples

The following example erases the image stored in the secondary flash of the system.

```
device# erase flash secondary
```

The following example erases the image stored in the secondary flash of a set of stack units.

```
device# erase flash unit-id-sec 3,4,5-8,9
```

erase startup-config

Erases the startup configuration.

Syntax

```
erase startup-config [ unit-id unit-list ]
```

Parameters

unit-id *unit-list*

Erases the startup configuration file from the specified stack member. The member list is specified without blank spaces (2,3,5-7).

Modes

Privileged EXEC mode

Examples

The following example erases the startup configuration from specified members in a stack.

```
device# erase startup-config unit-id 2,5,7-8,10
```

errdisable packet-inerror-detect

Enables the device to monitor configured ports for inError packets and defines the sampling time interval in which the number of inError packets is counted.

Syntax

errdisable packet-inerror-detect *sampling-interval*
no errdisable packet-inerror-detect *sampling-interval*

Command Default

There is no monitoring for inError packets on any port of the device.

Parameters

sampling-interval
Specifies the sampling interval in seconds. It can take a value in the inclusive range of 2 through 60 seconds.

Modes

Global configuration mode

Usage Guidelines

If the number of inError packets exceeds the configured threshold for two consecutive sampling windows, then the configured port is error-disabled. The **no** form of this command disables this monitoring.

Examples

The following example sets the sampling interval in which the number of inError packets is counted to three seconds.

```
device(config)# errdisable packet-inerror-detect 3
```

History

Release version	Command history
07.3.00g	This command was introduced.

errdisable recovery

Enables a port to recover automatically from the error-disabled state.

Syntax

```
errdisable recovery cause { all | cause }
no errdisable recovery cause { all | cause }
errdisable recovery interval time
no errdisable recovery interval time
```

Command Default

The ports in the error-disabled state are not recovered.

Parameters

all

Enables the ports to automatically recover from an error-disabled state caused by reasons such as BPDU guard violation, the number of inError packets exceeding the configured threshold, a loop-detection violation, or due to reception of a critical event from the remote device in the case of EFM-OAM interface.

cause

Configures the ports to recover from an error-disabled state caused by a specific reason which can be any of the following:

- **bpduguard**
- **loam-critical-event**
- **loop-detection**
- **packet-inerror-detect**

bpduguard

Configures the port to recover from the error-disabled state if the state was caused because of BPDU guard violation.

loam-critical-event

Configures the EFM-OAM interface to recover from the error-disabled state if the state was caused due to reception of a critical event from the remote device.

loop-detection

Configures the port to recover from the error-disabled state if the state was caused because of loop detection.

packet-inerror-detect

Configures the port to recover from the error-disabled state if the state was caused because the number of inError packets exceeded the configured threshold.

interval

Configures a timeout value for the recovery mechanism when the port is in an error-disabled state. Upon the expiry of the timeout value, the ports are automatically recovered.

time

Specifies the recovery time interval in seconds for the device to wait before automatically recovering the ports. The valid values are from 10 through 65535 seconds. The default recovery timeout value is 300 seconds.

Modes

Global configuration mode

Usage Guidelines

When automatic recovery re-enables the port, the port is not in the error-disabled state, but it can remain down for other reasons, such as the Tx/Rx of the fibre optic not being seated properly. Thus, the port is not able to receive the signal from the other side. In this case, after the optic is inserted correctly, you should manually disable the port and then enable it.

The **no** form of the **errdisable recovery cause** command disables the error-disabled recover functionality.

The **no** form of the **errdisable recovery interval** command reverts to the default recovery time interval value.

Examples

The following example configures the device to recover the port from the error-disabled state caused because of BPDU guard violation.

```
device(config)# errdisable recovery bpduguard
```

The following example configures the device to recover the EFM-OAM interface from the error-disabled state caused by reception of a critical event from the remote device.

```
device(config)# errdisable recovery loam-critical-event
```

The following example configures the device to recover the port from the error-disabled state caused because of loop detection.

```
device(config)# errdisable recovery loop-detection
```

The following example configures the device to recover the port from the error-disabled state caused because the number of inError packets exceeded the configured threshold.

```
device(config)# errdisable recovery packet-inerror-detect
```

The following example configures the error-disabled recovery timeout interval as 120 seconds.

```
device(config)# errdisable recovery interval 120
```

History

Release version	Command history
08.0.30	The loam-critical-event option was introduced.

ethernet (EFM-OAM)

Enables or disables EFM-OAM on an interface or multiple interfaces.

Syntax

ethernet *stackid/slot/port* [[**to** *stackid/slot/port*] [**ethernet** *stackid/slot/port*] ...] { **active** | **passive** | **allow-loopback** | **remote-failure critical-event action block-interface** }

no ethernet *stackid/slot/port* [[**to** *stackid/slot/port*] [**ethernet** *stackid/slot/port*] ...] { **active** | **passive** | **allow-loopback** | **remote-failure critical-event action block-interface** }

Command Default

The EFM-OAM is disabled locally on an interface.

Parameters

ethernet *stackid/slot/port*

Specifies the interface.

to

Configures the range of interfaces to enable EFM-OAM.

active

Sets the EFM-OAM operational mode as active on the interface.

passive

Sets the EFM-OAM operational mode as passive on the interface.

allow-loopback

Enables the interface to respond to a loopback request from the remote device.

remote-failure critical-event action block-interface

Configures the device to block the remote interface upon reception of a critical event information from the remote interface.

Modes

EFM-OAM protocol configuration mode

Usage Guidelines

When the active mode is specified, the device can send OAMPDU packets over the port to initiate an EFM-OAM discovery process. For the discovery process to be initiated, the EFM-OAM protocol must be enabled.

When the passive mode is specified, the device cannot use the port to send OAMPDU packets, but can respond if it receives OAMPDUs from the remote device.

When both peers are in passive mode (abnormal configuration), EFM-OAM protocol will not converge.

The OAMPDUs and pause frames will not be looped back in the loopback mode. All other Layer 2 protocol packets will be looped back if received on a loopbacked interface.

The **no** form of the command disables the EFM-OAM locally on the specified interface.

Examples

The following example enables EFM-OAM on an interface and sets it to active mode.

```
device(config)# link-oam  
device(config-link-oam)# ethernet 1/1/3 active
```

The following example enables EFM-OAM on a range of interfaces and sets them to active mode.

```
device(config)# link-oam  
device(config-link-oam)# ethernet 1/1/4 to 1/1/8 active
```

The following example enables EFM-OAM on an interface and sets it to passive mode.

```
device(config)# link-oam  
device(config-link-oam)# ethernet 2/1/1 passive
```

The following example enables EFM-OAM on a range of interfaces and sets them to passive mode.

```
device(config)# link-oam  
device(config-link-oam)# ethernet 2/1/1 to 2/1/6 passive
```

The following example configures the interface to respond to the loopback request from the remote device.

```
device(config)# link-oam  
device(config-link-oam)# ethernet 1/1/3 allow-loopback
```

The following example sets the device to block the interface when a critical event failure condition is detected.

```
device(config)# link-oam  
device(config-link-oam)# ethernet 2/1/1 remote-failure critical-event action block-interface
```

History

Release version	Command history
08.0.30	This command was introduced.

ethernet loopback

Enables the Ethernet loopback functionality on a port in the VLAN-unaware mode.

Syntax

ethernet loopback

no ethernet loopback

Command Default

Ethernet loopback is not enabled on a port.

Modes

Interface configuration mode

Usage Guidelines

The Ethernet loopback functionality on a port in the VLAN-unaware mode can be configured either as flow-aware or flow-unaware. The specified port does not need to be explicitly assigned as a member of any VLAN.

To enable Ethernet loopback on a port in the VLAN-unaware mode as flow-aware, the **ethernet loopback test-mac** command must be executed before enabling the Ethernet loopback. The **ethernet loopback test-mac** command is mandatory on Brocade ICX 7750, Brocade ICX 7450, and Brocade ICX 7250 devices. To enable Ethernet loopback on these devices, you must first configure the **ethernet loopback test-mac** command. In other supported platforms, the **ethernet loopback test-mac** command is optional to enable Ethernet loopback.

A port cannot be configured as VLAN-aware and VLAN-unaware simultaneously, and the flow configuration must be either flow-aware or flow-unaware.

The **ethernet loopback** command is not supported on multiple ports (MIF) mode.

The **no** form of the command disables the Ethernet loopback functionality on the specified port.

Examples

The following example configures Ethernet loopback on a specific port in the VLAN-unaware mode as flow-unaware.

```
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# ethernet loopback
```

The following example configures Ethernet loopback in VLAN-unaware mode as flow-aware.

```
device# configure terminal
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# ethernet loopback test-mac 1111.2222.3333 4444.5555.5555
device(config-if-e1000-1/1/1)# ethernet loopback
```

History

Release version	Command history
08.0.30	This command was introduced.

ethernet loopback (VLAN-aware)

Configures the Ethernet loopback functionality on one or a set of ports in a specific VLAN (VLAN-aware mode).

Syntax

ethernet loopback ethernet *stackid/slot/port* [[**to** *stackid/slot/port*] [**ethernet** *stackid/slot/port*]...]

no ethernet loopback ethernet *stackid/slot/port* [[**to** *stackid/slot/port*] [**ethernet** *stackid/slot/port*]...]

Command Default

Ethernet loopback is not enabled on any port in a VLAN.

Parameters

ethernet

Specifies the Ethernet interface.

to

Configures the range of ports.

stackid/slot/port

Specifies the interface details.

Modes

VLAN configuration mode

Usage Guidelines

The Ethernet loopback functionality on a port in the VLAN-aware mode can be configured either as flow-aware or flow-unaware. The ports on which Ethernet loopback is being enabled must be explicitly assigned as a member of the VLAN.

To enable Ethernet loopback on a port in the VLAN-aware mode as flow-aware, the **ethernet loopback test-mac** command must be executed for the specific port from the interface mode before enabling Ethernet loopback. The **ethernet loopback test-mac** command is mandatory on Brocade ICX 7750, Brocade ICX 7450, and Brocade ICX 7250 devices. To enable Ethernet loopback on these devices, you must first configure the **ethernet loopback test-mac** command. In other supported platforms, the **ethernet loopback test-mac** command is optional to enable Ethernet loopback.

A port cannot be configured as VLAN-aware and VLAN-unaware simultaneously, and the flow configuration must be either flow-aware or flow-unaware.

The **ethernet loopback** command in VLAN-aware mode is not supported on VLAN Group, VLAN Range, or mult-range VLAN (MVLAN) mode.

The **ethernet loopback** command VLAN-aware mode cannot be configured on a set of VLANs that share a Layer 2 topology (Topology Group).

The **no** form of the command disables Ethernet loopback from the ports of the specified VLAN.

Examples

The following example configures Ethernet loopback in VLAN-aware mode as flow-aware.

```
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# ethernet loopback test-mac 1111.2222.3333 4444.5555.5555
device(config-if-e1000-1/1/1)# exit
device(config)# vlan 100
device(config-vlan-100)# ethernet loopback ethernet 1/1/1 to 1/1/10
```

The following example configures Ethernet loopback on a port in VLAN-aware mode as flow-unaware.

```
device(config)# vlan 100
device(config-vlan-100)# ethernet loopback ethernet 1/1/1
```

The following example configures Ethernet loopback on a range of ports in VLAN-aware mode as flow-unaware.

```
device(config)# vlan 100
device(config-vlan-100)# ethernet loopback ethernet 1/1/1 to 1/1/10
```

The following example configures Ethernet loopback on two separate ports in VLAN-aware mode as flow-unaware.

```
device(config)# vlan 100
device(config-vlan-100)# ethernet loopback ethernet 1/1/1 ethernet 1/2/3
```

History

Release version	Command history
08.0.30	This command was introduced.

ethernet loopback test-mac

Configures the port as flow-aware by specifying the source and destination MAC addresses of the flow on the interface.

Syntax

ethernet loopback test-mac *destination-MAC source-MAC*

no ethernet loopback test-mac *destination-MAC source-MAC*

Command Default

The port is flow-unaware.

Parameters

destination-MAC

Specifies the flow parameter destination MAC address of the traffic.

source-MAC

Specifies the flow parameter source MAC address of the traffic.

Modes

Interface configuration mode

Usage Guidelines

You must configure the **ethernet loopback test-mac** command on Brocade ICX 7750, Brocade ICX 7450, and Brocade ICX 7250 devices before enabling Ethernet loopback. In other supported platforms, configure the **ethernet loopback test-mac** command only if you require the port to be flow-aware.

The source MAC address and destination MAC address must be unicast MAC addresses and the source MAC address must be unique across the network for proper Ethernet loopback operation.

You cannot configure a port as flow-aware and flow-unaware simultaneously. The flow can be configured on an in-service Ethernet loopback port. However, the flow configuration cannot be modified or removed if there is an ongoing loopback service on the interface.

The **ethernet loopback test-mac** command is not supported in multi-range VLAN (MVLAN) mode.

The **no** form of the command removes the flow configuration for the specified port.

Examples

The following example configures the flow on a specific port.

```
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# ethernet loopback test-mac 1111.2222.3333/4444.5555.5555
```

History

Release version	Command history
08.0.30	This command was introduced.

excluded-address

Specifies the addresses that should be excluded from the address pool.

Syntax

excluded-address { *address* | *address-low address-high* }

Parameters

address

Specifies a single address.

address-low address-high

Specifies a range of addresses.

Modes

DHCP server pool configuration mode.

Usage Guidelines

Use this command to specify either a single address or a range of addresses that are to be excluded from the address pool.

Examples

The following example specifies the excluded address.

```
device(config)# ip dhcp-server-pool cabo  
device(config-dhcp-cabo)# excluded-address 10.2.3.44
```

exclude ethernet

Excludes a port from the protocol VLAN membership.

Syntax

exclude ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port to stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]

no exclude ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port to stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]

Command Default

The port is not excluded from the protocol VLAN membership.

Parameters

stackid/slot/port

Specifies the Ethernet port which should be excluded from the static protocol VLAN membership.

to *stackid/slot/port*

Specifies the range of ports that should be excluded from the static protocol VLAN membership.

Modes

IP protocol VLAN configuration mode

IPX protocol VLAN configuration mode

IPv6 protocol VLAN configuration mode

AppleTalk protocol VLAN configuration mode

DECnet protocol VLAN configuration mode

NetBIOS protocol VLAN configuration mode

Other protocol VLAN configuration mode

Usage Guidelines

The **no** form of the command includes in the protocol VLAN membership.

Examples

The following example shows how to exclude ports from the protocol VLAN membership.

```
device(config)# vlan 10
device(config-vlan-10)# atalk-proto name Red
device(config-atalc-PROTO)# no dynamic
device(config-atalc-PROTO)# exclude ethernet 1/1/1 to 1/1/3
```

execute batch

Issues the commands that are saved in the batch buffer immediately or at a scheduled time, count, and interval.

Syntax

execute batch *batch-id* { **after** *duration* | **at** *at-time at-date* | **cancel** }

execute batch *batch-id* **now** [{ **count** *count-value* | **end** *end-date* [*end-time*] } [**interval** { **days** *value* | **hours** *value* | **mins** *value* }]]

execute batch *batch-id* **begin** *start-date* [[*start-time*] [**end** *end-date* [*end-time*]] [**interval** { **days** *value* | **hours** *value* | **mins** *value* }] | **count** *count-value* [**interval** { **days** *value* | **hours** *value* | **mins** *value* }] | **end** *end-date*]

Command Default

Batch execution of CLI commands is not enabled.

Parameters

batch-id

Specifies the unique batch buffer ID.

after *duration*

Schedules to run the commands in a batch after a specified period of time. The duration can be configured up to a maximum period of 49 days from the current system clock time. The duration is specified in the dd:hh:mm format indicating that the commands will be executed after the specified number of days, hours and minutes respectively.

at *at-time at-date*

Schedules to run the commands in a batch at a specific time and date.

cancel

Cancels the configured schedule to run the commands in a batch.

now

Issues the commands immediately.

count *count-value*

Specifies the number of times the commands in a batch must run. The range for the number of iterations is from 1 through 50.

end *end-date*

Specifies the date on which the batch command execution must stop. An end-date must be specified, followed by an end-time which is optional.

end-time

Specifies the time at which the batch command execution must stop. The default end-time is 23:59:59 of the specified end-date.

interval

Specifies the time interval at which the commands in a batch must run. The default value is 30 minutes. The time interval can be specified in days, hours, or minutes.

days *value*

Specifies the time interval in days at which the commands in a batch must run. The range is from 1 through 16 days.

hours *value*

Specifies the time interval in hours at which the commands in a batch must run. The range is from 1 through 24 hours.

mins *value*

Specifies the time interval in minutes at which the commands in a batch must run. The range is from 1 through 60 minutes.

begin

Schedules to run the commands in a batch from a specific date.

start-date

Specifies the date on which the batch command execution must start.

start-time

Specifies the time at which the batch command execution must start. The default start-time is 00:00:00 of the specified start-date.

Modes

Privileged EXEC mode

Usage Guidelines

At a particular instance, a batch can be scheduled only once.

A batch buffer cannot be scheduled when the batch execution process for that batch is in progress.

When a telnet or SSH session executing a batch command is closed, the corresponding batch execution will be cancelled.

Any command that requires user intervention will fail during batch execution.

The **no batch buffer** *batch-id* command from the global configuration mode removes the configured batch.

Examples

The following example runs the commands that are saved in the batch buffer after 5 days, 3 hours, and 1 minute from the current system clock time.

```
device# execute batch 1 after 05:03:01
```

The following example runs the commands that are saved in the batch buffer at 04:05 AM on December 22, 2015.

```
device# execute batch 1 at 04:05:00 22-12-15
```

The following example runs the commands that are saved in the batch buffer immediately.

```
device# execute batch 1 now
```

The following example runs the commands that are saved in the batch buffer immediately and for a total of 5 times at an interval of 30 minutes (default interval).

```
device# execute batch 1 now count 5
```

The following example runs the commands that are saved in the batch buffer immediately and for a total of 5 times at an interval of 2 hours.

```
device# execute batch 1 now count 5 interval hours 2
```

The following example runs the commands that are saved in the batch buffer immediately and continues to execute the batch at an interval of 30 minutes (default interval) until 11:59 PM and 59 seconds (default end-time) on December 22, 2015.

```
device# execute batch 1 now end 12-22-15
```

The following example runs the commands that are saved in the batch buffer immediately and continues to execute the batch at an interval of 30 minutes (default interval) until 10:20 AM on December 22, 2015.

```
device# execute batch 1 now end 12-22-15 10:20:00
```

The following example runs the commands that are saved in the batch buffer immediately and continues to execute the batch at an interval of 4 days until 10:20 AM on December 22, 2015.

```
device# execute batch 1 now end 12-22-15 10:20:00 interval days 4
```

The following example cancels the configured schedule to issue the commands in a batch.

```
device# execute batch 1 cancel
```

The following example runs the commands that are saved in the batch buffer infinitely starting from 12 AM (midnight) (default start-time) on December 22, 2015 at an interval of 30 minutes (default interval).

```
device# execute batch 1 begin 12-22-15
```

The following example runs the commands that are saved in the batch buffer infinitely starting from 12 AM (midnight) (default start-time) on December 22, 2015 at an interval of 4 hours.

```
device# execute batch 1 begin 12-22-15 interval hours 4
```

The following example runs the commands that are saved in the batch buffer starting from 12 AM (midnight) (default start-time) on December 10, 2015 and continues to execute the batch at an interval of 30 minutes (default interval) until 11:59 PM and 59 seconds (default end-time) on December 22, 2015

```
device# execute batch 1 begin 12-10-15 end 12-22-15
```

The following example runs the commands that are saved in the batch buffer infinitely starting from 3:20 AM on December 22, 2015 at an interval of 30 minutes (default interval).

```
device# execute batch 1 begin 12-22-15 03:20:00
```

The following example runs the commands that are saved in the batch buffer infinitely starting from 3:20 AM on December 22, 2015 at an interval of 3 days.

```
device# execute batch 1 begin 12-22-15 03:20:00 interval days 3
```

The following example runs the commands that are saved in the batch buffer starting from 3:20 AM on December 10, 2015 and continues to execute the batch at an interval of 30 minutes (default interval) until 11:59 PM and 59 seconds (default end-time) on December 22, 2015.

```
device# execute batch 1 begin 12-10-15 03:20:00 end 12-22-15
```

Commands A - E

execute batch

The following example runs the commands that are saved in the batch buffer starting from 3:20 AM on December 10, 2015 and continues to execute the batch at an interval of 4 hours until 4:10 AM on December 22, 2015.

```
device# execute batch 1 begin 12-10-15 03:20:00 end 12-22-15 04:10:00 interval hours 4
```

The following example runs the commands that are saved in the batch buffer starting from 12 AM (midnight) (default start-time) on December 10, 2015 and for a total of 5 times at an interval of 30 minutes (default interval).

```
device# execute batch 1 begin 12-10-15 count 5
```

History

Release version	Command history
8.0.40	The begin keyword and corresponding options were introduced. Also, options such as count and end were added to the now keyword.

external-lsdb-limit (OSPFv2)

Configures the maximum size of the external link state database (LSDB).

Syntax

external-lsdb-limit *value*
no external-lsdb-limit

Parameters

value

Maximum size of the external LSDB. Valid values range from 1 through 14913080. The default is 14913080.

Modes

OSPF router configuration mode

OSPF router VRF configuration mode

Usage Guidelines

If you change the value, make sure to save the running-config file and reload the software. The change does not take effect until you reload or reboot the software.

The **no** form of the command restores the default setting.

Examples

The following example sets the limit of the LSDB to 20000.

```
device# configure terminal
device(config)# router ospf
device(config-ospf-router)# external-lsdb-limit 20000
```

external-lsdb-limit (OSPFv3)

Configures the maximum size of the external link state database (LSDB).

Syntax

external-lsdb-limit *value*
no external-lsdb-limit

Parameters

value

Maximum size of the external LSDB. Valid values range from 1 through 250000. The default is 250000.

Modes

OSPFv3 router configuration mode

OSPFv3 router VRF configuration mode

Usage Guidelines

If you change the value, you must save the running-config file and reload the software. The change does not take effect until you reload or reboot the software.

The **no** form of command reverts to the default setting.

Examples

The following example sets the limit of the external LSDB to 15000.

```
device# configure terminal
device(config)# ipv6 router ospf
device(config-ospf6-router)# external-lsdb-limit 15000
```

Commands F - J

failover

Enables or disables LAG (Link Aggregation Group) hardware failover on the next port in LAG or on all ports in LAG.

Syntax

failover {next | all}

no failover {next | all}

Command Default

LAG hardware failover is disabled.

Parameters

next

Specifies that failover is to be enabled or disabled on the next port in LAG.

all

Specifies that failover is to be enabled or disabled on all ports in LAG.

Modes

Dynamic LAG configuration mode

Usage Guidelines

The **no** form of this command disables LAG hardware failover.

LAG hardware failover is supported only on Brocade ICX 7750 devices.

Examples

The following example enables LAG failover on the next port in LAG:

```
device(config)# lag one dynamic
device(config-lag-one)# failover next
```

The following example enables LAG failover on all ports in LAG:

```
device(config)# lag one dynamic
device(config-lag-one)# failover all
```

History

Release version	Command history
08.0.10	This command was introduced.

fast-external-fallover

Resets the session if a link to an eBGP peer goes down.

Syntax

fast-external-fallover

no fast-external-fallover

Modes

BGP configuration mode

Usage Guidelines

Use this command to terminate and reset external BGP sessions of a directly adjacent peer if the link to the peer goes down, without waiting for the timer, set by the BGP **timers** command, to expire. This can improve BGP convergence time, but can also lead to instability in the BGP routing table as a result of a flapping interface.

Examples

The following example configures the device to reset the session if a link to an eBGP peer goes down.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# fast-external-fallover
```

fast port-span

Enables Fast Port Span, configuring the ports attached to the end stations to enter into the forwarding state in four seconds.

Syntax

fast port-span [**exclude ethernet** *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*]...]]

no fast port-span [**exclude ethernet** *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*]...]]

Command Default

Fast Port Span is enabled by default on all ports that are attached to end stations.

Parameters

exclude

Excludes a port from Fast Port Span while leaving Fast Port Span enabled globally.

ethernet *stackid/slot/port*

Specifies the Ethernet port that you want to exclude from Fast Port Span.

to *stackid/slot/port*

Specifies a range of Ethernet ports that you want to exclude from Fast Port Span.

Modes

Global configuration mode

VLAN configuration mode

Usage Guidelines

Disabling and then re-enabling Fast Port Span clears the exclude settings and thus enables Fast Port Span on all eligible ports. To make sure Fast Port Span remains enabled on the ports following a system reset, save the configuration changes to the startup-config file after you re-enable Fast Port Span. Otherwise, when the system resets, those ports will again be excluded from Fast Port Span.

Fast Port Span allows faster convergence on ports that are attached to end stations and thus do not present the potential to cause Layer 2 forwarding loops. Because the end stations cannot cause forwarding loops, they can safely go through the STP state changes (blocking to listening to learning to forwarding) more quickly than is allowed by the standard STP convergence time. Fast Port Span performs the convergence on these ports in four seconds (two seconds for listening and two seconds for learning).

Fast Port Span is a system-wide parameter and is enabled by default. Thus, when you boot a device, all the ports that are attached only to end stations run Fast Port Span. For ports that are not eligible for Fast Port Span, such as ports connected to other networking devices, the device automatically uses the normal STP settings.

The **no** form of the command disables Fast Port Span. Using the **exclude** option with the **no** form of the command enables Fast Port Span on the specified ports.

Examples

The following example enables Fast Port Span on all ports.

```
device(config)# fast port-span
```

The following example excludes a set of ports from Fast Port Span.

```
device(config)# fast port-span exclude ethernet 1/1/1 ethernet 1/2/1 ethernet 1/3/1
```

The following example shows how to re-enable Fast Port Span on port 1/1/1 only while not re-enabling other excluded ports.

```
device(config)# no fast port-span exclude 1/1/1
```

The following example shows how to re-enable Fast Port Span on all excluded ports.

```
device(config)# no fast port-span  
device(config)# fast port-span  
device(config)# write memory
```

fast uplink-span

Enables Fast Uplink Span, configuring a device deployed as a wiring closet switch to decrease the convergence time for the uplink ports to another device to just one second.

Syntax

fast uplink-span ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]

no fast uplink-span ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]

Command Default

Fast Uplink Span is not enabled.

Parameters

ethernet *stackid/slot/port*

Specifies the Ethernet port on which you want to enable Fast Uplink Span.

to *stackid/slot/port*

Specifies a range of ports on which you want to enable Fast Uplink Span.

Modes

Global configuration mode

VLAN configuration mode

Usage Guidelines

The new uplink port goes directly to forward mode (bypassing listening and learning modes). The wiring closet switch must be a Brocade device, but the device at the other end of the link can be a Brocade device or another vendor's switch.

To configure Fast Uplink Span, specify a group of ports that have redundant uplinks on the wiring closet switch (Brocade device). If the active link becomes unavailable, Fast Uplink Span transitions the forwarding to one of the other redundant uplink ports in just one second. All Fast Uplink Span-enabled ports are members of a single Fast Uplink Span group.

To avoid the potential for temporary bridging loops, Brocade recommends that you use Fast Uplink Span only for wiring closet switches (switches at the edge of the network cloud). In addition, enable Fast Uplink Span only on a group of ports intended for redundancy, so that at any given time only one of the ports is expected to be in the forwarding state.

The **no** form of the command removes Fast Uplink Span on the ports.

Examples

The following example configures a group of ports for Fast Uplink Span.

```
device(config)# fast uplink-span ethernet 1/4/1 to 1/4/4
```

The following example configures Fast Uplink Span for a VLAN.

```
device(config)# vlan 10  
device(config-vlan-10)# untag ethernet 1/8/1 to 1/8/2  
device(config-vlan-10)# fast uplink-span ethernet 1/8/1 to 1/8/2
```

fdp advertise

Configures the IP management address to advertise for Foundry Discovery Protocol (FDP) neighbors.

Syntax

```
fdp advertise { ipv4 | ipv6 }  
no fdp advertise { ipv4 | ipv6 }
```

Command Default

When FDP is enabled, by default, the device advertises one IPv4 address and one IPv6 address to its FDP neighbors.

Parameters

ipv4
Advertises only the IPv4 management address.

ipv6
Advertises only the IPv6 management address.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of the command sets the device to advertise one IPv4 address and one IPv6 address to its FDP neighbors.

When FDP is enabled, by default, the device advertises one IPv4 address and one IPv6 address to its FDP neighbors. If desired, you can configure the device to advertise only the IPv4 management address or only the IPv6 management address. You can set the configuration globally on a Layer 2 switch or at the interface level on a Layer 3 switch.

Examples

The following example configures the device to advertise only the IPv6 management address.

```
device(config)# interface ethernet 1/1/1  
device(config-if-e1000-1/1/1)# fdp advertise ipv6
```

fdp enable

Enables Foundry Discovery Protocol (FDP) on an interface.

Syntax

fdp enable

no fdp enable

Command Default

FDP is enabled at the interface level once FDP is enabled on the device.

Modes

Interface configuration mode

Usage Guidelines

When FDP is enabled globally, you can disable and re-enable FDP on individual ports.

The **no** form of the command disables FDP on an interface.

Examples

The following example enables FDP on an interface.

```
device(config)# interface ethernet 1/1/1  
device(config-if-e1000-1/1/1)# fdp enable
```

fdp holdtime

Configures the Foundry Discovery Protocol (FDP) update hold time.

Syntax

fdp holdtime *secs*

no fdp holdtime

Command Default

By default, a device that receives an FDP update holds the information until the device receives a new update or until 180 seconds have passed since receipt of the last update.

Parameters

secs

Specifies the number of seconds for which a device that receives an FDP update can hold the update before discarding it. Valid values are from 10 through 255. The default value is 180.

Modes

Global configuration mode

Usage Guidelines

Once the device receives a new update or once 180 seconds have passed since receipt of the last update, the device discards the update.

The **no** form of the command sets the hold time to its default value of 180 seconds.

Examples

The following example sets the FDP hold time to 200 seconds.

```
device(config)# fdp holdtime 200
```

fdp run

Enables a device to send Foundry Discovery Protocol (FDP) packets globally.

Syntax

fdp run

no fdp run

Command Default

FDP is disabled.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command disables the sending of FDP packets.

Examples

The following example enables FDP globally.

```
device(config)# fdp run
```

fdp timer

Configures the Foundry Discovery Protocol (FDP) update timer.

Syntax

fdp timer *secs*

no fdp timer

Command Default

By default, a device enabled for FDP sends an FDP update every 60 seconds.

Parameters

secs

Specifies the number of seconds between FDP updates. The value can range from 5 through 900 seconds. The default value is 60 seconds.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command sets the FDP timer to its default value of 60 seconds.

Examples

The following example sets the FDP timer to 360 seconds.

```
device(config)# fdp timer 360
```

filter-strict-security enable

Enables or disables strict filter security for MAC authentication and 802.1X authentication.

Syntax

filter-strict-security
no filter-strict-security

Command Default

Strict filter security is enabled.

Modes

Authentication mode

Usage Guidelines

When strict security mode is enabled, authentication for a port fails if the Filter-Id attribute contains invalid information, or if insufficient system resources are available to implement the IP ACLs.

When strict security mode is enabled:

- If the Filter-Id attribute in the Access-Accept message contains a value that does not refer to an existing filter (that is, IP ACL configured on the device), then the client will not be authorized, regardless of any other information in the message (for example, if the Tunnel-Private-Group-ID attribute specifies a VLAN on which to assign the port).
- If the device does not have the system resources available to dynamically apply a filter to a port, then the client will not be authenticated.

When strict filter security is disabled:

- If the Filter-Id attribute in the Access-Accept message contains a value that does not refer to an existing filter (that is, a MAC address filter or IP ACL configured on the device), then the client remains authorized and no filter is dynamically applied to it.
- By default, strict security mode is enabled for all MAC authentication and 802.1X-enabled interfaces, but you can manually disable or enable it using the **filter-strict-security** command from the authentication configuration mode or using the **authentication filter-strict-security** command from the interface configuration mode.

The **no** form of the command disables strict filter security.

Examples

The following example enables strict filter security.

```
device(config)# authentication
device(config-authen)# filter-strict-security enable
```

History

Release version	Command history
08.0.20	This command was introduced.

flash

Use the **flash** command to perform basic flash file maintenance.

Syntax

```
flash { copy source-file destination-file | dbgflock | delete flash-file | files directory-name | rename source-file destination-file }
```

Command Default

N/A

Parameters

copy *source-file destination-file*

Copy the source flash file to a new file

dbgflock

Display the flash access lock holder

delete *flash-file*

Delete the flash file

files *directory-name*

Display flash files in a particular directory

rename *source-file destination-file*

Rename a flash file

Modes

Exec mode

Usage Guidelines

The command is useful in flash file maintenance.

Examples

In the following example, flash files are displayed.

```
device# flash files
Type      Size    Name
-----
F         24108665 primary
F         24108665 secondary
F           610 startup-config.backup
F          2052 startup-config.txt

48219992 bytes 4 File(s) in FI root

      1768706048 bytes free in FI root
      1768706048 bytes free in /
```

The **show flash** command also displays flash file information but with different results.

```
device# show flash
Stack unit 1:
Compressed Pri Code size = 24108665, Version:08.0.40qT213 (SPR08040q074.bin)
Compressed Sec Code size = 24108665, Version:08.0.40qT213 (SPR08040q074.bin)
Compressed Boot-Monitor Image size = 786944, Version:10.1.05T215
Code Flash Free Space = 1768706048
```

History

Release version	Command history
8.0.10	This command was introduced.

flash-timeout

Configures the flash timeout duration.

Syntax

flash-timeout *time*

no flash-timeout *time*

Command Default

The default flash timeout value is 12 minutes.

Parameters

time

Specifies the flash timeout value in minutes and the range is from 12 to 60 minutes.

Modes

Global configuration mode

Usage Guidelines

The new timeout value will be effective from the next flash operation.

The **no** form of the command removes the flash timeout configuration and restores the default value of 12 minutes.

Examples

The following example configures the flash timeout value as 30 minutes.

```
device(config)# flash-timeout 30
```

History

Release version	Command history
08.0.30	This command was introduced.

flow-control

Enables or disables flow control and flow control negotiation, and advertises flow control.

Syntax

flow-control [**both** | **generate-only** | **honor-only**]

no flow-control [**both** | **generate-only** | **honor-only**]

Command Default

Flow control is enabled.

Parameters

both

Flow control in PAUSE generation and honoring mode.

generate-only

Flow control in PAUSE generation only mode.

honor-only

Flow control in PAUSE honoring (Default) mode.

Modes

Global configuration mode

Interface configuration mode

Usage Guidelines

The **no** form of this command disables flow control.

On ICX 7750 devices the default packet-forwarding method is cut-through, in which port flow control (IEEE 802.3x) is not supported but priority-based flow control (PFC) is supported. You can configure the **store-and-forward** command in global configuration mode to enable the store-and-forward method for packet-forwarding.

The recommended flow control settings when the ICX 7750 switch is set for store-and-forward, are listed below.

Symmetrical flow control	Port-based flow control	Configuration commands	Cut-through (Jumbo enabled)	Store-and-Forward (Jumbo Enabled)
disabled	honor-only	# flow-control honor-only	Not Recommended	OK
	no flow-control-both	#no flow-control both	OK	OK

Symmetrical flow control	Port-based flow control	Configuration commands	Cut-through (Jumbo enabled)	Store-and-Forward (Jumbo Enabled)
enabled	no flow-control-both	#symmetrical-flow-control enable # no flow-control both	OK	OK
	honor-only	# symmetrical-flow-control enable #flow-control honor-only	Not Recommended	OK
	generate-only	# symmetrical-flow-control enable # flow-control generate-only	OK	OK
	both	# symmetrical-flow-control enable #flow-control both	Not Recommended	OK

By default, when flow control is enabled globally and auto-negotiation is on, flow control is enabled and advertised on 10/100/1000M ports. If auto-negotiation is off or if the port speed was configured manually, flow control is neither negotiated with nor advertised to the peer.

NOTE

Enabling only port auto-negotiation does not enable flow control negotiation. You must use the **flow-control neg-on** command to enable flow-control negotiation.

Examples

The following example disables flow control globally.

```
device(config)#no flow-control
```

The following example enables flow control on ethernet ports 0/1/11 to 0/1/15.

```
device(config)#interface ethernet 0/1/11 to 0/1/15
device(config-mif-0/1/11-0/1/15)#flow-control
```

The following example disables flow control on ethernet port 1/1/9.

```
device(config)# interface ethernet 1/1/9
device(config-if-e1000-1/1/9)no flow-control
```

History

Release version	Command history
8.0.20	This command was modified. Enabling only auto-negotiation does not enable flow-control negotiation.

force-up ethernet

Forces the member port of a dynamic LAG (Link Aggregation Group) to be logically operational even if the dynamic LAG is not operating.

Syntax

force-up ethernet *port*

no force-up ethernet *port*

Command Default

The member ports of a dynamic LAG are logically operational only if the dynamic LAG is operating.

Parameters

port

Specifies the port.

Modes

Dynamic LAG configuration mode

Usage Guidelines

The **no** form of the command causes the specified port to be logically operational only when the dynamic LAG is operating.

When the dynamic LAG is not operational, the port goes to "force-up" mode. In this mode, the port is logically operational, which enables a PXE-capable host to boot from the network using this port. Once the host successfully boots from the network, the dynamic LAG can connect the host to the network with the LAG link. Even if the dynamic LAG fails later, this port is brought back to "force-up" mode and remains logically operational.

A port that is in "force-up" mode has the operational status ("Ope") of "Frc". Use the **show lag** command to display the operational status.

If any port in a dynamic LAG receives an LACPDU, the port in force-up mode leaves force-mode and becomes a member port in the dynamic LAG.

Examples

The following example enables PXE boot support on member port 3/1/1 of a dynamic LAG R4-dyn.

```
device(config)# lag R4-dyn
device(config-lag-R4-dyn)# force-up ethernet 3/1/1
```

History

Release version	Command history
08.0.01	This command was introduced.

format disk0

Formats the external USB.

Syntax

format disk0

Modes

User EXEC mode.

Examples

The following example formats the external USB.

```
device# format disk0  
Are you sure?(enter 'y' or 'n'): formatting The External USB (disk0) of size 64.2GB
```

History

Release version	Command history
08.0.30	This command was introduced.

gig-default

Configures the Gbps fiber negotiation mode on individual ports, overriding the global configuration mode.

Syntax

```
gig-default { neg-full-auto | auto-gig | neg-off }
```

```
no gig-default { neg-full-auto | auto-gig | neg-off }
```

Command Default

The globally configured Gbps negotiation mode is the default mode for all Gbps fiber ports.

Parameters

neg-full-auto

Configures the port to first try to perform a handshake with the other port to exchange capability information. If the other port does not respond to the handshake attempt, the port uses the manual configuration (or the defaults if an administrator has not configured the information). That is, the device performs autonegotiation first and if it is failed then performs non-autonegotiation. This is the default.

auto-gig

Configures the port to try to perform a handshake with the other port to exchange capability information.

neg-off

Configures the port to not try to perform a handshake. Instead, the port uses information that was manually configured by an administrator.

Modes

Interface configuration mode

Usage Guidelines

NOTE

When Gbps negotiation mode is turned off (CLI command **gig-default neg-off**), the device may inadvertently take down both ends of a link. This is a hardware limitation for which there is currently no workaround.

The **no** form of the command resets the configuration to the default of trying to perform a handshake with other ports to exchange capability information.

Examples

The following example sets the negotiation mode to auto-gig mode for ports 1/1/1 to 1/1/4.

```
device(config)# interface ethernet 1/1/1 to 1/1/4  
device(config-mif-1/1/1-1/1/4)# gig-default auto-gig
```

graceful-restart (BGP)

Enables the BGP graceful restart capability.

Syntax

graceful-restart [**purge-time** *seconds* | **restart-time** *seconds* | **stale-routes-time** *seconds*]

no graceful-restart [**purge-time** *seconds* | **restart-time** *seconds* | **stale-routes-time** *seconds*]

Command Default

Graceful restart is enabled globally.

Parameters

purge-time *seconds*

Specifies the maximum period of time, in seconds, for which a restarting device maintains stale routes in the BGP routing table before purging them. Range is from 1 to 3600 seconds. The default value through 600 seconds.

restart-time *seconds*

Specifies the restart time, in seconds, advertised to graceful-restart-capable neighbors. Range is from 1 through 3600 seconds. The default value is 120 seconds.

stale-routes-time *seconds*

Specifies the maximum period of time, in seconds, that a helper device will wait for an End-of-RIB (EOR) marker from a peer. All stale paths are deleted when this time period expires. Range is from 1 through 3600 seconds. The default value is 360 seconds.

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

Usage Guidelines

Use this command to enable or disable the graceful restart capability globally for all BGP neighbors in a BGP network. If the graceful restart capability is re-enabled after a BGP session has been established, the neighbor session must be cleared for GR to take effect.

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

Use this command in BGP configuration mode to disable or re-enable the BGP4 graceful restart capability globally, or to alter the default parameters. Use this command in address-family IPv6 unicast configuration mode to disable or re-enable the BGP4+ graceful restart capability globally or to alter the default parameters.

The **purge-time** parameter is applicable for both restarting and helper devices. The timer starts when a BGP connection is closed. The timer ends when an EOR is received from all nodes, downloaded into BGP and an EOR sent to all neighbors. The configured purge-time timer value is effective only on the configured node.

The **restart-time** parameter is applicable only for helper devices. The timer starts at the time the BGP connection is closed by the remote peer and ends when the Peer connection is established. The configured restart time timer value is effective only on the peer node, and not in the configured node. During negotiation time, the timer value is exchanged.

The **stale-routes-time** parameter is applicable only for helper devices. The timer starts when the peer connection is established once the HA-failover peer node has been established. The timer ends at the time an EOR is received from the peer. The configured stale-time timer value is effective only on the configured node.

Use the **clear ip bgp neighbor** command with the **all** parameter for the changes to the GR parameters to take effect immediately.

The **no** form of the command disables the BGP graceful restart capability globally for all BGP neighbors.

Examples

The following example disables the BGP4 graceful restart capability.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# no graceful-restart
```

The following example re-enables the BGP4 graceful restart capability.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# local-as 1
device(config-bgp-router)# neighbor 1.1.1.1 remote-as 2
device(config-bgp-router)# graceful-restart
```

The following example disables the BGP4+ graceful restart capability.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast
device(config-bgp-ipv6u)# no graceful-restart
```

The following example re-enables the BGP4+ graceful restart capability.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# local-as 1
device(config-bgp-router)# neighbor 1000::1 remote-as 2
device(config-bgp-router)# address-family ipv6 unicast
device(config-bgp-ipv6u)# neighbor 1000::1 activate
device(config-bgp-ipv6u)# graceful-restart
```

The following example sets the purge time to 240 seconds at the IPv4 address family configuration level.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# local-as 1
device(config-bgp-router)# neighbor 1.1.1.1 remote-as 2
device(config-bgp-router)# graceful-restart
%Warning: Please clear the neighbor session for the parameter change to take effect!
device(config-bgp-router)# graceful-restart purge-time 240
```

Commands F - J

graceful-restart (BGP)

The following example sets the restart time to 60 seconds at the IPv4 address family configuration level.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# local-as 1
device(config-bgp-router)# neighbor 1.1.1.1 remote-as 2
device(config-bgp-router)# graceful-restart
%Warning: Please clear the neighbor session for the parameter change to take effect!
device(config-bgp-router)# graceful-restart restart-time 60
%Warning: Please clear the neighbor session for the parameter change to take effect!
```

The following example sets the stale-routes time to 180 seconds at the IPv6 address family configuration level.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# local-as 1
device(config-bgp-router)# neighbor 1000::1 remote-as 2
device(config-bgp-router)# address-family ipv6 unicast
device(config-bgp-ipv6u)# neighbor 1000::1 activate
device(config-bgp-ipv6u)# graceful-restart
%Warning: Please clear the neighbor session for the parameter change to take effect!
device(config-bgp-ipv6u)# graceful-restart stale-routes-time 180
%Warning: Please clear the neighbor session for the parameter change to take effect!
```

graceful-restart (OSPFv2)

Enables the OSPF Graceful Restart (GR) capability.

Syntax

```
graceful-restart [ helper-disable | restart-time seconds ]  
no graceful-restart
```

Command Default

Graceful restart and graceful restart helper capabilities are enabled.

Parameters

helper-disable

Disables the GR helper capability.

restart-time

Specifies the maximum restart wait time, in seconds, advertised to neighbors. The default value is 120 seconds. The configurable range of values is from 10 through 1800 seconds.

Modes

OSPF router configuration mode

OSPF router VRF configuration mode

Usage Guidelines

Use **no graceful-restart helper-disable** to re-enable the GR helper capability.

The **no** form of the command disables the graceful restart capability.

Examples

The following example disables the GR helper capability.

```
device# configure terminal  
device(config)# router ospf  
device(config-ospf-router)# graceful-restart helper-disable
```

The following example re-enables the GR helper capability.

```
device# configure terminal  
device(config)# router ospf  
device(config-ospf-router)# no graceful-restart helper-disable
```

Commands F - J

graceful-restart (OSPFv2)

The following example re-enables the GR capability.

```
device# configure terminal
device(config)# rbridge-id 10
device(config-rbridge-id-10)# router ospf
device(config-router-ospf-vrf-default-vrf)# graceful-restart
```

The following example re-enables the GR capability and changes the maximum restart wait time from the default value to 240 seconds.

```
device# configure terminal
device(config)# router ospf
device(config-ospf-router)# graceful-restart restart-time 240
```

graceful-restart helper (OSPFv3)

Enables the OSPFv3 graceful restart (GR) helper capability.

Syntax

```
graceful-restart helper { disable | strict-lsa-checking }  
no graceful-restart helper
```

Command Default

GR helper is enabled.

Parameters

disable

Disables the OSPFv3 GR helper capability.

strict-lsa-checking

Enables the OSPFv3 GR helper mode with strict link-state advertisement (LSA) checking.

Modes

OSPFv3 router configuration mode

OSPFv3 router VRF configuration mode

Usage Guidelines

The **no** form of the command disables the GR helper capability on a device.

Examples

The following example enables GR helper and sets strict LSA checking.

```
device# configure terminal  
device(config)# ipv6 router ospf  
device(config-ospf6-router-ospf)# graceful-restart helper strict-lsa-checking
```

graft-retransmit-timer

Configures the time between the transmission of graft messages sent by a device to cancel a prune state.

Syntax

graft-retransmit-timer *seconds*
no graft-retransmit-timer *seconds*

Command Default

The graft retransmission time is 180 seconds.

Parameters

seconds
Specifies the time in seconds. The range is 60 through 3600 seconds. The default is 180 seconds.

Modes

PIM router configuration mode

Usage Guidelines

The **no** form of this command restores the default graft retransmission time, 180 seconds.

Messages sent by a device to cancel a prune state are called graft messages. When it receives a graft message, the device responds with a Graft Ack (acknowledge) message. If this Graft Ack message is lost, the device that sent it resends it.

Examples

This example configures a graft retransmission timer to 90 seconds.

```
device(config)# router pim
device(config-pim-router)# graft-retransmit-timer 90
```

group-router-interface

Creates router interfaces for each VLAN in the VLAN group.

Syntax

group-router-interface

no group-router-interface

Command Default

A group router interface is not configured.

Modes

VLAN group configuration mode

Usage Guidelines

The **group-router-interface** command creates router interfaces for each VLAN in the VLAN group by using the VLAN IDs of each of the VLANs as the corresponding virtual interface number. This command enables a VLAN group to use a virtual routing interface group. You can enter this command when you configure the VLAN group for the first time or later, after you have added tagged ports to the VLAN, and so on.

If a VLAN group contains VLAN IDs greater than the maximum virtual interface number allowed, the **group-router-interface** command will be rejected.

The **no** form of the command disables the VLAN group router interface.

Examples

The following example shows how to create a router interface for a VLAN.

```
device(config)# vlan-group 1 vlan 10
device(config-vlan-group-1)# group-router-interface
```

gvrp-base-vlan-id

Configures a VLAN ID as a base VLAN for GVRP.

Syntax

gvrp-base-vlan-id *vlan-id*

no gvrp-base-vlan-id *vlan-id*

Command Default

GVRP uses VLAN 4093 as the base VLAN for the protocol.

Parameters

vlan-id

Configures the new base VLAN. You can specify a VLAN ID from 2 through 4092 or 4095.

Modes

Global configuration mode

Usage Guidelines

All ports that are enabled for GVRP become tagged members of the base VLAN. If you need to use VLAN 4093 for a statically configured VLAN, you can change the GVRP base VLAN ID.

NOTE

If you want to change the GVRP base VLAN ID, you must do so before enabling GVRP.

The **no** form of the command changes the base VLAN to the default VLAN ID of 4093.

Examples

The following example shows how to configure a new base VLAN for GVRP.

```
device(config)# gvrp-base-vlan-id 1001
```

gvrp-enable

Enables the Generic Attribute Registration Protocol (GARP) VLAN Registration Protocol (GVRP) and enters GVRP configuration mode.

Syntax

gvrp-enable

no gvrp-enable

Command Default

GVRP is not enabled.

Modes

Global configuration mode

Usage Guidelines

Single STP must be enabled on the device. Brocade implementation of GVRP requires Single STP. If you do not have any statically configured VLANs on the device, you can enable Single STP.

The **no** form of the command disables GVRP.

Examples

The following example shows how to enable Single STP and then GVRP.

```
device(config)# vlan 1
device(config-vlan-1)# spanning-tree
device(config-vlan-1)# exit
device(config)# spanning-tree single
device(config)# gvrp-enable
device(config-gvrp)#
```

gvrp-max-leaveall-timer

Configures the maximum value for the minimum interval at which GVRP sends Leaveall messages on all GVRP interfaces.

Syntax

gvrp-max-leaveall-timer *time*

no gvrp-max-leaveall-timer *time*

Command Default

The default value is 300,000 milliseconds (ms).

Parameters

time

Specifies the maximum time in milliseconds to which you want to set the Leaveall timer. You can specify from 300,000 to 1,000,000 (one million) milliseconds. The value must be a multiple of 100 ms.

Modes

Global configuration mode

Usage Guidelines

Enter this command before enabling GVRP. Once GVRP is enabled, you cannot change the maximum Leaveall timer value. By default, you can set the Leaveall timer to a value five times the Leave timer - the maximum value allowed by the software (configurable from 300000 ms to 1000000 ms).

This command does not change the default value of the Leaveall timer itself. The command only changes the maximum value to which you can set the Leaveall timer.

The **no** form of the command changes the maximum time value to the default value.

Examples

The following example shows how to set the maximum value for the Leaveall timer.

```
device(config)# gvrp-max-leaveall-timer 1000000
```

hardware-drop-disable

Disables passive multicast route insertion (PMRI).

Syntax

hardware-drop-disable

no hardware-drop-disable

Command Default

PMRI is enabled.

Modes

PIM router configuration mode

Usage Guidelines

The **no** form of this command restores the default and enables PMRI.

To prevent unwanted multicast traffic from being sent to the CPU, PIM routing and PMRI can be used together to ensure that multicast streams are forwarded out only on ports with interested receivers and unwanted traffic is dropped in hardware on Layer 3 switches. To disable this process, use the **hardware-drop-disable** command.

NOTE

Disabling hardware-drop does not immediately take away existing hardware-drop entries, they will go through the normal route aging processing when the traffic stops.

Examples

This example disables PMRI.

```
device(config)#router pim
device(config-pim-router)# hardware-drop-disable
```

hello-interval (VRRP)

Configures the interval at which master Virtual Router Redundancy Protocol (VRRP) routers advertise their existence to the backup VRRP routers.

Syntax

hello-interval [msec] *interval*
no hello-interval [msec] *interval*

Command Default

Hello messages from VRRP master routers are sent to backup routers every second.

Parameters

msec *interval*

Interval, in milliseconds, at which a master VRRP router advertises its existence to the backup VRRP routers. Valid values range from 100 through 84000. The default is 1000. VRRP-E does not support the hello message interval in milliseconds.

interval

Sets the interval, in seconds, for which a VRRP backup router waits for a hello message from the VRRP master router before determining that the master is offline. Valid values range from 1 through 84. The default value is 1.

Modes

VRID interface configuration mode

Usage Guidelines

A VRRP master router periodically sends hello messages to the backup routers. The backup routers use the hello messages as verification that the master is still online. If the backup routers stop receiving the hello messages for the period of time specified by the dead interval, the backup routers determine that the master router is dead. At that point, the backup router with the highest priority becomes the new master router.

By default, the dead interval is internally derived from the hello interval. It is equal to 3 times the hello interval plus the skew time, where the skew time is equal to (256 minus the priority) divided by 256. Generally, if you change the hello interval on the master VRRP router using the **hello-interval** command, you also should also change the dead interval on the VRRP backup routers using the **dead-interval** command.

The **hello-interval** command is configured only on master VRRP routers and is supported by VRRP and VRRP-E.

The **no** form resets the hello message interval to its default value of 1000 milliseconds (1 second).

NOTE

VRRP-E does not support the hello message interval in milliseconds.

Examples

The following example enables advertisements from the VRRP master router and sets the hello message interval to 10,000 milliseconds.

```
device# configure terminal
device(config)# router vrrp
device(config)# interface ethernet 1/1/6
device(config-if-e1000-1/1/6)# ip address 10.53.5.1/24
device(config-if-e1000-1/1/6)# ip vrrp vrid 1
device(config-if-e1000-1/1/6-vrid-1)# owner
device(config-if-e1000-1/1/6-vrid-1)# ip address 10.53.5.1
device(config-if-e1000-1/1/6-vrid-1)# hello-interval msec 10000
device(config-if-e1000-1/1/6-vrid-1)# activate
VRRP router 1 for this interface is activating
```

The following example enables advertisements from the VRRP-E master router and sets the hello message interval to 15 seconds.

```
device# configure terminal
device(config)# router vrrp-extended
device(config)# interface ethernet 1/1/5
device(config-if-e1000-1/1/5)# ip address 10.53.5.3/24
device(config-if-e1000-1/1/5)# ip vrrp-extended vrid 2
device(config-if-e1000-1/1/5-vrid-2)# backup priority 50 track-priority 10
device(config-if-e1000-1/1/5-vrid-2)# ip-address 10.53.5.1
device(config-if-e1000-1/1/5-vrid-2)# hello-interval 15
device(config-if-e1000-1/1/5-vrid-2)# activate
VRRP router 2 for this interface is activating
```

hello-interval (VSRP)

Configures the number of seconds between hello messages from the master to the backups for a given VRID.

Syntax

hello-interval { **msec** *interval* | *interval* }

no hello-interval { **msec** *interval* | *interval* }

Command Default

Hello messages from master are sent to backup every second.

Parameters

msec *interval*

Interval, in milliseconds, at which a master advertises its existence to the backup. Valid values range from 100 through 40900. The default is 1000.

interval

Sets the interval, in seconds, for which a backup waits for a hello message from the master before determining that the master is offline. Valid values range from 1 through 84. The default value is 1.

Modes

VSRP VRID configuration mode

Usage Guidelines

The Master periodically sends hello messages to the backup. The backup routers use the hello messages as verification that the master is still online. If the backup routers stop receiving the hello messages for the period of time specified by the dead interval, the backup routers determine that the master router is dead. At that point, the backup router with the highest priority becomes the new master router.

By default, the dead interval is internally derived from the hello interval. It is equal to 3 times the hello interval plus one-half second. Generally, if you change the hello interval on the master router using the **hello-interval** command, you also should also change the dead interval on the backup routers using the **dead-interval** command.

The **no** form resets the hello message interval to its default value of 1000 milliseconds (1 second).

Examples

The following example sets the hello message interval to 10,000 milliseconds.

```
device# configure terminal
device(config)# vlan 400
device(config-vlan-400)# tagged ethernet 1/1/4 to 1/1/9
device(config-vlan-400)# vsrp vrid 4
device(config-vlan-400-vrid-4)# hello-interval msec 10000
```

The following example sets the hello message interval to 15 seconds.

```
device# configure terminal
device(config)# vlan 400
device(config-vlan-400)# tagged ethernet 1/1/4 to 1/1/9
device(config-vlan-400)# vsrp vrid 4
device(config-vlan-400-vrid-4)# hello-interval 15
```

hello-timer

Configures the interval at which hello messages are sent out of Protocol Independent Multicast (PIM) interfaces.

Syntax

hello-timer *seconds*

no hello-timer *seconds*

Command Default

The hello interval is 30 seconds.

Parameters

seconds

Specifies the interval in seconds. The range is 10 through 3600 seconds. The default is 30 seconds.

Modes

PIM router configuration mode

Usage Guidelines

The **no** form of this command restores the default hello interval, 30 seconds.

Devices use hello messages to inform neighboring devices of their presence.

Examples

This example configures a hello interval of 120 seconds on all ports on a device operating with PIM.

```
device(config)# router pim
device(config-pim-router)# hello-timer 120
```

hitless-failover enable

Enables hitless stacking failover and switchover. The standby controller is allowed to take over the active role without reloading the stack when failover occurs.

Syntax

hitless-failover enable

no hitless-failover enable

Command Default

Hitless stacking failover is enabled. In earlier releases, failover and switchover were disabled by default.

Modes

Global configuration mode

Usage Guidelines

Use the **no** form of the command to disable hitless stacking failover. The change takes effect immediately.

The **hitless-failover enable** and **no hitless-failover enable** commands must be executed from the active stack controller.

You must assign a stack mac address to the device using the **stack mac address** command before you can execute the **hitless-failover enable** command.

Examples

The following example enables hitless stacking switchover and failover on the active controller for the stack.

```
device(config)# hitless-failover enable
```

History

Release version	Command history
08.0.00a	This command was introduced.
08.0.20	Hitless failover is enabled by default.

hold-down-interval

Configures the hold-down interval.

Syntax

hold-down-interval *number*

no hold-down-interval *number*

Command Default

The default hold-down time interval is 3 seconds.

Parameters

number

The time interval for the new master to hold the traffic. The time interval ranges from 1 through 84 seconds.

Modes

VSRP VRID configuration mode

Usage Guidelines

The hold-down interval prevents the occurrence of Layer 2 loops during failover by delaying the new master from forwarding traffic long enough to ensure that the failed master is unavailable.

The **no** form of the command sets the time interval to the default value.

Examples

The following example shows how to change the hold-down interval.

```
device(config)# vlan 200
device(config-vlan-200)# tagged ethernet 1/1/1 to 1/1/8
device(config-vlan-200)# vsrp vrid 1
device(config-vlan-200-vrid-1)# hold-down-interval 4
```

host-max-num

Limits the number of hosts that are authenticated at any one time.

Syntax

host-max-num *number*

no host-max-num *number*

Command Default

There is no limit to the number of hosts that can be authenticated (0).

Parameters

number

Specifies the number of hosts that can be authenticated at any one time. The valid values are from 0 through 8192. The default is 0, that is there is no limit to the number of hosts that can be authenticated.

Modes

Web Authentication configuration mode

Usage Guidelines

The maximum number of hosts that can be authenticated at one time is 8192 or the maximum number of MAC addresses the device supports. When the maximum number of hosts has been reached, the device redirects any new host that has been authenticated successfully to the Maximum Host web page.

The **no** form of the command sets no limit (default).

Examples

The following example limits the number of hosts that can be authenticated at one time to 10.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# host-max-num 10
```

hostname

Configures a system name for a device and saves the information locally in the configuration file for future reference.

Syntax

hostname *string*
no hostname

Command Default

The device has a factory-set hostname.

Parameters

string

Configures the system name. The name can be up to 255 alphanumeric characters. The host name should be enclosed in quotation marks if it contains spaces.

Modes

Global configuration mode

Usage Guidelines

When you configure a system name, the name replaces the default system name in the CLI command prompt.

The **no** form of the command removes the configured hostname.

Examples

The following example configures a system name.

```
device(config)# hostname headquarters  
headquarters(config)#
```

ike-profile

Configures an IKEv2 profile for an IPsec profile.

Syntax

ike-profile *name*

no ike-profile *name*

Command Default

The default IKEv2 profile is **def-ike-profile**.

Parameters

name

Specifies the name of an IKEv2 profile.

Modes

IPsec profile configuration mode

Usage Guidelines

When an IPsec profile is created, it is automatically configured to use the default IKEv2 profile. Use this command to configure an alternate IKEv2 profile for the IPsec profile.

The **no** form of the command restores the default IKEv2 profile configuration for the IPsec profile.

Examples

The following example shows how to configure an IKEv2 profile named `ikev2_prof` for an IPsec profile named `ipsec_prof`.

```
device(config)# ipsec profile ipsec_prof
device(config-ipsec-profile-ipsec_prof)# ike-profile ikev2_prof
```

History

Release version	Command history
8.0.50	This command was introduced.

ikev2 auth-proposal

Creates an Internet Key Exchange version 2 (IKEv2) authentication proposal and enters configuration mode for the proposal.

Syntax

ikev2 auth-proposal *auth-name*
no ikev2 auth-proposal *auth-name*

Parameters

auth-name
Specifies the name of an IKEv2 authentication proposal.

Modes

Global configuration mode

Usage Guidelines

An IKEv2 authentication proposal defines the authentication methods used in IKEv2 peer negotiations.
An IKEv2 authentication proposal is activated by attaching it to an IKEv2 profile.
The **no** form of the command removes the IKEv2 authentication proposal configuration.

Examples

The following example shows how to create an IKEv2 authentication proposal named "secure" and enters configuration mode for the proposal.

```
device# configure terminal
device(config)# ikev2 auth-proposal secure
device(config-ike-auth-proposal-secure)#
```

History

Release version	Command history
8.0.50	This command was introduced.

ikev2 exchange-max-time

Configures the maximum setup time for Internet Key Exchange version 2 (IKEv2) message exchange.

Syntax

ikev2 exchange-max-time *seconds*
no ikev2 exchange-max-time *seconds*

Command Default

The default value is 30 seconds.

Parameters

seconds
 Specifies the maximum setup time in seconds. The time range is from 1 through 300 seconds.

Modes

Global configuration mode.

Usage Guidelines

The **no** form of the command resets the maximum setup time to the default value.

Examples

The following example sets the maximum setup time for IKEv2 message exchange to 50 seconds.

```
device# configure terminal
device(config)# ikev2 exchange-max-time 50
```

History

Release version	Command history
8.0.50	This command was introduced.

ikev2 limit

Configures limits for the number of Internet Key Exchange version 2 (IKEv2) security association (SA) sessions.

Syntax

```
ikev2 limit { max-in-negotiation-sa limit | max-sa limit limit }  
no ikev2 limit { max-in-negotiation-sa limit | max-sa limit limit }
```

Command Default

The default limit (for each type of SA session) is 256.

Parameters

max-in-negotiation-sa *limit*

Limits the total number of in-negotiation IKEv2 SA sessions. The range is from 1 through 256.

max-sa *limit*

Limits the total number of IKEv2 SA sessions. The range is from 1 through 256.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command returns the specified SA session limit to the default value.

Examples

The following example shows how to limit the maximum number of in-negotiation IKEv2 SA sessions to 10.

```
device# configure terminal  
device(config)# ikev2 limit max-in-negotiation-sa 10
```

The following example shows how to limit the maximum number of IKEv2 SA sessions to 200.

```
device# configure terminal  
device(config)# ikev2 limit max-sa 200
```

History

Release version	Command history
8.0.50	This command was introduced.

ikev2 policy

Creates an Internet Key Exchange version 2 (IKEv2) policy and enters IKEv2 policy configuration mode.

Syntax

ikev2 policy *name*

no ikev2 policy *name*

Command Default

The default IKEv2 policy is **def-ike-policy**.

Parameters

name

Specifies the name of an IKEv2 policy.

Modes

Global configuration mode

Usage Guidelines

There is a default IKEv2 policy (**def-ike-policy**) that is used to protect IKEv2 SA negotiations. The default policy does not require configuration and has the following settings:

- **proposal:** **def-ike-prop**
- **local_address:** Not set; matches all local addresses
- **vrf:** Not set; matches the default-VRF

Use the **ikev2 policy** command to configure any additional IKEv2 policies that you need.

The **no** form of the command removes any IKEv2 policy configuration other than the default IKEv2 policy.

The default IKEv2 policy cannot be removed.

Only one IKEv2 policy can be selected for a local endpoint (single IPv4 address). Configuring multiple IKEv2 policies for the same IP address is invalid.

When multiple matching policies are identified during IKEv2 negotiations, the most recently created matching policy is used.

Examples

The following example creates an IKEv2 policy named test_policy1.

```
device# configure terminal
device(config)# ikev2 policy test_policy1
device(config-ike-policy-test_policy1)#
```

History

Release version	Command history
8.0.50	This command was introduced.

ikev2 profile

Creates an Internet Key Exchange version 2 (IKEv2) profile and enters IKEv2 profile configuration mode.

Syntax

ikev2 profile *name*

no ikev2 profile *name*

Command Default

The default IKEv2 profile is **def-ike-profile**.

Parameters

name

Specifies the name of an IKEv2 profile.

Modes

Global configuration mode

Usage Guidelines

An IKEv2 profile defines the local and peer identities and the authentication proposal for an IKEv2 session.

The default IKEv2 profile (**def-ike-profile**) does not require configuration and has the following settings:

- **authentication:** **def-ike-auth-prop**
- **protected:** Any
- **local-identifier address:** 0.0.0.0
- **lifetime:** 2592000
- **keepalive:** 300

Use the **ikev2 profile** command to configure any additional IKEv2 profiles.

The **no** form of the command removes any IKEv2 profile configuration other than the default IKEv2 profile.

The default IKEv2 profile cannot be removed.

Examples

The following example shows how to create an IKEv2 profile named ikev2_profile1.

```
device# configure terminal
device(config)# ikev2 profile ikev2_profile1
device(config-ike-profile-ikev2_profile1)#
```

History

Release version	Command history
8.0.50	This command was introduced.

ikev2 proposal

Creates an Internet Key Exchange version 2 (IKEv2) proposal and enters IKEv2 proposal configuration mode.

Syntax

ikev2 proposal *name*

no ikev2 proposal *name*

Command Default

The default IKEv2 proposal is **def-ike-proposal**.

Parameters

name

Specifies the name of an IKEv2 proposal.

Modes

Global configuration mode

Usage Guidelines

An IKEv2 proposal defines a set of algorithms that are used in IKEv2 peer negotiations.

There is a default IKEv2 proposal (**def-ike-proposal**) that does not require configuration and has the following settings:

- **encryption:** AES-CBC-256
- **prf:** SHA-384
- **integrity:** SHA-384
- **dh-group:** 20

Use the **ikev2 proposal** command to configure any additional IKEv2 proposals.

The default IKEv2 proposal configuration cannot be removed.

Examples

The following example shows how to create an IKEv2 proposal named test_proposal1.

```
device# configure terminal
device(config)# ikev2 proposal test_proposal1
device(config-ike-proposal-test_proposal1)#
```

History

Release version	Command history
8.0.50	This command was introduced.

ikev2 retransmit-interval

Configures the delay time for resending Internet Key Exchange version 2 (IKEv2) messages.

Syntax

ikev2 retransmit-interval *time*
no ikev2 retransmit-interval *time*

Command Default

The default delay time is 5 seconds.

Parameters

time
 Specifies the delay time in seconds. The time ranges from 1 through 60.

Modes

Global configuration mode

Usage Guidelines

The retransmit interval increases exponentially.
 The **no** form of the command restores the default value.

Examples

The following example show how to configure the delay time for resending IKEv2 messages to 20 seconds.

```
device# configure terminal
device(config)# ikev2 retransmit-interval 20
```

History

Release version	Command history
8.0.50	This command was introduced.

ikev2 retry-count

Configures the maximum number of attempts to retransmit an Internet Key Exchange version 2 (IKEv2) message.

Syntax

ikev2 retry-count *number*

no ikev2 retry-count *number*

Command Default

The default number of attempts is 5.

Parameters

number

Specifies the maximum number of attempts to retransmit an IKE message. The range is from 1 through 25.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command resets the retry count to the default value.

Examples

The following example shows how to configure the number of retry attempts for transmitting an IKEv2 message to 8.

```
device# configure terminal
device(config)# ikev2 retry-count 8
```

History

Release version	Command history
8.0.50	This command was introduced.

image-auto-copy disable

Turns off the auto image copy function used in a stack or an 802.1br (bridge port extension) configuration to restore all units to the same software image.

Syntax

image-auto-copy disable
no image-auto-copy disable

Command Default

Auto image copy is enabled by default.

Modes

Global configuration mode

Usage Guidelines

Use this command when you want to have manual control over image updates in the stack or bridge port extension domain.

The auto image copy process is not triggered if the major versions of the mismatched units are not the same. For example, if the image version is 8.0.30 in the mismatched unit, it cannot be automatically updated to 8.0.40. However, if an 8.0.40 image is present in the mismatched unit, and it needs to be updated to 8.0.40b, the auto image copy process works.

Use the **show stack detail** or the **show running-config** command to determine whether auto image copy is enabled.

The **no** form of the command re-enables auto image copy, which restarts immediately and ensures all stack units have the same image.

Examples

The following example disables auto image copy.

```
device(config)# image-auto-copy disable
```

History

Release version	Command history
8.0.40	This command was introduced.

import-users

Imports a text file of user records from a TFTP server to the device.

Syntax

```
import-users tftp ip-address filename name
```

Parameters

tftp *ip-address*

Specifies the IP address of the TFTP server from which the file must be imported.

filename *name*

Specifies the name of the file to import from the TFTP server.

Modes

Local user database configuration mode

Usage Guidelines

Before importing the file, make sure it adheres to the ASCII text format. The text file to be imported must be in the following ASCII format.

```
[delete-all]
[no] username
username1
password
password1
cr
[no] username
username2
password
password2
cr
...
```

The **delete-all** command entry in the text file indicates that the user records in the text file will replace the user records in the specified local user database on the switch. If the **delete-all** entry is not present, the new user records will be added to the specified local user database on the switch. The **delete-all** command entry is optional. If present, it must appear on the first line, before the first user record in the text file. If you want to delete a user entry from the specified local user database on the switch, use the **no username** command entry in the text file. User records that already exist in the local user database will be updated with the information in the text file when it is uploaded to the switch. For username1, username2, and so on, enter up to 31 ASCII characters.

Examples

The following example imports a text file of user records from a TFTP server.

```
device(config)# local-userdb userdb1
device(config-localuserdb-userdb1)# import-users tftp 192.168.1.1 filename userdb1
```

inactivity-timer

Configures the time a forwarding entry can remain unused before the device deletes it.

Syntax

inactivity-timer *seconds*

no inactivity-timer *seconds*

Command Default

The default inactive time is 180 seconds.

Parameters

seconds

Specifies the time in seconds. The range is 60 through 3600 seconds. The default is 180 seconds.

Modes

PIM router configuration mode

Usage Guidelines

The **no** form of this command restores the default inactive time, 180 seconds.

A device deletes a forwarding entry if the entry is not used to send multicast packets. The Protocol Independent Multicast (PIM) inactivity timer defines how long a forwarding entry can remain unused before the device deletes it.

Examples

This example configures an inactive time to 90 seconds.

```
device# configure terminal
device(config)# router pim
device(config-pim-router)# inactivity-timer 90
```

include-port

Adds ports to the VSRP.

Syntax

include-port ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*]...]

no include-port ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*]...]

Command Default

By default, all the ports on which you configure a VRID are interfaces for the VRID.

Parameters

ethernet *stackid/slot/port*

Adds the Ethernet interface to the VRID.

to *stackid/slot/port*

Adds a range of Ethernet interfaces to the VRID.

Modes

VSRP VRID configuration mode

Usage Guidelines

Removing a port is useful because there is no risk of a loop occurring, such as when the port is attached directly to an end host and you plan to use a port in a metro ring.

When a port is removed from VSRP, the port remains in the VLAN but its forwarding state is not controlled by VSRP.

The **no** form of the command removes the ports from VSRP.

Examples

The following example shows how to remove a port from the VRID.

```
device(config)# vlan 200
device(config-vlan-200)# tagged ethernet 1/1/1 to 1/1/8
device(config-vlan-200)# vsrp vrid 1
device(config-vlan-200-vrid-1)# no include-port ethernet 1/1/2
```

initial-contact-payload

Configures sending an initial contact message to a peer for an Internet Key Exchange version 2 (IKEv2) profile.

Syntax

initial-contact-payload

no initial-contact-payload

Command Default

No initial contact message is sent to a peer for an IKEv2 profile.

Modes

IKEv2 profile configuration mode

Usage Guidelines

The initial contact message is sent to ensure that old security associations (SAs) on the peer are deleted. When a device reboots, peers may have security associations (SAs) that are no longer valid. The initial contact message ensures that any old SAs on the peer are deleted.

The **no** form of the command disables initial contact messages from being sent to a peer for an IKEv2 profile.

Examples

The following example enables sending an initial contact message to a peer for an IKEv2 profile named ikev2_profile1.

```
device# configure terminal
device(config)# ikev2 profile ikev2_profile1
device(config-ike-profile-ikev2_profile1)# initial-contact-payload
```

History

Release version	Command history
8.0.50	This command was introduced.

initial-ttl

Configures the Hello packet time to live (TTL) (the number of hops a Hello message can traverse after leaving the device and before the Hello message is dropped).

Syntax

initial-ttl *number*
no initial-ttl *number*

Command Default

The default TTL is 2.

Parameters

number

Specifies the number of hops a Hello message can traverse after leaving the device and before the Hello message is dropped. The range is from 1 through 255. The default value is 2.

Modes

VSRP VRID configuration mode

Usage Guidelines

When a VSRP device (master or backup) sends a VSRP Hello packet, the device subtracts one from the TTL. Thus, if the TTL is 2, the device that originates the Hello packet sends it out with a TTL of 1. Each subsequent device that receives the packet also subtracts one from the packet TTL. When the packet has a TTL of 1, the receiving device subtracts 1 and then drops the packet because the TTL is zero.

A metro ring counts as one hop, regardless of the number of nodes in the ring.

The **no** form of the command sets the TTL to the default value.

Examples

The following examples sets the TTL to 5.

```
device(config)# vlan 200
device(config-vlan-200)# tagged ethernet 1/1/1 to 1/1/8
device(config-vlan-200)# vsrp vrid 1
device(config-vlan-200-vrid-1)# initial-ttl 5
```

inline power

Configures inline power on Power over Ethernet (PoE) ports in interface configuration mode and link aggregation group (LAG) secondary ports in global configuration mode.

Syntax

```
inline power ethernet interface [ decouple-datalink ] [ power-by-class power-class ] [ power-limit power-limit ]  
[ priority priority -value ]
```

```
no inline power ethernet interface [ decouple-datalink ] [ power-by-class power-class ] [ power-limit power-limit ]  
[ priority priority -value ]
```

NOTE

The **ethernet**/*interface* pair of parameters is required only if you want to configure inline power on secondary ports (you must use global configuration mode to do this).

Parameters

ethernet

Specifies an ethernet interface. You can configure the **ethernet** keyword only in global configuration mode.

interface

Specifies the number of the ethernet interface. This is used only with the **ethernet** keyword.

decouple-datalink

Specifies decoupling of datalink and PoE so that datalink state changes do not affect the PoE state. You can configure the **decouple-datalink** keyword in global and interface configuration modes.

power-by-class

Specifies the power limit based on class value. The range is 0-4. The default is 0.

power-limit

Specifies the power limit based on actual power value in mW. The range is 1000-15400|30000mW. The default is 15400|30000mW. For PoH ports, the range is 1000-95000mW, and the default is 95000mW. The power-limit value is rounded to the nearest multiple of 5 on PoH ports.

priority

Specifies the priority for power management. The range is 1 (highest) to 3 (lowest). The default is 3.

Modes

Global configuration mode

Interface configuration mode

Usage Guidelines

You cannot configure inline power on PoE LAG ports in interface configuration mode because the interface-level configuration is not available in the CLI for LAG secondary ports. The **inline power ethernet** command enables you to configure inline power on secondary ports in global configuration mode.

The **decouple-datalink** keyword was introduced in Release 08.0.01 to support the inline-power functionality. The decouple-datalink functionality is not supported in releases earlier than Release 08.0.01.

WARNING

If you want to keep decoupling in place on a PoE port when you configure the **inline power ethernet** command to change its other parameters, (for example, priority) you must also configure the **decouple-datalink** keyword.

WARNING

If you downgrade to a release earlier than 08.0.01, you cannot use **inline power** commands that have the **decouple-datalink** keyword. Any **inline power** commands in the startup config will not be effective.

Examples

Examples

The following example configures inline power on LAG ports.

```
Device(config)# lag "mylag" static id 5
Device(config-lag-mylag)# ports ethernet 1/1/1 to 1/1/4
Device(config-lag-mylag)# primary-port 1/1/1
Device(config-lag-mylag)# deploy
LAG mylag deployed successfully!
Device(config)#inline power ethernet 1/1/1 power-by-class 3
Device(config)#inline power ethernet 1/1/2
Device(config)#inline power ethernet 1/1/3 priority 2
Device(config)#inline power ethernet 1/1/4 power-limit 12000
```

Examples

The following example decouples the behavior of the PoE and the datalink operations for PoE LAG ports. After the optional **decouple-datalink** keyword in the **inline power ethernet** command is entered, the datalink operational behavior on a PoE port does not affect the power state of the powered device (PD) that is connecting to the port.

```
Device(config)#inline power ethernet 1/1/1 decouple-datalink power-by-class 3
Device(config)#inline power ethernet 1/1/2 decouple-datalink
Device(config)#inline power ethernet 1/1/3 decouple-datalink priority 2
Device(config)#inline power ethernet 1/1/4 decouple-datalink power-limit 12000
Device(config)# lag "mylag" static id 5
Device(config-lag-mylag)# ports ethernet 1/1/1 to 1/1/4
Device(config-lag-mylag)# primary-port 1/1/1
Device(config-lag-mylag)# deploy
LAG mylag deployed successfully!
```

Examples

The following example decouples the behavior of the PoE and the datalink operations for regular PoE ports. After the optional **decouple-datalink** keyword in the **inline power** command is entered, the datalink operational behavior on a PoE port does not affect the power state of the powered device (PD) that is connecting to the port.

```
Device(config)# interface ethernet 1/1/1
Device(config-if-e1000-1/1/1)# inline power decouple-datalink power-by-class 3
Device(config-if-e1000-1/1/1)# interface ethernet 1/1/2
Device(config-if-e1000-1/1/2)# inline power decouple-datalink
Device(config-if-e1000-1/1/2)# interface ethernet 1/1/3
Device(config-if-e1000-1/1/3)# inline power decouple-datalink priority 2
Device(config-if-e1000-1/1/3)# interface ethernet 1/1/4
Device(config-if-e1000-1/1/4)# inline power decouple-datalink power-limit 12000
```

History

Release	Command History
08.0.01	This command was modified to run in global configuration mode using the ethernet keyword. The decouple-datalink keyword was also introduced.
08.0.20	This command was modified to allow requisite PoH power limits.

inline power adjust class

Use these commands when powered devices (PDs) are entering an overload state as a result of faulty PDs power requests.

Syntax

```
inline power adjust class class { delta milliwatts | minimum milliwatts }  
no inline power adjust class class { delta milliwatts | minimum milliwatts }
```

Parameters

class

The detected PD class for which this configuration is applied to. Values range from 0 through 4.

delta

The amount of extra power allocated above the LLDP/CDP requested power.

milliwatts

The additional allocated power measured in milliwatts.

minimum

The minimum power that must be allocated, even if the PD LLDP/CDP requested power is lower than the configuration.

Modes

Global configuration mode

Usage Guidelines

These configurations should be used only when ports are entering an overload condition because of faulty PDs that are requesting lower power through LLDP/CDP messages and then consuming higher than the requested power.

The delta option assures the power allocation is equal to LLDP/CDP requested power plus delta power that is configured for that PD class.

The minimum option assures that the power allocation is equal to the maximum of LLDP/CDP power requested and the minimum power configured for that PD class.

Given a configuration of **inline power adjust class 1 delta 800**. If a class 1 PD is connected and is requesting power of 2600 milliWatts through LLDP/CDP, then the total allocation from the switch would be 3200 milliWatts. But if a class 2 PD is connected then there won't be any extra power allocation. If you want the extra power allocation for a class 2 PD, the configuration would be **inline power adjust class 2 delta 800**.

Examples

Set the detected PD class to 1 and allocate 800 milliwatts of extra power for the class.

```
device(config)# inline power adjust class 1 delta 800
```

Set the detected PD class to 1 and allocate minimum power (in milliwatts) regardless of the LLDP/CDP requested power level.

```
device(config)# inline power adjust class 1 minimum 3200
```

History

Release	Command History
8.0.30f	This command was introduced.

inline power install-firmware

Installs Power over Ethernet (PoE) firmware.

Syntax

```
inline power install-firmware stack-unit unit-number tftp ip-address file-name
```

Parameters

stack-unit *unit-number*

Specifies the unit ID of the stack. If the switch is not a part of the stack, the unit number is the default value. The default stack-unit value is 1.

tftp *ip-address*

Specifies the IP address of the TFTP server.

file-name

Specifies the name of the file, including its path name.

Modes

Privileged EXEC mode

Usage Guidelines

If you want to install firmware on a stack, you must install firmware on one switch at a time using the **inline power install-firmware stack-unit** command.

Examples

The following example installs PoE firmware.

```
device# inline power install-firmware stack-unit 1 tftp 10.120.54.161 icx74xx_poh_01.2.1.b003.fw
```

inline power install-firmware scp

Upgrades the PoE firmware of a Brocade SX module or FastIron stacking device by downloading a firmware file from an SCP server.

Syntax

```
inline power install-firmware { stack-unit unit-id | module module-id } scp { ipv4-address- | ipv4-hostname- | ipv6
{ ipv6-address- | ipv6-hostname- } outgoing-interface { ethernet stackid/slot/port | ve ve-number } } [ public-key
{ dsa | rsa } ] [ remote-port ] remote-filename
```

Parameters

stack-unit *unit-id*

Specifies the unit ID of the FastIron device in the stack to copy the PoE firmware. You must specify the stack unit when you configure the **inline power install-firmware** command to upgrade PoE firmware on a stacking device.

module *module-id*

Specifies the module ID of the Brocade SX device to copy the PoE firmware. You must specify the module when you configure the **inline power install-firmware** command to upgrade PoE firmware on a Brocade SX device.

ipv4-address-

Specifies the IPV4 address of the SCP server, using 8-bit values in dotted decimal notation.

ipv4-hostname-

Specifies the IP hostname of the SCP server.

ipv6

Specifies the IPV6 address method for SCP file transfer.

ipv6-address-prefix/prefix-length

Specifies the IPV6 address of the SCP server. You must specify this address in hexadecimal using 16-bit values between colons, as documented in RFC 2373.

ipv6-hostname-

Specifies the IPv6 hostname of the SCP server.

outgoing-interface

Specifies the interface to be used to reach the remote host.

ethernet *stackid/slot/port*

Configures an Ethernet interface as the outgoing interface.

ve *ve-number*

Configures a virtual interface (VE) as the outgoing interface.

public-key

Specifies the type of public key authentication to use for the connection, either digital signature algorithm (DSA) or Rivest, Shamir, and Adelman (RSA) . If you do not configure this parameter, the default authentication type is password.

dsa

Specifies DSA as the public key authentication.

Commands F - J

inline power install-firmware scp

rsa

Specifies RSA as the public key authentication.

remote-port

Specifies the remote port number for the TCP connection.

remote-filename

Specifies the name of the file in the SCP server that is to be transferred. You can specify up to 127 characters for the filename.

Modes

Privileged EXEC mode

Usage Guidelines

You are prompted for username and password when you configure this command.

If you do not configure the type of public key authentication, the default authentication type is password.

You must specify the stack unit and module when you configure the **inline power install-firmware** command to upgrade PoE firmware on a stacking device.

Examples

This example upgrades the PoE firmware of a FastIron device by downloading a firmware file from an SCP server:

```
Device#inline power install-firmware stack-unit 2 scp 2.2.2.2 icx64xx_poeplus_02.1.0.b004.fw
```

History

Release version	Command history
08.0.20	This command was introduced.

inline power interface-mode-2pair-pse

Corrects a condition where some non-standard powered devices (PD) are undetected on PoH ports due to difference in allowed capacitance between a 2-pair port and a 4-pair port.

Syntax

inline power interface-mode-2pair-pse

Modes

Configure interface port extender.

Usage Guidelines

This command is for the Brocade ICX 7450 24P and ICX 7450 48P platforms.

Before this command is executed the user may see the following behavior:

```
SPX(config)# interface ethernet 17/1/8
SPX(config-if-pe-e1000-17/1/8)# enable
SYSLOG: <14> Sep 27 17:32:49 SPX PORT: 17/1/8 enabled by un-authenticated user
from console session.
SYSLOG: <14> Sep 27 17:32:49 SPX System: PoE: Allocated power of 95000 mwatts
on port 17/1/8.
SYSLOG: <14> Sep 27 17:32:56 SPX System: PoE: Released complete power of 95000
mwatts on port 17/1/8.
SPX(config-if-pe-e1000-17/1/8)# show inline power 17/1/8
```

Port	Admin State	Oper State	---Power(mWatts)---		PD Type	PD Class	Pri	Fault/Error
			Consumed	Allocated				
17/1/8	On	Off	0	0	n/a	n/a	3	n/a

Where the Operating State is listed as Off, there is no power consumed or allocated, and the PD is not recognized..

Examples

To correct this problem:

```

SPX# configure terminal
SPX(config)# interface ethernet 17/1/8
SPX(config-if-pe-e1000-17/1/8)# inline power interface-mode-2pair-pse
SYSLOG: <14> Sep 27 17:34:52 SPX System: PoE: Allocated power of 7000 mwatts on
port 17/1/8. PoE: Power enabled on port 17/1/8.
SYSLOG: <14> Sep 27 17:34:52 SPX System: PoE: Power enabled on port 17/1/8.
SYSLOG: <14> Sep 27 17:34:52 SPX System: Interface ethernet 17/1/8, state up
SPX(config-if-pe-e1000-17/1/8)# show running-config interface ethernet 17/1/8
interface ethernet 17/1/8
 spanning-tree root-protect
 spanning-tree 802-1w admin-edge-port
 inline power
 inline power interface-mode-2pair-pse
 stp-bpdu-guard
 trust dscp
 port security
 enable
!
SPX(config-if-pe-e1000-17/1/8)# show inline power 17/1/8

Port      Admin   Oper    ---Power(mWatts)---  PD Type  PD Class  Pri  Fault/
      State State  Consumed  Allocated
-----
17/1/8 On      On      2700      7000  Legacy   Class 2   3   n/a
    
```

History

Release version	Command history
08.0.30	This command was introduced.

inline power non-pd-detection enable

Enables detection for nonpowered endpoints or devices (non-PD).

Syntax

inline power non-pd-detection enable

no inline power non-pd-detection enable

Command Default

By default, non-PD detection is enabled.

Modes

Global configuration mode.

Usage Guidelines

A multiport PD must be connected to a single unit and must have a LAG defined for the ports.

By default, this feature is enabled and new devices that connect to the Power over Ethernet (PoE) ports are detected.

When this feature is disabled by using the **no** form of the command, new devices that connect to the PoE ports are not detected.

When this feature is re-enabled after having been disabled, only new devices that connect to the PoE ports are detected. To ensure that all existing non-PDs are detected, you must save the configuration and reload the device or follow the below order of configuration:

1. Configure the LAG for multiport PDs.
2. Enable non-PD detection mode.
3. Configure inline power on interfaces.

When the **no** form of the command is used to disable non-PD detection, the existing non-PD state declarations on the ports are not cleared. The state declarations on the ports clear when they are disconnected from the non-PDs or when you save the configuration and reload the device.

Either reload after disabling the mode or disable and then enable inline power on ports that are in a non-PD state.

When a port has detected a non-PD, it generates the following syslog message:

```
PoE: Power disabled on port 1/1/21 because of detection of non-PD.  
PD detection will be disabled on port.
```

When a port loses a non-PD (cable disconnected, etc.), it generates the following syslog message:

```
PoE: Port 1/1/21 lost non-PD, so enabling PD detection.
```

Commands F - J

inline power non-pd-detection enable

Examples

The following example disables non-PD detection.

```
device# configure terminal
device(config)# no inline power non-pd-detection enable
```

The following example enables non-PD detection.

```
device# configure terminal
device(config)# inline power non-pd-detection enable
Warning: Enabling or disabling non-PD detection requires reload or
disable/enable of ports with existing non-PDs.
Warning: Enabling this configuration also has following limitation:
All ports of a multi-port PD must be connected to one unit only so
that a LAG configured does not span more than a single unit.
device(config)# write memory
device(config)# exit
device# reload
```

History

Release version	Command history
08.0.30f	This command was introduced.
08.0.50	The command was modified; non-PD detection is now enabled by default.

integrity

Configures an integrity algorithm for an Internet Key Exchange version 2 (IKEv2) proposal.

Syntax

```
integrity { sha256 | sha384 }
no integrity { sha256 | sha384 }
```

Command Default

The default integrity algorithm is SHA-384.

Parameters

- sha256**
Specifies SHA-2 family 256-bit (hash message authentication code (HMAC) variant) as the hash algorithm.
- sha384**
Specifies SHA-2 family 384-bit (HMAC variant) as the hash algorithm.

Modes

IKEv2 proposal configuration mode

Usage Guidelines

- Multiple integrity algorithms may be configured for an IKEv2 proposal.
- When only one integrity algorithm is configured for an IKEv2 proposal, removing it restores the default configuration.
- The **no** form of the command removes the specified integrity algorithm configuration.

Examples

The following example shows how to configure the integrity algorithm SHA-256 for an IKEv2 proposal name ikev2_proposal.

```
device(config)# ikev2 proposal ikev2_proposal
device(config-ikev2-proposal-ikev2_proposal)# integrity sha256
```

History

Release version	Command history
8.0.50	This command was introduced.

interface ethernet

Enters interface configuration mode for the specified Ethernet interface.

Syntax

interface ethernet *stackid/slot/port* [[**ethernet** *stackid/slot/port*]... | **to** *stackid/slot/port*]

no interface ethernet *stackid/slot/port* [[**ethernet** *stackid/slot/port.*]... | **to** *stackid/slot/port*]

Parameters

ethernet *stackid/slot/port*

Specifies the Ethernet interface.

to *stackid/slot/port*

Specifies a range of Ethernet interfaces.

Modes

Global configuration mode

Interface configuration mode

Usage Guidelines

The **no** form of the command exits from the interface configuration mode.

Examples

The following example shows how to enter interface configuration mode.

```
device(config)# interface ethernet 1/1/1  
device(config-if-e1000-1/1/1)# interface ethernet 1/1/2
```

The following example shows how to move to one interface mode to another.

```
device(config)# interface ethernet 1/1/1  
device(config-if-e1000-1/1/1)# interface ethernet 1/1/2  
device(config-if-e1000-1/1/2)#
```

interface group-ve

Associates the virtual interface routing group with a VLAN group.

Syntax

interface group-ve *num*

no interface group-ve *num*

Command Default

A virtual routing interface group is not associated with a VLAN group.

Parameters

num

Specifies the VLAN group ID with which you want to associate the virtual routing interface group.

Modes

Global configuration mode

Usage Guidelines

The VLAN group must already be configured and enabled to use a virtual routing interface group. The software automatically associates the virtual routing interface group with the VLAN group that has the same ID. You can associate a virtual routing interface group only with the VLAN group that has the same ID.

When you configure a virtual routing interface group, all members of the group have the same IP subnet address.

NOTE

Configuring a virtual interface routing group is not supported with IPv6. Configuring a virtual interface routing group is supported only with the OSPF, VRRPv2, and VRRP-Ev2 protocols.

The **no** form of the command removes the virtual routing interface group from a VLAN group.

Examples

The following example shows how to associate the virtual routing interface group with a VLAN group.

```
device(config)# vlan-group 1
device(config-vlan-group-1)# group-router-interface
device(config-vlan-group-1)# exit
device(config)# interface group-ve 1
```

interface loopback

Configures a loopback interface and enters loopback interface configuration mode.

Syntax

```
interface loopback port-number
```

```
interface loopback port-number
```

Command Default

A loopback interface is not configured.

Parameters

port-number

Specifies the port number for the loopback interface. The range is 1 through 32.

Modes

Global configuration mode

Usage Guidelines

A loopback interface adds stability to the network by working around route flap problems that can occur due to unstable links between the device and neighbors.

Loopback interfaces are always up, regardless of the states of physical interfaces.

The **no** form of the command removes the specified loopback interface.

Examples

The following example configures a loopback interface and enters loopback interface configuration mode.

```
device(config)# interface loopback 10  
device(config-lbif-3) #
```

interface management

Specifies a management interface and enters management interface configuration mode.

Syntax

```
interface management { 1 }  
no interface management
```

Command Default

No management interface is specified.

Parameters

1
The only available interface for management.

Modes

Global configuration mode

Usage Guidelines

Use the **no** form of this command to remove the management interface.

Examples

To specify the management interface and enter management interface configuration mode:

```
device# configure terminal  
device(config)# interface management 1  
device(config-if-mgmt-1)#
```

History

Release version	Command history
8.0.50	This command was introduced.

interface tunnel

Configures a tunnel interface.

Syntax

```
interface tunnel tunnel-number  
no interface tunnel tunnel-number
```

Command Default

No tunnel interface is configured.

Parameters

tunnel-number
Specifies the tunnel number.

Modes

Global configuration mode

Usage Guidelines

Use the **no interface tunnel** command to remove the tunnel interface.

Examples

This example creates a tunnel interface.

```
device# configure terminal  
device(config)# interface tunnel 2  
device(config-tnif-2)#
```

Related Commands

[tunnel destination](#), [tunnel mode gre ip](#), [tunnel source](#)

interface ve

Configures a virtual Ethernet (VE) interface.

Syntax

interface ve *vlan-num*

no interface ve *vlan-num*

Command Default

A virtual Ethernet interface is not configured.

Parameters

vlan-num

Specifies the corresponding VLAN interface that must already be configured before the VE interface can be created. Valid values are from 1 through 4095.

Modes

Global configuration mode

VLAN configuration mode

Usage Guidelines

A virtual interface is a logical port associated with a Layer 3 Virtual LAN (VLAN) configured on a Layer 3 switch. You can configure routing parameters on the virtual interface to enable the Layer 3 switch to route protocol traffic from one Layer 3 VLAN to the other, without using an external router.

The no form of the command removes the VE interface.

Examples

The following example configures a VE interface.

```
device(config)# interface ve 10
device(config-vif-10)#
```

ip access-group

Applies numbered or named IPv4 access control lists (ACLs) to traffic entering or exiting an interface.

Syntax

ip access-group { *acl-num* | *acl-name* } { **in** | **out** }

no ip access-group { *acl-num* | *acl-name* } { **in** | **out** }

ip access-group { *acl-num* | *acl-name* } **in** [**ethernet** *stack / slot / port ...*] [**ethernet** *stack / slot / port to ethernet* *stack / slot / port ...*]

no ip access-group { *acl-num* | *acl-name* } **in** [**ethernet** *stack / slot / port ...*] [**ethernet** *stack / slot / port to ethernet* *stack / slot / port ...*]

ip access-group frag deny

no ip access-group frag deny

Command Default

ACLs are not applied to interfaces.

Parameters

acl-num

Specifies an ACL number. You can specify from 1 through 99 for standard ACLs and from 100 through 199 for extended ACLs.

acl-name

Specifies a valid ACL name.

in

Applies the ACL to inbound traffic on the port.

ethernet *stack / slot / port*

Specifies the Ethernet interface from which the packets are coming.

to *stack / slot / port*

Specifies the range of Ethernet interfaces from which the packets are coming.

out

Applies the ACL to outbound traffic on the port.

frag deny

Denies all IP fragments on the port.

Modes

Interface subtype configuration modes

Usage Guidelines

To apply an IPv4 ACL name that contains spaces, enclose the name in quotation marks (for example, **ip access-group "ACL for Net1" in**).

Through a virtual routing interface, you have the following options:

- (Default) Apply an ACL to all ports of the VLAN.
- One or both of the following options:
 - Apply an ACL to specified ports.
 - Apply an ACL to one or more ranges of ports.

To remove an ACL from an interface, use one of the **no** forms of this command.

Examples

The following example creates a named standard IPv4 ACL, defines rules in the ACL, and applies it on an ethernet interface in the ingress direction:

```
device# configure terminal
device(config)# ip access-list standard Net1
device(config-std-nacl)# deny host 10.157.22.26
device(config-std-nacl)# deny 10.157.29.12
device(config-std-nacl)# deny host IPHost1
device(config-std-nacl)# permit any
device(config-std-nacl)# interface ethernet 1/1/1
device(config-if-e10000-1/1/1)# ip access-group Net1 in
```

The following example creates a named extended IPv4 ACL, defines rules in the ACL, and applies it on an ethernet interface in the ingress direction:

```
device# configure terminal
device(config)# ip access-list extended "block Telnet"
device(config-ext-nacl-block telnet)# deny tcp host 10.157.22.26 any eq telnet
device(config-ext-nacl-block telnet)# permit ip any any
device(config-ext-nacl-block telnet)# interface ethernet 1/1/1
device(config-if-e10000-1/1/1)# ip access-group "block Telnet" in
```

The first phase of the following example configures port-based VLAN 10, adds ports 1/1 through 2/12 to the VLAN, and then adds virtual routing interface 1 to the VLAN.

```
device# configure terminal
device(config)# vlan 10 name IP-subnet-vlan
device(config-vlan-10)# untag ethernet 1/1/1 to 1/1/20 ethernet 1/2/1 to 1/2/12
device(config-vlan-10)# router-interface ve 1
device(config-vlan-10)# exit
```

The next commands configure a standard numbered IPv4 ACL, and define rules in it.

```
device(config)# ip access-list standard 1
device(config-std-nacl)# deny host 10.157.22.26
device(config-std-nacl)# deny 10.157.29.12
device(config-std-nacl)# deny host IPHost1
device(config-std-nacl)# permit any
```

The concluding commands apply the ACL, in an ingress direction, to a subset of the ports associated with virtual interface 1 and to outgoing traffic on all ports.

```
device(config)# interface ve 1
device(config-vif-1)# ip access-group 1 in ethernet 1/1/1 ethernet 1/1/3 ethernet 1/2/1 to 1/2/4
device(config-vif-1)# ip access-group 1 out
```

ip access-list

Creates a named or numbered IPv4 standard or extended access list (ACL). In ACLs, you can define rules that permit or deny network traffic based on criteria that you specify.

Syntax

```
ip access-list { standard | extended } { acl-num | acl-name }
```

```
no ip access-list { standard | extended } { acl-num | acl-name }
```

Command Default

No IPv4 named or numbered ACLs are defined. However, you can also create numbered IPv4 ACLs, using the **access-list** command.

Parameters

standard

Creates a standard access list. Contains rules that permit or deny traffic based on source addresses that you specify. The rules are applicable to all ports of the specified address.

extended

Contains rules that permit or deny traffic according to source and destination addresses, as well as other parameters. For example, you can also filter by port, protocol (TCP or UDP), and TCP flags.

acl-num

Specifies the ACL number for a standard or extended access list. The value can be from 1 through 99 for standard IPv4 ACLs and from 100 through 199 for extended IPv4 ACLs.

acl-name

Specifies a unique IPv4 ACL name. The name can be up to 255 characters, and must begin with an alphabetic character. If the name contains spaces, put it within quotation marks. Otherwise, no special characters are allowed, except for underscores and hyphens.

Modes

Global configuration mode

Usage Guidelines

An ACL name must be unique among IPv4 and IPv6 standard and extended ACL types.

After you create an IPv4 ACL, enter one or more **permit** or **deny** commands to create filtering rules for that ACL.

An IPv4 ACL starts functioning only after it is applied to an interface using the **ip access-group** command.

The system supports the following IPv4 ACL resources:

- IPv4 numbered standard ACLs—99
- IPv4 numbered extended ACLs—100

- IPv4 named standard ACLs—99
- IPv4 named extended ACLs—100
- Maximum filter-rules per IPv4 or IPv6 ACL—2000. You can change the maximum up to 8192 by using the **system-max ip-filter-sys** command.

The **no** form of this command deletes the ACL. You can delete an IPv4 ACL only after you first remove it from all interfaces to which it is applied, using the **no ip access-group** command.

Examples

The following example creates an extended, named IPv4 ACL, defines rules in it, and applies it to an ethernet interface, in the ingress direction.

```
device(config)# ip access-list extended "block Telnet"  
device(config-ext-nacl-block telnet)# deny tcp host 10.157.22.26 any eq telnet  
device(config-ext-nacl-block telnet)# permit ip any any  
device(config-ext-nacl-block telnet)# interface ethernet 1/1/1  
device(config-if-e10000-1/1/1)# ip access-group "block Telnet" in
```

The following example creates an extended, numbered IPv4 ACL and defines rules in it.

```
device# configure terminal  
device(config)# ip access-list extended 101  
device(config-ext-nacl)# seq 30 deny udp 19.1.2.0 0.0.0.255 eq 2023 20.1.2.0 0.0.0.255 eq 2025 dscp-  
mapping 23  
device(config-ext-nacl)# permit 12 host 098.096.31.10 any  
device(config-ext-nacl)# deny tcp host 098.092.12.10 131.21.12.0/24 syn  
device(config-ext-nacl)# deny 120 host 18.192.112.110 13.2.2.0/24 log  
device(config-ext-nacl)# permit ip any any mirror
```

The following example configures a standard access list.

```
device(config)# ip access-list standard acl1  
device(config-std-nacl)#
```

The following example configures an extended access list.

```
device(config)# ip access-list extended 125  
device(config-ext-nacl)#
```

ip address

Configures an IP address on an interface.

Syntax

ip address *ip-address/mask* { **dynamic** | **ospf-ignore** | **ospf-passive** } [**replace**]

ip address *ip-address/mask* [**secondary**]

no ip address [*ip-address/mask*]

Parameters

ip-address

Specifies the IP address.

mask

IP address or subnet mask length.

dynamic

Specifies the interface IP address is dynamic.

ospf-ignore

Disables adjacency formation with OSPF neighbors and disables advertisement of the interface to OSPF.

ospf-passive

Disables adjacency formation with OSPF neighbors but does not disable advertisement of the interface to OSPF.

replace

Replaces the configured primary IP address on the interface.

secondary

Specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address.

Modes

Interface configuration mode

Management interface configuration mode

Usage Guidelines

- Use this command to configure a primary or secondary IP address for a specific interface. You can also use this command to prevent OSPF from running on specified subnets. Multiple primary IP addresses are supported on an interface.
- You can use this command to configure a primary or secondary IP address for a management interface.
- For a management interface, only one primary IP address is supported. Secondary IP addresses are not supported.
- A primary IP address cannot overlap with a previously configured IP subnet.
- A primary IP address must be configured before you configure a secondary IP address in the same subnet.

- To remove the configured static or DHCP address, enter **no ip address**. This resets the address to 0.0.0.0/0.
- The **no** form of the command removes a specific IP address from the interface.

Examples

The following example configures a primary IP address on a specified Ethernet interface.

```
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# ip address 10.1.1.1/24
```

The following example replaces the primary IP address of an interface. .

```
device# configure terminal
device (config)# interface ethernet 1/1/21
device(config-if-e1000-1/1/21)# ip address 10.1.1.2/24 replace
```

ip-address

Configures a virtual IP address for a Virtual Router Redundancy Protocol (VRRP) or VRRP Extended (VRRP-E) instance.

Syntax

ip-address *ip-address*

no ip-address *ip-address*

Command Default

A virtual IP address is not configured for a VRRP or VRRP-E instance.

Parameters

ip-address

Configures the IP address, in dotted-decimal format.

Modes

VRID interface configuration mode

Usage Guidelines

For VRRP instances, the IP address used for the virtual router must be configured on the device assigned to be the initial VRRP owner device. The same IP address cannot be used on any other VRRP device.

For VRRP-E instances, the IP address used for the virtual router must not be configured on any other device.

The **no** form of this command removes the virtual router IP address.

Examples

The following example configures a virtual IP address for VRID 1 when VRRP is implemented. In this example, the device is configured as the VRRP owner device.

```
device# configure terminal
device(config)# router vrrp
device(config)# interface ethernet 1/1/6
device(config-if-e1000-1/1/6)# ip address 10.53.5.1/24
device(config-if-e1000-1/1/6)# ip vrrp vrid 1
device(config-if-e1000-1/1/6-vrid-1)# owner
device(config-if-e1000-1/1/6-vrid-1)# ip-address 10.53.5.1
device(config-if-e1000-1/1/6-vrid-1)# activate
VRRP router 1 for this interface is activating
```

The following example configures a virtual IP address for VRID 2 when VRRP-E is implemented. In this example, the device is configured as a VRRP backup device and the highest priority device will become the master VRRP device.

```
device# configure terminal
device(config)# router vrrp-extended
device(config-vrrpe-router)# interface ethernet 1/1/5
device(config-if-e1000-1/1/5)# ip address 10.53.5.3/24
device(config-if-e1000-1/1/5)# ip vrrp-extended vrid 2
device(config-if-e1000-1/1/5-vrid-2)# backup priority 110
device(config-if-e1000-1/1/5-vrid-2)# version 2
device(config-if-e1000-1/1/5-vrid-2)# ip-address 10.53.5.254
device(config-if-e1000-1/1/5-vrid-2)# activate
VRRP router 2 for this interface is activating
```

ip-address (VSRP)

Configures the IP address to back up.

Syntax

ip-address *ip-address*

no ip-address *ip-address*

ip address *ip-address*

no ip address *ip-address*

Command Default

The IP address to backup is not configured.

Parameters

ip-address

Configures the IP address to back up.

Modes

VSRP VRID configuration mode

Usage Guidelines

If you are configuring a Layer 3 switch for VSRP, you can specify an IP address to back up. When you specify an IP address, VSRP provides redundancy for the address. This is useful if you want to back up the gateway address used by hosts attached to the VSRP backups. VSRP does not require you to specify an IP address. If you do not specify an IP address, VSRP provides Layer 2 redundancy. If you do specify an IP address, VSRP provides Layer 2 and Layer 3 redundancy.

The VRID IP address must be in the same subnet as a real IP address configured on the VSRP interface, but cannot be the same as a real IP address configured on the interface.

Failover applies to both Layer 2 and Layer 3.

The **no** form of the command removes the configured backup IP address.

Examples

The following example configures the backup IP address.

```
device(config)# vlan 200
device(config-vlan-200)# tagged ethernet 1/1/1 to 1/1/8
device(config-vlan-200)# vsrp vrid 1
device(config-vlan-200-vrid-1)# ip-address 10.10.10.1
```

ip arp-age

Configures ARP aging parameter.

Syntax

ip arp-age *age-time*

no ip arp-age *age-time*

Command Default

The default ARP aging is 10 minutes.

Parameters

age-time

Specifies the ARP age time in minutes. Valid range is from 0 to 240, 0 disables aging. The the default is 10 minutes.

Modes

Global configuration mode

Interface configuration mode

Usage Guidelines

When the Layer 3 switch places an entry in the ARP cache, the Layer 3 switch also starts an aging timer for the entry. The aging timer ensures that the ARP cache does not retain learned entries that are no longer valid. An entry can become invalid when the device with the MAC address of the entry is no longer on the network.

The ARP age affects dynamic (learned) entries only, not static entries. The default ARP age is ten minutes. On Layer 3 switches, you can change the ARP age to a value from 0 through 240 minutes. You cannot change the ARP age on Layer 2 switches. If you set the ARP age to zero, aging is disabled and entries do not age out.

Use the command from interface configuration mode to override the globally configured IP ARP age on an individual interface.

The **no** form of the command resets the ARP aging to the default value of 10 minutes.

Examples

The following example configures the ARP aging time as 100 minutes.

```
device(config)# ip arp-age 100
```

The following example overrides the global ARP aging time on a particular interface.

```
device(config)# interface ethernet 1/1/1  
device(config-if-e1000-1/1/1)# ip arp-age 30
```

ip arp inspection validate

Enables validation of the ARP packet destination MAC, ARP Packet IP, and source MAC addresses.

Syntax

```
ip arp inspection validate [dst-mac | ip | src-mac]
```

Command Default

IP ARP packet destination address validation is disabled.

Parameters

dst-mac

Checks the destination MAC address in the Ethernet header against the target MAC address in the ARP body for ARP responses. When enabled, packets with different MAC addresses are classified as invalid and are dropped.

ip

Checks the ARP body for invalid and unexpected IP addresses. Addresses include 0.0.0.0, 255.255.255.255, and all IP multicast addresses. Sender IP addresses are checked in all ARP requests and responses, and target IP addresses are checked only in ARP responses.

src-mac

Checks the source MAC address in the Ethernet header against the sender MAC address in the ARP body for ARP requests and responses. When enabled, packets with different MAC addresses are classified as invalid and are dropped.

Modes

Global configuration mode

Usage Guidelines

You can enable validation of ARP packet destination addresses for a single destination address or for all destination addresses.

You must execute the command once for each type of ARP packet destination address you want to validate.

Examples

The following example enables validation of the MAC, ARP Packet IP, and source MAC ARP packet destination addresses.

```
device(config)# configure terminal
device(config)# ip arp inspection validate dst-mac
device(config)# ip arp inspection validate src-mac
device(config)# ip arp inspection validate ip
```

History

Release version	Command history
08.0.10a	This command was introduced.

ip arp inspection syslog disable

Disables the syslog messages for Dynamic ARP Inspection.

Syntax

ip arp inspection syslog disable

no ip arp inspection syslog disable

Command Default

Syslog messages are enabled by default.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command re-enables syslog messages for Dynamic ARP Inspection.

Examples

The following example disables the syslog messages for dynamic ARP inspection.

```
device(config)# ip arp inspection syslog disable
```

History

Release version	Command history
08.0.30b	This command was introduced.

ip arp inspection vlan

Enables dynamic ARP inspection on a VLAN.

Syntax

ip arp inspection vlan *vlan-number*

no ip arp inspection vlan *vlan-number*

Command Default

Dynamic ARP inspection is disabled by default.

Parameters

vlan-number

Specifies the VLAN number.

Modes

Global configuration mode

Usage Guidelines

The no form of this command disables this functionality.

Examples

The following example shows enabling IP ARP inspection on VLAN 2.

```
device(config)# ip arp inspection vlan 2
```

ip arp learn-gratuitous-arp

Enables learning gratuitous ARP.

Syntax

ip arp learn-gratuitous-arp

no ip arp learn-gratuitous-arp

Command Default

Learning gratuitous ARP is not enabled.

Modes

Global configuration mode

Usage Guidelines

Learning gratuitous ARP enables Brocade Layer 3 devices to learn ARP entries from incoming gratuitous ARP packets from the hosts which are directly connected. This help achieve faster convergence for the hosts when they are ready to send traffic.

A new ARP entry is created when a gratuitous ARP packet is received. If the ARP is already existing, it will be updated with the new content.

The **no** form of the command disables learning gratuitous ARP.

Examples

The following example enables learning gratuitous ARP.

```
device(config)# ip arp learn-gratuitous-arp
```

ip bootp-gateway

Changes the IP address used for stamping BootP or DHCP requests received on the interface.

Syntax

ip bootp-gateway *ip-address*

Parameters

ip-address

Specifies the IP address used to stamp requests received on the interface.

Modes

Interface configuration mode

Usage Guidelines

The BootP or DHCP stamp address is an interface parameter. Use this command to change the parameter on the interface that is connected to the BootP/DHCP client.

In the example given below the command changes the CLI to the configuration level for port 1/1, then changes the BootP or DHCP stamp address for requests received on port 1/1 to 10.157.22.26. The Layer 3 switch will place this IP address in the Gateway Address field of BootP or DHCP requests that the Layer 3 switch receives on port 1/1 and forwards to the BootP or DHCP server.

Examples

The following command changes the IP address used for stamping BootP or DHCP requests received on interface 1/1/1.

```
device(config)# interface ethernet 1/1/1
device(config-if-1/1/1)# ip bootp-gateway 10.157.22.26
```

ip bootp-use-intf-ip

Configures a Dynamic Host Configuration Protocol (DHCP) relay agent to set the source IP address of a DHCP-client packet with the IP address of the interface in which the DHCP-client packet is received.

Syntax

ip bootp-use-intf-ip
no ip bootp-use-intf-ip

Command Default

The DHCP relay agent sets the source IP address of a DHCP-client packet with the IP address of the outgoing interface to the DHCP server.

Modes

Global configuration mode

Usage Guidelines

You can configure ACLs on a DHCP server to permit or block access to the DHCP server from particular subnets or networks. You can then use this command on the DHCP relay agent to reveal the source subnet or network of a DHCP packet to the DHCP server, which enables the DHCP server to process or discard the DHCP traffic according to the configured ACLs.

no

Examples

The following example configures a FastIron DHCP relay agent so that it sets the source IP address of a DHCP-client packet with the IP address of the interface on which the DHCP-client packet is received.

```
device(config)# ip bootp-use-intf-ip
```

ip broadcast-zero

Enables the Layer 3 switch for zero-based IP subnet broadcasts in addition to ones-based IP subnet broadcasts.

Syntax

ip broadcast-zero

no ip broadcast-zero

Command Default

By default, the Layer 3 switch treats IP packets with all ones in the host portion of the address as IP broadcast packets.

Modes

Global configuration mode

Usage Guidelines

Most IP hosts are configured to receive IP subnet broadcast packets with all ones in the host portion of the address. However, some older IP hosts instead expect IP subnet broadcast packets that have all zeros instead of all ones in the host portion of the address. To accommodate this type of host, you can enable the Layer 3 switch to treat IP packets with all zeros in the host portion of the destination IP address as broadcast packets.

When you enable the Layer 3 switch for zero-based subnet broadcasts, the Layer 3 switch still treats IP packets with all ones the host portion as IP subnet broadcasts too. Thus, the Layer 3 switch can be configured to support all ones only (the default) or all ones and all zeroes.

NOTE

This feature applies only to IP subnet broadcasts, not to local network broadcasts. The local network broadcast address is still expected to be all ones.

You must save the configuration and reload the software to place this configuration change into effect.

The **no** form of the command disables the Layer 3 switch for zero-based IP subnet broadcasts in addition to ones-based IP subnet broadcasts.

Examples

The following example enables the Layer 3 switch for zero-based IP subnet broadcasts in addition to ones-based IP subnet broadcasts.

```
device(config)# ip broadcast-zero
device(config)# write memory
device(config)# end
device# reload
```

ip default-gateway

Configures the default gateway for a Layer 2 switch.

Syntax

ip default-gateway *ip-address*

no ip default-gateway *ip-address*

Command Default

Default gateway is not configured.

Parameters

ip-address

Specifies the IP address of the default gateway.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command removes the configured default gateway.

Examples

The following example configures the default gateway.

```
device(config)# ip default-gateway 10.30.5.1
```

ip default-network

Configures a default network route.

Syntax

ip default-network *ip-address*

no ip default-network *ip-address*

Command Default

Default network is not configured.

Parameters

ip-address

Specifies the IP address of the network in the format A.B.C.D/L or A.B.C.D followed by the network mask in dotted decimal format.

Modes

Global configuration mode

Usage Guidelines

The Layer 3 switch enables you to specify a candidate default route without the need to specify the next hop gateway. If the IP route table does not contain an explicit default route (for example, 0.0.0.0/0) or propagate an explicit default route through routing protocols, the software can use the default network route as a default route instead.

When the software uses the default network route, it also uses the default network route's next hop gateway as the gateway of last resort. Configuring the default network route is especially useful in environments where network topology changes can make the next hop gateway unreachable. This feature allows the Layer 3 switch to perform default routing even if the default network route's default gateway changes.

You can configure up to four default network routes.

The **no** form of the command removes the default network route.

Examples

The following example configures a default IP network route.

```
device(config)# ip default-network 10.157.22.0
device(config)# write memory
```

ip dhcp-client auto-update enable

Enables the DHCP auto-update functionality.

Syntax

ip dhcp-client auto-update enable

no ip dhcp-client auto-update enable

Command Default

DHCP client auto-update is enabled by default.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command disables DHCP auto-update.

Examples

The following example re-enables auto-update.

```
device(config)# ip dhcp-client auto-update enable
```

ip dhcp-client enable

Enables DHCP client auto-update.

Syntax

ip dhcp-client enable

no ip dhcp-client enable

Modes

Global configuration mode.

Interface configuration mode.

Usage Guidelines

The **no** form of the command disables the DHCP client.

You can enable this command on a switch in global configuration mode. On routers, you can enable this command in interface configuration mode.

Examples

The following example enables the DHCP client on a switch.

```
device(config)# ip dhcp-client enable
```

The following example enables the DHCP client on a router.

```
device(config-if-e1000-0/1/1)# ip dhcp-client enable
```

ip dhcp-client continuous-mode max-duration

Limits the level of IPv4 address acquisition attempts globally on a DHCP client.

Syntax

ip dhcp-client continuous-mode max-duration *interval*

no dhcp-client continuous-mode max-duration *interval*

Command Default

The default time is one hour.

Parameters

interval

Specifies the interval value for the DHCP client to limit or stop the address acquisition feature in hours. The minimum time is 1 hour and the maximum time is 65535 hours.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command disables the functionality.

Address acquisition stops once it reaches the configured maximum duration.

Examples

The following example sets the maximum duration interval to two hours.

```
device(config)# ip dhcp-client continuous-mode max-duration 2
```

History

Release version	Command history
08.0.30	This command was introduced.

ip dhcp-client discovery-interval

Specifies the discovery interval value for the DHCP client to acquire IPv4 addresses.

Syntax

ip dhcp-client discovery-interval *interval*

no ip dhcp-client discovery-interval *interval*

Command Default

The default interval is 10 minutes.

Parameters

interval

Specifies the interval value for the DHCP client to acquire IPv4 addresses, in minutes. The minimum is 5 minutes, while the maximum time is 60 minutes.

Modes

Global configuration mode

Interface configuration mode

Usage Guidelines

The **no** form of this command disables the functionality.

Use this command to configure the discovery-interval value. The DHCP client starts sending discovery messages based on the interval value you configure on the device.

Examples

The following example configures the client to send discovery messages at intervals of every 20 minutes. This global configuration mode is applicable only for a switch.

```
device(config)# ip dhcp-client discovery-interval 20
```

The following example configures the client to send discovery messages at intervals of every 20 minutes. The interface configuration mode is applicable only for a router.

```
device(config-if-e1000-0/1/1)# ip dhcp-client discovery-interval 20
```

History

Release version	Command history
08.0.30	This command was introduced.

Commands F - J

ip dhcp-client discovery-interval

Release version	Command history
08.0.50	The command syntax changed from ip dhcp-client discover-interval to ip dhcp-client discovery-interval .

ip dhcp-server arp-ping-timeout

Sets the ARP-ping timeout value.

Syntax

ip dhcp-server arp-ping-timeout *number*

no ip dhcp-server arp-ping-timeout *number*

Command Default

ARP-ping timeout is not enabled.

Parameters

number

The number of seconds to wait for a response to an ARP-ping packet. The minimum setting is 5 seconds and the maximum is 30 seconds.

Modes

Global configuration mode.

Usage Guidelines

The **no** form of the command disables the ARP ping timeout. If there is no response to the ARP-ping packet within a set amount of time (set in seconds), the server deletes the client from the lease-binding database.

NOTE

Do not alter the default value unless it is necessary. Increasing the value of this timer may increase the time to get console access after a reboot.

Examples

The following example sets the ARP-ping timeout to 25 seconds.

```
device# ip dhcp-server arp-ping-timeout 25
```

ip dhcp-server enable

Enables the DHCP server.

Syntax

ip dhcp-server enable

no ip dhcp-server enable

Command Default

The DHCP server is not enabled.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command disables the DHCP server.

Examples

The following example enables the DHCP server.

```
device(config)# ip dhcp-server enable
```

ip dhcp-server mgmt

Enables or disables the DHCP server on the management port.

Syntax

ip dhcp-server mgmt

no ip dhcp-server mgmt

Command Default

DHCP server management is enabled by default.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command disables the DHCP server on the management port.

When disabled, DHCP client requests that are received on the management port are discarded.

Examples

The following example enables the DHCP server on the management port.

```
device(config)# ip dhcp-server mgmt
```

The following example disables the DHCP server on the management port.

```
device(config)# no ip dhcp-server mgmt
```

ip dhcp-server server-identifier

Specifies the IP address of the selected DHCP server.

Syntax

ip dhcp-server server-identifier *ip-address*

Parameters

ip-address

Specifies the IP address of the DHCP server.

Modes

Global configuration mode

Examples

The following example shows assigning an IP address to the selected DHCP server.

```
device(config)# ip dhcp-server-identifier 10.1.1.144
```

ip dhcp-server pool

Creates a DHCP server address pool.

Syntax

ip dhcp-server pool *name*

no ip dhcp-server pool *name*

Parameters

name

The name of the address pool.

Modes

Global configuration mode.

Usage Guidelines

The **no** form of this command disables the address pool. Use this command to switch to pool configuration mode (config-dhcp-name# prompt) and create an address pool.

Examples

The following example creates a DHCP address pool.

```
device(config)# ip dhcp-server pool cabo
```

ip dhcp-server relay-agent-echo enable

Activates the DHCP option 82.

Syntax

ip dhcp-server relay-agent-echo enable

Command Default

The DHCP option 82 functionality is not enabled by default.

Modes

Global configuration mode

Usage Guidelines

This command enables the DHCP server to echo the entire contents of the relay agent information option in all replies.

Examples

The following example enables the DHCP server relay agent.

```
device(config)# ip dhcp-server relay-agent-echo enable
```

ip dhcp snooping vlan

Enables DHCP snooping on a VLAN.

Syntax

ip dhcp snooping vlan *vlan-id*

no ip dhcp snooping vlan *vlan-id*

Command Default

DHCP snooping is disabled by default.

Parameters

vlan-id

Specifies the ID of a configured client or DHCP server VLAN.

Modes

Global configuration mode.

Usage Guidelines

The **no** form of the command disables DHCP snooping on the specified VLAN.

When DHCP snooping is enabled on a VLAN, DHCP packets are inspected. DHCP snooping must be enabled on the client and the DHCP server VLANs.

Examples

The following example enables DHCP snooping on VLAN 2.

```
device(config)# ip dhcp snooping vlan 2
```

ip dhcp relay information policy

Configures the DHCP relay information policy.

Syntax

ip dhcp relay information policy [drop | keep | replace]

Command Default

The device replaces the information with its own relay agent information.

Parameters

drop

Configures the device to discard messages containing relay agent information.

keep

Configures the device to keep the existing relay agent information.

replace

Configures the device to overwrite the relay agent information with the information in the Brocade configuration.

Modes

Global configuration mode.

Usage Guidelines

When the Brocade device receives a DHCP message that contains relay agent information, if desired, you can configure the device to keep the information instead of replacing it, or to drop (discard) messages that contain relay agent information.

Examples

The following example configures the device to keep the relay agent information contained in a DHCP message.

```
device(config)# ip dhcp relay information policy keep
```

The following example configures the device to drop the relay agent information contained in a DHCP message.

```
device(config)# ip dhcp relay information policy drop
```

ip directed-broadcast

Enables directed broadcast forwarding.

Syntax

ip directed-broadcast

no ip directed-broadcast

Command Default

Directed broadcast forwarding is disabled by default.

Modes

Global configuration mode

Usage Guidelines

A Smurf attack relies on the intermediary to broadcast ICMP echo request packets to hosts on a target subnet. When the ICMP echo request packet arrives at the target subnet, it is converted to a Layer 2 broadcast and sent to the connected hosts. This conversion takes place only when directed broadcast forwarding is enabled on the device. To avoid being an intermediary in a Smurf attack, make sure forwarding of directed broadcasts is disabled on the device.

The **no** form of the command disables directed broadcast forwarding.

Examples

The following example enables directed broadcast forwarding.

```
device(config)# ip directed-broadcast
```

ip dns

Configures the IPv4 Domain Name System (DNS).

Syntax

```
ip dns { domain-list domain-name | server-address ip-address [ ip-address... ] }  
no ip dns { domain-list domain-name | server-address ip-address [ ip-address... ] }
```

Command Default

IP DNS is not configured.

Parameters

domain-list

Configures a list of DNS domains.

domain-name

The domain name.

server-address

Configures the DNS server IPv4 address.

ip-address

The IPv4 address of the DNS server. You can configure up to a maximum of four IP addresses separated by a space.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command removes the DNS configurations.

Examples

The following example shows how to configure an IPv4 address for a DNS server.

```
device(config)# ip dns server-address 192.168.10.1 192.168.100.1
```

The following example shows how to configure the DNS domain-list.

```
device(config)# ip dns domain-list company.com
```

ip dscp-remark

Enables remarking of the differentiated services code point (DSCP) field for all IPv4 packets.

Syntax

```
ip dscp-remark dscp-value
```

```
no ip dscp-remark dscp-value
```

Command Default

DSCP remarking is disabled.

Parameters

dscp-value

Specifies the DSCP value ranges you are remarking.

Modes

Global configuration mode

Interface configuration mode

Usage Guidelines

The **no** form of this command disables DSCP remarking.

In interface configuration mode, the command enables DSCP remarking for the given port. The configuration can be done on a physical port, LAG, and VE port.

If DHCP snooping is enabled, you cannot globally enable DSCP remarking. When you enter the global configuration **ip dscp-remark** command, the following error message is displayed.

```
Error: DHCP Snooping is configured on the system. Cannot enable DSCP remarking
```

Examples

The following example globally enables DSCP remarking on all IPv4 packets when the DSCP bit value is 40:

```
Device(config)# ip dscp-remark 40
```

The following example enables DSCP remarking on all IPv4 packets received on a specific port when the DSCP bit value is 50:

```
Device(config)# interface ethernet1/1/1  
Device(config-if-e1000-1/1/1)# ip dscp-remark 50
```

ip encapsulation

Changes the IP encapsulation type.

Syntax

```
ip encapsulation { ethernet-2 | snap }  
no ip encapsulation { ethernet-2 | snap }
```

Command Default

Brocade Layer 3 switches use Ethernet II by default.

Parameters

ethernet-2
Configures the IP encapsulation type as Ethernet II.

snap
Configures the IP encapsulation type as Ethernet SNAP (also called IEEE 802.3).

Modes

Interface configuration mode

Usage Guidelines

The Layer 3 switch encapsulates IP packets into Layer 2 packets, to send the IP packets on the network.

All IP devices on an Ethernet network must use the same format. Brocade Layer 3 switches use Ethernet II by default. All devices connected to the Layer 3 switch port must use the same encapsulation type.

The **no** form of the command resets the encapsulation type as Ethernet II.

Examples

The following example configures the IP encapsulation type as Ethernet SNAP.

```
device(config)# interface ethernet 1/1/1  
device(config-if-e1000-1/1/1)# ip encapsulation snap
```

ip follow ve

Configures a virtual routing interface to share the IP address with other virtual routing interfaces.

Syntax

ip follow ve *number*

no ip follow ve *number*

Command Default

A virtual routing interface does not share its IP address with other interfaces.

Parameters

number

Specifies the virtual routing interface number.

Modes

Virtual routing configuration mode

Usage Guidelines

When this command is configured, one virtual routing interface is configured with an IP address, while the other virtual routing interfaces are configured to use that IP address, thus, they "follow" the virtual routing interface that has the IP address. This is helpful in conserving IP address space.

When configuring IP Follow, the primary virtual routing interface should not have ACL or DoS Protection configured. It is recommended that you create a dummy virtual routing interface as the primary and use the IP-follow virtual routing interface for the network. Global Policy Based Routing is not supported when IP Follow is configured. IPv6 is not supported with IP Follow. FastIron devices support IP Follow with OSPF and VRRP protocols only.

The **no** form of the command removes the configuration.

Examples

The following example configures IP Follow.

```
device(config)# vlan 2 name IP-Subnet_10.1.2.0/24
device(config-vlan-2)# untag ethernet 1 to 4
device(config-vlan-2)# router-interface ve 1
device(config-vlan-2)# interface ve 1
device(config-vif-1)# ip address 10.10.2.1/24
device(config-vif-1)# interface ve 2
device(config-vif-2)# ip follow ve 1
device(config-vif-2)# interface ve 3
device(config-vif-3)# ip follow ve 1
```

ip forward-protocol udp

Configures the Layer 3 switch to forward client requests for UDP applications.

Syntax

```
ip forward-protocol udp { port-name | port-num }  
no ip forward-protocol udp { port-name | port-num }
```

Command Default

Layer 3 switch does not forward client requests for UDP applications.

Parameters

port-name

Specifies the UDP application name. The values can be **echo**, **discard**, **time**, **tacacs**, **dns**, **bootps**, **bootpc**, **tftp**, **ntp**, **netbios-ns**, **netbios-dgm**, **mobile-ip**, and **talk**.

port-num

Specifies the UDP application port number.

Modes

Global configuration mode

Usage Guidelines

You also must configure a helper address on the interface that is connected to the clients for the application. The Layer 3 switch cannot forward the requests unless you configure the helper address

This command disables forwarding of SNMP requests to the helper addresses configured on Layer 3 switch interfaces.

The **no** form of the command stops forwarding client requests for the UDP applications.

Examples

The following example enables the forwarding of NTP broadcasts.

```
device(config)# ip forward-protocol udp ntp
```

ip helper-address

Configures a helper address on the interface connected to the client to enable forwarding of client broadcast request for a UDP application when the client and server are on different networks.

Syntax

```
ip helper-address address-number [ ip-address [ unicast ] ]
```

```
no ip helper-address address-number [ ip-address [ unicast ] ]
```

Command Default

IP helper address is not configured.

Parameters

address-number

Specifies the IP helper address number. Valid values are 1 to 16.

ip-address

Specifies the server IP address or the subnet directed broadcast address of the IP subnet the server is in.

unicast

Specifies that the client request must be forwarded to the server that is on the same network.

Modes

Interface configuration mode

Usage Guidelines

To forward a client broadcast request for a UDP application when the client and server are on different networks, you must configure a helper address on the interface connected to the client. Specify the server IP address or the subnet directed broadcast address of the IP subnet the server is in as the helper address.

You can configure up to 16 helper addresses on each interface. You can configure a helper address on an Ethernet port or a virtual interface.

By default, IP helper does not forward client broadcast request to a server within the network. To forward a client broadcast request when the client and server are on the same network, configure an IP helper with **unicast** option on the interface connected to the client.

The **no** form of the command removes the configured helper address.

Examples

The following example configures an IP helper address on Ethernet interface 1/1/1.

```
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# ip helper-address 1 10.20.3.4
```

Commands F - J

ip helper-address

The following example configures an IP helper address on Ethernet interface 1/2/2 to enable forwarding of broadcast request to a server within the network.

```
device(config)# interface ethernet 1/2/2
device(config-if-e1000-1/1/1)# ip helper-address 2 10.10.3.4 unicast
```

ip helper-use-responder-ip

Configures the Brocade device so that a BOOTP or DHCP reply to a client contains the server IP address as the source address instead of the router IP address.

Syntax

ip helper-use-responder-ip

no ip helper-use-responder-ip

Modes

Global configuration mode

Examples

The following example retains the responder source IP in the reply.

```
device(config)# ip helper-use-responder-ip
```

ip hitless-route-purge-timer

Configures the timer to set the duration for which the routes should be preserved after switchover.

Syntax

ip hitless-route-purge-timer *seconds*

no ip hitless-route-purge-timer *seconds*

Command Default

The default timer setting is 45 seconds.

Parameters

seconds

Specifies the time after switchover to start IPv4 route purge. The value can range from 2 to 600 seconds.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command removes the configured value and sets the timer to the default 45 seconds.

Examples

The following example shows how to set the IPv4 hitless purge timer to 60 seconds.

```
device(config)# ip hitless-route-purge-timer 60
```

ip icmp burst-normal

Configures the device to drop ICMP packets when excessive number of packets are encountered.

Syntax

ip icmp burst-normal *num-packets* **burst-max** *num-packets* **lockup** *time*

no ip icmp burst-normal *num-packets* **burst-max** *num-packets* **lockup** *time*

ip icmp attack-rate burst-normal *num-packets* **burst-max** *num-packets* **lockup** *time*

no ip icmp attack-rate burst-normal *num-packets* **burst-max** *num-packets* **lockup** *time*

Command Default

Threshold values for ICMP packets are configured.

Parameters

num-packets

Configures the number of packets per second in normal burst mode. Valid values are from 1 through 100,000 packets per second.

NOTE

For the Brocade ICX 7750, the value is in Kbps.

burst-max *num-packets*

Specifies the number of packets per second in maximum burst mode. Valid values are 1 through 100,000 packets per second.

NOTE

For the Brocade ICX 7750, the value is in Kbps.

lockup *time*

Configures the lockup period in seconds. Valid values are from 1 through 10,000 seconds.

attack-rate

Configures the attack rate. This is specific to the Brocade ICX 7750.

Modes

Global configuration mode

Interface configuration mode

Usage Guidelines

You can configure the Brocade device to drop ICMP packets when excessive number of packets are encountered, as is the case when the device is the victim of a Smurf attack. You can set threshold values for ICMP packets that are targeted at the router itself or passing through an interface, and drop them when the thresholds are exceeded.

Commands F - J

ip icmp burst-normal

For Layer 3 router code, if the interface is part of a VLAN that has a router VE, you must configure ICMP attack protection at the VE level. When ICMP attack protection is configured at the VE level, it will apply to routed traffic only. It will not affect switched traffic.

NOTE

You must configure VLAN information for the port before configuring ICMP attack protection. You cannot change the VLAN configuration for a port on which ICMP attack protection is enabled.

The **no** form of the command removes the configured threshold value.

Examples

The following example sets threshold values for ICMP packets targeted at the router.

```
device(config)# ip icmp burst-normal 5000 burst-max 10000 lockup 300
```

The following example sets threshold values for ICMP packets received on interface 3/1/1.

```
device(config)# interface ethernet 3/1/1
device(config-if-e1000-3/1/1)# ip icmp burst-normal 5000 burst-max 10000 lockup 300
```

The following example sets the threshold value for ICMP packets received on VE 31.

```
device(config)# interface ve 31
device(config-vif-31)# ip icmp burst-normal 5000 burst-max 10000 lockup 300
```

ip icmp echo broadcast-request

Enables an ICMP echo response caused by a broadcast echo request.

Syntax

ip icmp echo broadcast-request

no ip icmp echo broadcast-request

Command Default

By default, Brocade devices are enabled to respond to broadcast ICMP echo packets, which are ping requests.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command disables the response to broadcast ICMP echo packets (ping requests).

Examples

The following example enables an ICMP echo response caused by a broadcast echo request.

```
device(config)# ip icmp echo broadcast-request
```

ip icmp redirects

Enables IPv4 ICMP redirect messages.

Syntax

ip icmp redirects

no ip icmp redirects

Command Default

By default, IP ICMP redirect at the global level is disabled and a Brocade Layer 3 switch does not send an ICMP redirect message to the source of a misdirected packet in addition to forwarding the packet to the appropriate router.

Modes

Global configuration mode

VE interface configuration mode

Usage Guidelines

You can enable and disable IPv4 ICMP redirect messages globally or on individual Virtual Ethernet (VE) interfaces, but not on individual physical interfaces.

NOTE

The device forwards misdirected traffic to the appropriate router, even if you disable the redirect messages.

The **no** form of the command removes the ICMP redirect control.

Examples

The following example configures the IP redirect messages at the global level.

```
device(config)# ip icmp redirects
```

The following example configures the IP redirect messages on a VE interface.

```
device(config)# interface ve 10  
device(config-vif-10)# ip icmp redirects
```

ip icmp unreachable

Enables sending ICMP unreachable messages.

Syntax

ip icmp unreachable { **administration** | **fragmentation-needed** | **host** | **network** | **port** | **protocol** | **source-route-fail**}

no ip icmp unreachable { **administration** | **fragmentation-needed** | **host** | **network** | **port** | **protocol** | **source-route-fail**}

Command Default

By default, when a Brocade device receives an IP packet that the device cannot deliver, the device sends an ICMP unreachable message back to the host that sent the packet.

Parameters

administration

Sends the ICMP unreachable message when the packet is dropped by the device due to a filter or ACL configured on the device.

fragmentation-needed

Sends the ICMP unreachable message when the packet has the Do not Fragment bit set in the IP Flag field, but the device cannot forward the packet without fragmenting it.

host

Sends the ICMP unreachable message when the destination network or subnet of the packet is directly connected to the device, but the host specified in the destination IP address of the packet is not on the network.

network

Sends the ICMP unreachable message when the destination network is

port

Sends the ICMP unreachable message when the destination host does not have the destination TCP or UDP port specified in the packet. In this case, the host sends the ICMP port unreachable message to the device, which in turn sends the message to the host that sent the packet.

protocol

Sends the ICMP unreachable message when TCP or UDP on the destination host is not running. This message is different from the port unreachable message, which indicates that the protocol is running on the host but the requested protocol port is unavailable.

source-route-fail

Sends the ICMP unreachable message when the device received a source-routed packet but cannot locate the next hop IP address indicated in the packet Source-Route option.

Modes

Global configuration mode

Usage Guidelines

You can disable the Brocade device from sending these types of ICMP messages on an individual basis.

NOTE

Disabling an ICMP unreachable message type does not change the Brocade device ability to forward packets. Disabling ICMP unreachable messages prevents the device from generating or forwarding the unreachable messages.

The **no** form of the command disables the ICMP unreachable messages.

Examples

The following example enables the ICMP unreachable message when the destination network or subnet of the packet is directly connected to the device, but the host specified in the destination IP address of the packet is not on the network.

```
device(config)# ip icmp unreachable host
```

ip igmp group-membership-time

Specifies how long an IGMP group remains active on an interface in the absence of a group report.

Syntax

```
ip igmp group-membership-time num  
no ip igmp group-membership-time num
```

Command Default

By default, a group will remain active on an interface for 260 seconds in the absence of a group report.

Parameters

num
Number in seconds, from 5 through 26000.

Modes

Global configuration mode.

Usage Guidelines

The **no** form of this command resets the group membership time interval to the default of 260 seconds.
Group membership time defines how long a group will remain active on an interface in the absence of a group report.

Examples

This example specifies an IGMP (V1 and V2) membership time of 240 seconds.

```
Device(config)# ip igmp group-membership-time 240
```

ip igmp max-group-address

Configures the maximum number of IGMP addresses for the default virtual routing and forwarding (VRF) instance or for a specified VRF.

Syntax

```
ip igmp max-group-address num  
no ip igmp max-group-address num
```

Command Default

If this command is not configured, the maximum number of IGMP addresses is determined by available system resources.

Parameters

num
specifies the maximum number of IGMP group addresses available for all VRFs. The range is 1 through 8192; the default is 4096.

Modes

Global configuration mode
VRF configuration mode

Usage Guidelines

This command replaces the **system-max igmp-max-group-address** command.

If the **no** form of this command is configured, the maximum number of IGMP addresses is determined by available system resources.

Examples

This example configures a maximum of 1000 IGMP addresses for the default VRF.

```
device(config)# ip igmp max-group-address 1000
```

The following example configures a maximum of 1000 IGMP addresses for the VRF named vpn1.

```
device(config)# vrf vpn1  
device(config-vrf-vpn1)# address-family ipv4  
device(config-vrf-vpn1-ipv4)# ip igmp max-group-address 1000
```

ip igmp max-response-time

Defines how long a device waits for an IGMP response from an interface before determining that the group member on that interface is down and removing the interface from the group.

Syntax

```
ip igmp max-response-time num  
no ip igmp max-response-time num
```

Command Default

The device waits 10 seconds.

Parameters

num
Number, in seconds, from 1 through 25. The default is 10.

Modes

Global configuration mode.

Usage Guidelines

The **no** form of this command resets the maximum response time interval to the default of 10 seconds.

Examples

To define

This example changes the IGMP (V1 and V2) maximum response time to 8 seconds.

```
Device(config)# ip igmp max-response-time 8
```

ip igmp port-version

Configures an IGMP version recognized by a physical port that is a member of a virtual routing interface.

Syntax

ip igmp port-version *version-number* **ethernet** *port-number* [**to ethernet** *port-number* [**ethernet** *port-number...*]]

no ip igmp port-version *version-number* **ethernet** *port-number* [**to ethernet** *port-number* [**ethernet** *port-number...*]]

Command Default

IGMP Version 2 is enabled.

Parameters

version-number

Specifies the version number: 1, 2, or 3. Version 2 is the default.

ethernet *port-number*

Specifies the physical port within a virtual routing interface.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of this command restores the default; IGMP Version 2 is enabled.

Examples

This example enables IGMP Version 3 on a physical port that is a member of a virtual routing interface. It first enables IGMP Version 2 globally, then enables Version 3 on ports 1/3 through 1/7 and port e2/9. All other ports in this virtual routing interface are configured with IGMP Version 2.

```
device(config)#interface ve 3
device(config-vif-3)# ip igmp version 2
device(config-vif-3)# ip igmp port-version 3 e1/3 to e1/7 e2/9
```

ip igmp proxy

Configures IGMP proxy on an interface

Syntax

ip igmp proxy [**group-filter***access-list*]

no ip igmp proxy [**group-filter***access-list*]

Command Default

IGMP proxy is not enabled.

Parameters

group-filter

Specifies filtering out groups in proxy report messages.

access-list

Specifies the access list name or number you want filtered out.

Modes

Interface configuration mode.

Usage Guidelines

The **no** form of this command disables IGMP proxy on an interface.

IGMP proxy is supported only in PIM dense environments where there are IGMP clients connected to the Brocade device. PIM DM must be enabled in passive mode.

IGMP proxy is not supported on interfaces on which PIM sparse mode (SM) or Source Specific Multicast (SSM) is enabled.

Enter the **ip igmp proxy** command without the **group-filter** keyword to remove the group-filter association without disabling the proxy.

Examples

This example enables IGMP proxy on an interface. It first shows how to configure PIM globally, configure an IP address that will serve as the IGMP proxy for an upstream device on interface 1/3, enable PIM passive on the interface, and then enable IGMP proxy.

```
device(config)#router pim
device(config)#interface ethernet 1/3/3
device(config-if-e1000-1/3)#ip address 10.95.5.1/24
device(config-if-e1000-1/3)#ip pim passive
device(config-if-e1000-1/3)#ip igmp proxy
```

Commands F - J

ip igmp proxy

The following example filters out the ACL1 group in proxy report messages.

```
device(config)#router pim
device(config)#interface ethernet 1/3/3
device(config-if-e1000-1/3)#ip address 10.95.5.1/24
device(config-if-e1000-1/3)#ip pim passive
device(config-if-e1000-1/3)#ip igmp proxy group-filter ACL1
```

ip igmp query-interval

Defines how often a device queries an interface for IGMP group membership.

Syntax

ip igmp query-interval *num*

no ip igmp query-interval *num*

Command Default

The query interval is 125 seconds

Parameters

num

Number in seconds, from 2 through 3600. The default is 125.

Modes

Global configuration mode.

Usage Guidelines

The **no** form of this command resets the query interval to the default of 125 seconds.

You must specify a query-interval value that is a little more than twice the group membership time. You can configure the `ip igmp group-membership-time` command to specify the IGMP group membership time.

Examples

This example sets the IGMP query interval to 120 seconds.

```
Device(config)# ip igmp query-interval 120
```

ip igmp static-group

Configures one or more physical ports to be a permanent (static) member of an IGMP group based on the range or count. Manually adds a port to a multicast group.

Syntax

```
ip igmp static-group ip-addr [ count count-number | to ip-addr ] [ ethernet stack/slot/port ]  
no ip igmp static-group ip-addr [ count count-number | to ip-addr ] [ ethernet stack/slot/port ]
```

Command Default

The port is not added to multicast group.

Parameters

ip-addr

The address of the static IGMP group.

count *count-number*

Specifies the number of continuous static groups. The range is from 2 through 256.

ethernet *stack/slot/port*

Specifies the ID of the physical port of the VLAN that will be a member of the group.

to

Specifies a range of interface.

Modes

Interface configuration mode

Usage Guidelines

You can manually add a multicast group to individual ports only. If the port is a member of a virtual routing and forwarding (VRF) interface, you must add the ports to the group individually.

IGMP Version 3 does not support static IGMP group members.

Static IGMP groups are supported only in Layer 3 mode.

The **no** form of this command removes the port from the static group.

Examples

The following example manually adds port 1/1/2 to multicast group 224.2.2.2.

```
device(config)# interface ethernet 1/1/2  
device(config-if-e10000-1/1/2)# ip igmp static-group 224.2.2.2
```

The following example adds port 5/2 that is a member of a VRF interface 1 to multicast group 224.2.2.2.

```
device(config)# interface ve 1
device(config-vif-1)# ip igmp static-group 224.2.2.2 ethernet 5/2/2
```

The following example configures two static groups on virtual ports starting from 226.0.0.1, using the **count** keyword.

```
device(config)# interface ethernet 1/5/1
device(config-if-e1000-1/5/1)# ip igmp static-group 226.0.0.1 count 2 ethernet 1/5/1
```

The following example configures two static groups on virtual ports starting from 226.0.0.1, using the **to** keyword.

```
device(config)# interface ve 10
device(config-vif-10)# ip igmp static-group 226.0.0.1 to 226.0.0.2 ethernet 1/5/1
```

The following example configures two static groups starting from 226.0.0.1, using the **count** keyword.

```
device(config)# interface ethernet 1/5/1
device(config-if-e1000-1/5/1)# ip igmp static-group 226.0.0.1 count 2
```

ip igmp tracking

Enables tracking and fast leave on an interface.

Syntax

ip igmp tracking
no ip igmp tracking

Command Default

Tracking and fast leave are disabled.

Modes

Interface configuration mode.

Usage Guidelines

The **no** form of this command restores the default; tracking and fast leave are disabled.

The IGMP Version 3 fast leave feature is supported in include mode but does not work in exclude mode.

Examples

This example enables tracking and fast leave on a virtual routing interface.

```
Device(config)# interface ve 13  
Device(config-vif-13)# ip igmp tracking
```

This example enables tracking and fast leave on a physical interface.

```
Device(config)# i(config)#interface ethernet 1/2/2  
Device(config-if-e10000-1/2/2)# ip igmp tracking
```

ip igmp version

Specifies the IGMP version on a device.

Syntax

ip igmp version *version-number*

no ip igmp version *version-number*

Command Default

IGMP Version 2 is enabled.

Parameters

version-number

Specifies the version number: 1, 2, or 3. Version 2 is the default.

Modes

Global configuration mode.

Usage Guidelines

The **no** form of this command restores the default; IGMP Version 2 is enabled.

Configure the **ip igmp port-version** command to configure an IGMP version recognized by a physical port that is a member of a virtual routing interface.

Examples

The following example enables IGMP Version 3 globally.

```
device# configure terminal
device(config)# ip igmp version 3
```

The following example, in interface configuration mode, enables IGMP Version 3 for a physical port.

```
device# configure terminal
device(config)# interface ethernet 1/5
device(config-if-1/5)# ip igmp version 3
```

The following example, in interface configuration mode, enables IGMP Version 3 for a virtual routing interface on a physical port.

```
device# configure terminal
device(config)# interface ve 3
device(config-vif-1)# ip igmp version 3
```

ip irdp

Enables ICMP Router Discovery Protocol (IRDP) globally.

Syntax

ip irdp

no ip irdp

Command Default

IRDP is disabled.

Modes

Global configuration mode

Usage Guidelines

IRDP is used by Brocade Layer 3 switches to advertise the IP addresses of its router interfaces to directly attached hosts.

You can enable the feature on a global basis or on an individual port basis. If you enable the feature globally, all ports use the default values for the IRDP parameters. If you leave the feature disabled globally but enable it on individual ports, you also can configure the IRDP parameters on an individual port basis. Use the **ip irdp** command in interface configuration mode to enable IRDP on individual ports.

The **no** form of the command disables IRDP.

Examples

The following example enables IRDP globally.

```
device(config)# ip irdp
```

ip irdp (interface)

Enables ICMP Router Discovery Protocol (IRDP) on an interface and configures IRDP parameters.

Syntax

```
ip irdp { broadcast | multicast } [ holdtime seconds ] [ minadvertinterval seconds ] [ maxadvertinterval seconds ]
[ preference number ]
```

```
no ip irdp { broadcast | multicast } [ holdtime seconds ] [ minadvertinterval seconds ] [ maxadvertinterval seconds ]
[ preference number ]
```

Command Default

IRDP is not enabled.

Parameters

broadcast

Configures the Layer 3 switch to send the Router Advertisement as IP broadcasts. This is the default.

multicast

Configures the Layer 3 switch to send the Router Advertisement as multicast packets addressed to IPmulticast group 224.0.0.1.

holdtime *seconds*

Specifies how long a host that receives a Router Advertisement from the Layer 3 switch should consider the advertisement to be valid. The value must be greater than the value of the `maxadvertinterval` parameter and cannot be greater than 9000. The default is three times the value of the `maxadvertinterval` parameter.

minadvertinterval *seconds*

Specifies the minimum amount of time the Layer 3 switch can wait between sending Router Advertisements. The default is three-fourths (0.75) the value of the `maxadvertinterval` parameter.

maxadvertinterval *seconds*

Specifies the maximum amount of time the Layer 3 switch waits between sending Router Advertisements. You can specify a value from 1 to the current value of the `holdtime` parameter. The default is 600 seconds.

preference *number*

Specifies the IRDP preference level of this Layer 3 switch. If a host receives Router Advertisements from multiple routers, the host selects the router interface that sent the message with the highest interval as the host default gateway. The valid range is from 0 to 4294967296. The default is 0.

Modes

Interface configuration mode

Usage Guidelines

IRDP is used by Brocade Layer 3 switches to advertise the IP addresses of its router interfaces to directly attached hosts.

Commands F - J

ip irdp (interface)

You can enable the feature on a global basis or on an individual port basis. If you enable the feature globally, all ports use the default values for the IRDP parameters. If you leave the feature disabled globally but enable it on individual ports, you also can configure the IRDP parameters on an individual port basis. You cannot configure IRDP parameters on individual ports if the feature is globally enabled.

The **no** form of the command disables IRDP on the specific interface.

Examples

The following example enables IRDP on a specific port and changes the maximum advertisement interval for Router Advertisement messages to 400 seconds

```
device(config)# interface ethernet 1/1/3
device(config-if-e1000-1/1/3)# ip irdp maxadvertinterval 400
```

ip load-sharing

Configures IPv4 load sharing.

Syntax

```
ip load-sharing [ number-of-paths ]
```

```
no ip load-sharing [ number-of-paths ]
```

Command Default

Default number of load sharing paths is four.

Parameters

number-of-paths

Specifies the number of paths and can be from 2 through 8, depending on the device you are configuring. On the Brocade ICX 7750, the value of the num variable can be from 2 through 32.

Modes

Usage Guidelines

For optimal results, set the maximum number of paths to a value at least as high as the maximum number of equal-cost paths your network typically contains. For example, if the Layer 3 switch you are configuring for IP load sharing has six next-hop routers, set the maximum paths value to six.

The configuration of the maximum number of IP load sharing paths to a value more than 8 is determined by the maximum number of ECMP paths defined at the system level using the **system-max max-ecmp** command. This command is supported only on the Brocade ICX 7750. You cannot configure the maximum number of IP load sharing paths higher than the value defined at the system level. Also, you cannot configure the maximum number of ECMP paths at the system level to a value less than the configured IP load sharing value.

The **no** form of the command resets the load sharing paths to four.

Examples

The following example configures IP load sharing paths as 8.

```
device(config)# ip load-sharing 8
```

ip-mac

Manually configures an IP MAC address on an IP interface.

Syntax

ip-mac *mac-address*

no ip-mac *mac-address*

Command Default

If an IP MAC address is not configured, the IP interface will use the MAC address of the device or the configured stack MAC address.

Parameters

MAC-address

Configures a MAC address on a physical or virtual Ethernet (VE) interface.

Modes

Interface configuration mode

Usage Guidelines

Use the **system-max max-ip-mac** command to change the maximum number of MAC addresses to be configured on IP interfaces. The number of MAC addresses to be configured on IP interfaces is a range from 120 to 248 with a default of 120.

Use the **show ip interface** command with a specified interface to view whether a MAC address is configured for the interface.

The **no** form of the command removes the MAC address from the interface.

Examples

The following example configures a MAC address on Ethernet interface 1/1/6.

```
device# configure terminal
device(config)# interface ethernet 1/1/6
device(config-if-e1000-1/1/6)# ip address 10.53.5.1/24
device(config-if-e1000-1/1/6)# ip-mac aaaa.bbbb.cccc
```

History

Release version	Command history
8.0.40	This command was introduced.

ip max-mroute

Configures the maximum number of IPv4 multicast routes that are supported.

Syntax

ip max-mroute *num*
no ip max-mroute *num*

Command Default

No maximum number of supported routes is configured.

Parameters

num
Configures the maximum number of multicast routes supported.

Modes

VRF configuration mode

Usage Guidelines

The **no** form of this command restores the default (no maximum number of supported routes is configured).

Examples

The following example configures the maximum number of 20 supported IPv4 multicast routes on the VRF named `my_vrf`.

```
Device(config)# vrf my_vrf
Device(config)# address-family ipv4
Device(config-vrf)# ip max-mroute 20
```

History

Release version	Command history
8.0.10a	This command was introduced.

ip mroute

Configures a directly connected static IPv4 multicast route.

Syntax

```
ip mroute [ vrf vrf-name ] ip-address ip-address mask { ethernet stackid / slot / portnum | ve num | tunnel num } [cost ]  
[ distance distance-value ] [ name name ]
```

```
no ip mroute [ vrf vrf-name ] ip-address ip-address mask { ethernet stackid / slot / portnum | ve num | tunnel num }  
[cost ] [ distance distance-value ] [ name name ]
```

Command Default

No static IPv4 multicast route is configured.

Parameters

vrf *vrf-name*

Configures a static mroute for this virtual routing and forwarding (VRF) route.

ip-address ip-address mask

Configures the destination IPv4 address and prefix for which the route should be added.

ethernet *stackid / slot / portnum*

Configures an Ethernet interface as the route path.

ve *num*

Configures a virtual interface as the route path.

tunnel *num*

Configures a tunnel interface as the route path.

cost

Configures a metric for comparing the route to other static routes in the static route table that have the same destination. The range is 1-16; the default is 1.

distance *distance-value*

Configures the route's administrative distance. The range is 1-255; the default is 1.

name *name*

Name for this static route.

Modes

VRF configuration mode

Usage Guidelines

The **no** form of this command deletes a previously configured directly connected static multicast route.

Connected routes on PIM enabled interfaces are automatically added to the mRTM table.

Examples

The following example configures a directly connected mroute to network 10.1.1.0/24 on interface ve 10.

```
Device(config-vrf)# ip mroute 10.1.1.0 255.255.255.0 ve 10
```

History

Release version	Command history
8.0.10a	This command was introduced.

ip mroute (next hop)

Configures a static IPv4 multicast route (mroute) with a next hop..

Syntax

ip mroute [**vrf** *vrf-name*] *ip-address ip-address mask next-hop address* [*cost*] [**distance** *distance-value*] [**name** *name*]

no ip mroute [**vrf** *vrf-name*] *ip-address ip-address mask next-hop address* [*cost*] [**distance** *distance-value*] [**name** *name*]

Command Default

No next-hop static IPv4 multicast route is configured.

Parameters

vrf *vrf-name*

Configures a static mroute for this virtual routing and forwarding (VRF) route.

ip-address ip-address mask

Configures the destination IPv4 address and prefix for which the route should be added.

next-hop address

Configures a next-hop address as the route path.

cost

Configures a metric for comparing the route to other static routes in the static route table that have the same destination. The range is 1-16; the default is 1.

distance *distance-value*

Configures the route's administrative distance. The range is 1 through 255; the default is 1.

name *name*

Name for this static route.

Modes

VRF configuration mode

Usage Guidelines

The **no** form of this command deletes a previously configured next-hop static IPv4 multicast route.

Examples

The following example configures a next-hop static multicast IPv4 route to network 10.1.1.0/24 with next hop 10.2.1.1.

```
Device(config-vrf)# ip mroute 10.1.1.0 255.255.255.0 10.2.1.1
```

History

Release version	Command history
8.0.10a	This command was introduced.

ip mroute next-hop-enable-default

Enables the option to use the default multicast route (mroute) to resolve a static IPv4 mroute next hop.

Syntax

ip mroute [*vrf vrf-name*] **next-hop-enable-default**
no ip mroute [*vrf vrf-name*] **next-hop-enable-default**

Command Default

Static mroutes are not resolved using the default mroute.

Parameters

vrf *vrf-name*
Configures a static mroute for this virtual routing and forwarding (VRF) route.

Modes

VRF configuration mode

Usage Guidelines

The **no** form of this command disables the default IPv4 mroute option for next hops.

Examples

The following example enables the use of the default mroute to resolve a static IPv4 mroute next hop:

```
Device(config-vrf)# ip mroute next-hop-enable-default
```

History

Release version	Command history
8.0.10a	This command was introduced.

ip mroute next-hop-recursion

Configures the recursion level when using static mroutes to resolve a static mroute next hop.

Syntax

```
ip mroute [ vrf vrf-name ] next-hop-recursion num  
no ip mroute [ vrf vrf-name ] next-hop-recursion
```

Command Default

The recursion level for resolving a static mroute next hop is 3.

Parameters

vrf *vrf-name*

Configures a static mroute for this virtual routing and forwarding (VRF) route.

num

Specifies the recursion level used to resolve a static mroute next hop. The range of possible values is from 1 to 10. This is not used in the **no** form.

Modes

VRF configuration mode

Usage Guidelines

The **no** form restores the default recursion level for resolving a static mroute next hop, which is 3. You do not specify a value for the recursion level.

Examples

The following example configures the recursion level for resolving a static mroute next hop to 7:

```
device(config)# vrf vrf2  
device(config-vrf-vrf2)# ip mroute next-hop-recursion 7
```

The following example configures the recursion level for resolving a static mroute next hop to 2:

```
device(config)# vrf vrf2  
device(config-vrf-vrf2)# ip mroute next-hop-recursion 2
```

The following example restores the default recursion level of 3 for resolving a static mroute next hop:

```
device(config)# vrf vrf2  
device(config-vrf-vrf2)# no ip mroute next-hop-recursion
```

History

Release version	Command history
8.0.10a	This command was introduced.

ip mtu

Changes the MTU for a specific interface.

Syntax

ip mtu *value*

no ip mtu *value*

Command Default

1500 bytes for Ethernet II encapsulation and 1492 bytes for SNAP encapsulation. When jumbo mode is enabled, the default is 9216.

Parameters

value

Specifies the MTU. Ethernet II packets can hold IP packets from 576 through 1500 bytes long. If jumbo mode is enabled, Ethernet II packets can hold IP packets up to 10,218 bytes long. Ethernet SNAP packets can hold IP packets from 576 through 1492 bytes long. If jumbo mode is enabled, SNAP packets can hold IP packets up to 10,214 bytes long. The default MTU for Ethernet II packets is 1500. The default MTU for SNAP packets is 1492.

Modes

Interface configuration mode

Usage Guidelines

If you set the MTU of a port to a value lower than the global MTU and from 576 through 1499, the port fragments the packets. However, if the port MTU is exactly 1500 and this is larger than the global MTU, the port drops the packets. The minimum IPv4 MTU values for both physical and virtual interfaces are 1280.

You must save the configuration change and then reload the software to enable the configuration.

The **no** form of the command resets the default MTU values.

Examples

The following example configures the IP MTU as 1300.

```
device(config)# interface ethernet 1/1/5
device(config-if-e1000-1/1/5)# ip mtu 1300
device(config-if-e1000-1/1/5)# write memory
device(config-if-e1000-1/1/5)# end
device# reload
```

ip multicast

Configures the IGMP mode on a specific VLAN or on all VLANs on a device as active or passive.

Syntax

```
ip multicast [ vlan | vlan-id ] [ active | passive ]  
no ip multicast
```

Command Default

IGMP mode is passive.

Parameters

vlan *vlan-id*
Specifies a VLAN.

active

Configures IGMP active mode, that is, the device actively sends out IGMP queries to identify multicast groups on the network and makes entries in the IGMP table based on the group membership reports it receives.

passive

Configures IGMP passive mode, that is, the device does not send queries but forwards reports to the router ports that receive queries. When passive mode is configured on a VLAN, queries are forwarded to the entire VLAN.

Modes

Global configuration mode

VLAN configuration mode

Usage Guidelines

The **no** form of this command returns the device to the previous IGMP mode.

When entered without the **vlan** keyword, this command configures active or passive IGMP mode on all VLANs.

Routers in the network generally handle mode. Configure active IGMP mode only on a device in a standalone Layer 2 Switched network with no external IP multicast router attachments. If you want to configure active IGMP mode on a device in such a network, you should do so on only one device and leave the others configured as passive.

The IGMP mode configured on a VLAN overrides the mode configured globally.

Examples

The following example globally configures IGMP mode as active.

```
device#configure terminal  
device(config)#ip multicast active
```

This example configures IGMP mode as active on VLAN 20.

```
device#configure terminal
device(config)#config vlan 20
device(config-vlan-20)#ip multicast active
```

ip multicast age-interval

Configures the time that group entries can remain in an IGMP group table on a specific VLAN or on all VLANs.

Syntax

```
ip multicast age-interval [ vlan vlan-id ] interval  
no ip multicast age-interval [ vlan vlan-id ] interval
```

Command Default

Group entries can remain in the IGMP group table for up to 260 seconds.

Parameters

vlan *vlan-id*
Specifies a VLAN.

interval
Specifies time, in seconds, that group entries can remain in the IGMP group table. The range is 20 through 26000 seconds. The default is 260 seconds.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the default age interval to 260 seconds.

When entered without the **vlan** keyword, this command configures the time that group entries can remain in an IGMP group table on all VLANs.

When a device receives a group membership report it makes an entry for that group in the IGMP group table. You can configure the **ip multicast age-interval** to specify how long the entry can remain in the table before the device receives another group membership report. When multiple devices are connected, they must all be configured for the same age interval, which must be at least twice the length of the query interval, so that missing one report does not stop traffic.

Non-querier age intervals must be the same as the age interval of the querier.

Examples

This example configures the IGMP group-table age interval to 280 seconds.

```
device#configure terminal  
device(config)#ip multicast age-interval 280
```

ip multicast-boundary

Defines boundaries for PIM enabled interfaces.

Syntax

ip multicast-boundary *acl-spec*

no ip multicast-boundary *acl-spec*

Command Default

Boundaries are not defined.

Parameters

acl-spec

Specifies the number or name identifying an access list that controls the range of group addresses affected by the boundary.

Modes

VE interface configuration mode

Usage Guidelines

The **no** form of this command removes the boundary on a PIM enabled interface.

You can use standard ACL syntax to configure an access list.

Examples

The following example defines a boundary named MyAccessList for a PIM enabled interface.

```
device(config)# ip multicast-boundary MyAccessList
```

ip multicast disable-flooding

Disables the flooding of unregistered IPv4 multicast frames in an IGMP-snooping-enabled VLAN.

Syntax

ip multicast disable-flooding

no ip multicast disable-flooding

Command Default

The device floods unregistered IPv4 multicast frames in an IGMP-snooping-enabled VLAN.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command enables the flooding of unregistered IPv4 multicast frames in an IGMP-snooping-enabled VLAN.

Support for this command on the Brocade ICX 7750 was introduced in FastIron 8.0.10d. In releases prior to FastIron 8.0.30, support for this command on the Brocade ICX 7750 was for devices in standalone mode only.

Support for this command on the Brocade ICX 7450 and Brocade ICX 7250 was introduced in FastIron 8.0.30.

After the hardware forwarding database (FDB) entry is made, the multicast traffic is switched only to the VLAN hosts that are members of the multicast group. This can avoid congestion and loss of traffic on the ports that have not subscribed to this IPv4 multicast traffic.

Examples

The following example disables flooding of unregistered IPv4 multicast frames.

```
device(config)# ip multicast disable-flooding
```

History

Release version	Command history
08.0.01	This command was introduced.

ip multicast leave-wait-time

Configures the wait time before stopping traffic to a port when a leave message is received.

Syntax

ip multicast leave-wait-time *num*

no ip multicast leave-wait-time *num*

Command Default

The wait time is 2 seconds.

Parameters

num

Specifies the time, in seconds, the device should wait before stopping traffic to a port when a leave message is received. The range is 1 through 5 seconds. The default is 2 seconds.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the default wait time.

The device sends group-specific queries once per second to ask if any client in the same port still needs this group. Because of internal timer granularity, the actual wait time is between n and $(n+1)$ seconds (n is the configured value).

Examples

This example configures the maximum time a client can wait before responding to a query to 1 second.

```
Device(config)#ip multicast leave-wait-time 1
```

ip multicast max-response-time

Sets the maximum number of seconds a client (IPv4) can wait before responding to a query sent by the device.

Syntax

ip multicast max-response-time *interval*

no ip multicast max-response-time *interval*

Command Default

The wait time is 10 seconds.

Parameters

interval

Specifies the maximum time, in seconds, a client can wait before responding to a query sent by the switch. The range is 1 through 25 seconds. The default is 10 seconds.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the default maximum interval.

Examples

This example configures the maximum time a client can wait before responding to a query to 5 seconds.

```
device(config)# ip multicast max-response-time 5
```

History

Release version	Command history
8.0.40	This command was modified to increase the range of the maximum response time from 1 through 10 seconds to 1 through 25 seconds.

ip multicast mcache-age

Configures the time for an mcache to age out when it does not receive traffic.

Syntax

```
ip multicast mcache-age num  
no ip multicast mcache-age
```

Command Default

The mcache ages out after the default age-out interval, which is 180 seconds for ICX 7750, ICX 7450, and ICX 7250 devices.

Parameters

num

Specifies the time, in multiples of 60 seconds, the device should wait before stopping traffic to a port when a leave message is received. The range is 60 through 3600 seconds, in multiples of 60.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the default mcache age-out time.

Multicast traffic is hardware switched. One minute before aging out an mcache, the device mirrors a packet of this mcache to CPU to reset the age. If no data traffic arrives within 60 seconds, this mcache is deleted. Configuring a lower age-out time removes resources consumed by idle streams quickly, but it mirrors packets to CPU often. Configure a higher value only when data streams are arriving consistently.

Examples

This example configures the time for an mcache to age out to 180 seconds.

```
device(config)# ip multicast mcache-age 180
```

ip multicast optimization

Enables or disables IP multicast (IPMC) entry optimization for Layer 2 IPv4 multicast flows.

Syntax

ip multicast optimization oif-list all

no ip multicast optimization oif-list all

Command Default

IPMC entry optimization is disabled by default on ICX 7750 devices, and enabled by default on ICX 7450 and ICX 7250 devices.

Parameters

oif-list

Shares the Output Interface Lists across entries.

all

Specifies all types of Output Interface Lists.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command disables hardware entry optimization for Layer 2 IPv4 multicast flows.

Examples

The following example enables hardware entry optimization for Layer 2 IPv4 multicast flows.

```
device(config)# ip multicast optimization oif-list all
```

History

Release version	Command history
8.0.40	This command was introduced.

ip multicast query-interval

Configures how often the device sends general queries when IP multicast traffic reduction is set to active mode.

Syntax

ip multicast query-interval *interval*

no ip multicast query-interval *interval*

Command Default

The query interval is 125 seconds.

Parameters

interval

Specifies the time, in seconds, between queries. The range is 10 through 3600 seconds. The default is 125 seconds.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the query interval to 125 seconds.

You can configure this command only when IP multicast traffic reduction is set to active IGMP snooping mode.

When multiple queries are connected, they must all be configured for the same interval.

Examples

This example configures the time between queries to 120 seconds.

```
Device(config)#ip multicast query-interval 120
```

ip multicast report-control

Limits report forwarding within the same multicast group to no more than once every 10 seconds.

Syntax

ip multicast report-control

no ip multicast report-control

Command Default

A device in passive mode forwards reports and leave messages from clients to the upstream router ports that are receiving queries.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the default.

NOTE

This feature applies to IGMP V2 only. The leave messages are not rate limited.

This rate-limiting does not apply to the first report answering a group-specific query.

Configure this command to alleviate report storms from many clients answering the upstream router query.

The **ip multicast report-control** command was formerly named **ip igmp-report-control** . You can still configure the command as **ip igmp-report-control** ; however, it is renamed when you configure the **show configuration** command.

Examples

This example limits the rate of report forwarding within the same multicast group.

```
Device(config)#ip multicast report-control
```

ip multicast verbose-off

Turns off the error or warning messages displayed by the device when it runs out of software resources or when it receives packets with the wrong checksum or groups.

Syntax

ip multicast verbose-off

no ip multicast verbose-off

Command Default

Error and warning messages are displayed.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores display of error and warning messages .

Error and warning messages are rate-limited.

Examples

This example turns off error or warning messages .

```
Device(config)#ip multicast verbose-off
```

ip multicast version

Configures the IGMP version for snooping globally.

Syntax

ip multicast version [2 | 3]

no ip multicast version

Command Default

IGMP version 2 is configured.

Parameters

2
Configures IGMP version 2.

3
Configures IGMP version 3.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the version to IGMP version 2.

If Layer 3 multicast routing is enabled on the device, Layer 2 IGMP snooping is automatically enabled.

See the description of the **multicast version** command for information on how to configure the IGMP version on a VLAN.

See the description of the **multicast port-version** command for information on how to configure the IGMP version on an individual port

Examples

This example specifies IGMP version 3 on a device.

```
Device(config)#ip multicast version 3
```

ip multicast-routing optimization

Enables or disables IP multicast (IPMC) hardware entry optimization for Layer 3 IPv4 multicast flows.

Syntax

ip multicast-routing optimization oif-list all

no ip multicast-routing optimization oif-list all

Command Default

Hardware entry optimization is disabled by default on ICX 7750 devices and enabled by default on ICX 7450 and 7250 devices.

Parameters

oif-list

Shares the Output Interface Lists across entries.

all

Specifies all types of Output Interface Lists.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command disables optimization for IPv4 multicast flows. Multicast routing entries are deleted and recreated when optimization is enabled or disabled on all VRFs.

Examples

The following example enables IPMC hardware entry optimization for IPv4 multicast flows.

```
device(config)# ip multicast-routing optimization oif-list all
```

History

Release version	Command history
8.0.40	This command was introduced.

ip multicast-routing rpf-check mac-movement

Triggers Reverse Path Forwarding (RPF) check on MAC movement for directly connected sources and sends a MAC address movement notification to the Protocol Independent Multicast (PIM) module which results in PIM convergence.

Syntax

ip multicast-routing rpf-check mac-movement

no ip multicast-routing rpf-check mac-movement

Command Default

RPF check on MAC movement for directly connected sources is not enabled.

Modes

Global configuration mode

Usage Guidelines

PIM convergence on MAC movement is applicable only in a topology where the multicast source port and PIM routers are in the same Layer 2 domain.

The **ip multicast-routing rpf-check mac-movement** command is not supported on the Brocade ICX 7250 devices.

The **no** form of the command disables RPF check on MAC movement for directly connected sources.

Examples

The following example configures RPF check on MAC movement for directly connected sources.

```
device(config)# ip multicast-routing rpf-check mac-movement
```

History

Release version	Command history
08.0.10h	This command was introduced.
08.0.30	Support for the ip multicast-routing rpf-check mac-movement command was added in 08.0.30 and later releases.

ip multicast-debug-mode

Enables global multicast debug mode for all VRFs.

Syntax

```
ip multicast-debug-mode  
no ip multicast-routing
```

Command Default

Support for multicast debug mode is not enabled.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the default multicast debug mode.

Examples

This example shows how to enable global support for multicast debug mode.

```
Device(config)#ip multicast-debug-mode
```

ip multicast-nonstop-routing

Globally enables multicast non-stop routing for all virtual routing and forwarding (VRF) instances.

Syntax

ip multicast-nonstop-routing
no ip multicast-nonstop-routing

Command Default

Multicast non-stop routing is not enabled on VRFs.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the default non-stop routing.

Examples

The following example globally enables multicast non-stop routing for all VRFs.

```
device#configure terminal
device(config)#ip multicast-nonstop-routing
```

ip proxy-arp

Enables IP proxy ARP globally.

Syntax

ip proxy-arp

no ip proxy-arp

Command Default

Proxy ARP is disabled by default on Brocade Layer 3 switches.

Modes

Global configuration mode

Usage Guidelines

Proxy ARP allows a Layer 3 switch to answer ARP requests from devices on one network on behalf of devices in another network. Because ARP requests are MAC-layer broadcasts, they reach only the devices that are directly connected to the sender of the ARP request. Thus, ARP requests do not cross routers.

An ARP request from one subnet can reach another subnet when both subnets are on the same physical segment (Ethernet cable), because MAC-layer broadcasts reach all the devices on the segment.

This feature is not supported on Brocade Layer 2 switches.

The **no** form of the command disables IP proxy ARP.

Examples

The following example enables IP proxy ARP globally.

```
device(config)# ip proxy-arp
```

ip proxy-arp (interface)

Enables IP proxy ARP on an interface.

Syntax

```
ip proxy-arp { enable | disable }  
no ip proxy-arp { enable | disable }
```

Command Default

IP proxy ARP is disabled.

Parameters

- enable**
Enables IP proxy ARP on an interface.
- disable**
Disables IP proxy ARP on an interface.

Modes

Interface configuration mode

Usage Guidelines

Configuring proxy ARP at the Interface level overrides the global configuration.

Proxy ARP allows a Layer 3 switch to answer ARP requests from devices on one network on behalf of devices in another network. Because ARP requests are MAC-layer broadcasts, they reach only the devices that are directly connected to the sender of the ARP request. Thus, ARP requests do not cross routers.

An ARP request from one subnet can reach another subnet when both subnets are on the same physical segment (Ethernet cable), because MAC-layer broadcasts reach all the devices on the segment.

This feature is not supported on Brocade Layer 2 switches.

The **no** form of the command enables or disables IP proxy ARP.

Examples

The following example enables IP proxy ARP on an interface.

```
device(config)# interface ethernet 1/1/1  
device(config-if-e1000-1/1/1)# ip proxy-arp enable
```

The following example disables IP proxy ARP on an interface.

```
device(config)# interface ethernet 1/1/1  
device(config-if-e1000-1/1/1)# ip proxy-arp disable
```

ip prefix-list

Configures a RIP routing prefix list that can permit or deny specific routes. The prefix list can be applied globally or to individual interfaces, where they may apply to incoming (learned) our outgoing (advertised) routes.

Syntax

```
ip prefix-list name [ seq number ] { permit | deny } { source-ip-address / L }
```

```
ip prefix-list name description string
```

```
no ip prefix-list name [ seq number ] { permit | deny } { source-ip-address / L }
```

```
no ip prefix-list name description string
```

Command Default

By default, routes that do not match a prefix list are learned or advertised. To prevent a route from being learned or advertised, you must configure and apply a prefix list to deny the route.

Parameters

name

Identifies the prefix list.

description *string*

Provides information describing the named prefix list in an ASCII string.

seq *number*

Specifies an optional sequence number for the named prefix list.

permit

Indicates that designated routes will be allowed; that is, either learned or advertised, depending on how the prefix list is applied.

deny

Indicates that designated routes will be denied; that is, will not be learned or will not be advertised, depending on how the prefix list is applied.

source-ip-address / *L*

Designates a specific route, based on its IP address prefix and mask length.

[**ge** *value*] [**le** *value*]

The keyword **le** indicates the maximum prefix length that can be matched. The keyword **ge** indicates minimum prefix length that can match. Possible values for ge (greater than or equal to) and le (less than or equal to) are 1 through 32. The **ge** and **le** values can be used separately or together.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command disables the prefix list.

A route is defined by the destination's IP address and network mask. Because the default action is permit, all other routes (routes not explicitly permitted or denied by the filters) can be learned or advertised.

Prefix lists can be applied to RIP globally using the separate **prefix-list** command or at the interface level using the separate **ip rip prefix-list** command.

Examples

The following example creates four prefix lists. Three of the prefix lists permit a route for a different network. The last prefix list denies a route for one network. The routes are defined but not applied in the example.

```
device# configure terminal
device(config)# ip prefix-list list1 permit 10.53.4.1 255.255.255.0
device(config)# ip prefix-list list2 permit 10.53.5.1 255.255.255.0
device(config)# ip prefix-list list3 permit 10.53.6.1 255.255.255.0
device(config)# ip prefix-list list4 deny 10.53.7.1 255.255.255.0
```

ip ospf active

Sets a specific OSPF interface to active.

Syntax

ip ospf active

Modes

Interface subtype configuration mode

Usage Guidelines

Use the **ip ospf active** command on each interface participating in adjacency formation. This command overrides the global passive setting on that interface, and enables transmission of OSPF control packets.

Examples

The following example sets a specific OSPFv2 virtual Ethernet (VE) interface to active.

```
device# configure terminal
device(config)# interface ve 1
device(config-vif-1)# ip ospf active
```

ip ospf area

Enables OSPFv2 on an interface.

Syntax

ip ospf area *area-id* | *ip-addr*
no ip ospf area

Command Default

Disabled.

Parameters

area-id
Area ID in decimal format. Valid values range from 1 through 2147483647.

ip-addr
Area ID in IP address format.

Modes

Interface subtype configuration mode

Usage Guidelines

The **no** form of the command disables OSPFv2 on the interface.

Examples

The following example enables a configured OSPFv2 area named 0 on a specific OSPFv2 virtual Ethernet (VE) interface.

```
device# configure terminal
device(config)# interface ve 1
device(config-vif-1)# ip ospf area 0
```

ip ospf auth-change-wait-time

Configures authentication-change hold time.

Syntax

ip ospf auth-change-wait-time *wait-time*
no ip ospf auth-change-wait-time

Command Default

Wait time is 300 seconds

Parameters

wait-time

Time before an authentication change takes place. Valid values range from 0 to 14400 seconds.

Modes

Interface subtype configuration mode

Usage Guidelines

Use this command to set or reset the authentication change hold time for the interface to which you are connected.

OSPFv2 provides graceful authentication change for the following types of authentication changes:

Changing authentication methods from one of the following to another of the following:

- Simple text password
- MD5 authentication
- No authentication

Configuring a new simple text password or MD5 authentication key.

Changing an existing simple text password or MD5 authentication key

The **no** form of the command resets the wait time to the default of 300 seconds.

Examples

The following example sets the wait time to 600 seconds on a specific OSPFv2 virtual Ethernet (VE) interface.

```
device# configure terminal
device(config)# interface ve 1
device(config-vif-1)# ip ospf auth-change-wait-time 600
```

ip ospf authentication-key

Configures simple password-based authentication for OSPF.

Syntax

```
ip ospf authentication-key { 0 password | 1 password | password }  
no ip ospf authentication-key
```

Command Default

Authentication is disabled.

Parameters

- 0** *password*
the key string is not encrypted and is in clear text.
- 1** *password*
the key string uses proprietary simple cryptographic 2-way algorithm.
- password*
OSPF processes *password* as a plain text password. OSPF internally encrypts this password.

Modes

Interface subtype configuration mode

Usage Guidelines

Use this command to set or reset simple password-based authentication on the OSPFv2 interface to which you are connected. The **no** form of the command disables OSPFv2 authentication.

Examples

The following example configures an authentication key in clear text.

```
device# configure terminal  
device(config)# interface ve 1  
device(config-vif-1)# ip ospf authentication-key 0 morningadmin
```

ip ospf cost

Configures cost for a specific interface.

Syntax

ip ospf cost *value*
no ip ospf cost

Command Default

Cost value is 1.

Parameters

value

Cost value. Valid values range from 1 through 65535. The default is 1.

Modes

Interface subtype configuration mode

Usage Guidelines

Use this command to set or reset the OSPFv2 cost on the interface. If the cost is not configured with this command, OSPFv2 calculates the value from the reference and interface bandwidths.

You can modify the cost to differentiate between 100 Mbps, 1 Gbps, and 10 Gbps. The default cost is calculated by dividing 100 million by the bandwidth. For 10 Mbps links, the cost is 10. The cost for 100 Mbps, 1 Gbps, and 10 Gbps links is 1, because the speed of 100 Mbps and 10 Gbps was not in use at the time the OSPF cost formula was devised.

The **no** form of the command disables the configured cost.

Examples

The following example sets the cost to 600 on a specific OSPFv2 Virtual Ethernet (VE) interface.

```
device# configure terminal
device(config)# interface ve 1
device(config-vif-11)# ospf cost 600
```

ip ospf database-filter

Configures filters for different types of outgoing Link State Advertisements (LSAs).

Syntax

ip ospf database-filter all out

ip ospf database-filter all-external { allow-default out | allow-default-and-type-4 out | out }

ip ospf database-filter all-summary-external { allow-default out | allow-default-and-type-4 out | out }

no ip ospf database-filter all out

no ip ospf database-filter all-external

no ip ospf database-filter all-summary-external

Command Default

All filters are disabled.

Parameters

all out

Blocks all LSAs.

all-external

Blocks all external LSAs.

allow-default-and-type-4

Allows default-route LSAs and Type 4 LSAs, but block all other LSAs.

allow-default-out

Allows default-route LSAs, but block all other LSAs.

out

Filters outgoing LSAs.

all-summary-external

Blocks all summary (Type 3) and external (type 5) LSAs.

Modes

Interface subtype configuration mode

Usage Guidelines

By default, the device floods all outbound LSAs on all the OSPFv2 interfaces within an area. You can configure a filter to block outbound LSAs on an OSPF interface. This feature is particularly useful when you want to block LSAs from some, but not all, of the interfaces attached to the area. When enabled, this command blocks the specified outgoing LSAs on the interface. Some cases where you might want to enable filters are:

- To control the information being advertised to the network.

- To use a passive router for debugging only.

Enter **no ip ospf database-filter** followed by the appropriate operands to disable this configuration.

NOTE

You cannot block LSAs on virtual links and LSA filtering is not supported on sham links.

Examples

To apply a filter to block flooding of all LSAs on a specific OSPF 40-gigabit Ethernet interface:

```
device(config)# interface fortygigabitethernet 101/0/10
device(conf-if-fo-101/0/10)# ip ospf database-filter all-out
```

To apply a filter to block flooding of all LSAs on a specific OSPF virtual Ethernet (VE) interface:

```
device(config)# rbridge-id 178
device(config-rbridge-id-178)# interface ve 24
device(config-Ve-24)# ip ospf database-filter all-out
```

ip ospf dead-interval

Configures the neighbor dead interval, which is the number of seconds that a neighbor router waits for a hello packet from the device before declaring the router down.

Syntax

ip ospf dead-interval *interval*

no ip ospf dead-interval

Command Default

The specified time period is 40 seconds.

Parameters

interval

Dead interval in seconds. Valid values range from 3 through 65535 seconds. The default is 40.

Modes

Interface subtype configuration mode

Usage Guidelines

If you change the dead interval, the hello interval is automatically changed to a value that is one fourth that of the new dead interval, unless the hello interval is also explicitly configured using the **ip ospf hello-interval** command.

The recommended setting is that:

- The dead interval is four times that of the hello interval.
- The hello interval is $\frac{1}{4}$ times that of the dead interval.
- If the OSPF hello interval and dead interval are set to more aggressive levels than 1:4 seconds respectively, the OSPF protocol might flap when the **write memory** command is used or in the case of any high CPU.

The **running-config** command displays only explicitly configured values of the hello interval, which means that a value that was automatically changed as the result of a dead-interval change is not displayed.

The **no** form of the command restores the default value.

Examples

The following example sets the dead interval to 200 on a specific OSPFv2 virtual Ethernet (VE) interface.

```
device# configure terminal
device(config)# interface ve 1
device(config-vif-1)# ip ospf dead-interval 200
```

ip ospf hello-interval

Configures the hello interval, which is the length of time between the transmission of hello packets that this interface sends to neighbor routers.

Syntax

```
ip ospf hello-interval interval
```

```
no ip ospf hello-interval
```

Command Default

The default value is 10 seconds.

Parameters

interval

Hello interval in seconds. Valid values range from 1 through 65535.

Modes

Interface subtype configuration mode

Usage Guidelines

If you change the hello interval, the dead interval is automatically changed to a value that is four times that of the new hello interval, unless the dead interval is also explicitly configured using the **ip ospf dead-interval** command.

The recommended setting is that:

- The dead interval is four times that of the hello interval.
- The hello interval is $\frac{1}{4}$ times that of the dead interval.
- If the OSPF hello interval and dead interval are set to more aggressive levels than 1:4 seconds respectively, the OSPF protocol might flap when the **write memory** command is used or in the case of any high CPU.

The **running-config** command displays only explicitly configured values of the dead interval, which means that a value that was automatically changed as the result of a hello-interval change is not displayed.

The **no** form of the command restores the default value.

Examples

The following example sets the hello interval to 50 on a specific OSPFv2 virtual Ethernet (VE) interface.

```
device# configure terminal
device(config)# interface ve 1
device(config-vif-1)# ip ospf hello-interval 50
```

ip ospf md5-authentication

Configures MD5 password and authentication change hold time.

Syntax

```
ip ospf md5-authentication { key-activation-wait-time wait-time | key-id id MD5_key key password }  
no ip ospf md5-authentication key-id
```

Command Default

No authentication.

Parameters

key-activation-wait-time *wait-time*

Sets the time that OSPFv2 waits before activating a new MD5 key. This parameter provides a graceful transition from one MD5 key to another without disturbing the network. All new packets transmitted after the wait time ends use the newly configured MD5 Key. OSPFv2 packets that contain the old MD5 key are accepted for up to five minutes after the new MD5 key is in operation. Valid values range from 0 to 14400 seconds. The default value is 300 seconds.

key-id

Sets MD5 key and OSPFv2 password.

id MD5_key

The *num* is a number between 1 and 255 and identifies the MD5 key that is being used. This parameter is required to differentiate among multiple keys defined on a router. When MD5 is enabled, the *key* is an alphanumeric password of up to 16 characters that is later encrypted and included in each OSPFv2 packet transmitted. You must enter a password in this field when the system is configured to operate with either simple or MD5 authentication. By default, the MD5 authentication key is encrypted.

0 *password*

The key string is not encrypted and is in clear text.

1 *password*

The key string uses proprietary simple cryptographic 2-way algorithm.

2 *password*

The key string uses proprietary base64 cryptographic 2-way algorithm.

ospf_password

OSPF processes *password* as a plain text password. OSPF internally encrypts this password as if encryption key 2 was specified and shows the encrypted password in the **show running** command output as follows: `key 2 $ci1pVT0=`

Modes

Interface subtype configuration mode

Usage Guidelines

Use this command to set or reset the MD5 password and/or authentication change hold time on the interface to which you are connected.

By default, the authentication key is encrypted. If you want the authentication key to be in clear text, insert a 0 between authentication-key and string. The software adds a prefix to the authentication key string in the configuration. For example, the following portion of the code has the encrypted code "2".

Enter **no ip ospf md5-authentication key-id** to disable this configuration.

Examples

The following example sets the time that OSPFv2 waits before activating a new MD5 key to 240.

```
device# configure terminal
device(config)# interface ve 1
device(config-vif-1)# ip ospf md5-authentication key-activation-wait-time 240
```

ip ospf mtu-ignore

Enables or disables maximum transmission unit (MTU) match checking.

Syntax

```
ip ospf mtu-ignore  
no ip ospf mtu-ignore
```

Command Default

Enabled

Modes

Interface subtype configuration mode

Usage Guidelines

In default operation, the IP MTU on both sides of an OSPFv2 link must be the same, and a check of the MTU is performed when Hello packets are first exchanged.

The **no** form of the command disables MTU-match checking on a specific interface.

Examples

The following example disables MTU-match checking on a specific OSPFv2 Virtual Ethernet (VE) interface.

```
device# configure terminal  
device(config)# interface interface ve 1  
device(config-vif-1)# no ip ospf mtu-ignore
```

The following example enables MTU-match checking on a specific OSPFv2 Virtual Ethernet (VE) interface.

```
device# configure terminal  
device(config)# interface interface ve 1  
device(config-vif-1)# ip ospf mtu-ignore
```

ip ospf network

Configures the network type for the interface. Point-to-point can support unnumbered links, which requires less processing by OSPF.

Syntax

```
ip ospf network { broadcast | non-broadcast | point-to-point }
```

```
no ip ospf network
```

Command Default

Network type is broadcast.

Parameters

broadcast

Network type is broadcast.

non-broadcast

Network type is non-broadcast. An interface can be configured to send OSPF traffic to its neighbor as unicast packets rather than multicast packets.

point-to-point

Network type is point-to-point.

Modes

Interface subtype configuration mode

Usage Guidelines

On a non-broadcast interface, the devices at either end of the interface must configure non-broadcast interface type and the neighbor IP address. There is no restriction on the number of devices sharing a non-broadcast interface.

To configure an OSPF interface as a non-broadcast interface, the feature must be enabled on a physical interface or a VE, following the **ip ospf area** statement, and then specify the IP address of the neighbor in the OSPF configuration. The non-broadcast interface configuration must be done on the OSPF devices at either end of the link.

The **no** form of the command removes the network-type configuration.

Examples

The following example configures an OSPFv2 point-to-point link on a specific OSPFv2 Virtual Ethernet (VE) interface.

```
device# configure terminal
device(config)# interface interface ve 1
device(config-vif-1)# ip ospf network point-to-point
```

Commands F - J

ip ospf network

The following example configures an OSPFv2 broadcast link on a specific OSPFv2 Virtual Ethernet (VE) interface.

```
device# configure terminal
device(config)# interface interface ve 1
device(config-vif-1)# ip ospf network broadcast
```

ip ospf passive

Sets a specific OSPFv2 interface to passive.

Syntax

ip ospf passive

no ip ospf passive

Command Default

All OSPF interfaces are active.

Modes

Interface subtype configuration mode

Usage Guidelines

When you configure an OSPF interface to be passive, that interface does not send or receive OSPF route updates. Since a passive interface does not send or receive route information, the interface is in effect a stub network.

You might want to set an interface to passive mode if:

- You are planning to use the router mostly for debugging purposes.
- The router is a stub and does not route traffic.

The **no** form of the command sets an interface back to active.

Examples

The following example sets a specific OSPFv2 virtual Ethernet (VE) interface to passive.

```
device# configure terminal
device(config)# interface interface ve 1
device(config-vif-1)# ip ospf passive
```

ip ospf priority

Configures priority for designated router (DR) election.

Syntax

ip ospf priority *value*
no ip ospf priority

Command Default

The default value is 1.

Parameters

value
Priority value. Valid values range from 0 through 255.

Modes

Interface subtype configuration mode

Usage Guidelines

The OSPFv2 router assigned the highest priority becomes the designated router, and the OSPFv2 router with the second-highest priority becomes the backup router.

If you set the priority to 0, the device does not participate in DR and BDR election.

The **no** form of the command restores the default value.

Examples

The following example sets a priority of 10 for the OSPFv2 router that is connected to an OSPFv2 Virtual Ethernet (VE) interface.

```
device# configure terminal
device(config)# interface interface ve 1
device(config-vif-1)# ipv6 ospf priority 10
```

ip ospf retransmit-interval

Configures the retransmit interval. The retransmit interval is the time between Link-State Advertisement (LSA) retransmissions to adjacent routers for a given interface.

Syntax

ip ospf retransmit-interval *interval*

no ip ospf retransmit-interval

Command Default

The interval is 5 seconds.

Parameters

interval

Retransmit interval in seconds. Valid values range from 0 through 3600 seconds.

Modes

Interface subtype configuration mode

Usage Guidelines

The **no** form of the command resets the retransmit interval to its default.

Examples

The following example sets the retransmit interval to 8 for all OSPFv2 devices on an OSPFv2 Virtual Ethernet (VE) interface.

```
device# configure terminal
device(config)# interface interface ve 1
device(config-vif-1)# ip ospf retransmit-interval 8
```

ip ospf transmit-delay

Configures transmit delay for link-update packets. The transmit delay is the estimated time required for OSPFv2 to send link-state update packets on the interface to which you are connected.

Syntax

ip ospf transmit-delay *value*

no ip ospf transmit-delay

Command Default

The transmit delay is set to 1 second.

Parameters

value

Transmit delay in seconds. Valid values range from 0 through 3600 seconds.

Modes

Interface subtype configuration mode

Usage Guidelines

The **no** form of the command restores the default value.

Examples

The following example sets a transmit delay of 25 seconds for devices on a specific OSPFv2 Virtual Ethernet (VE) interface.

```
device# configure terminal
device(config)# interface interface ve 1
device(config-vif-1)# ip ospf transmit-delay 25
```

ip pcp-remark

Enables remarking of the priority code point (PCP) field in the VLAN header for all received tagged packets.

Syntax

ip pcp-remark *pcp-value*

no ip pcp-remark *pcp-value*

Command Default

PCP remarking is disabled.

Parameters

pcp-value

Specifies the PCP value ranges you are remarking.

Modes

Global configuration mode

Interface configuration mode

Usage Guidelines

The **no** form of this command disables PCP remarking.

In Interface configuration mode, the command enables PCP remarking for each port. The command can be configured only on Layer 2 ports. The configuration can be done on a physical port, LAG, and VE port.

Examples

The following example globally enables remarking of received tagged packets when the PCP bit value is 4.

```
Device(config)# ip pcp-remark 4
```

The following example enables remarking of received tagged packets on a specific port when the PCP bit value is 5.

```
Device(config)# interface ethernet1/1/1  
Device(config-if-e1000-1/1/1)# ip pcp-remark 5
```

ip pim

Configures PIM in Dense mode on an interface.

Syntax

```
ip pim [ passive ]  
no ip pim [ passive ]
```

Command Default

PIM is not enabled.

Parameters

passive
Specifies PIM passive mode on the interface.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of this command disables PIM.

You must enable PIM globally before you enable it on an interface.

You must enable PIM on an interface before you can configure PIM passive on it.

Support for the **ip pim passive** command is implemented at Layer 3 interface (Ethernet or virtual Ethernet) level.

Because the loopback interfaces are never used to form PIM neighbors, the **ip pim passive** command is not supported on loopback interfaces.

The sent and received statistics of a PIM Hello message are not changed for an interface while it is configured as PIM passive.

Examples

This example enables PIM globally, then enables it on interface 3.

```
Device(config)# router pim  
Device(config-pim-router)# interface ethernet 1/1/3  
Device(config-if-e10000-1/1/3)# ip address 207.95.5.1/24  
Device(config-if-e10000-1/1/3)# ip pim
```

This example enables PIM passive on an interface.

```
Device(config)# router pim
device(config-pim-router)#exit
Device(config)#interface ethernet 2
Device(config-if-e1000-2)#ip pim
Device(config-if-e1000-2)#ip pim passive
Device(config-if-e1000-2)#exit
Device(config)#interface ve 2
Device(config-vif-2)#ip pim-sparse
Device(config-vif-2)#ip pim passive
Device(config-vif-2)#exit
```

ip pim border

Configures PIM parameters on an interface on a PIM Sparse border.

Syntax

ip pim border

no ip pim border

Command Default

The interface is not configured as a border device.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of this command removes the boundary on a PIM-enabled interface.

You can configure this command only in a PIM Sparse domain, that is, you must configure the **ip pim-sparse** command before you configure the **ip pim border** command.

Examples

This example adds an IPv4 interface to port 1/2/2, enables PIM Sparse on the interface and configures it as a border device.

```
Device(config)# interface ethernet 1/2/2
Device(config-if-e10000-1/2/2)# ip address 207.95.7.1 255.255.255.0
Device(config-if-e10000-1/2/2)# ip pim-sparse
Device(config-if-e10000-1/2/2)# ip pim border
```

ip pim dr-priority

Configures the designated router (DR) priority on IPv4 interfaces.

Syntax

ip pim dr-priority *priority-value*

no ip pim dr-priority *priority-value*

Command Default

The DR priority value is 1.

Parameters

priority-value

Specifies the DR priority value as an integer. The range is 0 through 65535. The default is 1.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of this command restores the default DR priority value, 1.

You must enable PIM globally before you enable it on an interface.

You can configure the **ip pim dr-priority** command in either Dense mode (DM) or Sparse mode (SM).

If more than one device has the same DR priority on a subnet (as in the case of default DR priority on all), the device with the numerically highest IP address on that subnet is elected as the DR.

The DR priority information is used in the DR election only if all the PIM devices connected to the subnet support the DR priority option. If at least one PIM device on the subnet does not support this option, the DR election falls back to the backwards compatibility mode in which the device with the numerically highest IP address on the subnet is declared the DR regardless of the DR priority values.

Examples

This example configures a DR priority value of 50.

```
Device(config)# interface ethernet 1/3/24
Device(config-if-e10000-1/3/24)# ip pim dr-priority 50
```

ip pim neighbor-filter

Determines which devices can become PIM neighbors.

Syntax

ip pim neighbor-filter { *acl-name* | *acl-id* }

no ip pim neighbor-filter { *acl-name* | *acl-id* }

Command Default

Neighbor filtering is not applied on the interface.

Parameters

acl-name

Specifies an ACL as an ASCII string.

acl-id

Specifies either a standard ACL as a number in the range 1 to 99 or an extended ACL as a number in the range 100 to 199.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of this command removes any neighbor filtering applied on the interface.

You must enable PIM globally before you enable it on an interface.

You can configure the **ip pim neighbor-filter** command in either Dense mode (DM) or Sparse mode (SM).

Configure the **access-list** command to create an access-control list (ACL) that specifies the devices you want to permit and deny participation in PIM

Examples

This example prevents the host from becoming a PIM neighbor on interface Ethernet 1/3/24.

```
Device(config)# interface ethernet 1/3/24
Device(config-if-e10000-1/3/24)# ip pim neighbor-filter
```

This example configures an ACL named 10 to deny a host and then prevents that host, 10.10.10.2, identified in that ACL from becoming a PIM neighbor on interface Ethernet 1/3/24.

```
Device(config)# access-list 10 deny host 10.10.10.2
Device(config)# access-list 10 permit any
Device(config)# interface ethernet 1/3/24
Device(config-if-e10000-1/3/24)# ip pim neighbor-filter 10
```

History

Release version	Command history
8.0.20a	This command was introduced.

ip pimsm-snooping

Enables PIM Sparse mode (SM) traffic snooping globally.

Syntax

ip pimsm-snooping
no ip pimsm-snooping

Command Default

PIM SM traffic snooping is disabled.

Modes

Global configuration mode
VLAN configuration mode

Usage Guidelines

The **no** form of this command disables PIM SM traffic snooping.

The device must be in passive mode before it can be configured for PIM SM snooping.

Use PIM SM snooping only in topologies where multiple PIM sparse routers connect through a device. PIM SM snooping does not work on a PIM dense mode router that does not send join messages and on which traffic to PIM dense ports is stopped. A PIM SM snooping-enabled device displays a warning if it receives PIM dense join or prune messages.

When PIM SM snooping is enabled globally, you can override the global setting and disable it for a specific VLAN.

Examples

This example shows how to enable PIM SM traffic snooping.

```
Device(config)# ip pimsm-snooping
```

This example overrides the global setting and disable PIM SM traffic snooping on VLAN 20.

```
Device(config)# vlan 20  
Device(config-vlan-20)# no ip pimsm-snooping
```

ip pim-sparse

Enables PIM Sparse on an interface that is connected to the PIM Sparse network.

Syntax

ip pim-sparse [**passive**]

no ip pim-sparse [**passive**]

Command Default

PIM Sparse is not enabled on the interface.

Parameters

passive

Specifies PIM passive mode on the interface.

Modes

Interface configuration mode

Usage Guidelines

The **no ip pim-sparse** command disables PIM Sparse.

The **no ip pim-sparse passive** command disables PIM passive mode on the interface.

You must enable PIM Sparse globally before you enable it on an interface.

If the interface is on the border of the PIM Sparse domain, you also must configure the **ip pim border** command.

Examples

This example adds an IP interface to port 1/2/2, then enable PIM Sparse on the interface.

```
Device(config)# interface ethernet 1/2/2
Device(config-if-e10000-2/2)# ip address 207.95.7.1 255.255.255.0
Device(config-if-e10000-2/2)# ip pim-sparse
```

ip policy route-map

Enables policy-based routing (PBR).

Syntax

ip policy route-map *map-name*

no ip policy route-map *map-name*

Command Default

PBR is not enabled.

Parameters

map-name

Specifies the name of the route map.

Modes

Global configuration mode

Interface configuration mode

Virtual interface configuration mode

Usage Guidelines

This command can be used to enable PBR globally on all interfaces or on a specific interface.

The **no** form of the command disables PBR.

Examples

The following example enables PBR globally.

```
device(config)# route-map map1
device(config-routemap map1)# exit
device(config)# ip policy route-map map1
```

The following example enables PBR on a specific interface.

```
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# ip policy route-map map1
```

History

Release version	Command history
8.0.40a	The support for the command was added on Brocade ICX 7250.

ip preserve-acl-user-input-format

Preserves the user input format for ACL configuration.

Syntax

ip preserve-acl-user-input-format

no ip preserve-acl-user-input-format

Command Default

ACL implementations automatically display the TCP or UDP port name instead of the port number.

Modes

Global configuration mode

Usage Guidelines

When the option to preserve user input is enabled, the system displays either the port name or the number as used during configuration.

The **no** form of the command removes the user input perseverance configuration.

Examples

The following example shows the behavior when the option to preserve user input is enabled. In this example, the TCP port is configured by number (80) when configuring ACL group 140. However, **show ip access-lists 140** reverts to the port name for the TCP port (HTTP in this example). When the **ip preserve-acl-user-input-format** command is configured, the **show ip access-lists** command displays either the TCP port number or name, depending on how it was configured by the user.

```
device(config)# access-list 140 permit tcp any any eq 80
device(config)# access-list 140 permit tcp any any eq ftp
device(config)# exit
```

```
device# show ip access-lists 140
Extended IP access list 140
permit tcp any any eq http
permit tcp any any eq ftp
```

```
device(config)# access-list 140 permit tcp any any eq 80
device(config)# access-list 140 permit tcp any any eq ftp
```

```
device# show ip access-lists 140
Extended IP access list 140
permit tcp any any eq http
permit tcp any any eq ftp
```

```
device(config)# ip preserve-acl-user-input-format
device(config)# exit
```

```
device# show ip access-lists 140
Extended IP access list 140
permit tcp any any eq 80
permit tcp any any eq ftp
```

ip-proto

Configures an IP protocol-based VLAN.

Syntax

ip-proto [**name** *string*]

no ip-proto [**name** *string*]

Command Default

An IP protocol-based VLAN is not configured.

Parameters

name *string*

Specifies the name of the IP protocol VLAN. The maximum length of the string is 32 characters.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of the command removes the IP protocol-based VLAN.

Examples

The following example configures the IP protocol-based VLAN.

```
device (config)# vlan 10
device(config-vlan-10)# ip-proto name IP_Prot_VLAN
```

ip radius source-interface

Configures an interface as the source IP address from which the RADIUS client sends RADIUS requests or receives responses.

Syntax

```
ip radius source-interface { ethernet stack-id/slot/port | loopback number | management number | ve number }  
no ip radius source-interface { ethernet stack-id/slot/port | loopback number | management number | ve number }
```

Command Default

When a management VRF is configured, the RADIUS client sends RADIUS requests and receives responses only through ports belonging to the management VRF and through the out-of-band management port.

Parameters

- ethernet** *stack-id/slot/port*
Specifies the Ethernet interface address used for setting the source IP address.
- loopback** *number*
Specifies the loopback interface address used for setting the source IP address.
- management** *number*
Specifies the management interface address used for setting the source IP address.
- ve** *number*
Specifies the Virtual Ethernet interface address used for setting the source IP address.

Modes

Global configuration mode

Usage Guidelines

When a source interface is configured, management applications use the lowest configured IP address of the specified interface as the source IP address in all the outgoing packets. If the configured interface is not part of the management VRF, the response packet does not reach the destination.

The RADIUS source interface configuration command **ip radius source-interface** should be compatible with the management VRF configuration.

NOTE

Any change in the management VRF configuration takes effect immediately for the RADIUS client.

The **no** form of the command removes the configured interface as the source IP address for the RADIUS client.

Examples

The following example configures an Ethernet interface as the source IP address for the RADIUS client.

```
device(config)# ip radius source-interface ethernet 1/1/1
```

The following example configures a loopback interface as the source IP address for the RADIUS client.

```
device(config)# ip radius source-interface loopback 1
```

ip rarp

Enables IP Reverse Address Resolution Protocol (RARP).

Syntax

ip rarp
no ip rarp

Command Default

RARP is enabled by default.

Modes

Global configuration mode

Usage Guidelines

RARP allows an IP host that does not have a means of storing its IP address across power cycles or software reloads to query a directly-attached router for an IP address. RARP is enabled by default. However, you must create a RARP entry for each host that will use the Layer 3 switch for booting.

The **no** form of the command disables IP RARP.

Examples

The following example disables IP RARP.

```
device(config)# no ip rarp
```

ip redirect

Enables IPv4 redirect messages on individual Virtual Ethernet (VE) interface.

Syntax

ip redirect

no ip redirect

Command Default

Redirect is not enabled.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of the command disables IPv4 redirect messages.

NOTE

The command is supported only on VE interface configuration mode.

Examples

The following example enables ICMP redirect on a VE interface.

```
device(config-vlan-10)# interface ve 10
device(config-vif-10)# ip redirect
```

ip rip

Configures Routing Information Protocol at the interface level. RIP must first be enabled globally on the device.

Syntax

```
ip rip { v1-only | v1-compatible-v2 | v2-only }  
no ip rip { v1-only | v1-compatible-v2 | v2-only }
```

Command Default

By default, RIP is not configured on any interface.

Parameters

v1-only

Configures the interface for RIP Version.

v1-compatible-v2

Configures the interface for RIP Version 1 with RIP Version 2 compatibility.

v2-only

Configures the interface for RIP Version 2.

Modes

Interface configuration mode.

Usage Guidelines

The **no** form of the command disables RIP on the interface.

RIP must first be configured globally. Refer to the **router rip** command. Then you must configure individual interfaces, including physical interfaces as well as virtual routing interfaces, with the **ip rip** command.

Examples

The following example configures RIP Version 1 on Ethernet interface 1/2/3 (device 1/slot 2/interface 3).

```
device# configure terminal  
device(config)# interface ethernet 1/2/3  
device(config-if-e01000-1/2/3)# ip rip v1-only
```

The following examples removes RIP configuration from the same interface.

```
device# configure terminal  
device(config)# interface ethernet 1/2/3  
device(config-if-e01000-1/2/3)# no ip rip v1-only
```

ip rip metric-offset

Increases the cost metric an interface applies to learned or advertised RIP routes.

Syntax

```
ip rip metric-offset num { in | out }
```

```
no ip rip metric-offset num { in | out }
```

Command Default

By default, the interface adds one to the route metric before storing the route.

Parameters

num

A decimal number from 1 through 16 that the interface adds to the cost metric for learned or advertised RIP routes.

in

Applies cost to routes the interface learns from RIP neighbors.

out

Applies cost to routes the interface advertises to RIP neighbors.

Modes

Interface configuration mode.

Usage Guidelines

The **no** form of the command removes the added cost from RIP routes learned or advertised on the interface.

Routes with a higher cost are less likely to be used. You can prevent the RIP router from using a route learned on a particular interface by adding a cost metric of 16 on the interface.

Examples

The following example adds 5 to the cost metric for routes advertised on Ethernet interface 1/2/3 (Device 1/Slot 2/Interface 3).

```
device# configure terminal
device(config)# interface ethernet 1/2/3
device(config-if-e1000-1/2/3)# ip rip metric-offset 5 out
```

The following example returns the advertised route metric to default (1) for the interface in the previous example.

```
device# configure terminal
device(config)# interface ethernet 1/2/3
device(config-if-e1000-1/2/3)# no ip rip metric-offset 5 out
```

Commands F - J

ip rip metric-offset

The following example prevents the RIP router from using RIP routes learned on Ethernet interface 1/2/3.

```
device# configure terminal
device(config)# interface ethernet 1/2/3
device(config-if-e1000-1/2/3)# ip rip metric-offset 16 in
```

ip rip route-map

Applies a pre-configured route map to a RIP interface.

Syntax

```
ip rip route-map name { in | out }  
no ip rip route-map
```

Parameters

name

Specifies the route-map to be applied.

in

Applies the route-map as an inbound filter; that is, it applies to routes learned from RIP neighbors.

out

Applies the route-map as an outbound filter; that is, it applies to routes advertised to RIP neighbors.

Modes

Interface configuration mode.

Usage Guidelines

The **no** form of the command removes the route-map from the interface.

An access control list (ACL) or a prefix list can be applied as a route-map using this command.

Examples

The following command applies the route-map named map1 to filter RIP routes learned on Ethernet interface 1/1/2.

```
device# configure terminal  
device(config)# interface ethernet 1/1/2  
device(config-if-e1000-1/1/2)# ip rip route-map map1 in
```

ip route

Adds a static route to the IP routing tables.

Syntax

```
ip route [ vrf vrf-name ] dest-ip-addr next-hop-addr [ metric ] [ distance distance ] [ tag tag ] [ name string ]
```

```
ip route [ vrf vrf-name ] dest-ip-addr { ethernet unit/slot/port | ve number | tunnel tunnel-id } [ metric ] [ name string ]
```

```
ip route [ vrf vrf-name ] dest-ip-addr null0 [ name string ]
```

```
no ip route [ vrf vrf-name ] dest-ip-addr next-hop-addr [ metric ] [ distance distance ] [ tag tag ] [ name string ]
```

```
no ip route [ vrf vrf-name ] dest-ip-addr { ethernet unit/slot/port | ve number | tunnel tunnel-id } [ metric ] [ name string ]
```

```
no ip route [ vrf vrf-name ] dest-ip-addr null0 [ name string ]
```

Parameters

vrf *vrf-name*

Specifies the VRF associated with the destination IPv4 address.

dest-ip-addr

Specifies the destination IPv4 address and mask in the format A.B.C.D/L (where "L" is the prefix-length of the mask) or A.B.C.D P.Q.R.S (where "PQ.R.S" is the mask value).

next-hop-addr

Specifies the IPv4 address of the next hop.

ethernet *unit/slot/port*

Specifies the destination Ethernet port.

ve *vlan-id*

Specifies the outgoing interface type as VE.

tunnel *tunnel-id*

Specifies the outgoing interface type as tunnel.

null0

Configures the Layer 3 switch to drop IP packets to a specific network or host address by configuring a "null" (sometimes called "null0") static route for the address.

metric

Specifies the cost metric of the route. Valid values range from 1 through 16. The default is 1.

distance *distance*

Specifies the administrative distance of the route. When comparing otherwise equal routes to a destination, a Brocade device prefers lower administrative distances over higher ones. Valid values range from 1 through 255. The default is 1. The value 255 makes the route unusable.

tag *tag*

Specifies the tag value of the route to use for route filtering with a route map. Valid values range from 0 through 4294967295. The default is 0.

name *string*

Specifies the static route name. The maximum length of the name is 128 bytes.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command followed by the route identifier removes a static route. If the static route includes a name, you must enter the **no** form of the command twice (once to remove the name and the second time to remove the route from the routing table).

For a default route, enter 0.0.0.0/0 as the destination IP address followed by the next-hop IP address. Physical or virtual interfaces cannot be used as next-hops for a default route.

If you do not want to specify a next-hop IP address, you can instead specify a port or interface number on the Brocade device. If you specify an Ethernet port, the Brocade device forwards packets destined for the static route's destination network to the specified interface. Conceptually, this feature makes the destination network like a directly connected network, associated with a Brocade device interface.

The port or virtual interface you use for the static route's next hop must have at least one IP address configured on it. The address does not need to be in the same subnet as the destination network.

When a tunnel is configured as the next hop for a static route, the tunnel must already be configured if the destination is a non-default VRF. In contrast, a tunnel can be designated as the next hop in the default VRF before it is configured. The default VRF is used when no VRF is specified in the command.

Examples

The following example configures a static route to 10.95.7.0, using 10.95.6.157 as the next-hop gateway.

```
device(config)# ip route 10.95.7.0/24 10.95.6.157
```

The following example configures a default route through next-hop IP address 10.2.12.1.

```
device(config)# ip route 0.0.0.0/0 10.2.12.1
```

The following example configures a static route with an Ethernet interface as the destination.

```
device(config)# ip route 192.128.2.69 255.255.255.0 ethernet 1/4/1
```

The following example configures a null static route to drop packets destined for network 10.157.22.x.

```
device(config)# ip route 10.157.22.0 255.255.255.0 null0
```

The following example configures tunnel 1 as the next hop gateway. The tunnel is configured in the default VRF.

```
device(config)# ip route 56.1.1.0/24 tunnel 1
```

Commands F - J

ip route

The following example configures tunnel 5 as the next hop gateway in a non-default VRF, as long as the tunnel already exists.

```
device(config)# ip route vrf 1 56.1.5.0/24 tunnel 5
```

ip route next-hop

Enables the Brocade device to use routes from a specified protocol to resolve a configured static route.

Syntax

```
ip route next-hop { bgp | ospf | rip }
no ip next-hop { bgp | ospf | rip }
```

Command Default

The Brocade device is not enabled to use routes from a specified protocol to resolve a configured static route.

Parameters

- bgp** Configures the device to use iBGP and eBGP routes to resolve static routes.
- ospf** Configures the device to use OSPF routes to resolve static routes.
- rip** Configures the device to use RIP routes to resolve static routes.

Modes

Global configuration mode

Usage Guidelines

This command can be independently applied on a per-VRF basis. Connected routes are always used to resolve static routes.

The **no** form of the command disables the device to use routes from a specified protocol to resolve static routes.

Examples

The following example configures the device to use OSPF protocol to resolve static routes.

```
device(config)# ip route next-hop ospf
```

ip route next-hop-recursion

Enables the Brocade device to use static routes to resolve another static route.

Syntax

ip route next-hop-recursion [*level*]
no ip route next-hop-recursion *level*

Command Default

The recursive static route next hop lookup is disabled.

Parameters

level

Specifies the number of levels of recursion allowed. Valid values are 1 to 10. The default value is 3.

Modes

Global configuration mode

Usage Guidelines

This command can be independently applied on a per-VRF basis..

The **no** form of the command disables the recursive static route next hop lookup.

Examples

The following example enables the device to use static routes to resolve another static route.

```
device(config)# ip route next-hop-recursion 5
```

ip route next-hop-enable-default

Enables the Brocade device to use the default route (0.0.0.0/0) to resolve a static route.

Syntax

ip route next-hop-enable-default
no ip route next-hop-enable-default

Command Default

Device does not use the default route to resolve static route.

Modes

Global configuration mode

Usage Guidelines

This command can be independently applied on a per-VRF basis.

This command works independently with the `ip route next-hop-recursion` and `ip route next-hop` commands. If the default route is a protocol route, that protocol needs to be enabled to resolve static routes using the **ip route next-hop** command in order for static routes to resolve by this default route. If the default route itself is a static route, you must configure the **ip route next-hop-recursion** command to resolve other static routes by this default route.

The **no** form of the command disables the device to use the default route to resolve a static route.

Examples

The following example enables static route resolve by default route

```
device(config)# ip route next-hop-enable-default
```

ip router-id

Configures an IPv4 router ID.

Syntax

ip router-id *ipv4-address*

no ip router-id *ipv4-address*

Command Default

A router ID is not configured.

Parameters

ipv4-address

Specifies the IPv4 address. The default is the lowest IP address in use.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command removes the configured IPv4 router ID.

Examples

The following example configures the IPv4 router ID.

```
device(config)# ip router-id 10.14.52.11
```

ip show-portname

Displays interface names in syslog messages.

Syntax

ip show-portname

no ip show-portname

Command Default

An interface slot number (if applicable), port number, and interface type are displayed when you display syslog messages.

Modes

Global configuration mode

Usage Guidelines

Syslog messages show the interface type, such as "ethernet", and so on. However, if the **ip show-portname** command is configured and a name has been assigned to the port, the port name replaces the interface type.

The **no** form of the command displays the interface slot number and port number in syslog messages.

Examples

The following example configures the display of the interface name in syslog messages.

```
device(config)# ip show-portname
```

ip show-service-number-in-log

Displays TCP or UDP port numbers instead of the port names.

Syntax

ip show-service-number-in-log

no ip show-service-number-in-log

Command Default

By default, the device displays TCP or UDP application information in named notation.

Modes

Global configuration mode

Usage Guidelines

When this command is enabled, the device displays 80 (the port number) instead of http (the well-known port name) in the output of show commands and other commands that contain application port information.

The **no** form of the command displays the TCP or UDP port name.

Examples

The following example sets the display of TCP or UDP port numbers instead of their names.

```
device(config)# ip show-service-number-in-log
```

ip show-subnet-length

Enables CIDR format for displaying network masks.

Syntax

ip show-subnet-length

no ip show-subnet-length

Command Default

By default, the CLI displays network masks in classical IP address format (example: 255.255.255.0).

Modes

Global configuration mode

Usage Guidelines

This command changes the displays to prefix format (CIDR format) (example: /18) on a Layer 3 switch or Layer 2 switch.

The **no** form of the command enables the display of network masks in classical IP address format.

Examples

The following example enables CIDR format for displaying network masks.

```
device(config)# ip show-subnet-length
```

ip snmp source-interface

Sets the lowest-numbered IP address configured on an interface as the device source for all SNMP packets.

Syntax

```
ip snmp source-interface { ethernet stack/slot/port | loopback loopback-num | management mgmt-num | ve ve-num }  
no ip snmp source-interface { ethernet stack/slot/port | loopback loopback-num | management mgmt-num | ve ve-num }
```

Command Default

When the Layer 3 switch originates a packet, the source address of the packet is the lowest-numbered IP address on the interface that sends the packet.

Parameters

ethernet *stack/slot/port*

Configures the device source IP address for all SNMP packets as the IP address of the specified Ethernet interface.

loopback *loopback-num*

Configures the device source IP address for all SNMP packets as the IP address of the specified loopback interface.

management *mgmt-num*

Configures the device source IP address for all SNMP packets as the IP address of the specified management interface.

ve *ve-num*

Configures the device source IP address for all SNMP packets as the IP address of the specified Virtual Ethernet (VE) interface.

Modes

Global configuration mode

Usage Guidelines

You can configure the Layer 3 switch to always use the lowest-numbered IP address on a specific Ethernet, loopback, or virtual interface as the source addresses for these packets. When configured, the Layer 3 switch uses the same IP address as the source for all packets of the specified type, regardless of the ports that actually sends the packets.

If your server is configured to accept packets only from specific IP addresses, you can use this configuration to simplify configuration of the server by configuring the Brocade device to always send the packets from the same link or source address.

If you specify a loopback interface as the single source for specified packets, servers can receive the packets regardless of the states of individual links. Thus, if a link to the server becomes unavailable but the client or server can be reached

through another link, the client or server still receives the packets, and the packets still have the source IP address of the loopback interface.

The **no** form of the command resets the source address of the packet as the lowest-numbered IP address on the interface that sends the packet.

Examples

The following example configures the IP address of the Ethernet interface 1/1/1 as the source IP address for SNMP packets.

```
device(config)# ip snmp source-interface ethernet 1/1/1
```

ip source-route

Enables forwarding of IP source-routed packets.

Syntax

ip source-route
no ip source-route

Command Default

The Layer 3 switch forwards both types of source-routed (strict and loose) packets by default.

Modes

Global configuration mode

Usage Guidelines

A source-routed packet specifies the exact router path for the packet. The packet specifies the path by listing the IP addresses of the router interfaces through which the packet must pass on its way to the destination. The Layer 3 switch supports strict and loose types of IP source routing.

Strict source routing requires the packet to pass through only the listed routers. If the Layer 3 switch receives a strict source-routed packet but cannot reach the next hop interface specified by the packet, the Layer 3 switch discards the packet and sends an ICMP Source-Route-Failure message to the sender.

NOTE

The Layer 3 switch allows you to disable sending of the Source-Route-Failure messages.

Loose source routing requires that the packet pass through all of the listed routers but also allows the packet to travel through other routers, which are not listed in the packet.

The **no** form of the command disables forwarding of IP source-routed packets.

Examples

The following example disables forwarding of IP source-routed packets.

```
device# configure terminal
device(config)# no ip source-route
```

The following example reenables forwarding of IP source-routed packets.

```
device(config)# ip source-route
```

ip ssh authentication-retries

Configures the number of SSH authentication retries.

Syntax

ip ssh authentication-retries *number-retries*

no ip ssh authentication-retries *number-retries*

Command Default

By default, the Brocade device attempts to negotiate a connection with the connecting host three times.

Parameters

number-retries

The number of SSH authentication retries. Valid values are from 1 through 5.

Modes

Global configuration mode

Usage Guidelines

The **ip ssh authentication-retries** command is not applicable on devices that act as an SSH client. On such devices, when you try to establish an SSH connection with the wrong credentials, the session is not established and the connection is terminated. The device does not check the SSH authentication retry configuration set using the **ip ssh authentication-retries** command. The command is applicable only to SSH clients such as PuTTY, SecureCRT, and so on.

The **no** form of the command sets the number of retries to the default value of three.

Examples

The following example shows how to set the authentication retries to 5.

```
device(config)# ip ssh authentication-retries 5
```

ip ssh client

Restricts Secure Shell (SSH) access to a Brocade device based on the client IP address and MAC address.

Syntax

ip ssh client { *ipv4-address* [*mac-address*] | **any** *mac-address* | **ipv6** *ipv6-address* }

no ip ssh client { *ipv4-address* [*mac-address*] | **any** *mac-address* | **ipv6** *ipv6-address* }

Command Default

SSH access is not enabled.

Parameters

ipv4-address

Allows SSH access from the host with the specified IP address.

mac-address

Allows SSH access from the host with the specified IP address and MAC address.

any *mac-address*

Allows SSH access from any host with any IP address and specified MAC address.

ipv6 *ipv6-address*

Allows SSH access from any host with the specified IPv6 address.

Modes

Global configuration mode

Usage Guidelines

You can specify only one IP address with one command. However, you can enter the command ten times to specify up to ten IP addresses.

The **no** form of the command removes the SSH access restrictions.

Examples

The following example shows how to allow SSH access to a Brocade device based on the host with IP address 10.157.22.39.

```
device(config)# ip ssh client 10.157.22.39
```

The following example shows how to allow SSH access to the Brocade device based on the host with IP address 10.157.22.39 and MAC address 0000.000f.e9a0.

```
device(config)# ip ssh client 10.157.22.39 0000.000f.e9a0
```

The following example shows how to allow SSH access to the Brocade device based on the host with IPv6 address 2001::1 and MAC address 0000.000f.e9a0.

```
device(config)# ip ssh client ipv6 2001::1
```

ip ssh encryption aes-only

Enables SSH AES encryption and disables support for 3des-cbc.

Syntax

ip ssh encryption aes-only

no ip ssh encryption aes-only

Command Default

The 3des-cbc encryption is enabled by default.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command disables the AES encryption support.

Examples

The following example shows how to enable AES encryption.

```
device(config)# ip ssh encryption aes-only.
```

ip ssh encryption disable-aes-cbc

Disables the Advanced Encryption Standard - Cipher-Block Chaining (AES-CBC) encryption mode for the Secure Shell (SSH) protocol.

Syntax

ip ssh encryption disable-aes-cbc
no ip ssh encryption disable-aes-cbc

Command Default

If JITC is enabled, only AES-CTR encryption mode is supported and AES-CBC mode is disabled by default. In the standard mode, the AES-CBC encryption mode is enabled.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command enables the AES-CBC encryption mode.

Examples

The following example disables the AES-CBC encryption mode.

```
device(config)# ip ssh encryption disable-aes-cbc
```

History

Release version	Command history
08.0.20a	This command was introduced.

ip ssh idle-time

Configures the amount of time an SSH session can be inactive before the device closes it.

Syntax

ip ssh idle-time *time*

no ip ssh idle-time *time*

Command Default

By default, SSH sessions do not time out.

Parameters

time

Time in minutes. Valid values are from 0 through 240. The default is 0 (never time out).

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command sets the timeout value to the default.

If an established SSH session has no activity for the specified number of minutes, the device closes it. An idle time of 0 minutes (the default value) means that SSH sessions never time out.

Examples

The following example configures the SSH idle time to 50 minutes.

```
device(config)# ip ssh idle-time 50
```

ip ssh interactive-authentication

Configures the keyboard-interactive authentication.

Syntax

ip ssh interactive-authentication { yes | no }

no ip ssh interactive-authentication { yes | no }

Command Default

Keyboard-interactive authentication is not enabled.

Parameters

yes

Enables keyboard-interactive authentication.

no

Disables keyboard-interactive authentication.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command disables keyboard-interactive authentication.

Examples

The following example enables keyboard-interactive authentication.

```
device(config)# ip ssh interactive-authentication yes
```

ip ssh key-authentication

Configures DSA or RSA challenge-response authentication.

Syntax

ip ssh key-authentication { yes | no }

no ip ssh key-authentication { yes | no }

Command Default

DSA or RSA challenge-response authentication is enabled by default.

Parameters

yes

Enables DSA or RSA challenge-response authentication. The default is **yes**.

no

Disables DSA or RSA challenge-response authentication.

Modes

Global configuration mode

Usage Guidelines

After the SSH server on the Brocade device negotiates a session key and encryption method with the connecting client, user authentication takes place. The implementation of SSH supports DSA or RSA challenge-response authentication and password authentication. You can deactivate one or both user authentication methods for SSH. Note that deactivating both authentication methods disables the SSH server entirely.

With DSA or RSA challenge-response authentication, a collection of clients' public keys are stored on the device. Clients are authenticated using these stored public keys. Only clients that have a private key that corresponds to one of the stored public keys can gain access to the device using SSH.

The **no** form of the command disables DSA or RSA challenge-response authentication.

Examples

The following example enables DSA or RSA challenge-response authentication.

```
device(config)# ip ssh key-authentication
```

ip ssh key-exchange-method dh-group14-sha1

Configures diffie-hellman-group14-sha1 as the key-exchange method to establish an SSH connection.

Syntax

```
ip ssh key-exchange-method dh-group14-sha1  
no ip ssh key-exchange-method dh-group14-sha1
```

Command Default

The diffie-hellman-group1-sha1 is used as the key-exchange method.

Modes

Global configuration mode

Usage Guidelines

The **ip ssh key-exchange-method dh-group14-sha1** command is not supported in FIPS or CC mode.

In FIPS mode, only diffie-hellman-group-exchange-sha256 is supported and in common criteria(CC) mode, only diffie-hellman-group14-sha1 is supported.

The **no** form of the command restores diffie-hellman-group1-sha1 as the key-exchange method.

Examples

The following example overrides the default key-exchange method and configures diffie-hellman-group14-sha1 as the key-exchange method.

```
device(config)# ip ssh key-exchange-method dh-group14-sha1
```

History

Release version	Command history
08.0.30f	This command was introduced.

ip ssh password-authentication

Configures password authentication.

Syntax

```
ip ssh password-authentication { yes | no }  
no ip ssh password-authentication { yes | no }
```

Command Default

Password authentication is enabled.

Parameters

yes
Enables the password authentication. The default is **yes**.

no
Disables the password authentication.

Modes

Global configuration mode

Usage Guidelines

After the SSH server on the device negotiates a session key and encryption method with the connecting client, user authentication takes place. The implementation of SSH supports DSA or RSA challenge-response authentication and password authentication. You can deactivate one or both user authentication methods for SSH. Note that deactivating both authentication methods disables the SSH server entirely.

With password authentication, users are prompted for a password when they attempt to log in to the device (provided empty password logins are not allowed). If there is no user account that matches the username and password supplied by the user, the user is not granted access.

The **no** form of the command enables password authentication.

Examples

The following example disables the password authentication.

```
device(config)# ip ssh password-authentication yes
```

ip ssh permit-empty-password

Allows a user with an SSH client to log in without being prompted for a password.

Syntax

ip ssh permit-empty-password { yes | no }

no ip ssh permit-empty-password { yes | no }

Command Default

By default, empty password logins are not allowed.

Parameters

yes

Allows a user to log in to an SSH client without being prompted for a password.

no

Disallows a user to log in to an SSH client without being prompted for a password.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command disallows user to log in without being prompted for a password.

By default, empty password logins are not allowed; users with an SSH client are always prompted for a password when they log in to the device. To gain access to the device, each user must have a username and password. Without a username and password, a user is not granted access.

If you enable empty password logins, users are not prompted for a password when they log in. Any user with an SSH client can log in without being prompted for a password.

Examples

The following example enables the user to log in to an SSH client without being prompted for a password.

```
device(config)# ip ssh permit-empty-password yes
```

ip ssh port

Configures the port for SSH traffic.

Syntax

ip ssh port *port-num*

no ip ssh port *port-num*

Command Default

By default, SSH traffic occurs on TCP port 22.

Parameters

port-num

Specifies the port number.

Modes

Global configuration mode

Usage Guidelines

If you change the default SSH port number, you must configure SSH clients to connect to the new port. Also, you should be careful not to assign SSH to a port that is used by another service. If you change the SSH port number, Brocade recommends that you change it to a port number greater than 1024.

The **no** form of the command changes the port to the default.

Examples

The following example configures the SSH port as 2200.

```
device(config)# ip ssh port 2200
```

ip ssh pub-key-file

Imports the authorized public keys into the active configuration of the device by loading the public key file from a TFTP server.

Syntax

```
ip ssh pub-key-file { remove | tftp { ipv4-address | ipv6 ipv6-address } file-name }
no ip ssh pub-key-file { remove | tftp { ipv4-address | ipv6 ipv6-address } file-name }
```

Command Default

The private key is normally stored in a password-protected file on the local host; the public key is stored in another file and is not protected.

Parameters

remove
Removes the SSH client public key file from the device.

tftp
Imports DSS public key from the TFTP server.

ipv4-address
Specifies the IPv4 address of the TFTP server.

ipv6 *ipv6-address*
Specifies the IPv6 address of the TFTP server.

file-name
Specifies the public key file name.

Modes

Global configuration mode

Usage Guidelines

You can use the **show ip client-pub-key** command to display the currently loaded public keys.

SSH clients that support DSA or RSA authentication normally provide a utility to generate a DSA or RSA key pair. The private key is normally stored in a password-protected file on the local host; the public key is stored in another file and is not protected. You must import the client public key for each client into the Brocade device.

The **no** form of the command removes the imported public keys.

Examples

The following example imports a public key file from the TFTP server 192.168.10.1.

```
device(config)# ip ssh pub-key-file tftp 192.168.10.1 pkeys.txt
```

The following example removes a public key file from the device.

```
device(config)# ip ssh pub-key-file remove
```

ip ssh scp

Enables Secure Copy (SCP).

Syntax

```
ip ssh scp { enable | disable }  
no ip ssh scp { enable | disable }
```

Command Default

SCP is enabled.

Parameters

enable
Enables SCP.

disable
Disables SCP.

Modes

Global configuration mode

Usage Guidelines

SCP uses security built into SSH to transfer image and configuration files to and from the device. SCP automatically uses the authentication methods, encryption algorithm, and data compression level configured for SSH.

If you disable SSH, SCP is also disabled.

The **no** form of the command disables SCP.

Examples

The following example disables SCP.

```
device(config)# ip ssh scp disable
```

The following example enables SCP.

```
device(config)# ip ssh scp enable
```

ip ssh strict-management-vrf

Allows incoming SSH connection requests only from the management VRF and not from the out-of-band (OOB) management port.

Syntax

ip ssh strict-management-vrf
no ip ssh strict-management-vrf

Command Default

When the management VRF is configured, incoming SSH connection requests are allowed from the ports that belong to the management VRF and from the OOB management port.

Modes

Global configuration mode

Usage Guidelines

The **ip ssh strict-management-vrf** command is applicable only when the management VRF is configured. If a management VRF is not configured, configuring the **ip ssh strict-management-vrf** command displays an error message.

The **ip ssh strict-management-vrf** command does not prevent a connection initiated from the OOB management interface if the management interface VRF and the management VRF are the same. The user must configure either the **management exclude all oob** command or the **management exclude ssh oob** command.

For the SSH server, changing the management VRF configuration or configuring the **ip ssh strict-management-vrf** command does not affect the existing SSH connections. The changes are applied only to new incoming connection requests.

The **ip ssh strict-management-vrf** command and the **management exclude** command are mutually exclusive. If the latter command is configured, outbound SSH connections are not blocked.

The **no** form of the command enables the incoming SSH connection requests from ports that belong to the management VRF and from the OOB management port.

Examples

The following example allows incoming SSH connection requests from the management VRF only.

```
device(config)# ip ssh strict-management-vrf
```

History

Release version	Command history
8.0.50	The Usage Guidelines were modified.

Related Commands

[management exclude](#)

ip ssh timeout

Configures the wait time for a response from the client when the SSH server attempts to negotiate a session key and encryption method with a connecting client.

Syntax

ip ssh timeout *time*

no ip ssh timeout *time*

Command Default

The default timeout value is 120 seconds.

Parameters

time

Timeout value in seconds. The valid range is from 1 through 120 seconds.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command sets the timeout value to the default.

Examples

The following example configures the SSH timeout value to 60 seconds.

```
device(config)# ip ssh timeout 60
```

ip ssl

Configures Secure Socket Layer (SSL) settings.

Syntax

ip ssl cert-key-size *size*

no ip ssl cert-key-size *size*

ip ssl { **certificate-data-file** | **client-certificate** | **client-private-key** | **private-key-file** } **tftp** { *ipv4-address* | **ipv6** *ipv6-address* } *file-name*

no ip ssl { **certificate-data-file** | **client-certificate** | **client-private-key** | **private-key-file** } **tftp** { *ipv4-address* | **ipv6** *ipv6-address* } *file-name*

ip ssl port *port-num*

no ip ssl port *port-num*

ip ssl certificate { **common-name** | **country** | **locality** | **org** | **org-unit** | **state** } *name*

no ip ssl certificate { **common-name** | **country** | **locality** | **org** | **org-unit** | **state** } *name*

Command Default

The default key size for Brocade-issued and imported digital certificates is 2048 bits.

By default, SSL protocol exchanges occur on TCP port 443.

The default TFTP server is not configured.

Parameters

cert-key-size *size*

Configures SSL server certificate key size. Valid values are 2048 and 4096.

certificate-data-file

Imports the server RSA certificate.

client-certificate

Imports the client RSA certificate.

client-private-key

Imports the client RSA private key.

private-key-file

Imports the server RSA private key.

tftp

Specifies that TFTP is used to import the certificates.

ipv4-address

Configures the IPv4 address of the TFTP server from which the certificates are imported.

ipv6 *ipv6-address*

Configures the IPv6 address of the TFTP server from which the certificates are imported.

file-name

The certificate data file name.

port *port-num*

Specifies the HTTPS/SSL port. The default port is 443.

certificate

Configures the SSL certificate generation signing request.

common-name

Specifies the common name, fully qualified domain name, or web address for which you plan to use your certificate.

country

Specifies the country name.

locality

Specifies the locality name.

org

Specifies the organization name.

org-unit

Specifies the organization unit name.

state

Specifies the state or province name.

name

Fully qualified domain name or web address for which you plan to use your certificate (for example, www.server.com) when used with **common-name**, two letter code country name (for example, US) when used with **country**, locality name (for example, city) when used with **locality**, organization name (for example, company) when used with **org**, organization unit name (for example, section) when used with **org-unit**, or province name (for example, California) when used with **state**.

Modes

Global configuration mode

Usage Guidelines

The SSL server certificate key size applies only to digital certificates issued by Brocade and does not apply to imported certificates.

To allow a client to communicate with another Brocade device using an SSL connection, you configure a set of digital certificates and RSA public-private key pairs on the device. A digital certificate is used for identifying the connecting client to the server. It contains information about the issuing Certificate Authority (CA), as well as a public key. You can either import digital certificates and private keys from a server, or you can allow the Brocade device to create them. The RSA private key can be up to 4096 bits.

The **no** form of the command removes the configurations.

Examples

The following example shows how to import a digital certificate issued by a third-party Certificate Authority (CA) and save it in the flash memory.

```
device(config)# ip ssl certificate-data-file tftp 10.10.10.1 cacert.pem
```

The following example shows how to change the key size for Brocade-issued and imported digital certificates to 4096 bits.

```
device(config)# ip ssl cert-key-size 4096
```

The following example shows how to change the port number used for SSL communication.

```
device(config)# ip ssl port 334
```

The following example shows how to import an RSA private key from a client.

```
device(config)# ip ssl private-key-file tftp 192.168.9.210 keyfile
```

The following example shows how to configure the SSL certificate generation signing request for a country.

```
device(config)# ip ssl certificate country us
```

ip ssl min-version

Configures the minimum TLS version to be used to establish the TLS connection.

Syntax

ip ssl min-version { **tls_1_0** | **tls_1_1** | **tls_1_2** }

no ip ssl min-version { **tls_1_0** | **tls_1_1** | **tls_1_2** }

Command Default

For devices which act as an SSL server or HTTPS server, the default connection is with TLS1.2.

For the Brocade device which acts as the SSL client or the syslog, OpenFlow, or secure AAA client, the TLS version is decided based on the server support.

Parameters

tls_1_0
Specifies TLS 1.0 as the minimum version.

tls_1_1
Specifies TLS 1.1 as the minimum version.

tls_1_2
Specifies TLS 1.2 as the minimum version.

Modes

Global configuration mode

Usage Guidelines

If **tls_1_1** is set as the minimum version, TLS 1.1 and later versions are supported.

The **no** form of the command removes the minimum TLS version configuration and supports all TLS versions.

Examples

The following example establishes the TLS connection using the TLS 1.1 version and above.

```
device(config)# ip ssl min-version tls_1_1
```

History

Release version	Command history
08.0.20a	This command was introduced.

ip-subnet

Configures an IP subnet VLAN within a VLAN.

Syntax

ip-subnet { *ip-address ip-mask* [**name string**] }

no ip-subnet { *ip-address ip-mask* [**name string**] }

Command Default

A VLAN is not configured with an IP subnet and mask.

Parameters

ip-address

Specifies the IP address you want to assign to a VLAN. The IP address can be in the format A.B.C.D or A.B.C.D/L, where L is the subnet mask length.

ip-mask

Specifies the subnet mask you want to assign. This is required when the subnet mask length is not specified along with the IP address.

name string

Specifies the name of the IP subnet. The name can be up to 32 characters in length.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of the command removes the IP subnet VLAN.

Examples

The following example shows how to configure an IP subnet VLAN within a VLAN.

```
device(config)# vlan 4
device(config-vlan-4)# ip-subnet 10.1.3.0/24 name Brown
```

ip syslog source-interface

Configures an interface as the source IP address from which the syslog module sends log messages.

Syntax

```
ip syslog source-interface { ethernet stack-id/slot/port | loopback number | management number | ve number }  
no ip syslog source-interface { ethernet stack-id/slot/port | loopback number | management number | ve number }
```

Command Default

When the management VRF is configured, the syslog module sends log messages only through ports that belong to the management VRF and through the out-of-band management port.

Parameters

- ethernet** *stack-id/slot/port*
Specifies the Ethernet interface to be used as the source IP address.
- loopback** *number*
Specifies the loopback interface to be used as the source IP address.
- management** *number*
Specifies the management interface to be used as the source IP address.
- ve** *number*
Specifies the Virtual Ethernet interface to be used as the source IP address.

Modes

Global configuration mode

Usage Guidelines

When a source interface is configured, management applications use the lowest configured IP address of the specified interface as the source IP address in all the outgoing packets. If the configured interface is not part of the management VRF, the response packet does not reach the destination.

The syslog source interface configuration command **ip syslog source-interface** should be compatible with the management VRF configuration. Any change in the management VRF configuration takes effect immediately for syslog.

The **no** form of the command removes the configured interface as the source IP address.

Examples

The following example configures an Ethernet interface as the source IP address for the syslog module to send log messages.

```
device(config)# ip syslog source-interface ethernet 1/1/1
```

The following example configures a management interface as the source IP address for the syslog module to send log messages.

```
device(config)# ip syslog source-interface management 1
```

ip tacacs source-interface

Configures an interface as the source IP address from which the TACACS+ client establishes connections with TACACS+ servers.

Syntax

```
ip tacacs source-interface { ethernet stack-id/slot/port | loopback number | management number | ve number }  
no ip tacacs source-interface { ethernet stack-id/slot/port | loopback number | management number | ve number }
```

Command Default

A TACACS+ source interface is not configured.

When a management VRF is configured, the TACACS+ client establishes connections with TACACS+ servers only through ports that belong to the management VRF and the out-of-band management port.

Parameters

ethernet *stack-id/slot/port*

Specifies the Ethernet interface to be used as the source IP address.

loopback *number*

Specifies the loopback interface to be used as the source IP address.

management *number*

Specifies the management interface to be used as the source IP address.

ve *number*

Specifies the Virtual Ethernet interface to be used as the source IP address.

Modes

Global configuration mode

Usage Guidelines

For the TACACS+ client, a change in the management VRF configuration does not affect the existing TACACS+ connections. The changes are applied only to new TACACS+ connections.

The TACACS+ source interface configuration command **ip tacacs source-interface** must be compatible with the management VRF configuration.

The **no** form of the command removes the configured interface as the source IP address.

Examples

The following example configures an Ethernet interface as the source IP address for the TACACS+ client to establish connections with TACACS+ servers.

```
device(config)# ip tacacs source-interface ethernet 1/1/1
```

The following example configures a Virtual Ethernet interface as the source IP address for the TACACS+ client to establish connections with TACACS+ servers.

```
device(config)# ip tacacs source-interface ve 1
```

ip-telephony data

Specifies the Avaya IP telephony data options in the DHCP server pool.

Syntax

ip-telephony data mcipadd *ip-address* [**tftpsrvr** *server-ip-address* | **httpsrvr** *server-ip-address* | **tlssrvr** *server-ip-address* | **mcport** *portnum* | **l2qaud** *prio* | **l2qsig** *prio* | **l2qvlan** *vlan-id* | **vlantest** *secs*]

no ip-telephony voice mcipadd *ip-address* [**tftpsrvr** *server-ip-address* | **httpsrvr** *server-ip-address* | **tlssrvr** *server-ip-address* | **mcport** *portnum* | **l2qaud** *prio* | **l2qsig** *prio* | **l2qvlan** *vlan-id* | **vlantest** *secs*]

Parameters

mcipadd *ip-address*

IP address of the gatekeeper. At least one IP address is required.

mcport *portnum*

Specifies IP telephony server port number. The default is 1719.

tftpsrvr/httpsrvr/tlssrvr *server ip-address*

Specifies the IP addresses of the TFP, HTTP, and TLS servers.

l2qaud or **l2qsig** *prio*

L2QAUD is the IP telephony L2 audio priority value. L2QSIG is the IP telephony L2 signaling priority value. This range is from 1 through 6. The default value is 6.

l2qvlan *vlan-id*

Specifies the IP telephony L2QVLAN number. The default is 0.

vlantest *secs*

The number of seconds a phone attempts to return to the previously known voice VLAN. This is not applicable for the default VLAN.

Modes

DHCP server pool configuration mode

Usage Guidelines

You must enter the MCIP address. The other parameters are optional.

The **no** form of the command removes the parameters from the DHCP server pool.

Examples

The following example configures the MCIP address and MCPORT number for IP telephony data.

```
device(config)# ip dhcp-server pool cabo
device(config-dhcp-cabo)# ip-telephony data mcipadd 1.1.1.2 mcport 1719
```

History

Release version	Command history
8.0.40	This command was introduced.

ip-telephony voice

Specifies the Avaya IP telephony voice options in the DHCP server pool.

Syntax

ip-telephony voice mcipadd *ip-address* [**tftpsrvr** *server-ip-address* | **httpsrvr** *server-ip-address* | **tlssrvr** *server-ip-address* | **mcport** *portnum* | **l2qaud** *prio* | **l2qsig** *prio* | **vlantest** *secs*]

no ip-telephony voice mcipadd *ip-address* [**tftpsrvr** *server-ip-address* | **httpsrvr** *server-ip-address* | **tlssrvr** *server-ip-address* | **mcport** *portnum* | **l2qaud** *prio* | **l2qsig** *prio* | **l2qvlan** *vlan-id* | **vlantest** *secs*]

Parameters

mcipadd *ip-address*

Specifies the addresses of gatekeepers. At least one IP address is required.

mcport *portnum*

Specifies the IP telephony server port number. The default is 1719.

tftpsrvr/httpsrvr/tlssrvr *server-ip-address*

Specifies the IP addresses of the TFTP, HTTP, and TLS servers.

l2qaud or **l2qsig** *prio*

Specifies the IP telephony L2QAUD or L2QSIG priority value. The range is from 1 to 6. The default value is 6.

l2qvlan *vlan-id*

Specifies the IP telephony L2QVLAN number. The default is 0.

vlantest *secs*

The number of seconds a phone attempts to return to the previously known voice VLAN. This is not applicable for the default VLAN.

Modes

DHCP server pool configuration mode

Usage Guidelines

You must enter the MCIP address. The other parameters are optional.

The **no** form of the command removes the parameters from the DHCP server pool.

Examples

The following example configures the MCIP address and MPORT number for IP telephony voice.

```
device(config)# ip dhcp-server pool cabo
device(config-dhcp-cabo)# ip-telephony voice mcipadd 1.1.1.2 mcport 1719
```

History

Release version	Command history
8.0.40	This command was introduced.

ip telnet source-interface

Sets the lowest-numbered IP address configured on an interface as the device source for all Telnet packets.

Syntax

```
ip telnet source-interface { ethernet stack/slot/port | loopback loopback-num | management mgmt-num | ve ve-num }
```

```
no ip telnet source-interface { ethernet stack/slot/port | loopback loopback-num | management mgmt-num | ve ve-num }
```

Command Default

The default is the lowest-numbered IP address configured on the port through which the packet is sent.

Parameters

ethernet *stack/slot/port*

Configures the device source IP address for all Telnet packets as the IP address of the specified Ethernet interface.

loopback *loopback-num*

Configures the device source IP address for all Telnet packets as the IP address of the specified loopback interface.

management *mgmt-num*

Configures the device source IP address for all Telnet packets as the IP address of the specified management interface.

ve *ve-num*

Configures the device source IP address for all Telnet packets as the IP address of the specified Virtual Ethernet (VE) interface.

Modes

Global configuration mode

Usage Guidelines

You can configure the Layer 3 switch to always use the lowest-numbered IP address on a specific Ethernet, loopback, or virtual interface as the source addresses for these packets. When configured, the Layer 3 switch uses the same IP address as the source for all packets of the specified type, regardless of the ports that actually sends the packets.

If your server is configured to accept packets only from specific IP addresses, you can use this configuration to simplify configuration of the server by configuring the Brocade device to always send the packets from the same link or source address.

If you specify a loopback interface as the single source for specified packets, servers can receive the packets regardless of the states of individual links. Thus, if a link to the server becomes unavailable but the client or server can be reached

through another link, the client or server still receives the packets, and the packets still have the source IP address of the loopback interface.

The **no** form of the command resets the source address of the packet as the lowest-numbered IP address on the interface that sends the packet.

Examples

The following example configures the IP address of the Ethernet interface 1/1/1 as the source IP address for Telnet packets

```
device(config)# ip telnet source-interface ethernet 1/1/1
```

ip tcp burst-normal

Configures the threshold values for TCP SYN packets that are targeted at the router itself or passing through an interface.

Syntax

```
ip tcp burst-normal num-packets burst-max num-packets lockup time  
no ip tcp burst-normal num-packets burst-max num-packets lockup time
```

Command Default

The threshold value is not configured.

Parameters

num-packets

Configures the number of packets per second in normal burst mode. Valid values are from 1 through 100,000 packets per second.

burst-max *num-packets*

Specifies the number of packets per second in maximum burst mode. Valid values are from 1 through 100,000 packets per second.

lockup *time*

Configures the lockup period in seconds. Valid values are from 1 through 10,000 seconds.

Modes

Global configuration mode

Interface configuration mode

Usage Guidelines

In a TCP SYN attack, an attacker floods a host with TCP SYN packets that have random source IP addresses. For each of these TCP SYN packets, the destination host responds with a SYN ACK packet and adds information to the connection queue. However, because the source host does not exist, no ACK packet is sent back to the destination host, and an entry remains in the connection queue until it ages out (after approximately one minute). If the attacker sends enough TCP SYN packets, the connection queue can fill up, and service can be denied to legitimate TCP connections.

To protect against TCP SYN attacks, you can configure the Brocade device to drop TCP SYN packets when excessive number of packets are encountered. You can set threshold values for TCP SYN packets that are targeted at the router itself or passing through an interface, and drop them when the thresholds are exceeded.

For Layer 3 router code, if the interface is part of a VLAN that has a router VE, you must configure TCP SYN attack protection at the VE level. When TCP SYN attack protection is configured at the VE level, it will apply to routed traffic only. It will not affect switched traffic.

NOTE

You must configure VLAN information for the port before configuring TCP SYN attack protection. You cannot change the VLAN configuration for a port on which TCP SYN attack protection is enabled.

NOTE

This command is available at the global configuration level on both chassis devices and compact devices. On chassis devices, this command is available at the interface level as well. This command is supported on Ethernet and Layer 3 interfaces.

The number of incoming TCP SYN packets per second is measured and compared to the threshold values as follows:

- If the number of TCP SYN packets exceeds the **burst-normal** value, the excess TCP SYN packets are dropped.
- If the number of TCP SYN packets exceeds the **burst-max** value, all TCP SYN packets are dropped for the number of seconds specified by the **lockup** value. When the lockup period expires, the packet counter is reset and measurement is restarted.

The **no** form of the command removes the threshold value set for TCP SYN packets.

Examples

The following example sets the threshold value for TCP SYN packets targeted at the router.

```
device(config)# ip tcp burst-normal 10 burst-max 100 lockup 300
```

The following example sets the threshold value for TCP SYN packets received on interface 1/1/1.

```
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# ip tcp burst-normal 10 burst-max 100 lockup 300
```

The following example sets the threshold value for TCP SYN packets received on VE 31.

```
device(config)# interface ve 31
device(config-vif-31)# ip tcp burst-normal 5000 burst-max 10000 lockup 300
```

ip tcp keepalive

Configures the time interval between TCP keepalive messages.

Syntax

ip tcp keepalive *timeout interval-time num-messages*

no ip tcp keepalive *timeout interval-time num-messages*

Command Default

The time interval between TCP keepalive messages is not configured.

Parameters

timeout

Configures the timeout in seconds to start sending keepalive messages. Set to 0 to disable the timeout.

interval-time

Configures the interval time in seconds between keepalive messages. Set to 0 to disable sending keepalive messages.

num-messages

Configures the number of keepalive messages to be sent before disconnecting.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command disables sending the keepalive messages. You can also set the *interval-time* variable as 0 to disable sending the keepalive messages.

Examples

The following example configures the interval between TCP keepalive messages as 5 seconds.

```
device(config)# ip tcp keepalive 10 5 2
```

ip tftp source-interface

Configures an interface as the source IP address from which TFTP sends and receives data and acknowledgments.

Syntax

ip tftp source-interface { **ethernet** *stack-id/slot/port* | **loopback** *number* | **management** *number* | **ve** *number* }

no ip tftp source-interface { **ethernet** *stack-id/slot/port* | **loopback** *number* | **management** *number* | **ve** *number* }

Command Default

A TFTP source interface is not configured.

When a management VRF is configured, TFTP sends and receives data and acknowledgments only through ports that belong to the management VRF and through the out-of-band management port.

Parameters

ethernet *stack-id/slot/port*

Specifies the Ethernet interface to be used as the source IP address.

loopback *number*

Specifies the loopback interface to be used as the source IP address.

management *number*

Specifies the management interface to be used as the source IP address.

ve *number*

Specifies the Virtual Ethernet interface to be used as the source IP address.

Modes

Global configuration mode

Usage Guidelines

Any change in the management VRF configuration takes effect immediately for TFTP. You cannot make changes in the management VRF configuration while TFTP is in progress.

The TFTP source interface configuration command **ip tftp source-interface** should be compatible with the management VRF configuration.

The **no** form of the command removes the configured interface as the source IP address.

Examples

The following example configures an Ethernet interface as the source IP address for TFTP to send and receive data and acknowledgments.

```
device(config)# ip tftp source-interface ethernet 1/1/1
```

Commands F - J

ip tftp source-interface

The following example configures a loopback interface as the source IP address for TFTP to send and receive data and acknowledgments.

```
device(config)# ip tftp source-interface loopback 1
```

ip ttl

Modifies the time-to-live (TTL) threshold value.

Syntax

ip ttl *threshold-value*

no ip ttl *threshold-value*

Command Default

The default value for the TTL threshold is 64.

Parameters

threshold-value

Sets the time TTL for packets on the network. The range is from 1 to 255 hops. The default is 64 hops.

Modes

Global configuration mode

Usage Guidelines

The time to live (TTL) threshold prevents routing loops by specifying the maximum number of router hops an IP packet originated by the Layer 3 switch can travel through. Each device capable of forwarding IP that receives the packet decrements (decreases) the packet TTL by one. If a device receives a packet with a TTL of 1 and reduces the TTL to zero, the device drops the packet.

The **no** form of the command resets TTL to 64 hops.

Examples

The following example sets the TTL value to 25 hops.

```
device(config)# ip ttl 25
```

ip use-acl-on-arp

Configures the ARP module to check the source IP address of the ARP request packets received on the interface before applying the specified ACL policies to the packet (ACL ARP filtering).

Syntax

ip use-acl-on-arp [*acl-num*]

no ip use-acl-on-arp [*acl-num*]

Command Default

ACL ARP filtering is not enabled.

Parameters

acl-num

Specifies an ACL number to explicitly specify the ACL to be used for filtering.

Modes

Interface configuration mode

Usage Guidelines

ACL ARP filtering is not applicable to outbound traffic.

This command is available on devices running Layer 3 code. This filtering occurs on the management processor. The command is available on physical interfaces and virtual routing interfaces. ACLs used to filter ARP packets on a virtual routing interface can be inherited from a previous interface if the virtual routing interface is defined as a follower virtual routing interface. Only extended ACLs that use IP only can be used. If any other ACL is used, an error is displayed.

When the **ip use-acl-on-arp** command is configured, the ARP module checks the source IP address of the ARP request packets received on the interface. It then applies the specified ACL policies to the packet. Only the packet with the IP address that the ACL permits will be allowed to be written in the ARP table; those that are not permitted will be dropped.

ARP requests will not be filtered by ACLs if one of the following conditions occur:

- If the ACL is to be inherited from an IP ACL, but there is no IP ACL defined.
- An ACL ID is specified for the **ip use-ACL-on-arp** command, but no IP address or "any any" filtering criteria has been defined under the ACL ID.

The **no** form of the command disables the ACL ARP filtering.

Examples

The following example shows a complete ACL ARP configuration.

```
device(config)# access-list 101 permit ip host 192.168.2.2 any
device(config)# access-list 102 permit ip host 192.168.2.3 any
device(config)# access-list 103 permit ip host 192.168.2.4 any
device(config)# vlan 2
device(config-vlan-2)# tag ethernet 1/1/1 to 1/1/2
device(config-vlan-2)# router-interface ve 2
device(config-vlan-2)# vlan 3
device(config-vlan-3)# tag ethernet 1/1/1 to 1/1/2
device(config-vlan-3)# router-int ve 3
device(config-vlan-3)# vlan 4
device(config-vlan-4)# tag ethernet 1/1/1 to 1/1/2
device(config-vlan-4)# router-int ve 4
device(config-vlan-4)# interface ve 2
device(config-ve-2)# ip access-group 101 in
device(config-ve-2)# ip address 192.168.2.1/24
device(config-ve-2)# ip use-acl-on-arp 103
device(config-ve-2)# exit
device(config)# interface ve 3
device(config-ve-3)# ip access-group 102 in
device(config-ve-3)# ip follow ve 2
device(config-ve-3)# ip use-acl-on-arp
device(config-ve-3)# exit
device(config-vlan-4)# interface ve 4
device(config-ve-4)# ip follow ve 2
device(config-ve-4)# ip use-acl-on-arp
device(config-ve-4)# exit
```

ip vrrp auth-type

Configures the type of authentication used on a Virtual Router Redundancy Protocol (VRRP) interface.

Syntax

```
ip vrrp auth-type { no-auth | simple-text-auth auth-text }  
no ip vrrp auth-type { no-auth | simple-text-auth auth-text }
```

Command Default

No authentication type is configured on a VRRP interface.

Parameters

no-auth

Configures no authentication on the VRRP interface.

simple-text-auth *auth-text*

Configures a simple text string as a password used for authenticating packets on the interface. The maximum length of the text string is 64 characters.

Modes

Interface configuration mode

Usage Guidelines

If the **no-auth** option is configured, ensure that all interfaces on all devices that support the virtual router ID do not use authentication.

If the **simple-text-auth** option is configured, ensure that all interfaces on all devices that support the virtual router ID are configured to use simple password authentication with the same password.

The **no** form of this command removes the VRRP authentication from the interface.

NOTE

Authentication is not supported by VRRP-Ev3.

Examples

The following example configures no authentication on Ethernet interface 1/1/6.

```
device# configure terminal  
device(config)# router vrrp  
device(config)# interface ethernet 1/1/6  
device(config-if-e1000-1/1/6)# ip vrrp auth-type no-auth
```

The following example configures simple password authentication on Ethernet interface 1/1/6.

```
device# configure terminal
device(config)# router vrrp
device(config)# interface ethernet 1/1/6
device(config-if-e1000-1/1/6)# ip vrrp auth-type simple-text-auth yourpwd
```

ip vrrp vrid

Configures an IPv4 Virtual Router Redundancy Protocol (VRRP) virtual router identifier (VRID).

Syntax

ip vrrp vrid *vrid*
no ip vrrp vrid *vrid*

Command Default

A VRRP VRID does not exist.

Parameters

vrid

Configures a number for the IPv4 VRRP VRID. The range is from 1 through 255.

Modes

Interface configuration mode

Usage Guidelines

Before configuring this command, ensure that VRRP is enabled globally; otherwise, an error stating "Invalid input..." is displayed as you try to create a VRRP instance.

The **no** form of this command removes the IPv4 VRRP VRID from the configuration.

Examples

The following example configures VRRP virtual router ID 1.

```
device# configure terminal
device(config)# router vrrp
device(config)# interface ethernet 1/1/6
device(config-if-e1000-1/1/6)# ip address 10.53.5.1/24
device(config-if-e1000-1/1/6)# ip vrrp vrid 1
device(config-if-e1000-1/1/6-vrid-1)# owner
device(config-if-e1000-1/1/6-vrid-1)# ip-address 10.53.5.1
device(config-if-e1000-1/1/6-vrid-1)# activate
VRRP router 1 for this interface is activating
```

ip vrrp-extended auth-type

Configures the type of authentication used on a Virtual Router Redundancy Protocol Extended (VRRP-E) interface.

Syntax

ip vrrp-extended auth-type { **no-auth** | **simple-text-auth** *auth-text* | **md5-auth** *auth-text* }

no ip vrrp-extended auth-type { **no-auth** | **simple-text-auth** *auth-text* | **md5-auth** *auth-text* }

Command Default

No authentication is configured for a VRRP-E interface.

Parameters

no-auth

Configures no authentication on the VRRP-E interface.

simple-text-auth *auth-text*

Configures a simple text string as a password used for authenticating packets on the interface. The maximum length of the text string is 64 characters.

md5-auth *auth-text*

Configures MD5 authentication on the interface. The maximum length of the text string is 64 characters.

Modes

Interface configuration mode

Usage Guidelines

If the **simple-text-auth** option is configured, ensure that all interfaces on all devices that support the virtual router ID are configured to use simple password authentication with the same password.

If the **md5-auth** option is configured, syslog and SNMP traps are generated if a packet is being dropped due to MD5 authentication failure. Using MD5 authentication implies that the software does not need to run checksum verification on the receiving device and can rely on the authentication code (message digest 5 algorithm) to verify the integrity of the VRRP-E message header.

Use the **show run** command with appropriate parameters to display the encrypted password; use the **enable password-display** command to display the unencrypted password.

If the **no-auth** option is configured, ensure that all interfaces on all devices that support the virtual router ID do not use authentication.

The **no** form of this command removes the VRRP-E authentication from the interface.

NOTE

Authentication is not supported by VRRP-Ev3.

Examples

The following example configures no authentication on Ethernet interface 1/1/6.

```
device# configure terminal
device(config)# router vrrp-extended
device(config-vrrpe-router)# interface ethernet 1/1/6
device(config-if-e1000-1/1/6)# ip vrrp-extended auth-type no-auth
```

The following example configures simple password authentication on Ethernet interface 1/1/6.

```
device# configure terminal
device(config)# router vrrp-extended
device(config-vrrpe-router)# interface ethernet 1/1/6
device(config-if-e1000-1/1/6)# ip vrrp-extended auth-type simple-text-auth yourpwd
```

The following example configures MD5 authentication on Ethernet interface 1/1/6. When MD5 authentication is configured, a syslog message is displayed.

```
device# configure terminal
device(config)# router vrrp-extended
device(config-vrrpe-router)# interface ethernet 1/1/6
device(config-if-e1000-1/1/6)# ip vrrp-extended auth-type md5-auth lyk28d3j

Aug 10 18:17:39 VRRP: Configuration VRRP_CONFIG_MD5_AUTHENTICATION request received

HMAC-MD5 CODE:[00000000000000000000400010]
IpAddr: 10.53.5.1
```

ip vrrp-extended vrid

Configures an IPv4 Virtual Router Redundancy Protocol Extended (VRRP-E) virtual router identifier (VRID).

Syntax

ip vrrp-extended vrid *vrid*

no ip vrrp-extended vrid *vrid*

Command Default

A VRRP-E VRID does not exist.

Parameters

vrid

Configures a number for the IPv4 VRRP-E VRID. The range is from 1 through 255.

Modes

Interface configuration mode

Usage Guidelines

Before configuring this command, ensure that VRRP-E is enabled globally; otherwise an error stating "Invalid input..." is displayed as you try to create a VRRP-E instance.

The **no** form of this command removes the IPv4 VRRP-E VRID from the configuration.

Examples

The following example configures VRRP-E VRID 1.

```
device# configure terminal
device(config)# router vrrp-extended
device(config-vrrpe-router)# interface ethernet 1/1/6
device(config-if-e1000-1/1/6)# ip address 10.53.10.1/24
device(config-if-e1000-1/1/6)# ip vrrp-extended vrid 1
device(config-if-e1000-1/1/6-vrid-1)# backup priority 50 track-priority 10
device(config-if-e1000-1/1/6-vrid-1)# ip-address 10.53.10.254
device(config-if-e1000-1/1/6-vrid-1)# activate
```

ipsec profile

Creates an IP security (IPsec) profile and enters IPsec profile configuration mode.

Syntax

ipsec profile *name*
no ipsec profile *name*

Command Default

No IPsec profile is configured.

Parameters

name
Specifies the name of an IPsec profile.

Modes

Global configuration mode

Usage Guidelines

An IPsec profile defines parameters for encrypting communications between IPsec peer devices.

After configuration, an IPsec profile is activated by attaching it to an IPsec virtual tunnel interface (VTI) by using the **tunnel protection ipsec profile** command in tunnel interface configuration mode.

The **no** form of the command removes the specified IPsec profile configuration.

Examples

The following example shows how to create an IPsec profile named ipsec_profile and enters IPsec profile configuration mode for the profile.

```
device(config)# ipsec profile ipsec_profile  
device(config-ipsec-profile-ipsec_profile)#
```

History

Release version	Command history
8.0.50	This command was introduced.

ipsec proposal

Creates an IP security (IPsec) proposal and enters IPsec proposal configuration mode.

Syntax

ipsec proposal *name*

Parameters

name

Specifies the name of an IPsec proposal.

Modes

Global configuration mode

Usage Guidelines

An IPsec proposal defines an encryption algorithm, encapsulation mode, and transform set used to negotiate with a data path peer. An IPsec proposal is activated by attaching it to an IPsec profile.

There is a default IPsec proposal (**def-ipsec-prop**) that is defined at IPsec initialization and has the following settings:

- **transform:** ESP
- **encapsulation-mode:** Tunnel
- **encryption-algorithm:** AES-GCM-256

Use the **ipsec proposal** command to configure any additional IPsec proposals.

The **no** form of the command removes any IPsec proposal configuration other than the default IPsec proposal configuration.

The default IPsec proposal cannot be removed.

Examples

The following example creates an IPsec proposal named ipsec_proposal and enters IPsec proposal configuration mode for the proposal .

```
device(config)# ipsec proposal ipsec_proposal
device(config-ipsec-proposal-ipsec_proposal)#
```

History

Release version	Command history
8.0.50	This command was introduced.

ipv6 access-list

Configures an IPv6 access list and enters IPv6 access list configuration mode.

Syntax

ipv6 access-list *acl-name*

no ipv6 access-list *acl-name*

Command Default

The IPv6 ACL is not configured.

Parameters

acl-name

Specifies the ACL name, which must contain at least one alphabetic character.

Modes

Global configuration mode

Usage Guidelines

An ACL name must be unique among IPv6 and IPv4 ACLs.

The **no** form of the command removes the configured IPv6 access list.

Examples

The following example configures an IPv6 ACL named "acl1".

```
device(config)# ipv6 access-list acl1
device(config-ipv6-access-list acl1)#
```

ipv6 address

Configures an IPv6 address for an interface.

Syntax

ipv6 address *ipv6-prefix* [**anycast** | **eui-64**]

no ipv6 address *ipv6-prefix* [**anycast** | **eui-64**]

ipv6 address *ipv6-address* **link-local**

no ipv6 address *ipv6-address* **link-local**

Command Default

An IPv6 address is not configured.

Parameters

ipv6-prefix

Specifies the IPv6 prefix address in the format X:X::X/M.

anycast

Configures an address as an anycast address.

eui-64

Configures the global address with an EUI-64 interface ID in the low-order 64 bits. The interface ID is automatically constructed in IEEE EUI-64 format using the interface's MAC address.

ipv6-address

Specifies the IPv6 address.

link-local

Configures the address as a link-local address.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of the command removes the IPv6 address.

Examples

The following example configures an IPv6 address for the tunnel interface.

```
device(config)# interface tunnel 1
device(config-tunif-1)# ipv6 address 2001:DB8:384d:34::/64 eui-64
```

ipv6 cache-lifetime

Configures the IPv6 cache-aging lifetime.

Syntax

ipv6 cache-lifetime *interval*

no ipv6 cache-lifetime *interval*

Command Default

Cache aging is enabled except on the Brocade ICX 7750.

Parameters

interval

Specifies the cache timeout interval in seconds. the range is ... The default is ...

Modes

Global configuration mode.

Usage Guidelines

The **no** form of this command disables cache aging.

On the Brocade ICX 7750, cache aging is disabled by default. You must ... to enable it.

Examples

This example sets the cache-aging interval to 17 seconds.

```
Device (config)# ipv6 cache-lifetime 17
```

History

Release version	Command history
8.0.30	This command was introduced.

ipv6 default-gateway

Configures the IPv6 address of the default gateway.

Syntax

```
ipv6 default-gateway ipv6-address
```

```
no ipv6 default-gateway
```

Parameters

ipv6-address

The IPv6 address of the default gateway.

Modes

Global configuration mode

Usage Guidelines

A device should have an IPv6 default gateway, for the following reasons:

- Although IPv6 discovers neighbors and routes dynamically, in some cases Router Advertisement (RA) and Router Solicitation (RS) operations are disabled and a default gateway is required to send traffic.
- Management devices (for example, TFTP servers, Telnet or SSH clients) are not members of the same subnet as the management IPv6 address.

If a management VLAN is not configured, the device can have only one IPv6 default gateway in the global configuration.

NOTE

If a management VLAN is configured (by means of the **default-ipv6-gateway** command in VLAN configuration mode), the device can have a maximum of 5 IPv6 default gateways with a metric (1 through 5) under the management VLAN.

Configured gateway addresses and the default gateway address must be in same subnet.

Use the **no** form of the command to remove the IPv6 address and disable the default gateway.

Examples

The following example configures the IPv6 address of the IPv6 default gateway without a management VLAN configuration.

```
device# configure terminal
device(config)# ipv6 default-gateway 2001:DB8::/32
```

The following example removes and disables the IPv6 default gateway.

```
device(config)# no ipv6 default-gateway 2001:DB8::/32
```

History

Release version	Command history
8.0.50	This command was introduced.

Related Commands

[default-ipv6-gateway](#)

ipv6 dhcp-relay destination

Enables the IPv6 DHCP relay agent function and specifies the IPv6 address as a destination address to which the client messages are forwarded.

Syntax

```
ipv6 dhcp-relay destination ipv6-address [ outgoing-interface { ethernet stack/slot/port | tunnel tunnel-id | ve ve-num ]
```

```
no ipv6 dhcp-relay destination ipv6-address [ outgoing-interface { ethernet stack/slot/port | tunnel tunnel-id | ve ve-num ]
```

Command Default

The IPv6 DHCP relay agent function is disabled.

Parameters

- ipv6-address*
Specifies the IPv6 address as a destination address to which the client messages can be forwarded.
- outgoing-interface**
Configures the interface on which DHCPv6 packet will be relayed.
- ethernet** *stack/slot/port*
Specifies the Ethernet interface on which DHCPv6 packet will be relayed.
- tunnel** *tunnel-id*
Specifies the tunnel interface on which DHCPv6 packet will be relayed.
- ve** *ve-num*
Specifies the Virtual Ethernet (VE) interface on which DHCPv6 packet will be relayed.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of the command removes the DHCP relay agent from the interface.
 You can configure up to 16 relay destination addresses on an interface.

Examples

The following example enables the DHCPv6 relay agent function and specifies the relay destination (the DHCP server) address on an interface.

```
device(config)# interface ethernet 1/2/3
device(config-if-e10000-1/2/3)# ipv6 dhcp-relay destination 2001::2
device(config-if-e10000-1/2/3)# ipv6 dhcp-relay destination fe80::224:38ff:febb:e3c0 outgoing-interface
ethernet 1/2/5
```

History

Release version	Command history
08.0.10d	This command was introduced.
08.0.30	Support for this command was added in 08.0.30 and later releases.

ipv6 dhcp-relay distance

Assigns the administrative distance to IPv6 DHCP static routes installed in the IPv6 route table for the delegated prefixes on the interface.

Syntax

ipv6 dhcp-relay distance *value*
no ipv6 dhcp-relay distance *value*

Command Default

The administrative distance is not assigned.

Parameters

value

Assigns the administrative distance to DHCPv6 static routes on the interface. The range is from 1 through 255. If the value is set to 255, then the delegated prefixes for this interface will not be installed in the IPv6 static route table.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of the command sets the parameter to a default value of 10.

The administrative distance value must be set so that it does not replace the same IPv6 static route configured by the user.

Examples

The following example sets the administrative distance value to 25.

```
device(config-if-eth2/1)# ipv6 dhcp-relay distance 25
```

History

Release version	Command history
08.0.10d	This command was introduced.
08.0.30	Support for this command was added in 08.0.30 and later releases.

ipv6 dhcp-relay include-options

Includes the parameters on the IPv6 DHCP relay agent messages.

Syntax

ipv6 dhcp-relay include-options [interface-id] [remote-id] [link-layer-option]

no ipv6 dhcp-relay include-options [interface-id] [remote-id] [link-layer-option]

Command Default

The parameters are not included on the IPv6 DHCP relay agent messages.

Parameters

interface-id

Includes the interface-ID parameter (option 18) in the IPv6 DHCP relay agent messages.

remote-id

Includes the remote-ID (option 37) parameter in the IPv6 DHCP relay agent messages.

link-layer-option

Includes the client link layer address (option 79) in the relay-forward messages.

Modes

Interface configuration mode

Usage Guidelines

The interface-ID parameter on the DHCPv6 relay forward message is used to identify the interface on which the client message is received. By default, this parameter is included only when the client message is received with the link-local source address.

You can enter either one or all of the include options as identifiers to specify in the relay-forward message.

The **no** form of the command disables the relay agent include options parameters.

Examples

The following example includes the **link-layer-option** parameter on the DHCPv6 relay agent messages.

```
device(config)# interface ethernet 1/1/3
device(config-if-eth-1/1/3)# ipv6 dhcp-relay include-options link-layer-option
```

History

Release version	Command history
08.0.10d	This command was introduced with support for the interface-id option.
08.0.30	Support for this command (with the interface-id keyword) was added in 08.0.30 and later releases.
8.0.40	Included support for remote-id and link-layer-option keywords.

ipv6 dhcp-relay maximum-delegated-prefixes

Sets the number of delegated prefixes that can be learned at the global and interface levels.

Syntax

ipv6 dhcp-relay maximum-delegated-prefixes *value*

no ipv6 dhcp-relay maximum-delegated-prefixes *value*

Command Default

The DHCPv6 Relay Agent Prefix Delegation Notification is enabled when the DHCPv6 relay agent feature is enabled on the interface.

Parameters

value

Limits the maximum number of prefixes that can be learned at the global level. The range is from 0 through 512. The global level default value is 500 while the interface level default is 100.

Modes

Global configuration mode

Interface configuration mode

Usage Guidelines

The **no** form of the command sets the parameter to the default value of the specified platform.

You can disable the DHCPv6 Relay Agent Prefix Delegation Notification at the system or the interface level by setting `ipv6 dhcp-relay maximum-delegated-prefixes` to 0 at the system or interface level.

The sum of all the delegated prefixes that can be learned at the interface level is limited by the system maximum. Make sure that there is enough free space in the flash memory to save information about delegated prefixes in flash on both the active and standby management processors.

Examples

The following example sets the maximum delegated prefixes to 500 at the global level.

```
device(config)# ipv6 dhcp-relay maximum-delegated-prefixes 500
```

The following example sets the maximum delegated prefixes to 100 at the interface level.

```
device(config)# config-if-eth2/1
device(config-if-eth2/1)# ipv6 dhcp-relay maximum-delegated-prefixes 100
```

History

Release version	Command history
08.0.10d	This command was introduced.
08.0.30	Support for this command was added in 08.0.30 and later releases.

ipv6 dhcp6 snooping

Enables DHCPv6 snooping on a VLAN.

Syntax

ipv6 dhcp6 snooping *vlan id*

no ipv6 dhcp6 snooping *vlan id*

Command Default

DHCPv6 snooping is disabled by default.

Parameters

vlan id

Specifies the ID of a configured client or DHCPv6 server VLAN.

Modes

Global configuration mode.

Usage Guidelines

The **no** form of the command disables DHCPv6 snooping on the VLAN.

DHCPv6 snooping must be enabled on the client and the DHCPv6 server VLANs.

Examples

The following example enables DHCPv6 snooping on VLAN 2.

```
device(config)# ipv6 dhcp6 snooping vlan 2
```

ipv6 dns server-address

Configures IPv6 DNS server address.

Syntax

ipv6 dns server-address *ipv6-address* [*ipv6-address ...*]
no ipv6 dns server-address *ipv6-address* [*ipv6-address ...*]

Command Default

IPv6 DNS server addresses are not configured.

Parameters

ipv6-address

Specifies the IPv6 address of the DNS server. You can specify up to four DNS server IPv6 address in the same command line.

Modes

Global configuration mode

Usage Guidelines

IPv6 defines new DNS record types to resolve queries for domain names to IPv6 addresses, as well as IPv6 addresses to domain names. Brocade devices running IPv6 software support AAAA DNS records, which are defined in RFC 1886.

AAAA DNS records are analogous to the A DNS records used with IPv4. They store a complete IPv6 address in each record. AAAA records have a type value of 28.

The **no** form of the command removes the DNS server address.

Examples

The following example configures an IPv6 DNS server address.

```
device(config)# ipv6 dns server-address 2001:DB8::1
```

ipv6 enable

Enables IPv6.

Syntax

ipv6 enable

no ipv6 enable

Command Default

IPv6 is enabled by default in the Layer 2 switch code.

IPv6 is disabled by default in the router code.

Modes

Global configuration mode

Interface configuration mode

Usage Guidelines

IPv6 is enabled by default in the Layer 2 switch code. If desired, you can disable IPv6 on a global basis on a device running the switch code.

IPv6 is disabled by default in the router code and must be configured on each interface that will support IPv6. In router code, the **ipv6 enable** command enables IPv6 on the switch and specifies that the interface is assigned an automatically computed link-local address

Before an IPv6 ACL can be applied to an interface, it must first be created, and then IPv6 must be enabled on that interface.

The **no** form of the command disables IPv6 on the interface.

Examples

The following example re-enables the IPv6 after it has been disabled.

```
device(config)# ipv6 enable
```

The following example enables IPv6 on Ethernet interface 1/1/1.

```
device(config)# interface ethernet 1/1/1  
device(config-if-e1000-1/1/1)# ipv6 enable
```

ipv6 hitless-route-purge-timer

Configures the timer to set the duration for which the routes should be preserved after switchover.

Syntax

ipv6 hitless-route-purge-timer *seconds*

no ipv6 hitless-route-purge-timer *seconds*

Command Default

The default timer setting is 45 seconds.

Parameters

seconds

Specifies the time after switchover to start IPv6 route purge. The value can range from 2 to 600 seconds.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command removes the configured value and sets the timer to the default 45 seconds.

Examples

The following example shows how to set the IPv6 hitless purge timer to 75 seconds.

```
device(config)# ipv6 hitless-route-purge-timer 60
```

ipv6 hop-limit

Configures the maximum number of hops an IPv6 packet can traverse.

Syntax

ipv6 hop-limit *number*

no ipv6 hop-limit *number*

Command Default

By default, the maximum number of hops an IPv6 packet can traverse is 64.

Parameters

number

Specifies the maximum number of hops an IPv6 packet can traverse. Valid values are 0 through 255. The default value is 64.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command resets the maximum number of hops an IPv6 packet can traverse to 64.

Examples

The following example configures the maximum number of hops an IPv6 packet can traverse to 70.

```
device(config)# ipv6 hop-limit 70
```

ipv6 icmp error-interval

Configures ICMP rate limiting, that is, the rate at which IPv6 ICMP error messages are sent out on a network.

Syntax

ipv6 icmp error-interval *interval* [*size*]

no ipv6 icmp error-interval *interval* [*size*]

Command Default

ICMP rate limiting is enabled by default.

Parameters

interval

Specifies the interval in milliseconds at which tokens are placed in the bucket. Valid values are 0 through 2147483647 and the default value is 100 milliseconds. Setting the value to 0 disables ICMP rate limiting.

size

Specifies the maximum number of tokens stored in the bucket. Valid values are 1 to 200 and the default is 10 tokens.

Modes

Global configuration mode

Usage Guidelines

You can limit the rate at which IPv6 ICMP error messages are sent out on a network. IPv6 ICMP implements a token bucket algorithm.

To illustrate how this algorithm works, imagine a virtual bucket that contains a number of tokens. Each token represents the ability to send one ICMP error message. Tokens are placed in the bucket at a specified interval until the maximum number of tokens allowed in the bucket is reached. For each error message that ICMP sends, a token is removed from the bucket. If ICMP generates a series of error messages, messages can be sent until the bucket is empty. If the bucket is empty of tokens, error messages cannot be sent until a new token is placed in the bucket.

If you configure the interval value to a number that does not evenly divide into 100000 (100 milliseconds), the system rounds up the value to a next higher value that does divide evenly into 100000. For example, if you specify an interval value of 150, the system rounds up the value to 200.

The **no** form of the command disables ICMP rate limiting.

Examples

The following example configures the interval to 1000 milliseconds and the number of tokens to 100 tokens.

```
device(config)# ipv6 icmp error-interval 1000 100
```

ipv6 icmp source-route

Generates ICMP parameter problem message for source routed IPv6 packet.

Syntax

ipv6 icmp source-route

no ipv6 icmp source-route

Command Default

By default, when the router drops a source-routed packet, it sends an ICMP Parameter Problem (type 4), Header Error (code 0) message to the packet's source address, pointing to the unrecognized routing type.

Modes

Global configuration mode

Usage Guidelines

The IPv6 specification (RFC 2460) specifies support for IPv6 source-routed packets using a type 0 Routing extension header, requiring device and host to process the type 0 routing extension header. However, this requirement may leave a network open to a DoS attack. A security enhancement disables sending IPv6 source-routed packets to IPv6 devices. (This enhancement conforms to RFC 5095.)

By default, when the router drops a source-routed packet, it sends an ICMP Parameter Problem (type 4), Header Error (code 0) message to the packet's source address, pointing to the unrecognized routing type.

The **no** form of the command disables the ICMP error messages for source routed IPv6 packet.

Examples

The following example disables the ICMP error messages for source routed IPv6 packet.

```
device(config)# no ipv6 icmp source-route
```

The following example re-enables the ICMP error messages for source routed IPv6 packet.

```
device(config)# ipv6 icmp source-route
```

ipv6 load-sharing

Enables Equal-cost multi-path routing (ECMP) load sharing for IPv6.

Syntax

ipv6 load-sharing [*num*]

no ipv6 load-sharing [*num*]

Command Default

ECMP load-sharing for IPv6 is enabled and allows traffic to be balanced across up to four equal paths.

Parameters

num

Specifies the number of load-sharing paths. The value can range from 2 through 8. The default value is 4.

Modes

Global configuration mode.

Usage Guidelines

If you want to re-enable the feature after disabling it, you must specify the number of load-sharing paths.

The **no** form of the command sets the load-sharing path to the default value of 4.

Examples

The following example sets the number of ECMP load-sharing paths for IPv6 to 6.

```
device(config)# ipv6 load-sharing 6
```

ipv6 max-mroute

Configures the maximum number of IPv6 multicast routes that are supported.

Syntax

ipv6 max-mroute *num*

no ipv6 max-mroute *num*

Command Default

No maximum number of supported routes is configured.

Parameters

num

Configures the maximum number of multicast routes supported.

Modes

VRF configuration mode

Usage Guidelines

The **no** form of this command restores the default (no maximum number of supported routes is configured).

Examples

The following example configures the maximum number of 20 supported IPv6 multicast routes on the VRF named `my_vrf`.

```
Device(config)# vrf my_vrf
Device(config)# address-family ipv6
Device(config-vrf)# ipv6 max-mroute 20
```

History

Release version	Command history
8.0.10a	This command was introduced.

ipv6 mld group-membership-time

Specifies the multicast listener discovery (MLD) group membership time for the default VRF or for a specified VRF.

Syntax

```
ipv6 mld group-membership-time num  
no ipv6 mld group-membership-time num
```

Command Default

An MLD group will remain active on an interface in the absence of a group report for 260 seconds, by default.

Parameters

num
Number in seconds, from 5 through 26000.

Modes

Global configuration mode.
VRF configuration mode.

Usage Guidelines

The **no** form of this command resets the group membership time interval to the default of 260 seconds.

Group membership time defines how long a group will remain active on an interface in the absence of a group report.

Examples

This example specifies an MLD group membership time of 2000 seconds for the default VRF.

```
device# configure terminal  
device(config)# ipv6 mld group-membership-time 2000
```

This example specifies an MLD group membership time of 2000 seconds for a specified VRF.

```
device# configure terminal  
device(config)# ipv6 router pim vrf blue  
device(config-ipv6-pim-router-vrf-blue)# ipv6 mld group-membership-time 2000
```

ipv6 mld llqi

Configures the multicast listener discovery (MLD) last listener query interval.

Syntax

ipv6 mld llqi *seconds*

no ipv6 mld llqi *seconds*

Command Default

The MLD last listener query interval is 1 second.

Parameters

seconds

specifies the number in seconds, of MLD group addresses available for all VRFs. The range is 1 through 25; the default is 1.

Modes

Global configuration mode

VRF configuration mode

Usage Guidelines

The **no** form of this command restores the default MLD last listener query interval.

Any MLD group memberships exceeding the group limit are not processed.

The last listener query interval is the maximum response delay inserted into multicast address-specific queries sent in response to Done messages, and is also the amount of time between multicast address-specific query messages. When a device receives an MLD Version 1 leave message or an MLD Version 2 state-change report, it sends out a query and expects a response within the time specified by the last listener query interval. Configuring a lower value for the last listener query interval allows members to leave groups faster.

Examples

This example configures a last listener query interval of 5 seconds.

```
Device(config)# ipv6 mld llqi 5
```

This example configures a last listener query interval of 5 seconds for a VRF.

```
Device(config)# ipv6 router pim vrf blue  
Device(config-ipv6-pim-router-vrf-blue)# ipv6 mld llqi 5
```

ipv6 mld max-group-address

Configures the maximum number of MLD addresses for the default virtual routing and forwarding (VRF) instance or for a specified VRF.

Syntax

```
ipv6 mld max-group-address num
no ipv6 mld max-group-address num
```

Command Default

If this command is not configured, the maximum number of MLD addresses is determined by available system resources.

Parameters

num
 specifies the maximum number of MLD group addresses available for all VRFs. The range is 1 through 8192; the default is 4096.

Modes

Global configuration mode
 VRF configuration mode

Usage Guidelines

If the **no** form of this command is configured, the maximum number of MLD addresses is determined by available system resources.

Any MLD group memberships exceeding the group limit are not processed.

Examples

This example configures a maximum of 1000 IGMP addresses for the default VRF.

```
Device(config)# ipv6 mld max-group-address 1000
```

This example configures a maximum of 1000 IGMP addresses for the VRF named vpn1.

```
Device(config)# vrf vpn1
Device(config-vrf-vpn1)# address-family ipv4
Device(config-vrf-vpn1-ipv4)# ip igmp max-group-address 1000
```

ipv6 mld max-response-time

Configures the maximum time a multicast listener has to respond to queries for the default virtual routing and forwarding (VRF) instance or for a specified VRF.

Syntax

```
ipv6 mld max-response-time num  
no ipv6 mld max-response-time num
```

Command Default

If this command is not configured, the maximum time a multicast listener has to respond to queries is 10 seconds.

Parameters

num
specifies the maximum time, in seconds, a multicast listener has to respond. The range is 1 through 25; the default is 10.

Modes

Global configuration mode
VRF configuration mode

Usage Guidelines

If the **no** form of this command is configured, the maximum time a multicast listener has to respond to queries is 10 seconds.

Examples

The following example configures the maximum time a multicast listener has to respond to queries to 20 seconds.

```
device# configure terminal  
device(config)# ipv6 mld max-response-time 20
```

The following example configures the maximum time a multicast listener has to respond to queries to 20 seconds for the VRF named vpn1.

```
device# configure terminal  
device(config)# vrf vpn1  
Device(config-vrf-vpn1)# address-family ipv6  
device(config)# ipv6 mld max-response-time 20
```

ipv6 mld port-version

Configures the multicast listening discovery (MLD) version on a virtual Ethernet interface.

Syntax

ipv6 mld port-version *version-number*

no ipv6 mld port-version

Command Default

The port uses the MLD version configured globally.

Parameters

version-number

Specifies the MLD version, 1 or 2.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of this command restores the MLD version configured globally.

Examples

This example configures MLD version 2 on virtual Ethernet interface 10.

```
device# configure terminal
device(config)# interface ve 10
device(config-vif-10)# ipv6 mld port-version 2
```

ipv6 mld query-interval

Configures the frequency at which multicast listening discovery (MLD) query messages are sent.

Syntax

ipv6 mld query-interval *num*

no ipv6 mld query-interval *num*

Command Default

125 seconds

Parameters

num

Number in seconds, from 2 through 3600. The default is 125.

Modes

Global configuration mode.

VRF configuration mode.

Usage Guidelines

The **no** form of this command resets the query interval to the default of 125 seconds.

You must specify a query-interval value that is greater than the interval configured by the `ipv6 mld max-response-time` command.

Examples

This example sets the MLD query interval to 50 seconds.

```
Device(config)# ipv6 mld query-interval 50
```

This example sets the MLD query interval for a VRF to 50 seconds.

```
Device(config)# ipv6 router pim vrf blue  
Device(config-ipv6-pim-router-vrf-blue)# ipv6 mld query-interval 50
```

ipv6 mld robustness

Configures the number of times that the device sends each multicast listening discovery (MLD) message from an interface.

Syntax

```
ipv6 mld robustness num  
no ipv6 mld robustness num
```

Command Default

The MLD robustness is 2 seconds.

Parameters

num
Number in seconds, from 2 through 7. The default is 2.

Modes

Global configuration mode.
VRF configuration mode.

Usage Guidelines

The **no** form of this command resets the query interval to the default of 2 seconds.
Configure a higher value to ensure high MLD reliability.

Examples

This example configures the MLD robustness to 3 seconds.

```
Device(config)# ipv6 mld robustness 3
```

This example configures the MLD robustness for a VRF to 3 seconds.

```
Device(config)# ipv6 router pim vrf blue  
Device(config-ipv6-pim-router-vrf-blue)# ipv6 mld robustness 3
```

ipv6 mld static-group

Configures one or more physical ports to be a permanent (static) member of a multicast listening discovery (MLD) group based on the range or count.

Syntax

ipv6 mld static-group *multicast-group-addr* [**count** *count-number* | **to** *multicast-group-addr*] [**ethernet** *stackid/slot/portnum*] [**ethernet** *stackid/slot/portnum* **to** **ethernet** *stackid/slot/portnum*]]

no ipv6 mld static-group *multicast-group-addr* [**count** *count-number* | **to** *multicast-group-addr*] [**ethernet** *stackid/slot/portnum*] [**ethernet** *stackid/slot/portnum* **to** **ethernet** *stackid/slot/portnum*]]

Command Default

The port is not added to MLD group.

Parameters

ip-addr

The address of the static MLD group.

count *count-number*

Specifies the number of static MLD groups. The range is 2 through 256.

to

Specifies a range of addresses.

ethernet *stackid/slot/portnum*

Specifies the ID of the physical port that will be a member of the MLD group. On standalone devices specify the interface ID in the format *slot/port-id*; on stacked devices you must also specify the stack ID, in the format *stack-id/slot/port-id*. You can configure a single port or a list of ports, separated by a space.

Modes

Interface configuration mode.

Usage Guidelines

The **no** form of this command removes the port or ports from the MLD group.

You can specify as many port numbers as you want to include in the static group.

For a virtual routing interface (ve), specify the physical Ethernet ports on which to add the group address.

Examples

The following example configures two static groups, starting from ff0d::1, without having to receive an MLDv1 report on a virtual Ethernet interface,

```
device# configure terminal
device(config)# interface ethernet 10000 1/1/2
device(config-if-e10000-1/1/2)# ipv6 mld static-group ff0d::1 count 2
```

The following example configures two static MLD groups, starting from ff0d::1, using the **to** keyword.

```
device# configure terminal
device(config)# interface ethernet 10000 1/1/2
device(config-if-e10000-1/1/2)# ipv6 mld static-group ff0d::1 to ff0d::2
```

The following example configures two static MLD groups on virtual ports starting from ff0d::1 using the **count** keyword.

```
device# configure terminal
device(config)# interface ve 10
device(config-vif-10)# ipv6 mld static-group ff0d::1 count 2 ethernet 1/5/2
```

The following example configures two static groups on virtual ports starting from ff0d::1 using the **to** keyword.

```
device# configure terminal
device(config)# interface ve 10
device(config-vif-10)# ipv6 mld static-group ff0d::1 to ff0d::2 ethernet 1/5/2
```

ipv6 mld tracking

Enables multicast listening discovery (MLD) tracking on a virtual interface.

Syntax

ipv6 mld tracking

no ipv6 mld tracking

Command Default

Multicast tracking is disabled on the virtual interface.

Modes

Virtual interface configuration mode

Usage Guidelines

The **no** form of this command restores the default; tracking is disabled.

When MLD tracking is enabled, a Layer 3 device tracks all clients that send membership reports. When a Leave message is received from the last client, the device immediately stops forwarding to the physical port, without waiting 3 seconds to confirm that no other clients still want the traffic.

Examples

This example enables multicast tracking on a virtual interface.

```
device# configure terminal
device(config)# interface ve 13
device(config-vif-13)# ipv6 mld tracking
```

ipv6 mld version

Configures the multicast listening discovery (MLD) version for snooping on an interface.

Syntax

```
ipv6 mld version { 1 | 2 }
```

```
no ipv6 mld version { 1 | 2 }
```

Command Default

MLD Version 1 is configured.

Parameters

- 1** Configures MLD version 1.
- 2** Configures MLD version 2.

Modes

Global configuration mode
Interface configuration mode
IPv6 PIM router configuration mode

Usage Guidelines

The default MLD version when PIM Sparse Mode (PIM-SM) is enabled on an interface is MLDv1. You must configure the version 2 to enable MLDv2.

The **no** form of this command restores the default, that is, 1.

Examples

The following example configures MLD version 2 globally.

```
device(config)# ipv6 mld version 2
```

The following example configures MLD version 2 for a specified VRF.

```
device(config)# ipv6 router pim vrf blue  
device(config-ipv6-pim-router-vrf-blue)# ipv6 mld version 2
```

The following example configures MLD version 2 on an interface.

```
device(config)# interface ve 10  
device(config-vif-10)# ipv6 mld version 2
```

Commands F - J

ipv6 mld version

The following example enables MLDv2.

```
device(config)# interface ethernet 1/1/1
device(config-if-e10000-1/1/1)# ipv6 mld version 2
```

ipv6 mroute

Configures a static IPv6 route to direct multicast traffic along a specific path.

Syntax

ipv6 mroute [**vrf** *vrf-name*] *ipv6-address-prefix/prefix-length* { **ethernet** *stackid / slot / portnum* | **ve** *num* | **tunnel** *num* }
 [*cost*] [**distance** *distance-value*] [**name** *name*]

no ipv6 mroute [**vrf** *vrf-name*] *ipv6-address-prefix/prefix-length* { **ethernet** *stackid / slot / portnum* | **ve** *num* | **tunnel** *num* } [*cost*] [**distance** *distance-value*] [**name** *name*]

Command Default

No static IPv6 multicast route is configured.

Parameters

vrf *vrf-name*

Configures a static mroute for this virtual routing and forwarding (VRF) route.

ipv6-address-prefix/prefix-length

Configures the destination IPv6 address and prefix for which the route should be added.

ethernet *stackid / slot / portnum*

Configures an Ethernet interface as the route path.

ve *num*

Configures a virtual interface as the route path.

tunnel *num*

Configures a tunnel interface as the route path.

cost

Configures a metric for comparing the route to other static routes in the IPv6 static route table that have the same destination. The range is 1 to 16; the default is 1.

distance *distance-value*

Configures the route's administrative distance. The range is 1 to 255; the default is 1.

name *name*

Name for this static route.

Modes

VRF configuration mode

Usage Guidelines

The **no** form of this command deletes a previously configured static multicast route.

Connected routes on PIM enabled interfaces are automatically added to the mRTM table.

Examples

The following example configures a static IPv6 mroute to directly connected network 2020::0/120 on virtual interface ve 130.

```
Device(config-vrf)# ipv6 mroute 2020::0/120 ve 130
```

History

Release version	Command history
8.0.10a	This command was introduced.

ipv6 mroute (next hop)

Configures a static IPv6 multicast route (mroute) with a next hop.

Syntax

ipv6 mroute [**vrf** *vrf-name*] *ipv6-address-prefix/prefix-length* *next-hop address* [*cost*] [**distance** *distance-value*] [**name** *name*]

no ipv6 mroute [**vrf** *vrf-name*] *ipv6-address-prefix/prefix-length* *next-hop address* [*cost*] [**distance** *distance-value*] [**name** *name*]

Command Default

No next-hop static IPv6 multicast route is configured.

Parameters

vrf *vrf-name*

Configures a static mroute for this virtual routing and forwarding (VRF) route.

ipv6-address-prefix/prefix-length

Configures the destination IPv6 address and prefix for which the route should be added.

next-hop address

Configures a next-hop address as the route path.

cost

Configures a metric for comparing the route to other static routes in the static route table that have the same destination. The range is 1-16; the default is 1.

distance *distance-value*

Configures the route's administrative distance. The range is 1 to 255; the default is 1.

name *name*

Name for this static route.

Modes

VRF configuration mode

Usage Guidelines

The **no** form of this command deletes a previously configured next-hop static IPv6 multicast route.

Examples

The following example configures a next-hop static multicast IPv6 route to network 2020::0/120 with 2022::0/120 as the next hop.

```
Device(config-vrf)# ipv6 mroute 2020::0/120 2022::0/120
```

History

Release version	Command history
8.0.10a	This command was introduced.

ipv6 mroute next-hop-enable-default

Enables the option to use the default multicast route (mroute) to resolve a static IPv6 mroute next hop.

Syntax

```
ipv6 mroute [ vrf vrf-name ] next-hop-enable-default  
no ipv6 mroute [ vrf vrf-name ] next-hop-enable-default
```

Command Default

IPv6 multicast static routes are not resolved using the default multicast static route.

Parameters

vrf *vrf-name*
Configures a static mroute for the specified virtual routing and forwarding (VRF) route.

Modes

Global configuration mode
VRF configuration mode

Usage Guidelines

Before configuring an IPv6 multicast static route, you must enable the forwarding of IPv6 traffic on the Layer 3 switch using the **ipv6 unicast-routing** command and must enable IPv6 on at least one interface by configuring an IPv6 address or explicitly enabling IPv6 on that interface.

The **no** form of the command disables IPv6 static route next-hop resolution through the default route. If a VRF is configured, the **no** form of the command removes the static IPv6 route configuration from the VRF.

Examples

The following example configures static routing next-hop recursion to three levels (the default). It configures the network default static route and allows it to resolve other static routes.

NOTE

You can specify a level of recursion up to 10.

```
device# configure terminal  
device(config)# ipv6 mroute next-hop-recursion  
device(config)# ipv6 mroute 0.0.0.0 0.0.0.0 xxx.xxx.xxx.xxx  
device(config)# ipv6 mroute next-hop-enable-default
```

Commands F - J

ipv6 mroute next-hop-enable-default

The following example enables the VRF named vpn1 to resolve an IPv6 multicast static route through the default IPv6 multicast static route, after configuring IPv6 on the device, setting a route descriptor for the VPN, and specifying IPv6 addressing be used on the VPN.

```
Device# configure terminal
Device(config)# ipv6 unicast-routing
Device(config)# vrf vpn1
Device (config-vrf-vpn1)# rd 100:200
Device (config-vrf-vpn1)# address-family ipv6
Device(config-vrf)# ipv6 mroute next-hop-enable-default
```

History

Release version	Command history
8.0.10a	This command was introduced.

ipv6 mroute next-hop-recursion

Configures the recursion level for resolving an IPv6 multicast static route static.

Syntax

```
ipv6 mroute [ vrf vrf-name ] next-hop-recursion [ number ]
no ipv6 mroute [ vrf vrf-name ] next-hop-recursion [ number ]
```

Command Default

By default, only the local IPv6 address table is consulted to resolve the next hop toward a multicast static route destination.

Parameters

vrf *vrf-name*

Specifies the VRF that contains the next-hop router (gateway) for the route.

number

Specifies the level of recursion for address lookup. The range is 1 through 10. If no number is specified, the default value is 3.

Modes

Global configuration mode

VRF configuration mode

Usage Guidelines

Before configuring a static IPv6 route, you must enable the forwarding of IPv6 traffic on the Layer 3 switch using the **ipv6 unicast-routing** command and must enable IPv6 on at least one interface by configuring an IPv6 address or explicitly enabling IPv6 on that interface.

The **no** form of the command disables IPv6 multicast static route next-hop recursion. If a VRF is configured, the **no** form of the command removes the static IPv6 route configuration from the VRF.

Examples

The following example configures recursive IPv6 multicast static route lookup to five levels.

```
device# configure terminal
device(config)# ipv6 mroute next-hop-recursion 5
```

Commands F - J

ipv6 mroute next-hop-recursion

The following example configures recursive lookup to seven levels for the VRF named vpn2. The VRF has a route descriptor of 100:200. IPv6 addressing is specified for the VRF.

```
Device# configure terminal
Device(config)# ipv6 unicast-routing
Device(config)# vrf vpn2
Device (config-vrf-vpn2)# rd 100:200
Device (config-vrf-vpn2)# address-family ipv6
Device (config-vrf-vpn2-ipv6)# ipv6 mroute next-hop-recursion 7
```

History

Release version	Command history
8.0.10a	This command was introduced.

ipv6 mtu

Configures the IPv6 MTU on individual interfaces.

Syntax

ipv6 mtu *unit*

no ipv6 mtu *unit*

Command Default

By default, in non-jumbo mode, the default and maximum Ethernet MTU size is 1500 bytes. When jumbo mode is enabled, the default Ethernet MTU size is 9216.

Parameters

unit

Specifies the maximum length of an IPv6 packet that can be transmitted on a particular interface. Valid values are between 1280 and 1500, or 1280 and 10182 if jumbo mode is enabled.

Modes

Interface configuration mode

Usage Guidelines

The IPv6 maximum transmission unit (MTU) is the maximum length of an IPv6 packet that can be transmitted on a particular interface. If an IPv6 packet is longer than an MTU, the host that originated the packet fragments the packet and transmits its contents in multiple packets that are shorter than the configured MTU.

By default, in non-jumbo mode, the default and maximum Ethernet MTU size is 1500 bytes. When jumbo mode is enabled, the default Ethernet MTU size is 9216. The maximum Ethernet MTU size is 10218.

The IPv6 MTU functionality is applicable to VEs and physical IP interfaces. It applies to traffic routed between networks. The minimum IPv4 and IPv6 MTU values for both physical and virtual interfaces are 1280.

IPv6 MTU cannot be configured globally. It is supported only on devices running Layer 3 software.

The **no** form of the command resets the MTU to the default values.

Examples

The following example configures the MTU on Ethernet interface 1/3/1 as 1280 bytes.

```
device(config)# interface ethernet 1/3/1
device(config-if-e1000-1/3/1)# ipv6 mtu 1280
```

ipv6 multicast

Globally sets the multicast listening discovery (MLD) snooping mode to active.

Syntax

ipv6 multicast [**active** | **passive**]

no ipv6 multicast [**active** | **passive**]

Command Default

MLD mode is passive.

Parameters

active

Specifies that the device actively sends out MLD queries to identify IPv6 multicast groups on the network, and makes entries in the MLD table based on the group membership reports it receives from the network.

passive

Specifies that the device forwards reports to the router ports which receive queries. MLD snooping in passive mode does not send queries, but does forward queries to the entire VLAN.

Modes

Global configuration mode

Usage Guidelines

If you specify an MLD mode for a VLAN, the MLD mode overrides the global setting.

In active MLD mode, a device actively sends out MLD queries to identify IPv6 multicast groups on the network, and makes entries in the MLD table based on the group membership reports it receives from the network. In passive MLD mode, the device forwards reports to the router ports that receive queries. MLD snooping in passive mode does not send queries, but does forward queries to the entire VLAN.

NOTE

The **ipv6 multicast** command replaces the **ipv6 mld-snooping** command. The **multicast6** command replaces the **mld-snooping** command.

The **no** form of this command when the **active** parameter is used stops the device from sending out MLD queries to identify IPv6 multicast groups on the network. The **no** form of the command when used with the **passive** parameter stops forwarding reports to the router ports which receive queries.

Examples

The following example globally sets the MLD snooping mode to active.

```
device(config)# ipv6 multicast active
```

ipv6 multicast age-interval

Configures the time that group entries can remain in a multicast listening discovery (MLD) group table.

Syntax

ipv6 multicast age-interval *interval*

no ipv6 multicast age-interval *interval*

Command Default

Group entries can remain in the MLD group table for up to 260 seconds.

Parameters

interval

Specifies the time, in seconds, that group entries can remain in the MLD group table. The range is 20 through 7200 seconds. The default is 260 seconds.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the default age interval to 260 seconds.

When a device receives a group membership report it makes an entry for that group in the MLD group table. You can configure the **ipv6 multicast age-interval** to specify how long the entry can remain in the table before the device receives another group membership report. When multiple devices are connected, they must all be configured for the same age interval, which must be at least twice the length of the query interval, so that missing one report does not stop traffic.

Non-querier age intervals must be the same as the age interval of the querier.

Examples

This example configures the MLD group-table age interval to 280 seconds.

```
Device(config)#ipv6 multicast age-interval 280
```

ipv6 multicast disable-flooding

Disables the flooding of unregistered IPv6 multicast frames in an MLD-snooping-enabled VLAN.

Syntax

ipv6 multicast disable-flooding

no ipv6 multicast disable-flooding

Command Default

The device floods unregistered IPv6 multicast frames in an MLD-snooping-enabled VLAN.

Modes

Global configuration mode

Usage Guidelines

NOTE

Disabling the flooding of unregistered IPv6 multicast frames in an MLD-snooping-enabled VLAN is supported only on the ICX 7750 (standalone and stacking) platform.

The **no** form of this command enables the flooding of unregistered IPv6 multicast frames in an MLD-snooping-enabled VLAN.

In releases prior to FastIron 8.0.30, support for this command on the Brocade ICX 7750 was for devices in standalone mode only.

After the hardware forwarding database (FDB) entry is made, the multicast traffic is switched only to the VLAN hosts that are members of the multicast group. This can avoid congestion and loss of traffic on the ports that have not subscribed to this IPv6 multicast traffic.

Examples

The following example disables flooding of unregistered IPv6 multicast frames.

```
device(config)# ipv6 multicast disable-flooding
```

History

Release version	Command history
08.0.01	This command was introduced.

ipv6 multicast leave-wait-time

Configures the wait time before stopping traffic to a port when a leave message is received.

Syntax

ipv6 multicast leave-wait-time *num*

no ipv6 multicast leave-wait-time *num*

Command Default

The wait time is 2 seconds.

Parameters

num

Specifies the time, in seconds, the device should wait before stopping traffic to a port when a leave message is received. The range is 1 through 5 seconds. The default is 2 seconds.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the default wait time.

The device sends group-specific queries once per second to ask if any client in the same port still needs the group. Because of internal timer granularity, the actual wait time is between n and $(n+1)$ seconds (n is the configured value).

Examples

This example configures the maximum time a client can wait before responding to a query as 1 second.

```
Device(config)#ipv6 multicast leave-wait-time 1
```

ipv6 multicast max-response-time

Sets the maximum number of seconds a client (IPv6) can wait before responding to a query sent by the device.

Syntax

ipv6 multicast max-response-time *interval*

no ipv6 multicast max-response-time *interval*

Command Default

The wait time is 10 seconds.

Parameters

interval

Specifies the maximum time, in seconds, a client can wait before responding to a query sent by the switch. The range is 1 through 25 seconds. The default is 10 seconds.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the default maximum interval.

Examples

This example configures the maximum time a client can wait before responding to a query to 5 seconds.

```
device(config)# ipv6 multicast max-response-time 5
```

History

Release version	Command history
8.0.40	This command was modified to increase the range of the maximum response time from 1 through 10 seconds to 1 through 25 seconds.

ipv6 multicast mcache-age

Configures the time for an mcache to age out when it does not receive traffic.

Syntax

ipv6 multicast mcache-age *num*

no ipv6 multicast mcache-age *num*

Command Default

The mcache ages out after the default age-out interval, which is 180 seconds for ICX 7750, ICX 7450, and ICX 7250 devices.

Parameters

num

Specifies the time, in seconds, the device should wait before stopping traffic to a port when a leave message is received. The range is 60 through 3600 seconds.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the default mcache age-out time.

You can set the time for a multicast cache (mcache) to age out when it does not receive traffic. Two seconds before an mcache is aged out, the device mirrors a packet of the mcache to the CPU to reset the age. If no data traffic arrives within two seconds, the mcache is deleted.

NOTE

On devices that support MAC-based MLD snooping (like the ICX 7750, ICX7450, and ICX 7250), more than one mcache can be mapped to the same destination MAC. When an mcache entry is deleted, the MAC entry may not be deleted. If you configure a lower value, the resource consumed by idle streams is quickly removed, but packets are mirrored to the CPU more frequently. Configure a higher value only when data streams are arriving consistently.

Examples

This example configures the time for an mcache to age out to 180 seconds.

```
device(config)# ipv6 multicast mcache-age 180
```

ipv6 multicast optimization

Enables or disables IP multicast (IPMC) hardware entry optimization for Layer 2 IPv6 multicast flows.

Syntax

ipv6 multicast optimization oif-listall

no ipv6 multicast optimization oif-list all

Command Default

Hardware entry optimization is disabled by default on ICX 7750 devices, and enabled by default on ICX 7450 and 7250 devices.

Parameters

oif-list

Shares the Output Interface Lists across entries.

all

Specifies all types of Output Interface Lists.

Modes

Global configuration mode.

Usage Guidelines

The **no** form of the command disables hardware entry optimization for Layer 2 IPv6 multicast flows.

Examples

The following example enables hardware entry optimization for Layer 2 IPv6 multicast flows.

```
device(config)# ip multicast optimization oif-list all
```

History

Release version	Command history
8.0.40	This command was introduced.

ipv6 multicast query-interval

Configures how often the device sends group membership queries when the multicast listening discovery (MLD) mode is set to active.

Syntax

```
ipv6 multicast query-interval interval  
no ipv6 multicast query-interval interval
```

Command Default

Queries are sent every 125 seconds.

Parameters

interval

Specifies the time, in seconds, between queries. The range is 10 through 3600 seconds. The default is 125 seconds.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the query interval to 125 seconds.

If the MLD mode is set to active, you can modify the query interval, which specifies how often the Brocade device sends group membership queries. When multiple queriers connect together, all queriers should be configured with the same interval.

Examples

The following example configures the query interval to 120 seconds.

```
device#configure terminal  
device(config)#ipv6 multicast query-interval 120
```

ipv6 multicast report-control

Limits report forwarding within the same group to no more than once every 10 seconds.

Syntax

ipv6 multicast report-control
no ipv6 multicast report-control

Command Default

A device in passive mode forwards reports and leave messages from clients to the upstream router ports that are receiving queries.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the default.

NOTE

This feature applies only to multicast listening discovery (MLD) version 1. The leave messages are not rate limited.

This rate-limiting does not apply to the first report answering a group-specific query.

Configure this command to alleviate report storms from many clients answering the upstream router query.

Examples

This example limits the rate that reports are forwarded.

```
Device(config)#ipv6 multicast-report-control
```

ipv6 multicast-routing optimization

Enables or disables IP multicast (IPMC) entry optimization for Layer 3 IPv6 multicast flows.

Syntax

ipv6 multicast-routing optimization oif-list all

no ipv6 multicast-routing optimization oif-list all

Command Default

IPMC entry optimization is disabled by default on ICX 7750 devices, and enabled by default on ICX 7450 and 7250 devices.

Parameters

oif-list

Shares the Output Interface Lists across entries.

all

Specifies all types of Output Interface Lists.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command disables IPMC entry optimization for IPv6 multicast flows. Multicast routing entries are deleted and recreated when optimization is enabled or disabled on all VRFs.

Examples

The following example enables hardware entry optimization for IPv6 multicast flows.

```
device(config)# ipv6 multicast-routing optimization oif-list all
```

History

Release version	Command history
8.0.40	This command was introduced.

ipv6 multicast verbose-off

Turns off error or warning messages that are displayed when the device runs out of software resources or when it receives packets with the wrong checksum or groups.

Syntax

ipv6 multicast verbose-off

no ipv6 multicast verbose-off

Command Default

Messages are displayed.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the default display of messages.

Examples

This example turns off the display of messages.

```
device# configure terminal
device(config)# ipv6 multicast verbose-off
```

ipv6 multicast version

Configures the multicast listening discovery (MLD) version for snooping globally.

Syntax

ipv6 multicast version [1 | 2]

no ipv6 multicast version

Command Default

MLD version 1 is configured.

Parameters

- 1** Configures MLD version 1.
- 2** Configures MLD version 2.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the version to MLD version 1.

You can configure the MLD version for individual VLANs, or individual ports within VLANs. If no MLD version is specified for a VLAN, the globally configured MLD version is used. If an MLD version is specified for individual ports in a VLAN, those ports use that version instead of the version specified for the VLAN or the globally specified version. The default is MLD version 1.

Examples

This example specifies MLD version 2 on a device.

```
Device(config)#ipv6 multicast version 2
```

ipv6 multicast-boundary

Defines multicast boundaries for PIM-enabled interfaces.

Syntax

ipv6 multicast-boundary *acl-spec*

no ipv6 multicast-boundary *acl-spec*

Command Default

Boundaries are not defined.

Parameters

acl-spec

Specifies the number or name identifying an access control list (ACL) that controls the range of group addresses affected by the boundary.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of this command removes the boundary on a PIM-enabled interface.

You can use standard ACL syntax to configure an access list.

Examples

This example defines a boundary named MyAccessList for a PIM-enabled interface.

```
Device(config)# interface ethernet 1/2/2  
Device(config-if-e1000-1/2)#ipv6 multicast-boundary MyAccessList
```

ipv6 multicast-routing rpf-check mac-movement

Triggers Reverse Path Forwarding (RPF) check on MAC movement for directly connected sources and sends a MAC address movement notification to the Protocol Independent Multicast (PIM) module which results in PIM convergence.

Syntax

ipv6 multicast-routing rpf-check mac-movement
no ipv6 multicast-routing rpf-check mac-movement

Command Default

RPF check on MAC movement for directly connected sources is not enabled.

Modes

Global configuration mode

Usage Guidelines

PIM convergence on MAC movement is applicable only in a topology where the multicast source port and PIM routers are in the same Layer 2 domain.

IPv6 PIM Dense mode is not supported for PIM convergence on MAC movement.

The **ipv6 multicast-routing rpf-check mac-movement** command is not supported on the Brocade ICX 7250 devices.

The **no** form of the command disables RPF check on MAC movement for directly connected sources.

Examples

The following example configures RPF check on MAC movement for directly connected sources.

```
device(config)# ipv6 multicast-routing rpf-check mac-movement
```

History

Release version	Command history
08.0.10h	This command was introduced.
08.0.30	Support for the ipv6 multicast-routing rpf-check mac-movement command was added in 08.0.30 and later releases.

ipv6 nd dad attempts

Configures the number of consecutive neighbor solicitation messages that duplicate address detection (DAD) sends on an interface.

Syntax

ipv6 nd dad attempts *number*
no ipv6 nd dad attempts *number*

Command Default

By default, duplicate address detection sends three neighbor solicitation messages without any follow-up messages.

Parameters

number

Specifies the number of consecutive neighbor solicitation messages that duplicate address detection sends on an interface. Valid values are 0 to 255. The default value is 3. Configuring a value of 0 disables duplicate address detection processing on the specified interface.

Modes

Interface configuration mode

Usage Guidelines

DAD is not currently supported with IPv6 tunnels. Make sure tunnel endpoints do not have duplicate IP addresses. The **no** form of the command restores the number of messages to the default value of 3.

Examples

The following example configures the number of consecutive neighbor solicitation messages that duplicate address detection sends on an interface to 100.

```
device(config)# interface ethernet 1/3/1  
device(config-if-e1000-1/3/1)# ipv6 nd dad attempts 2
```

ipv6 nd managed-config-flag

Sets the managed address configuration flag.

Syntax

ipv6 nd managed-config-flag

no ipv6 nd managed-config-flag

Command Default

By default, the managed address configuration flag is not set in router advertisement messages.

Modes

Interface configuration mode

Usage Guidelines

An IPv6 router advertisement message includes the managed address configuration flag. This flag indicates to hosts on a local link if they should use the stateful autoconfiguration feature to get IPv6 addresses for their interfaces. If the flag is set, the hosts use stateful autoconfiguration to get addresses as well as non-IPv6-address information. If the flag is not set, the hosts do not use stateful autoconfiguration to get addresses and if the hosts can get non-IPv6-address information from stateful autoconfiguration is determined by the setting of the Other Stateful Configuration flag.

The **no** form of the command removes the managed address configuration flag from the router advertisement messages.

Examples

The following example sets the managed address configuration flag.

```
device(config)# interface ethernet 1/3/1
device(config-if-e1000-1/3/1)# ipv6 nd managed-config-flag
```

ipv6 nd ns-interval

Configures the interval in milliseconds at which duplicate address detection sends a neighbor solicitation message on an interface.

Syntax

ipv6 nd ns-interval *interval*

no ipv6 nd ns-interval *interval*

Command Default

By default, duplicate address detection sends a neighbor solicitation message every 1000 milliseconds.

Parameters

interval

Specifies the interval in milliseconds at which duplicate address detection sends a neighbor solicitation message on an interface. Valid values are 0 to 4294967295 milliseconds. The default value is 1000 milliseconds.

Modes

Interface configuration mode

Usage Guidelines

Brocade does not recommend very short intervals in normal IPv6 operation. When a non-default value is configured, the configured time is both advertised and used by the router itself.

The **no** form of the command restores the interval to the default value of 1000 milliseconds.

Examples

The following example configures the interval between the transmission of the two messages to 9 seconds.

```
device(config)# interface ethernet 1/3/1
device(config-if-e1000-1/3/1)# ipv6 nd ns-interval 9000
```

ipv6 nd other-config-flag

Configures the hosts can use stateful autoconfiguration to get non-IPv6-address information.

Syntax

ipv6 nd other-config-flag

no ipv6 nd other-config-flag

Command Default

By default, the other stateful configuration flags are not set in router advertisement messages.

Modes

Interface configuration mode

Usage Guidelines

The other stateful configuration flag indicates to hosts on a local link if they can get non-IPv6 address autoconfiguration information. If the flag is set, the hosts can use stateful autoconfiguration to get non-IPv6-address information.

When determining if hosts can use stateful autoconfiguration to get non-IPv6-address information, a set Managed Address Configuration flag overrides an unset Other Stateful Configuration flag. In this situation, the hosts can obtain nonaddress information. However, if the Managed Address Configuration flag is not set and the Other Stateful Configuration flag is set, then the setting of the Other Stateful Configuration flag is used.

The **no** form of the command other stateful configuration flag.

Examples

The following example sets the other stateful configuration flag.

```
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# ipv6 nd other-config-flag
```

ipv6 nd prefix-advertisement

Configures the prefixes to be included in router advertisement messages.

Syntax

ipv6 nd prefix-advertisement *ipv6-address valid-lifetime preferred-lifetime* [**auto-config**] [**onlink**]

no ipv6 nd prefix-advertisement *ipv6-address valid-lifetime preferred-lifetime* [**auto-config**] [**onlink**]

Command Default

By default, router advertisement messages include prefixes configured as addresses on router interfaces using the **ipv6 address** command.

Parameters

ipv6-address

Specifies the IPv6 address in hexadecimal using 16-bit values between colons as documented in RFC 2373 along with the prefix length in the format X:X::X:X/M.

valid-lifetime

Configures the time interval (in seconds) in which the specified prefix is advertised as valid. Valid values are 0 through 4294967295 seconds. The default is 2592000 seconds (30 days). When the timer expires, the prefix is no longer considered to be valid.

preferred-lifetime

Configures the time interval (in seconds) in which the specified prefix is advertised as preferred. Valid values are 0 through 4294967295 seconds. The default is 604800 seconds (7 days). When the timer expires, the prefix is no longer considered to be preferred.

auto-config

If this flag is set, the stateless auto configuration feature can use the specified prefix in the automatic configuration of 128-bit IPv6 addresses for hosts on the local link, provided the specified prefix is aggregatable, as specified in RFC 2374.

onlink

If this flag is set, the specified prefix is assigned to the link upon which it is advertised. Nodes sending traffic to addresses that contain the specified prefix consider the destination to be reachable on the local link.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of the command removes a prefix from the router advertisement messages sent from a particular interface.

Examples

The following example configures to advertise the prefix 2001:DB8:a487:7365::/64 in router advertisement messages sent out on Ethernet interface 1/3/1 with a valid lifetime of 1000 seconds, a preferred lifetime of 800 seconds, and the Onlink and Autoconfig flags set.

```
device(config)# interface ethernet 1/3/1
device(config-if-e1000-1/3/1)# ipv6 nd prefix-advertisement 2001:DB8:a487:7365::/64 1000 800 onlink
autoconfig
```

ipv6 nd ra-hop-limit

Sets the hop limit for router advertisement messages.

Syntax

ipv6 nd ra-hop-limit *number*
no ipv6 nd ra-hop-limit *number*

Command Default

The default hop is 64.

Parameters

number
Specifies the number of hops. Valid values are 0 to 255. The default value is 64.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of the commands resets the number of hops to the default value of 64.

Examples

The following example sets the number of hops to 100.

```
device(config)# interface ethernet 1/3/1  
device(config-if-e1000-1/3/1)# ipv6 nd ra-hop-limit 100
```

ipv6 nd ra-interval

Configures the interval at which an interface sends router advertisement messages.

Syntax

ipv6 nd ra-interval [**range** *min-interval max-interval* | *interval*]

no ipv6 nd ra-interval [**range** *min-interval max-interval* | *interval*]

Command Default

By default, an interface sends a router advertisement message every 200 seconds.

Parameters

range *min-interval max-interval*

Configures an interval range. The min-range-value specifies the minimum number of seconds allowed between sending unsolicited multicast router advertisements from the interface. The default is 0.33 times the max-range-value if the max-range-value is greater than or equal to 9 seconds. Otherwise, the default is the value specified by the max-range-value. The min-range-value can be a number between -3 - (.75 x max range value). The max-range-value parameter specifies the maximum number of seconds allowed between sending unsolicited multicast router advertisements from the interface. This number can be between 4 - 1800 seconds and must be greater than the min-range-value x 1.33. The default is 600 seconds.

interval

Configures the interval. Valid values are 3 to 1800 seconds. The default is 200 seconds. The actual RA interval will be from .5 to 1.5 times the configured or default value.

Modes

Interface configuration mode

Usage Guidelines

Brocade recommends that the interval between router advertisement transmission be less than or equal to the router lifetime value if the router is advertised as a default router.

The **no** form of the command resets the interface at which an interface sends a router advertisement message to 200 seconds.

Examples

The following example configures the interval at which an interface sends a router advertisement message as 300 seconds.

```
device(config)# interface ethernet 1/3/1
device(config-if-e1000-1/3/1)# ipv6 nd ra-interval 300
```

Commands F - J

ipv6 nd ra-interval

The following example configures the interval at which an interface sends a router advertisement message to a range.

```
device(config)# interface ethernet 1/3/1
device(config-if-e1000-1/3/1)# ipv6 nd ra-interval range 33 55
```

ipv6 nd ra-lifetime

Configures the value (in seconds) indicates if the router is advertised as a default router on an interface.

Syntax

```
ipv6 nd ra-lifetime time
```

```
no ipv6 nd ra-lifetime time
```

Command Default

By default, the router lifetime value included in router advertisement messages sent from an interface is 1800 seconds.

Parameters

time

Specifies the value (in seconds) indicates if the router is advertised as a default router on an interface. Valid values are 0 to 9000 seconds. The default is 1800 seconds. If you set the value of this parameter to 0, the router is not advertised as a default router on an interface.

Modes

Interface configuration mode

Usage Guidelines

The "router lifetime" value, which is included in router advertisements sent from a particular interface.

If you set this parameter to a value that is not 0, the router is advertised as a default router on the interface.

Brocade recommends that the interval between router advertisement transmission be less than or equal to the router lifetime value if the router is advertised as a default router.

The **no** form of the command resets the value to 1800 seconds.

Examples

The following example configures the router lifetime value to 1900 seconds on Ethernet interface 1/3/1.

```
device(config)# interface ethernet 1/3/1
device(config-if-e1000-1/3/1)# ipv6 nd ra-lifetime 1900
```

ipv6 nd reachable-time

Configures the duration that a router considers a remote IPv6 node reachable.

Syntax

ipv6 nd reachable-time *duration*

no ipv6 nd reachable-time *duration*

Command Default

By default, a router interface uses the value of 30 seconds.

Parameters

duration

Specifies the duration (in seconds) that a router considers a remote IPv6 node reachable. Valid values are 0 to 3600 seconds. The default is 30 seconds.

Modes

Interface configuration mode

Usage Guidelines

The router advertisement messages sent by a router interface include the amount of time specified by the `ipv6 nd reachable-time` command so that nodes on a link use the same reachable time duration. By default, the messages include a default value of 0.

Brocade does not recommend configuring a short reachable time duration, because a short duration causes the IPv6 network devices to process the information at a greater frequency.

The actual reachable time will be from 0.5 to 1.5 times the configured or default value.

The **no** form of the command resets the duration that a router considers a remote IPv6 node reachable as 30 seconds.

Examples

The following example configures the reachable time of 40 seconds for Ethernet interface 1/3/1.

```
device(config)# interface ethernet 1/3/1
device(config-if-e1000-1/3/1)# ipv6 nd reachable-time 40
```

ipv6 nd router-preference

Configures the IPv6 router advertisement preference value to low or high (medium is the default). IPv6 router advertisement preference enables IPv6 router advertisement (RA) messages to communicate default router preferences from IPv6 routers to IPv6 hosts in network topologies where the host has multiple routers on its Default Router List.

Syntax

```
ipv6 nd router-preference [ low | medium | high ]
no ipv6 nd router-preference [ low | medium | high ]
```

Command Default

The IPv6 router advertisement preference value is set to medium.

Parameters

low

The two-bit signed integer (11) indicating the preference value "low".

medium

The two-bit signed integer (00) indicating the preference value "medium". This is the default preference value.

high

The two-bit signed integer (01) indicating the preference value "high".

Modes

Interface configuration mode

Usage Guidelines

The **no** form disables IPv6 router preference.

Examples

The following example configures IPv6 RA preference for IPv6 routers:

```
device #configure terminal
device (config)# interface ethernet 2/3
device (config-if-eth2/3)# ipv6 nd router-preference low
```

History

Release version	Command history
08.0.10	This command was introduced.

ipv6 nd skip-interface-ra

Disables the default interface-level IPv6 RA messages on an interface configured with IPv6 VRRP or VRRP-E.

Syntax

ipv6 nd skip-interface-ra

no ipv6 nd skip-interface-ra

Command Default

The IPv6-enabled interface sends the default IPv6 Router Advertisement (RA) messages. The IPv6 VRRP or VRRP-E instance configured on the interface also sends its virtual-IPv6 RA messages on the same interface. A connected IPv6 host receives these two different IPv6 RA messages with the same source address from this IPv6 router interface.

Modes

Interface configuration mode

Usage Guidelines

NOTE

This command is valid only on an interface configured with IPv6 VRRP or VRRP-E.

The **no** form of this command enables the default interface-level IPv6 RA messages on an interface configured with IPv6 VRRP or VRRP-E.

By default, all IPv6-enabled interfaces send IPv6 Router Advertisement (RA) messages. If you configure an IPv6 VRRP or VRRP-E instance on an interface, the VRRP/ VRRP-E instance also sends its IPv6 RA messages for the virtual IPv6 address on the same interface with the same source address. An IPv6 host cannot identify the valid IPv6 address for this router interface because of these two different IPv6 RA messages with the same source address from the same IPv6 router interface. To avoid this, run this command to disable the default interface-level IPv6 RA messages on an interface configured with IPv6 VRRP or VRRP-E.

Examples

The following example disables the default interface-level IPv6 RA messages on an ethernet interface 1/1/7 configured with IPv6 VRRP or VRRP-E.

```
device(config)# interface ethernet 1/1/7
device(config-if-e1000-1/1/7)# ipv6 address 2002:AB3::2/64
device(config-if-e1000-1/1/7)# ipv6 nd skip-interface-ra
```

History

Release version	Command history
08.0.01	This command was introduced.

ipv6 neighbor

Adds a static entry to the IPv6 neighbor discovery cache.

Syntax

ipv6 neighbor *ipv6-address* [**ve** *ve-num*] **ethernet** *stack/slot/port link-layer-address*

no ipv6 neighbor *ipv6-address* [**ve** *ve-num*] **ethernet** *stack/slot/port link-layer-address*

Command Default

A static entry is not added to the IPv6 neighbor discovery cache.

Parameters

ipv6-address

Specifies the IPv6 address of the neighbor.

ve *ve-num*

Specifies the outgoing interface type as VE.

ethernet *stack/slot/port*

Specifies the outgoing interface type as Ethernet. If you specify VE, specify the Ethernet interface associated with the VE.

link-layer-address

Specifies the 48-bit hardware address of the neighbor.

Modes

Global configuration mode

Usage Guidelines

In some special cases, a neighbor cannot be reached using the neighbor discovery feature. In this situation, you can add a static entry to the IPv6 neighbor discovery cache, which causes a neighbor to be reachable at all times without using neighbor discovery. (A static entry in the IPv6 neighbor discovery cache functions like a static ARP entry in IPv4.)

A port that has a statically assigned IPv6 entry cannot be added to a VLAN.

Static neighbor configurations will be cleared on secondary ports when a LAG is formed.

If you attempt to add an entry that already exists in the neighbor discovery cache, the software changes the already existing entry to a static entry.

The **no** form of the command removes a static IPv6 entry from the IPv6 neighbor discovery cache.

Examples

The following example adds a static entry for a neighbor with the IPv6 address 2001:DB8:2678:47b and linklayer address 0000.002b.8641 that is reachable through Ethernet interface 1/3/1.

```
device(config)# ipv6 neighbor 2001:DB8:2678:47b ethernet 1/3/1 0000.002b.8641
```

ipv6 nd suppress-ra

Disables the sending of router advertisement messages on an interface.

Syntax

ipv6 nd suppress-ra

no ipv6 nd suppress-ra

Command Default

Sending of router advertisement messages is enabled on Ethernet interfaces and disabled on non-LAN interfaces.

Modes

Interface configuration mode

Usage Guidelines

If IPv6 unicast routing is enabled on an Ethernet interface, by default, this interface sends IPv6 router advertisement messages. However, by default, non-LAN interface types, for example, tunnel interfaces, do not send router advertisement messages.

The **no** form of the command enables the sending of router advertisement messages on a interface.

Examples

The following example disables the sending of router advertisement messages on an Ethernet interface.

```
device(config)# interface ethernet 1/3/1
device(config-if-e1000-1/3/1)# ipv6 nd suppress-ra
```

The following example enables the sending of router advertisement messages on a tunnel interface.

```
device(config)# interface tunnel 1
device(config-tnif-1)# no ipv6 nd suppress-ra
```

ipv6 ospf active

Sets a specific OSPFv3 interface to active.

Syntax

ipv6 ospf active

Modes

Interface subtype configuration mode

Usage Guidelines

Use the **ipv6 ospf active** command on each interface participating in adjacency formation. This command overrides the global passive setting on that interface, and enables transmission of OSPFv3 control packets.

Examples

The following example sets a specific OSPFv3 virtual Ethernet (VE) interface to active.

```
device# configure terminal
device(config)# interface ve 1
device(config-vif-1)# ipv6 ospf active
```

ipv6 ospf area

Enables OSPFv3 on an interface.

Syntax

```
ipv6 ospf area area-id | ip-addr  
no ipv6 ospf area
```

Command Default

OSPFv3 is disabled.

Parameters

area-id
Area ID in dotted decimal or decimal format.

ip-addr
Area ID in IP address format.

Modes

Interface subtype configuration mode

Usage Guidelines

This command enables an OSPFv3 area on the interface to which you are connected.

The **no** form of the command disables OSPFv3 on this interface.

Examples

The following example enables a configured OSPFv3 area named 0 on a specific OSPFv3 virtual Ethernet (VE) interface.

```
device# configure terminal  
device(config)# interface ve 1  
device(config-vif-1)# ipv6 ospf area 0
```

ipv6 ospf authentication ipsec

Specifies IP security (IPsec) as the authentication type for an OSPFv3 interface.

Syntax

ipv6 ospf authentication ipsec key-add-remove-interval *interval*

no ipv6 ospf authentication ipsec key-add-remove-interval *interval*

Command Default

Disabled.

Parameters

key-add-remove-interval *interval*

Specifies the OSPFv3 authentication key add-remove interval. Valid values range from decimal numbers 0 through 14400. The default is 300.

Modes

Interface subtype configuration mode

Usage Guidelines

The **no** form of the command removes IPsec authentication from the interface.

Examples

The following example enables IPsec on a specified OSPFv3 virtual Ethernet (VE) interface.

```
device# configure terminal
device(config)# interface ve 1
device(config-vif-1)# ipv6 ospf area 0
device(config-vif-1)# ipv6 ospf authentication ipsec
```

The following example sets the OSPFv3 authentication key add-remove interval to 480.

```
device# configure terminal
device(config)# interface ve 1
device(config-vif-1)# ipv6 ospf area 0
device(config-vif-1)# ipv6 ospf authentication ipsec key-add-remove-interval 480
```

ipv6 ospf authentication ipsec disable

Disables IP security (IPsec) services on an OSPFv3 interface.

Syntax

ipv6 ospf authentication ipsec disable

no ipv6 ospf authentication ipsec disable

Command Default

Authentication is disabled.

Modes

Interface subtype configuration mode

Usage Guidelines

Use this command to disable IPsec if it is enabled on the interface. Packets that are sent out will not be IPsec encapsulated and the received packets which are IPsec encapsulated will be dropped.

The **no** form of the command re-enables IPsec on the interface if IPsec is already configured on the interface.

Examples

The following example disables IPsec on a specific OSPFv3 interface where IPsec is already enabled.

```
device# configure terminal
device(config)# interface ve 1
device(config-vif-1)# ipv6 ospf authentication ipsec disable
```

ipv6 ospf authentication ipsec spi

Specifies the IP security (IPsec) security policy index (SPI) value for an OSPFv3 interface.

Syntax

```
ipv6 ospf authentication ipsec spi value esp sha1 key [ no-encrypt ] key }  
no ipv6 ospf authentication spi
```

Command Default

Authentication is disabled.

The 40-hexadecimal character key is encrypted by default. Use the **no-encrypt** parameter to disable encryption.

Parameters

ipsec

Specifies IPsec as the authentication protocol.

spi

Specifies the Security Policy Index (SPI).

value

Specifies the SPI value. Valid values range from decimal numbers 256 through 4294967295. The near-end and far-end values must be the same.

esp

Specifies Encapsulating Security Payload (ESP) as the protocol to provide packet-level security. This is the only option currently available.

sha1

Enables Hashed Message Authentication Code (HMAC) Secure Hash Algorithm 1 (SHA-1) authentication.

key

Number used in the calculation of the message digest. The 40 hexadecimal character key is stored in encrypted format by default.

no-encrypt

The 40-character key is not encrypted upon either its entry or its display.

key

The 40 hexadecimal character key.

Modes

Interface subtype configuration mode

Usage Guidelines

The 40 hexadecimal character key is encrypted by default. The system adds the following in the configuration to indicate that the key is encrypted:

- encrypt = the key string uses proprietary simple cryptographic 2-way algorithm
- encryptb64 = the key string uses proprietary base64 cryptographic 2-way algorithm

To change an existing key, you must specify a different SPI value to that of the value already configured.

The **no** form of the command removes the SPI value from the interface.

Examples

The following example enables ESP and HMAC-SHA-1 on a specified OSPFv3 virtual Ethernet (VE) interface.

```
device# configure terminal
device(config)# interface ve 1
device(config-vif-1)# ipv6 ospf area 0
device(config-vif-1)# ipv6 ospf authentication ipsec spi 512 esp sha1
abcef12345678901234fedcba098765432109876
```

ipv6 ospf cost

Configures cost for a specific OSPFv3 interface.

Syntax

ipv6 ospf cost *value*
no ipv6 ospf cost

Command Default

Cost value is 1.

Parameters

value

Cost value. Valid values range from 1 through 65535. The default is 1.

Modes

Interface subtype configuration mode

Usage Guidelines

Use this command to set or reset the OSPFv3 cost on the interface. If the cost is not configured with this command, OSPFv3 calculates the value from the reference and interface bandwidths.

For more information, refer to the **auto-cost reference-bandwidth** command.

The **no** form of the command disables the configured cost.

Examples

The following example sets the cost to 620 on a specific OSPFv3 Virtual Ethernet (VE) interface.

```
device# configure terminal
device(config)# interface ve 1
device(config-vif-11)# ipv6 ospf cost 620
```

ipv6 ospf dead-interval

Specifies the time period for which a neighbor router waits for a hello packet from the device before declaring the router down.

Syntax

ipv6 ospf dead-interval *interval*

no ipv6 ospf dead-interval

Command Default

The specified time period is 40 seconds.

Parameters

interval

Dead interval in seconds. Valid values range from 2 through 65535 seconds.

Modes

Interface subtype configuration mode

Usage Guidelines

If you change the dead interval, the hello interval is automatically changed to a value that is one fourth that of the new dead interval, unless the hello interval is also explicitly configured using the **ipv6 ospf hello-interval** command.

The recommended setting is that:

- The dead interval is four times that of the hello interval.
- The hello interval is $\frac{1}{4}$ times that of the dead interval.
- If the OSPF hello interval and dead interval are set to more aggressive levels than 1:4 seconds respectively, the OSPF protocol might flap when the **write memory** command is used or in the case of any high CPU.

The **running-config** command displays only explicitly configured values of the hello interval, which means that a value that was automatically changed as the result of a dead-interval change is not displayed.

The **no** form of the command restores the default value.

Examples

The following example sets the dead interval to 80 on a specific OSPFv3 virtual Ethernet (VE) interface.

```
device# configure terminal
device(config)# interface ve 1
device(config-vif-1)# ipv6 ospf dead-interval 80
```

ipv6 ospf hello-interval

Sets the length of time between the transmission of hello packets that an interface sends to neighbor routers.

Syntax

```
ipv6 ospf hello-interval interval  
no ipv6 ospf hello-interval
```

Command Default

The length of time between the transmission of hello packets is set to 10 seconds.

Parameters

interval

Hello interval in seconds. Valid values range from 1 through 65535 seconds. The default is 10.

Modes

Interface subtype configuration mode

Usage Guidelines

If you change the hello interval, the dead interval is automatically changed to a value that is four times that of the new hello interval, unless the dead interval is also explicitly configured using the **ipv6 ospf dead-interval** command.

The recommended setting is that:

- The dead interval is four times that of the hello interval.
- The hello interval is $\frac{1}{4}$ times that of the dead interval.
- If the OSPF hello interval and dead interval are set to more aggressive levels than 1:4 seconds respectively, the OSPF protocol might flap when the **write memory** command is used or in the case of any high CPU.

The **running-config** command displays only explicitly configured values of the dead interval, which means that a value that was automatically changed as the result of a hello interval change is not displayed.

The **no** form of the command restores the default value.

Examples

The following example sets the hello interval to 20 on a specific OSPFv3 virtual Ethernet (VE) interface.

```
device# configure terminal  
device(config)# interface ve 1  
device(config-vif-1)# ipv6 ospf hello-interval 20
```

ipv6 ospf hello-jitter

Sets the allowed jitter between HELLO packets.

Syntax

ipv6 ospf hello-jitter *interval*

no ipv6 ospf hello-jitter

Parameters

jitter

Allowed interval between hello packets. Valid values range from 1 through 50 percent (%).

Modes

Interface subtype configuration mode

Usage Guidelines

The hello interval can vary from the configured hello-interval to a maximum of percentage value of configured jitter.

Examples

The following example sets the hello jitter to 20 on a specific OSPFv3 Virtual Ethernet (VE) interface.

```
device# configure terminal
device(config)# interface interface ve 1
device(config-vif-1)# ipv6 ospf hello-jitter 20
```

ipv6 ospf instance

Specifies the number of OSPFv3 instances running on an interface.

Syntax

ipv6 ospf instance *instanceID*

no ipv6 ospf instance

Parameters

instanceID

Instance identification number. Valid values range from 0 through 255.

Modes

Interface subtype configuration mode

Usage Guidelines

The **no** form of the command restores the default value.

Examples

The following example sets the number of IPv6 OSPF instances to 35 on a specific OSPFv3 Virtual Ethernet (VE) interface.

```
device# configure terminal
device(config)# interface interface ve 1
device(config-vif-1)# ipv6 ospf instance 35
```

ipv6 ospf mtu-ignore

Enables or disables maximum transmission unit (MTU) match checking.

Syntax

```
ipv6 ospf mtu-ignore  
no ipv6 ospf mtu-ignore
```

Command Default

Enabled.

Modes

Interface subtype configuration mode

Usage Guidelines

In default operation, the IP MTU on both sides of an OSPFv3 link must be the same, and a check of the MTU is performed when Hello packets are first exchanged.

The **no** form of the command disables MTU-match checking on a specific interface.

Examples

The following example disables MTU-match checking on a specific OSPFv3 Virtual Ethernet (VE) interface.

```
device# configure terminal  
device(config)# interface interface ve 1  
device(config-vif-1)# no ipv6 ospf mtu-ignore
```

The following example enables MTU-match checking on a specific OSPFv3 Virtual Ethernet (VE) interface.

```
device# configure terminal  
device(config)# interface interface ve 1  
device(config-vif-1)# ipv6 ospf mtu-ignore
```

ipv6 ospf network

Configures network type.

Syntax

```
ipv6 ospf network { broadcast | point-to-point }  
no ipv6 ospf network
```

Command Default

Network type is broadcast for Ethernet and VE interfaces. Network type is point-to-point for tunnel and GRE interfaces.

Parameters

broadcast

Network type is broadcast, such as Ethernet.

point-to-point

Network type is point-to-point.

Modes

Interface subtype configuration mode

Usage Guidelines

Point-to-point can support unnumbered links, which requires less processing by OSPFv3.

The **no** form of the command removes the network-type configuration.

NOTE

The network type non-broadcast is not supported at this time.

Examples

The following example configures an OSPFv3 point-to-point link on a specific OSPFv3 Virtual Ethernet (VE) interface.

```
device# configure terminal  
device(config)# interface interface ve 1  
device(config-vif-1)# ipv6 ospf network point-to-point
```

The following example configures an OSPFv3 broadcast link on a specific OSPFv3 Virtual Ethernet (VE) interface.

```
device# configure terminal  
device(config)# interface interface ve 1  
device(config-vif-1)# ipv6 ospf network broadcast
```

ipv6 ospf passive

Sets a specific OSPFv3 interface to passive.

Syntax

ipv6 ospf passive

no ipv6 ospf passive

Modes

Interface subtype configuration mode

Usage Guidelines

The **ipv6 ospf passive** command disables transmission of OSPFv3 control packets on that interface. OSPFv3 control packets received on a passive interface are discarded.

The **no** form of the command sets an interface back to active.

Examples

The following example sets a specific OSPFv3 virtual Ethernet (VE) interface to passive.

```
device# configure terminal
device(config)# interface interface ve 1
device(config-vif-1)# ipv6 ospf passive
```

ipv6 ospf priority

Configures priority for designated router (DR) election and backup designated routers (BDRs) on the interface you are connected to.

Syntax

ipv6 ospf priority *value*

no ipv6 ospf priority

Command Default

The value is set to 1.

Parameters

value

Priority value. Valid values range from 0 through 255. The default is 1.

Modes

Interface subtype configuration mode

Usage Guidelines

The OSPFv3 router assigned the highest priority becomes the designated router, and the OSPFv3 router with the second-highest priority becomes the backup router.

The **no** form of the command restores the default value.

Examples

The following example sets a priority of 4 for the OSPFv3 router that is connected to an OSPFv3 Virtual Ethernet (VE) interface.

```
device# configure terminal
device(config)# interface interface ve 1
device(config-vif-1)# ipv6 ospf priority 4
```

ipv6 ospf retransmit-interval

Configures the retransmit interval. The retransmit interval is the time between Link-State Advertisement (LSA) retransmissions to adjacent routers for a given interface.

Syntax

ipv6 ospf retransmit-interval *interval*

no ipv6 ospf retransmit-interval

Command Default

The interval is 5 seconds.

Parameters

interval

Retransmit interval in seconds. Valid values range from 0 through 3600 seconds. The default is 5.

Modes

Interface subtype configuration mode

Usage Guidelines

The **no** form of the command resets the retransmit interval to its default.

Examples

The following example sets the retransmit interval to 8 for all OSPFv3 devices on an OSPFv3 Virtual Ethernet (VE) interface.

```
device# configure terminal
device(config)# interface interface ve 1
device(config-vif-1)# ipv6 ospf retransmit-interval 8
```

ipv6 ospf suppress-linklsa

Suppresses link LSA advertisements.

Syntax

ipv6 ospf suppress-linklsa

no ipv6 ospf suppress-linklsa

Modes

Interface subtype configuration mode

Usage Guidelines

The **no** form of the command restores the defaults where link LSA advertisements are not suppressed.

Examples

The following example suppresses link LSAs from being advertised on devices on a specific OSPFv3 Virtual Ethernet (VE) interface.

```
device# configure terminal
device(config)# interface interface ve 1
device(config-vif-1)# ipv6 ospf suppress-linklsa
```

ipv6 ospf transmit-delay

Configures transmit delay for link-update packets. The transmit delay is the estimated time required for OSPFv3 to send link-state update packets on the interface to which you are connected.

Syntax

ipv6 ospf transmit-delay *value*

no ipv6 ospf transmit-delay

Command Default

The transmit delay is set to 1 second.

Parameters

value

Transmit delay in seconds. Valid values range from 0 through 3600 seconds.

Modes

Interface subtype configuration mode

Usage Guidelines

The **no** form of the command restores the default value.

Examples

The following example sets a transmit delay of 25 seconds for devices on a specific OSPFv3 Virtual Ethernet (VE) interface.

```
device# configure terminal
device(config)# interface interface ve 1
device(config-vif-1)# ipv6 ospf transmit-delay 25
```

ipv6 neighbor inspection

Configures the static neighbor discovery (ND) inspection entries.

Syntax

ipv6 neighbor inspection *ipv6-address mac-address*

no ipv6 neighbor inspection *ipv6-address mac-address*

Command Default

Static ND inspection entries are not configured.

Parameters

ipv6-address

Configures the IPv6 address of the host.

mac-address

Configures the MAC address of the host.

Modes

Global configuration mode

VRF configuration mode

Usage Guidelines

Use the **ipv6 neighbor inspection** command to manually configure static ND inspection entries for hosts on untrusted ports. During ND inspection, the IPv6 address and MAC address entries in the ND inspection table are used to validate the packets received on untrusted ports.

The **no** form of the command disables static ND inspection entries.

Examples

The following example displays the configuration of a static ND inspection entry.

```
device(config)# ipv6 neighbor inspection 2001::1 0000.1234.5678
```

The following example displays the configuration of a static ND inspection entry for VRF 3.

```
device(config)# vrf 3  
device(config-vrf-3)# ipv6 neighbor inspection 2001::100 0000.0000.4567
```

History

Release version	Command history
08.0.20	This command was introduced.

ipv6 neighbor inspection vlan

Configures and enables neighbor discovery (ND) inspection on a VLAN to inspect the IPv6 packets from untrusted ports.

Syntax

ipv6 neighbor inspection vlan *vlan-number*
no ipv6 neighbor inspection vlan *vlan-number*

Command Default

IPv6 neighbor inspection is not enabled.

Parameters

vlan-number
Configures the ID of the VLAN.

Modes

Global configuration mode
VRF configuration mode

Usage Guidelines

When you configure this command, IPv6 packets from untrusted ports on the VLAN undergo ND inspection. The **no** form of the command disables ND inspection.

Examples

The following example enables ND inspection on VLAN 10.

```
device(config)# ipv6 neighbor inspection vlan 10
```

The following example enables ND inspection on VLAN 10 of VRF 3.

```
device(config)# vrf 3  
device(config-vrf-3)# ipv6 neighbor inspection vlan 10
```

History

Release version	Command history
08.0.20	This command was introduced.

ipv6 pim border

Configures an interface to be on a PIM Sparse domain border.

Syntax

ipv6 pim border

no ipv6 pim border

Command Default

The interface is not configured as a border device.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of this command removes the boundary on a PIM-enabled interface.

You must enable PIM globally before you enable it on an interface.

Examples

This example configures Ethernet interface 3/2/4 to be on a PIM Sparse domain border.

```
device(config) interface ethernet 3/2/4  
Device(config-if-e10000-3/2/4)# ipv6 pim border
```

ipv6 pim dr-priority

Configures the designated router (DR) priority on IPv6 interfaces.

Syntax

```
ipv6 pim dr-priority priority-value  
no ipv6 pim priority-value
```

Command Default

The DR priority value is 1.

Parameters

priority-value
Specifies the DR priority value as an integer. The range is 0 through 65535. The default is 1.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of this command restores the default DR priority value, 1.

You must enable PIM globally before you enable it on an interface.

If more than one device has the same DR priority on a subnet (as in the case of default DR priority on all), the device with the numerically highest IPv6 address on that subnet is elected as the DR.

The DR priority information is used in the DR election only if all the PIM devices connected to the subnet support the DR priority option. If at least one PIM device on the subnet does not support this option, the DR election falls back to the backwards compatibility mode in which the device with the numerically highest IPv6 address on the subnet is declared the DR regardless of the DR priority values.

Examples

This example configures a DR priority value of 50 on Ethernet interface 3/2/4.

```
device(config) interface ethernet 3/2/4  
Device(config-if-e10000-3/2/4)# ipv6 pim dr-priority 50
```

This example configures a DR priority value of 50 on a virtual Ethernet interface.

```
Device(config)# interface ve 10  
Device(config-vif-10)# ipv6 pim dr-priority 50
```

ipv6 pim neighbor-filter

Determines which devices can become PIM neighbors.

Syntax

```
ipv6 pim neighbor-filter acl-name
```

```
no ipv6 pim acl-name
```

Command Default

Neighbor filtering is not applied on the interface.

Parameters

acl-name

Specifies the access-control list (ACL) that identifies the devices you want to permit and deny participation in PIM.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of this command removes any neighbor filtering applied on the interface.

You must enable PIM globally before you enable it on an interface.

You can configure the **ipv6 pim neighbor-filter** command in either Dense mode (DM) or Sparse mode (SM).

Configure the **access-list** command to create an ACL defining the devices you want to permit and deny participation in PIM.

Examples

This example prevents the host from becoming a PIM neighbor on interface Ethernet 1/3/24.

```
Device(config)# interface ethernet 1/3/24
Device(config-if-e10000-1/3/24)# ipv6 pim neighbor-filter
```

This example configures an ACL named 10 to deny a host and then prevents that host, 1001::1/96, identified in that ACL from becoming a PIM neighbor on interface Ethernet 1/3/24.

```
Device(config)# access-list 10 deny host 1001::1/96
Device(config)# access-list 10 permit any
Device(config)# interface ethernet 1/3/24
Device(config-if-e10000-1/3/24)# ipv6 pim neighbor-filter 10
```

History

Release version	Command history
8.0.20a	This command was introduced.

ipv6 pim-sparse

Enables PIM Sparse on an IPv6 interface.

Syntax

ipv6 pim-sparse

no ipv6 pim-sparse

Command Default

PIM Sparse is not enabled on the IPv6 interface.

Modes

Interface configuration mode

Usage Guidelines

The **no ipv6 pim-sparse** command removes the PIM sparse configuration from the IPv6 interface.

Examples

This example adds an IPv6 interface to port 1/2/2, then enables PIM Sparse on the interface.

```
Device(config)# interface ethernet 1/2/2
Device(config-if-e10000-2/2)# ipv6 address a000:1111::1/64
Device(config-if-e10000-2/2)# ipv6 pim-sparse
```

ipv6 pimsm-snooping

Enables PIM6 SM traffic snooping.

Syntax

ipv6 pimsm-snooping

no ipv6 pimsm-snooping

Command Default

PIM6 SM traffic snooping is disabled.

Modes

Global configuration mode

VLAN configuration mode

Usage Guidelines

The device must be in multicast listening discovery (MLD) passive mode before it can be configured for PIM6 SM snooping.

Use PIM6 SM snooping only in topologies where multiple PIM sparse routers connect through a device. PIM6 SM snooping does not work on a PIM dense mode router which does not send join messages and traffic to PIM dense ports is stopped. A PIM6 SM snooping-enabled device displays a warning if it receives PIM dense join or prune messages.

When PIM6 SM snooping is enabled globally, you can override the global setting and disable it for a specific VLAN.

The **no** form of this command disables PIM6 SM traffic snooping.

Examples

The following example enables PIM6 SM traffic snooping.

```
device(config)# ipv6 multicast passive
device(config)# ipv6 pimsm-snooping
```

The following example disables PIM6 SM traffic snooping.

```
device(config)# no ipv6 pimsm-snooping
```

The following example enables PIM6 SM traffic snooping on VLAN 20.

```
device(config)# vlan 20
device(config-vlan-20)# untagged ethernet 1/1/5 ethernet 1/1/7 ethernet 1/1/11
device(config-vlan-20)# multicast6 passive
device(config-vlan-20)# multicast6 pimsm-snooping
```

ipv6 prefix-list

Configures IPv6 prefix lists for use in basic traffic filtering.

Syntax

```
ipv6 prefix-list { name | sequence-number } deny ipv6-prefix/prefix-length [ ge ge-value ] [ le le-value ]
```

```
ipv6 prefix-list { name | sequence-number } description string
```

```
ipv6 prefix-list { name | sequence-number } permit ipv6-prefix/prefix-length [ ge ge-value ] [ le le-value ]
```

```
ipv6 prefix-list { name | sequence-number } seq sequence-number permit ipv6-prefix/prefix-length [ ge ge-value ] [ le le-value ]
```

```
ipv6 prefix-list { name | sequence-number } seq sequence-number deny ipv6-prefix/prefix-length [ ge ge-value ] [ le le-value ]
```

```
no ipv6 prefix-list name
```

Command Default

A prefix-list is not created.

Parameters

name

Specifies the prefix list name.

sequence-number

Specifies an IPv6 prefix list sequence number.

deny *ip-prefix/prefix-length*

Denies a packet that contains a route specified in the prefix list. The prefix list matches only on the specified prefix/prefix length, unless you use the **ge** *ge-value* or **le** *le-value* parameters.

ge *ge-value*

Specifies a minimum range of prefix lengths, from *ge-value* to 128.

le *le-value*

Specifies a maximum range of prefix lengths, up to 128, from the *le-value* to the *prefix-length* parameter.

description *string*

Specifies a text string describing the prefix list.

permit *ip-prefix/prefix-length*

Permits a packet that contains a route specified in the prefix list. The prefix list matches only on the specified prefix/prefix length, unless you use the **ge** *ge-value* or **le** *le-value* parameters.

seq *sequence-number*

Specifies an IPv6 prefix list sequence number. If you do not specify a sequence number, the software numbers them in increments of 5, beginning with prefix list entry 5. The Brocade device interprets the prefix list entries in numerical order, beginning with the lowest sequence number.

Modes

Global configuration mode

Usage Guidelines

An IPv6 prefix list is composed of one or more conditional statements that execute a permit or deny action if a packet matches a specified prefix. In prefix lists with multiple statements, you can specify a sequence number for each statement. The specified sequence number determines the order in which the statement appears in the prefix.

You can configure an IPv6 prefix list on a global basis, then use it as input to other commands or processes, such as route aggregation, route redistribution, route distribution, route maps, and so on. When a Brocade device interface sends or receives an IPv6 packet, it applies the statements within the IPv6 prefix list in their order of appearance to the packet. As soon as a match occurs, the device takes the specified action (permit or deny the packet) and stops further comparison for that packet.

You can use permit statements in the prefix list to specify the traffic that you want to send to the other feature. If you use deny statements, the traffic specified by the deny statements is not supplied to the other feature. You can configure up to one hundred IPv6 prefix lists.

You must specify the `ipv6-prefix` parameter in hexadecimal using 16-bit values between colons as documented in RFC 4291. You must specify the `prefix-length` parameter as a decimal value. A slash mark (/) must follow the `ipv6-prefix` parameter and precede the `prefix-length` parameter.

The *ge-value* or *le-value* you specify must meet the following condition for *prefix-length*:

```
ge-value <= le-value <= 128
```

If you do not specify **ge** *ge-value* or **le** *le-value*, the prefix list matches only on the exact prefix you specify with the *ipv6-prefix/prefix-length* parameter.

Prefix lists can be applied to RIPng globally using the separate **prefix-list** command) or at the interface level using the separate **ipv6 rip prefix-list** command. If both global IPv6 RIP prefix list and interface IPv6 rip prefix list are enabled, routes are filtered based on the interface prefix list.

The **no** form of the command deletes a prefix list.

Examples

The following example creates a prefix-list that allows routes with the prefix 2001:db8::/32 to be included in RIPng routing updates sent from Ethernet interface 3/1/1.

```
device# configure terminal
device(config)# ipv6 prefix-list routesfor2001 permit 2001:db8::/32
device(config) # interface ethernet 3/1/1
device(config-if-e1000-3/1/1)# ipv6 rip prefix-list routesfor2001 out
```

The following example creates a prefix-list that allows routes with the prefix 2001:db8::/32 to be included in RIPng routing updates sent from all the IPv6 RIP interfaces on the device.

```
device# configure terminal
device(config)# ipv6 prefix-list routesfor2001 permit 2001:db8::/32
device(config)# ipv6 router rip
device(config-ripng-router)# distribute-list prefix-list routesfor2001 out
```

ipv6-proto

Configures an IPv6 protocol-based VLAN.

Syntax

ipv6-proto [*name string*]

no ipv6-proto [*name string*]

Command Default

An IPv6 protocol-based VLAN is not configured.

Parameters

name *string*

Specifies the IPv6 protocol-based VLAN name. The maximum length of the string is 32 characters.

Modes

VLAN configuration mode

Usage Guidelines

You can configure a protocol-based VLAN as a broadcast domain for IPv6 traffic. When the Layer 3 switch receives an IPv6 multicast packet (a packet with 06 in the version field and 0xFF as the beginning of the destination address), the Layer 3 switch forwards the packet to all other ports.

The **no** form of the command disables the IPv6 protocol VLAN.

Examples

The following example configures the IPv6 protocol-based VLAN.

```
device(config)# vlan 2
device(config-vlan-2)# ipv6-proto name V6
```

ipv6 rguard policy

Configures the specified Router Advertisement (RA) guard policy and enters RA guard policy configuration mode.

Syntax

ipv6 rguard policy *name*
no ipv6 rguard policy *name*

Parameters

name

An ASCII string indicating the name of the RA guard policy to configure.

Modes

Global configuration mode

RA guard policy configuration mode

Usage Guidelines

You can configure up to 256 RA guard policies.

The **no** form of this command deletes the specified RA guard policy.

Examples

The following example configures an RA guard policy and enters RA guard policy configuration mode:

```
Brocade(config)# ipv6 rguard policy policy1  
Brocade(ipv6-RAG-policy policy1)#
```

ipv6 raguard vlan

Associates a Router Advertisement (RA) guard policy with a VLAN.

Syntax

ipv6 raguard vlan *vlan-number* **policy** *name*

no ipv6 raguard vlan *vlan-number* **policy** *name*

Parameters

vlan-number

Configures the ID number of the VLAN to which the specified RA guard policy should be associated. Valid range is from 1 to 4095.

policy

Associates a RA guard policy to the VLAN.

name

Specifies the name of the RA guard policy to be associated with the VLAN.

Modes

Global configuration mode

Usage Guidelines

A VLAN can have only one association with a RA guard policy. If you try to associate a new RA guard policy with a VLAN that is already associated with a policy, the new RA guard policy replaces the old one.

no

Examples

The following example associates RA guard policy named p1 with VLAN 1:

```
Brocade(config)# ipv6 raguard vlan 1 policy p1
```

ipv6 raguard whitelist

Configures the Router Advertisement (RA) guard whitelist and adds the IPv6 address as the allowed source IP address.

Syntax

ipv6 raguard whitelist *whitelist-number* **permit** *ipv6-address*

no ipv6 raguard whitelist *whitelist-number* **permit** *ipv6-address*

Parameters

whitelist-number

Configures the unique identifier for the RA guard whitelist. Valid values are 0 to 255.

permit

Configures the specified IPv6 address as the allowed source IP address to the RA guard whitelist.

ipv6-address

Configures the source IPv6 address. The address should be in the format X:X::X:X or X:X::X:X/M.

Modes

Global configuration mode

Usage Guidelines

You can configure source IP addresses from which RAs are permitted.

You can configure up to 64 RA guard whitelists, and each whitelist can have a maximum of 128 entries.

To remove the RA guard whitelist, use the **no** form of the command without the **permit** keyword.

To remove a particular IPv6 address from the whitelist, use the **no** form of the command with the **permit***ipv6-address* keyword-variable pair.

When a whitelist associated with an RA guard policy is removed, all the entries in the whitelist are also removed. All the RAs are dropped because there is no whitelist associated with the RA guard policy.

Examples

The following example configures an RA guard whitelist with the allowed source IP address:

```
Brocade(config)# ipv6 raguard whitelist 1 permit fe80:db8::db8:10
```

The following example removes an RA guard whitelist:

```
Brocade(config)# no ipv6 raguard whitelist 1
```

The following example removes a particular IPv6 address from the RA guard whitelist:

```
Brocade(config)# no ipv6 raguard whitelist 1 permit fe80:db8::db8:10
```

ipv6 redirects

Enables a Layer 3 switch to send an IPv6 ICMP redirect message to a neighboring host to inform it of a better first-hop router on a path to a destination.

Syntax

ipv6 redirects

no ipv6 redirects

Command Default

By default, the sending of IPv6 ICMP redirect messages by a Layer 3 switch is disabled.

Modes

Interface configuration mode

Usage Guidelines

This feature is supported on Virtual Ethernet (VE) interfaces only.

The **no** form of the command disables a Layer 3 switch to send an IPv6 ICMP redirect message to a neighboring host.

Examples

The following example enables a Layer 3 switch to send an IPv6 ICMP redirect message to a neighboring host.

```
device(config)# interface ve 1  
device(config-vif-1)# ipv6 redirects
```

ipv6 rip default-information

Configures learning and advertising of default routes for RIPng.

Syntax

```
ipv6 rip default-information { only | originate }  
no ipv6 rip default-information { only | originate }
```

Command Default

By default, the device does not learn IPv6 default routes.

Parameters

only

Originates the default routes and suppresses all other routes from RIPng route updates.

originate

Originates the default routes and includes all other routes in the RIPng route updates.

Modes

Interface configuration mode.

Usage Guidelines

Use the **no** form of the command to remove the explicit default routes from RIPng and to suppress advertisement of these routes.

Examples

The following example originates IPv6 default routes and includes all other routes in RIPng route updates sent from Ethernet interface 3/1/1.

```
device# configure terminal  
device(config)# interface ethernet 3/1/1  
device(config-if-e10000-3/1/1)# ipv6 rip default-information originate
```

ipv6 rip enable

Enables RIPng on an interface.

Syntax

ipv6 rip enable

no ipv6 rip enable

Command Default

RIPng is disabled by default.

Modes

RIPng configuration mode.

Usage Guidelines

Use the **no** form of the command to disable RIPng on an individual interface.

Before you can enable RIPng, you must first enable forwarding of IPv6 traffic on the device using the **ipv6 unicast-routing** command. You must also enable IPv6 on each interface that will support RIPng. Enable IPv6 explicitly on an interface with the **ipv6 enable** command or by configuring an IPv6 address on the interface.

After you enable RIPng on the device using the **ipv6 router rip** command, use the **ipv6 rip enable** command to enable each RIPng interface individually. You can use the command to enable RIPng on a physical or virtual routing interface.

Examples

The following example enables RIPng on Ethernet interface 3/1/1.

```
device# configure terminal
device(config)# interface ethernet 3/1/1
device(config-if-e100-3/1/1)# ipv6 rip enable
```

The following example enables RIPng on virtual ethernet interface 3.

```
device# configure terminal
device(config)# interface ve 3
device(config-vif-3)# ipv6 rip enable
```

ipv6 rip metric-offset

Changes the metric for RIPng routes learned and advertised on an interface.

Syntax

ipv6 rip metric-offset *value*

ipv6 rip metric-offset out *value*

no ipv6 rip metric-offset *value*

no ipv6 rip metric-offset out *value*

Command Default

By default, an IPv6 RIP interface adds 1 to the metric of an incoming RIPng route that it learns. By default, the interface advertises RIPng routes without adding to the metric (that is, with a default offset of zero).

Parameters

out

Specifies that the metric offset applies to outgoing (advertised) RIPng routes.

value

A decimal value that represents the offset to be added. The range is 1 through 16 for incoming routes and 0 through 15 for outgoing routes.

Modes

Interface configuration mode.

Usage Guidelines

Use the **no** form of these commands to return the metric offset to its default value, that is, 1 for incoming (learned) routes and 0 for outgoing (advertised) routes.

Examples

The following example increases the metric on learned RIPng routes by 2. The same interface increases the metric offset by 3 when it advertises a RIPng route.

```
device# configure terminal
device(config)# interface ethernet 3/1/1
device(config-if-e1000-3/1/1)# ipv6 rip metric-offset 2
device(config-if-e1000-3/1/1)# ipv6 rip metric-offset out 3
```

ipv6 rip summary-address

Advertises a summary of IPv6 addresses from an interface and specifies an IPv6 prefix that summarizes the routes.

Syntax

```
ipv6 rip summary-address {ipv6-prefix / prefix-length }
no ipv6 rip summary-address{ipv6-prefix / prefix-length }
```

Command Default

By default, original full-length routes rather than summary routes are advertised.

Parameters

ipv6-prefix
 Specifies the summarized IPv6 prefix as a hexadecimal value broken into 16-bit values separated by colons per RFC 2373.

prefix-length
 Specifies the IPv6 prefix length in bits as a decimal value.

Modes

Interface configuration mode.

Usage Guidelines

Use the **no** form of the command to stop advertising the summarized IPv6 prefix.
 The IPv6 prefix value must be separated from the prefix length by a forward slash (/).

Examples

The following example advertises the summarized prefix 2001:db8::/36 instead of the IPv6 address 2001:db8:0:adff:8935:e838:78:e0ff/64 from Ethernet interface 3/1/1.

```
device# configure terminal
device(config)# interface ethernet 3/1/1
device(config-if-e40000-3/1/1)# ipv6 address 2001:db8:0:adff:8935:e838:78:
e0ff /64
device(config-if-e40000-3/1/1)# ipv6 rip summary-address 2001:db8::/36
```

ipv6 route

Configures a static route.

Syntax

```
ipv6 route [ vrf vrf-name ] dest-ipv6-prefix [ ethernet unit/slot/port | ve ve-num ] next-hop-ipv6-address [ metric ]  
[distance number ]
```

```
no ipv6 route [ vrf vrf-name ] dest-ipv6-prefix [ ethernet unit/slot/port | ve ve-num ] next-hop-ipv6-address [ metric ]  
[distance number ]
```

```
ipv6 route [ vrf vrf-name ] dest-ipv6-prefix { tunnel num | null0 } [ metric ] [distance number ]
```

```
no ipv6 route [ vrf vrf-name ] dest-ipv6-prefix { tunnel num | null0 } [ metric ] [distance number ]
```

Parameters

vrf *vrf-name*

Specifies the VRF that contains the next-hop router (gateway) for the route.

dest-ipv6-prefix

Specifies the destination IPv6 address, including prefix length.

ethernet *unit/slot/port*

Configures the outgoing interface as the specified Ethernet interface.

ve *ve-num*

Configures the outgoing interface as the specified Virtual Ethernet interface.

next-hop-ipv6-address

Specifies the IPv6 address of a next-hop gateway. The next-hop address may be a global IPv6 address or a link-local IPv6 address.

metric

Specifies the route's metric. The value can range from 1 to 16. The default value is 1.

distance *number*

Specifies the route's administrative distance. The default value is 1.

tunnel *num*

Configures the outgoing interface as the specified tunnel interface.

null0

Drops packets with this destination.

Modes

Global configuration mode

Usage Guidelines

By default, static routes take precedence over routes learned by routing protocols.

Before configuring a static IPv6 route, you must enable the forwarding of IPv6 traffic on the Layer 3 switch using the **ipv6 unicast-routing** command and must enable IPv6 on at least one interface by configuring an IPv6 address or explicitly enabling IPv6 on that interface.

If a non-default VRF is configured, the **no** form of the command removes the static IPv6 route configuration from a VRF. When no VRF is configured, the **no** form of the command removes the IPv6 static route.

When a tunnel is configured as the next hop for a static route, the tunnel must already be configured if the destination is a non-default VRF. In contrast, a tunnel can be designated as the next hop in the default VRF before it is configured. The default VRF is used when no VRF is specified in the command.

Examples

The following example configures a static IPv6 route for a destination network with the prefix 2001:DB8::0/32 and a next-hop gateway with the global address 2001:DB8:0:ee44::1.

```
device(config)# ipv6 route 2001:DB8::0/32 2001:DB8:0:ee44::1
```

The following example configures a static IPv6 route for a destination network with the prefix 2001:DB8::0/32 and a next-hop gateway with the global address 2001:DB8:0:ee44::1 in the non-default VRF named blue.

```
device(config)# ipv6 route vrf blue 2001:DB8::0/32 2001:DB8:0:ee44::1
```

The following example configures tunnel 1 as the next hop gateway for 2001:DB8::0/32 destination addresses. Because the destination is a non-default VRF (VRF blue), the tunnel must be configured before the static route is configured.

```
device(config)# ipv6 route vrf blue 2001:DB8::0/32 tunnel 1
```

The following example configures a null route that discards packets to the destination ipv6 route 2001 : DB8 : : 0/32 when the preferred route using virtual interface 3 (ve 3) through the next hop with the link-local address fe80::1 is not available. The null route has a higher metric (2) than the preferred route, which has a default metric of 1.

```
device# configure terminal
device(config)# ipv6 route 2001 : DB8 : : 0/32 ve 3 fe80::1
device(config)# ipv6 route 2001 : DB8 : : 0/32 null0 2
```

ipv6 route next-hop

You can resolve IPv6 static routes through the specified protocol.

Syntax

```
ipv6 route [ vrf vrf-name ] next-hop { bgp | ospf | rip }  
no ipv6 route [ vrf vrf-name ] next-hop { bgp | ospf | rip }
```

Command Default

By default, static routes are not distributed or resolved through another protocol.

Parameters

vrf *vrf-name*

Specifies the VRF that contains the next-hop router (gateway) for the route.

next-hop { **bgp** | **ospf** | **rip** }

Specifies a protocol (BGP, OSPF, or RIP) to be used to resolve the IPv6 static route.

Modes

Global configuration mode

Usage Guidelines

Before configuring a static IPv6 route, you must enable the forwarding of IPv6 traffic on the Layer 3 switch using the **ipv6 unicast-routing** command and enable IPv6 on at least one interface by configuring an IPv6 address or explicitly enabling IPv6 on that interface.

The **no** form of the command disables IPv6 static route next-hop resolution through the designated protocol. If a VRF is configured, the **no** form of the command removes the static IPv6 route configuration from the VRF.

Examples

The following example enables IPv6 static route next-hop resolution through OSPF.

```
device# configure terminal  
device(config)# ipv6 route next-hop ospf
```

ipv6 route next-hop-enable-default

You can enable the IPv6 default static route to resolve other static routes.

Syntax

```
ipv6 route [ vrf vrf-name ] next-hop-enable-default  
no ipv6 route [ vrf vrf-name ] next-hop-enable-default
```

Command Default

By default, the IPv6 default static route is not used to resolve static route next hops.

Parameters

vrf *vrf-name*
Specifies the VRF that contains the next-hop router (gateway) for the route.

Modes

Global configuration mode

Usage Guidelines

Before configuring a static IPv6 route, you must enable the forwarding of IPv6 traffic on the Layer 3 switch using the **ipv6 unicast-routing** command and must enable IPv6 on at least one interface by configuring an IPv6 address or explicitly enabling IPv6 on that interface.

The **no** form of the command disables IPv6 static route next-hop resolution through the default route. If a VRF is configured, the **no** form of the command removes the static IPv6 route configuration from the VRF.

Examples

The following example configures static routing next-hop recursion to three levels (the default). It configures the network default static route and allows it to resolve other static routes.

NOTE

You can specify a level of recursion up to 10.

```
device# configure terminal  
device(config)# ipv6 route next-hop-recursion  
device(config)# ipv6 route 0.0.0.0 0.0.0.0 xxx.xxx.xxx.xxx  
device(config)# ipv6 route next-hop-enable-default
```

ipv6 route next-hop-recursion

You can resolve static route destination using recursive lookup in local address tables up to 10 hops away.

Syntax

```
ipv6 route [ vrf vrf-name ] next-hop-recursion [ number ]  
no ipv6 route [ vrf vrf-name ] next-hop-recursion [ number ]
```

Command Default

By default, only the local IPv6 address table is consulted to resolve the next hop toward a static route destination.

Parameters

vrf *vrf-name*

Specifies the VRF that contains the next-hop router (gateway) for the route.

number

Specifies the level of recursion for address lookup. The range is 1 through 10. If no number is specified, the default value is 3.

Modes

Global configuration mode

Usage Guidelines

Before configuring a static IPv6 route, you must enable the forwarding of IPv6 traffic on the Layer 3 switch using the **ipv6 unicast-routing** command and must enable IPv6 on at least one interface by configuring an IPv6 address or explicitly enabling IPv6 on that interface.

The **no** form of the command disables IPv6 static route next-hop recursion. If a VRF is configured, the **no** form of the command removes the static IPv6 route configuration from the VRF.

Examples

The following example configures recursive static route lookup to five levels for static route resolution.

```
device# configure terminal  
device(config)# ipv6 route next-hop-recursion 5
```

ipv6 router ospf

Enables and configures the Open Shortest Path First version 3 (OSPFv3) routing protocol.

Syntax

```
ipv6 router ospf [ vrf name ]  
no ipv6 router ospf
```

Command Default

Disabled.

Parameters

vrf name
Specifies a nondefault VRF.

Modes

Global configuration mode

Usage Guidelines

If you save the configuration to the startup-config file after disabling OSPFv3, all OSPFv3 configuration information is removed from the startup-config file.

Use this command to enable the OSPFv3 routing protocol and enter OSPFv3 router or OSPFv3 router VRF configuration mode. OSPFv3 maintains multiple instances of the routing protocol to exchange route information among various VRF instances.

The **no** form of the command deletes all current OSPFv3 configurations and blocks any further OSPFv3 configuration.

Examples

The following example enables OSPFv3 on a default VRF and enters OSPFv3 router configuration mode.

```
device# configure terminal  
device(config)# ipv6 router ospf  
device(config-ospf6-router)#
```

ipv6 router pim

Enables IPv6 PIM-Sparse mode for IPv6 routing globally or on a specified VRF.

Syntax

ipv6 router pim [**vrf** *vrf-name*]

no ipv6 router pim [**vrf** *vrf-name*]

Command Default

IPv6 PIM-Sparse mode is not enabled.

Parameters

vrf *vrf-name*

Specifies a VRF instance.

Modes

Global configuration mode.

VRF configuration mode.

Usage Guidelines

The **no** form of this command removes the IPv6 PIM-Sparse mode configuration.

Examples

The following example enables IPv6 PIM-Sparse mode on a VRF named blue.

```
Device(config)# ipv6 router pim vrf blue
```

ipv6 router rip

Enables RIPng globally (on the device).

Syntax

ipv6 router rip

no ipv6 router rip

Command Default

By default, RIPng is disabled.

Modes

Global configuration mode

Usage Guidelines

To disable RIPng globally, use the **no** form of this command.

Before you can enable RIPng, you must enable forwarding of IPv6 traffic on the device using the **ipv6 unicast-routing** command.

You must enable IPv6 on each interface on which RIPng is to be enabled. Enable IPv6 explicitly on the interface with the **ipv6 enable** command or by configuring an IPv6 address on the interface.

After enabling RIPng globally, you must enable it on individual device interfaces using the **ipv6 rip enable** command. You can enable RIPng on physical as well as virtual routing interfaces.

Examples

The following example enables RIPng on the device.

```
device# configure terminal
device(config)# ipv6 router rip
device(config-ripng-router)#
```

ipv6 router vrrp

Globally enables IPv6 Virtual Router Redundancy Protocol (VRRP).

Syntax

ipv6 router vrrp

no ipv6 router vrrp

Command Default

IPv6 VRRP is not globally enabled.

Modes

Global configuration mode

Usage Guidelines

After globally enabling IPv6 VRRP, the command prompt does not change. Nearly all subsequent IPv6 VRRP configuration is performed at the interface level, but IPv6 VRRP must be enabled globally before configuring IPv6 VRRP instances.

The **no** form of the command disables VRRP globally.

Examples

The following example enables IPv6 VRRP globally and enters interface configuration mode to allow you to enter more VRRP configuration.

```
device# configure terminal
device(config)# ipv6 router vrrp
device(config-ipv6-vrrp-router)# interface ethernet 1/1/4
device(config-if-e1000-1/1/4)# ipv6 address fd3b::3/64
device(config-if-e1000-1/1/4)# ipv6 vrrp vrid 2
device(config-if-e1000-1/1/4-vrid-2)# backup priority 100
device(config-if-e1000-1/1/4-vrid-2)# version 3
device(config-if-e1000-1/1/4-vrid-2)# advertise backup
device(config-if-e1000-1/1/4-vrid-2)# ipv6-address fe80::768e:f8ff:fe2a:0099
device(config-if-e1000-1/1/4-vrid-2)# ipv6-address fd3b::2
device(config-if-e1000-1/1/4-vrid-2)# activate
```

ipv6 router vrrp-extended

Globally enables IPv6 Virtual Router Redundancy Protocol Extended (VRRP-E).

Syntax

```
ipv6 router vrrp-extended  
no ipv6 router vrrp-extended
```

Command Default

VRRP-E is not globally enabled.

Modes

Global configuration mode

Usage Guidelines

After globally enabling IPv6 VRRP-E, nearly all subsequent IPv6 VRRP-E configuration is performed at the interface level. If IPv6 VRRP-E is not globally enabled, you will see an error message when configuring IPv6 VRRP-E instances.

The **no** form of the command disables VRRP-E globally.

Examples

The following example enables IPv6 VRRP-E globally and enters interface configuration mode for subsequent IPv6 VRRP-E configuration.

```
device# configure terminal  
device(config)# ipv6 router vrrp-extended  
device(config-ipv6-vrrpe-router)# interface ethernet 1/1/5
```

ipv6 traffic-filter

Applies an IPv6 ACL to incoming or outgoing traffic on an interface.

Syntax

ipv6 traffic-filter *acl-name* { **in** | **out** }

no ipv6 traffic-filter *acl-name* { **in** | **out** }

Command Default

The ACL is not applied to an interface.

Parameters

acl-name

Applies the specified ACL to the interface traffic.

in

Applies the specified IPv6 ACL to incoming IPv6 packets on the interface.

out

Applies the specified IPv6 ACL to outgoing IPv6 packets on the interface.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of the command removes the association of the ACL with interface traffic.

Examples

The following example applies the ACL "acl1" to the interface 1/1/1 .

```
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# ipv6 traffic-filter acl1 in
```

ipv6 vrrp vrid

Configures an IPv6 Virtual Router Redundancy Protocol (VRRP) virtual router identifier (VRID).

Syntax

ipv6 vrrp vrid *vrid*

no ipv6 vrrp vrid *vrid*

Command Default

An IPv6 VRRP VRID does not exist.

Parameters

vrid

Configures a number for the IPv6 VRRP VRID. The range is from 1 through 255.

Modes

Interface configuration mode

Usage Guidelines

Before configuring this command, ensure that IPv6 VRRP is enabled globally; otherwise, an error stating "Invalid input..." is displayed as you try to create a VRRP instance.

The **no** form of this command removes the IPv6 VRRP VRID from the configuration.

Examples

The following example configures IPv6 VRRP VRID 1.

```
device# configure terminal
device(config)# ipv6 router vrrp
device(config)# interface ethernet 1/1/5
device(config-if-e1000-1/1/5)# ipv6 address fd2b::2/64
device(config-if-e1000-1/1/5)# ipv6 vrrp vrid 2
device(config-if-e1000-1/1/5-vrid-2)# owner
device(config-if-e1000-1/1/5-vrid-2)# ipv6-address fe80::768e:f8ff:fe2a:0099
device(config-if-e1000-1/1/5-vrid-2)# ipv6-address fd2b::2
device(config-if-e1000-1/1/5-vrid-2)# activate
```

ipv6 vrrp-extended vrid

Configures an IPv6 Virtual Router Redundancy Protocol Extended (VRRP-E) virtual router identifier (VRID).

Syntax

```
ipv6 vrrp-extended vrid vrid  
no ipv6 vrrp-extended vrid vrid
```

Command Default

An IPv6 VRRP-E VRID does not exist.

Parameters

vrid

Configures a number for the IPv6 VRRP-E VRID. The range is from 1 through 255.

Modes

Interface configuration mode

Usage Guidelines

Before configuring this command, ensure that IPv6 VRRP-E is enabled globally; otherwise, an error stating "Invalid input..." is displayed as you try to create a VRRP-E instance.

The **no** form of this command removes the IPv6 VRRP-E VRID from the configuration.

Examples

The following example configures IPv6 VRRP-E VRID 2.

```
device# configure terminal  
device(config)# ipv6 router vrrp-extended  
device(config-ipv6-vrrpe-router)# interface ethernet 1/1/5  
device(config-if-e1000-1/1/5)# ipv6 address fd4b::2/64  
device(config-if-e1000-1/1/5)# ipv6 vrrp-extended vrid 2  
device(config-if-e1000-1/1/5-vrid-2)# backup priority 50 track-priority 10  
device(config-if-e1000-1/1/5-vrid-2)# ipv6-address fe80::768e:f8ff:fe3a:0099  
device(config-if-e1000-1/1/5-vrid-2)# ipv6-address fd4b::99  
device(config-if-e1000-1/1/5-vrid-2)# activate
```

ipv6-address

Configures a virtual IPv6 address for a Virtual Router Redundancy Protocol version 3 (VRRPv3) or VRRP Extended version 3 (VRRP-Ev3) instance.

Syntax

ipv6-address { *ipv6-address* | **auto-gen-link-local** }

no ipv6-address { *ipv6-address* | **auto-gen-link-local** }

Command Default

A virtual IPv6 address is not configured for a VRRPv3 or VRRP-Ev3 instance.

Parameters

ipv6-address

Configures an IPv6 address.

auto-gen-link-local

Automatically generates a virtual IPv6 link-local address for the VRRPv3 instance. Not supported in VRRP-Ev3.

Modes

Virtual routing ID interface configuration mode

Usage Guidelines

For VRRP instances, the IPv6 address used for the virtual router must be configured on the device assigned to be the initial VRRP owner device. The same physical IPv6 address cannot be used on any other VRRP device.

If the **auto-gen-link-local** keyword is entered, a virtual IPv6 link-local address is generated automatically for the specific VRRPv3 instance. The virtual link-local address is carried in VRRPv3 advertisements. A manually configured link-local address takes precedence over the automatically generated address.

NOTE

Automatically generated virtual link-local addresses are not supported for VRRP-Ev3 instances.

The **no** form of the command removes the virtual router IPv6 address. If the **auto-gen-link-local** keyword was active, the automatically generated virtual IPv6 link-local address is removed for the VRRPv3 instance, and subsequent VRRPv3 advertisements will not carry this link-local address.

Examples

The following example configures a virtual IPv6 address for VRID 1 when IPv6 VRRPv3 is implemented. In this example, the device is configured as the VRRPv3 owner device.

```
device# configure terminal
device(config)# router vrrp
device(config)# interface ethernet 1/1/6
device(config-if-e1000-1/1/6)# ipv6 address fd2b::1/64
device(config-if-e1000-1/1/6)# ipv6 vrrp vrid 1
device(config-if-e1000-1/1/6-vrid-1)# owner
device(config-if-e1000-1/1/6-vrid-1)# ipv6-address fe80::768e:f8ff:fe2a:0099
device(config-if-e1000-1/1/6-vrid-1)# ipv6-address fd2b::1
device(config-if-e1000-1/1/6-vrid-1)# activate
```

The following example configures a virtual IPv6 address for VRID 2 when VRRP-Ev3 is implemented. In this example, the device is configured as a VRRP-Ev3 backup device and the highest priority device will become the master VRRP-Ev3 device.

```
device# configure terminal
device(config)# ipv6 router vrrp-extended
device(config-ipv6-vrrpe-router)# interface ethernet 1/1/5
device(config-if-e1000-1/1/5)# ipv6 address fd4b::1/64
device(config-if-e1000-1/1/5)# ipv6 vrrp-extended vrid 2
device(config-if-e1000-1/1/5-vrid-2)# backup priority 110
device(config-if-e1000-1/1/5-vrid-2)# ipv6-address fe80::768e:f8ff:fe3a:0099
device(config-if-e1000-1/1/5-vrid-2)# ipv6-address fd4b::99
device(config-if-e1000-1/1/5-vrid-2)# activate
```

ipv6-address auto-gen-link-local

Generates a virtual link-local IPv6 address and assigns it as the virtual IPv6 address for a VRRPv3 instance.

Syntax

```
ipv6-address auto-gen-link-local
no ipv6-address auto-gen-link-local
```

Modes

VRRP sub-configuration mode

Usage Guidelines

The **no** form of this command deletes the auto-generated virtual link-local IPv6 address for the VRRP v3 instance.

The default VRRPv3 implementation allows only the link-local address that is configured on a physical interface to be used as the virtual IPv6 address of a VRRPv3 instance. This limits configuring a link-local address for each VRRP instance on the same physical interface because there can be only one link-local address per physical interface. You can use this command on the owner or backup router to generate a virtual link-local IPv6 address from the virtual MAC address of a VRRPv3 instance and assign it as the virtual IPv6 address for the VRRPv3 instance. This auto-generated link-local IPv6 address is not linked to any physical interface on the router.

Examples

The following example generates a virtual link-local IPv6 address and its allocation as the virtual IPv6 address of a VRRPv3 cluster on an owner router.

```
device(config)# interface ve 3
device(config-vif-3)# ipv6 vrrp vrid 2
device(config-vif-3-vrid-2)# owner
device(config-vif-3-vrid-2)# ipv6-address auto-gen-link-local
device(config-vif-3-vrid-2)# activate
```

History

Release version	Command history
08.0.01	This command was introduced.

ipv6-neighbor inspection trust

Enables trust mode for specific ports.

Syntax

ipv6-neighbor inspection trust [**vrf** *vrf-name*]

no ipv6-neighbor inspection trust [**vrf** *vrf-name*]

Command Default

Trust mode is not enabled. When you enable ND inspection on a VLAN, by default, all the interfaces and member ports are considered as untrusted.

Parameters

vrf

Specifies the VRF instance.

vrf-name

Specifies the ID of the VRF instance.

Modes

Interface configuration mode

VRF configuration mode

Usage Guidelines

The **no** form of the command disables trust mode on ports.

Examples

The following example displays the trust mode configuration for ports.

```
device(config)# interface ethernet 1/1/3
device(config-if-e1000-1/1/3)# ipv6-neighbor inspection trust
```

The following example displays the trust mode configuration on a port on VRF 3.

```
device(config-if-e1000-1/1/1)# ipv6-neighbor inspection trust vrf 3
```

History

Release version	Command history
08.0.20	This command was introduced.

ipv6 unicast-routing

Enables the forwarding of IPv6 traffic on a Layer 3 switch.

Syntax

ipv6 unicast-routing

no ipv6 unicast-routing

Command Default

The forwarding of IPv6 traffic is not enabled.

Modes

Global configuration mode

Usage Guidelines

Before configuring a static IPv6 route, you must enable the forwarding of IPv6 traffic on the Layer 3 switch using the **ipv6 unicast-routing** command and must enable IPv6 on at least one interface by configuring an IPv6 address or explicitly enabling IPv6 on that interface.

The **no** form of the command disables IPv6 unicast routing.

Examples

The following example enables IPv6 unicast routing.

```
device(config)# ipv6 unicast-routing
```

ipx-network

Configures the IPX network protocol-based VLANs.

Syntax

ipx-network *network-number ipx-frame-type* [**name string**]

no ipx-network *network-number ipx-frame-type* [**name string**]

Command Default

An IPX network protocol-based VLAN is not configured.

Parameters

network-number

Specifies the network number in hexadecimal format.

ipx-frame-type

Defines the IPX frame encapsulation standard types. The following are the supported encapsulation standard types:

ethernet_802.2

Specifies the Ethernet 802.2 standard that can be configured for the protocol.

ethernet_802.3

Specifies the Ethernet 803.3 standard that can be configured for the protocol.

ethernet_ii

Specifies the Ethernet II standard that can be configured for the protocol.

ethernet_snap

Specifies the Ethernet subnetwork access protocol standard that can be configured for the protocol.

name *string*

Specifies the Ethernet standard name. The string can be up to 32 characters in length.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of the command disables the IPX network protocol-based VLAN.

Examples

The following example shows how to configure the IPX network protocol-based VLAN.

```
device(config)# vlan 20 name IPX_VLAN by port
device(config-vlan-10)# untagged ethernet 1/2/1 to 1/2/6
added untagged port ethe 1/2/1 to 1/2/6 to port-vlan 20.
device(config-vlan-10)# ipx-network abcd ethernet_ii name Eng-LAN
```

ipx-proto

Configures the IPX protocol-based VLANs.

Syntax

ipx-proto [*name string*]

no ipx-proto [*name string*]

Command Default

An IPX protocol-based VLAN is not configured.

Parameters

name *string*

The IPX protocol-based VLAN name. The name can be up to 32 characters in length.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of the command removes the IPX protocol-based VLAN.

Examples

The following example shows the how to configure an IPX protocol-based VLAN.

```
device(config)# vlan 10 by port
device(config-vlan-10)# untagged ethernet 1/1/1 to 1/1/6
added untagged port ethe 1/1/1 to 1/1/6 to port-vlan 30.
device(config-vlan-10)# ip-proto name IP_Prot_VLAN
```

issu abort

Initiates an in service software upgrade (ISSU) termination.

Syntax

issu abort

Modes

Privileged EXEC mode

Usage Guidelines

This is a command that an operator uses to manually stop the currently running upgrade.

The upgrade terminates after the current unit, the one that is going through the upgrade, rejoins the stack.

If a manual abort is done or ISSU detects an abort condition (with ISSU started with no **on-error** option), the stack is left as it is and a manual recovery is required. You must reload the primary or secondary image to bring the stack back to working condition after issuing the **issu abort** command.

Examples

Follow this example to terminate an ISSU.

```
device# issu abort
```

History

Release version	Command history
08.0.50	This command was introduced.

issu primary

Initiates an in-service software upgrade (ISSU) using the image on the primary partition and configures the system to reload from either the primary image or the secondary image if the upgrade fails.

Syntax

```
issu primary [ on-error { reload-primary | reload-secondary } ]
```

Command Default

If an error occurs the default behavior is to abort the ISSU.

Parameters

on-error

Specifies the action to take if there is an upgrade failure from the primary image.

reload-primary

Causes the system to reload from the primary partition if an upgrade from the primary partition fails.

reload-secondary

Causes the system to reload from the secondary partition if an upgrade from the primary partition fails.

Modes

Privileged EXEC mode

Usage Guidelines

Before you use this command, back up the running image to the secondary partition, use the existing image upgrade framework to copy the new image to the primary or secondary partition, and check the sequence of the upgrade with the **show issu sequence** command.

The **issu primary** command without any keywords initiates an ISSU.

If a manual abort is done or ISSU detects an abort condition (with ISSU started with no **on-error** option), the stack is left as is and a manual recovery is required.

If a manual recovery is required, you run either the **reload-primary** or **reload-secondary** command.

Examples

The following example shows how to start an ISSU, using an image that has been copied to the primary partition.

```
device# issu primary
Topology is Ring                Yes
Standby Present                 Yes
Standby ready for upgrade      Yes
Flash use in progress          No
Secure Setup in progress       No
ISSU in progress or aborted    No
Election pending               No
Election in progress           No
Reload pending                  No
CPU utilization high            No
All units in ready state       Yes
Primary Image is upgrade compatible Yes
Startup config and Running Config Same Yes
User in Config mode            No
Proceed with upgrade? (enter 'y' or 'n'):
```

If the system is not ready for an ISSU, the error condition is highlighted.

```
device# issu primary
Topology is Ring                Yes
Standby Present                 No    ***
Standby ready for upgrade      No    ***
Flash use in progress          No
Secure Setup in progress       No
ISSU in progress or aborted    No
Election pending               No
Election in progress           No
Reload pending                  No
CPU utilization high            No
All units in ready state       Yes
Primary Image is upgrade compatible Yes
Secondary Image is upgrade compatible Yes
Startup config and Running Config Same Yes
User in Config mode            No
System not ready for issu. Check error condition highlighted by "****" and rectify.
ISSU not in progress
```

The behavior in case ISSU fails can be specified. In the following example the specified behavior is to reload the image on the secondary partition.

```
device# issu primary on-error reload-secondary
```

History

Release version	Command history
08.0.50	This command was introduced.

issu secondary

Initiates an in-service software upgrade (ISSU) using the image on the secondary partition and configures the system to reload from the image in either the primary partition or the secondary partition should the upgrade fail.

Syntax

```
issu secondary [ on-error { reload-primary | reload-secondary } ]
```

Command Default

If an error occurs the default behavior is to abort the ISSU.

Parameters

on-error

Specifies the action to take if there is an upgrade failure from the secondary image.

reload-primary

Causes the system to reload from the primary partition if an upgrade from secondary partition fails.

reload-secondary

Causes the system to reload from the secondary partition if an upgrade from secondary partition fails.

Modes

Privileged EXEC mode

Usage Guidelines

Before you use this command, back up the running image to the primary partition, use the existing image upgrade framework to copy the new image to the primary or secondary partition, and check the sequence of upgrade with the **show issu sequence** command.

The **issu secondary** command without any keywords initiates an ISSU.

If a manual abort is done or ISSU detects an abort condition (with ISSU started with no **on-error** option), the stack is left as is and a manual recovery is required.

If a manual recovery is required, you run either the **reload-primary** or **reload-secondary** command.

Examples

The following example shows how to start an ISSU.

```
device# issu secondary
Topology is Ring                Yes
Standby Present                 Yes
Standby ready for upgrade       Yes
Flash use in progress           No
Secure Setup in progress        No
ISSU in progress or aborted     No
Election pending                No
Election in progress            No
Reload pending                  No
CPU utilization high            No
All units in ready state        Yes
Primary Image is upgrade compatible Yes
Startup config and Running Config Same Yes
User in Config mode             No
Proceed with upgrade? (enter 'y' or 'n'):
```

If the system is not ready for an ISSU, the error condition is highlighted.

```
device# issu secondary
Topology is Ring                Yes
Standby Present                 No    ***
Standby ready for upgrade       No    ***
Flash use in progress           No
Secure Setup in progress        No
ISSU in progress or aborted     No
Election pending                No
Election in progress            No
Reload pending                  No
CPU utilization high            No
All units in ready state        Yes
Primary Image is upgrade compatible Yes
Secondary Image is upgrade compatible Yes
Startup config and Running Config Same Yes
User in Config mode             No
System not ready for issu. Check error condition highlighted by "****" and rectify.
ISSU not in progress
```

The behavior in case ISSU fails can be specified. In the following example the specified behavior is to reload the image on the secondary partition.

```
device# issu secondary on-error reload-secondary
```

History

Release version	Command history
08.0.50	This command was introduced.

jitc enable

Enables the Joint Interoperability Test Command (JITC) mode.

Syntax

jitc enable

no jitc enable

Command Default

JITC is not enabled.

Modes

Global configuration mode

Usage Guidelines

When JITC is enabled, the Advanced Encryption Standard - Cipher-Block Chaining (AES-CBC) encryption mode for the Secure Shell (SSH) protocol is disabled and the AES-CTR (Counter) encryption mode is enabled.

When JITC is enabled, the MD5 authentication scheme for NTP is disabled.

The **no** form of the command disables the JITC mode and puts the system back to the standard mode and enables both AES-CBC encryption mode and MD5 authentication configuration.

Examples

The following example enables the JITC mode.

```
device(config)# jitc enable
```

History

Release version	Command history
08.0.20a	This command was introduced.

jitc show

Displays the status of the JITC mode.

Syntax

jitc show

Modes

Global configuration mode

Privileged EXEC mode

Command Output

The **jitc show** command displays the following information.

Output field	Description
JITC mode	Displays the status of the JITC mode.
SSH AES-CTR mode	Displays the status of the SSH AES-CTR mode.
SSH AES-CBC mode	Displays the status of the SSH AES-CBC mode.

Examples

The following example shows the output of the **jitc show** command.

```
device(config)#jitc show
JITC mode : Enabled
Management Protocol Specific:
SSH AES-CTR mode : Enabled
SSH AES-CBC mode : Disabled
```

History

Release version	Command history
08.0.20a	This command was introduced.

join-timer leave-timer leaveall-timer

Changes the Join, Leave, and Leaveall timers for GVRP counters.

Syntax

join-timer *join-timer-ms* **leave-timer** *leave-timer-ms* **leaveall-timer** *leaveall-timer-ms*

Command Default

The default value for the Join timer is 200 ms. The default value for the Leave timer is 600 ms. The default value for the Leaveall timer is 10,000 ms.

Parameters

join-timer-ms

Specifies the maximum number of milliseconds (ms) a GVRP interface wait before sending VLAN advertisements on the interfaces. You can set the Join timer to a value from 200 to one third the value of the Leave timer.

leave-timer-ms

Specifies the number of milliseconds a GVRP interface waits after receiving a Leave message on the port to remove the port from the VLAN indicated in the Leave message. You can set the Leave timer to a value from three times the Join timer value to one fifth the value of the Leaveall timer.

leaveall-timer-ms

Specifies the minimum interval at which GVRP sends Leaveall messages on all GVRP interfaces. You can set the Leaveall timer to a value from five times the Leave timer value to the maximum value allowed by the software (configurable from 300,00 to 1,000,000 ms).

Modes

GVRP configuration mode

Usage Guidelines

All timer values must be in multiples of 100 ms.

The Leave timer value must be greater than or equal to three times the Join timer value. The Leaveall timer value must be greater than or equal to five times the Leave timer value.

The GVRP timers must be set to the same values on all the devices that are exchanging information using GVRP.

NOTE

When you enter this command, all the running GVRP timers are canceled and restarted using the new times specified by the command.

Examples

The following example shows how to set the Join, Leave, and Leaveall timers.

```
device(config)# gvrp-enable  
device(config-gvrp)# join-timer 1000 leave-timer 3000 leaveall-timer 15000
```

jumbo

Provides support for jumbo frames.

Syntax

jumbo

no jumbo

Command Default

Jumbo frame support is disabled.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command disables jumbo frame support.

Examples

The following example provides jumbo frame support.

```
device(config)# jumbo
```

Commands K - S

keepalive

Configures GRE link keepalive.

Syntax

keepalive [*interval* [*retries*]]

no keepalive [*interval* [*retries*]]

Command Default

GRE link keepalive is not enabled.

Parameters

interval

Specifies the number of seconds between each initiation of a keepalive message. The range is from 2 to 32767 seconds and the default is 10 seconds.

retries

Specifies the number of times that a packet is sent before the system places the tunnel in the DOWN state. Valid values are from 1 through 255. The default number of retries is 3.

Modes

Tunnel interface configuration mode

Usage Guidelines

When GRE tunnels are used in combination with static routing or policy-based routing, and a dynamic routing protocol such as RIP, BGP, or OSPF is not deployed over the GRE tunnel, a configured tunnel does not have the ability to bring down the line protocol of either tunnel endpoint, if the far end becomes unreachable. Traffic sent on the tunnel cannot follow alternate paths because the tunnel is always UP. To avoid this scenario, enable GRE link keepalive, which will maintain or place the tunnel in an UP or DOWN state based upon the periodic sending of keepalive packets and the monitoring of responses to the packets. If the packets fail to reach the tunnel far end more frequently than the configured number of retries, the tunnel is placed in the DOWN state.

The **no** form of the command disables GRE keepalive.

Examples

The following example enables GRE keepalive and sets the keepalive interval and retries.

```
device(config)# keepalive 500 150
```

keepalive (IKEv2)

Configures the interval between Internet Key Exchange version 2 (IKEv2) messages that are sent to detect if a peer is still alive.

Syntax

keepalive *interval*

no keepalive *interval*

Command Default

IKEv2 keepalive is enabled and the keepalive interval is 300 seconds.

Parameters

interval

Specifies the number of seconds between each initiation of an IKEv2 notify message. The range is from 10 through 3600. A value of 0 disables the keepalive function.

Modes

IKEv2 profile configuration mode

Usage Guidelines

The **no** form of the command restores the default configuration.

Examples

The following example shows how to configure a keepalive interval of 500 seconds for an IKEv2 profile named prof_mktg.

```
device(config)ikev2 profile prof_mktg
device(config-ike-profile-prof_mktg)# keepalive 500
```

History

Release version	Command history
8.0.50	This command was introduced.

keep-alive-vlan

Configures a keep-alive VLAN for the cluster.

Syntax

keep-alive-vlan *vlan-ID*

no keep-alive-vlan *vlan-ID*

Command Default

A keep-alive VLAN is not configured.

Parameters

vlan-ID

Specifies the VLAN number. The values can be from 1 through 4089.

Modes

Cluster configuration mode

Usage Guidelines

Only one VLAN can be configured as a keep-alive VLAN. The keep-alive VLAN cannot be a member VLAN of the Multi-Chassis Trunking (MCT) and this VLAN can be tagged or untagged.

When the CCP is down, the following results occur:

- If the keep-alive VLAN is configured, CCRR messages are sent every second over that VLAN.
- If no packets are received from the peer device for a period of three seconds, the peer is considered down.
- If a keep-alive VLAN is not configured and both the peer devices are up, both peers continue forwarding traffic independently, when the CCP is down.

NOTE

Keep-alive VLAN configuration is not allowed when the client isolation mode is strict; and when the keep-alive VLAN is configured, client isolation mode cannot be configured as strict.

The **no** form of the command removes the keep-alive VLAN configuration.

Examples

The following example shows how to configure the keep-alive VLAN.

```
device(config)# cluster SX 400
device(config-cluster-SX)# keep-alive-vlan 10
```

key-rollover-interval

Alters the timing of the existing configuration changeover.

Syntax

key-rollover-interval *interval*

no key-rollover-interval *interval*

Parameters

interval

Specifies the key-rollover-interval in seconds. Valid values range from 0 through 14400. The default is 300 seconds.

Modes

OSPFv3 router configuration mode

OSPFv3 router VRF configuration mode

Usage Guidelines

In order to have consistent security parameters, rekeying should be done on all nodes at the same time. Use the **key-rollover-interval** command to facilitate this. The key rollover timer waits for a specified period of time before switching to the new set of keys. Use this command to ensure that all the nodes switch to the new set of keys at the same time.

The **no** form of the command resets the rollover interval to the default value of 300 seconds.

Examples

The following example sets the key rollover interval to 420 seconds.

```
device# configure terminal
device(config)# ipv6 router ospf
device(config-ospf6-router)# key-rollover-interval 420
```

The following example re-sets the key rollover interval to the default value.

```
device# configure terminal
device(config)# ipv6 router ospf
device(config-ospf6-router)# no key-rollover-interval 420
```

The following example re-sets the key rollover interval to the default value in a nondefault VRF instance.

```
device# configure terminal
device(config)# ipv6 router ospf vrf red
device(config-ospf6-router-vrf-red)# no key-rollover-interval 420
```

key-server-priority

Configures the MACsec key-server priority for the MACsec Key Agreement (MKA) group.

Syntax

key-server-priority *value*

no key-server-priority *value*

Command Default

Key-server priority is set to 16. This is not displayed in configuration details.

Parameters

value

Specifies key-server priority. The possible values range from 0 to 255, where 0 is highest priority and 255 is lowest priority.

Modes

dot1x-mka-cfg-group mode

Usage Guidelines

MACsec commands are supported only on the ICX 7450.

The **no** form of the command removes the previous priority setting.

During key-server election, the server with the highest priority (the server with the lowest key-server priority value) becomes the key-server.

Examples

The following example sets the key-server priority for MKA group test1 to 5.

```
device(config)# dot1x-mka-enable
device(config-dot1x-mka)# mka-cfg-group test1
device(config-dot1x-mka-group-test1)# key-server-priority 5
```

History

Release version	Command history
08.0.20	This command was introduced.
08.0.20a	This command was modified. The key-server priority value range was increased from 0 through 127 to 0 through 255.
08.0.30	Support for this command was added on the ICX 7450 device.

kill

Terminates active CLI sessions.

Syntax

kill console { **all** | *unit-number* }

kill { **ssh** | **telnet** } *session-number*

Parameters

console

Logs out console sessions in a stack.

all

Logs out all console ports on stack units that are not the Active Controller.

unit-number

Logs out the console port on a specified unit.

ssh

Terminates an active SSH session.

telnet

Terminates an active Telnet session.

session-number

The Telnet or SSH session number.

Modes

Privileged EXEC mode

Usage Guidelines

Once the AAA console is enabled, you should log out any open console ports on your traditional stack using the **kill console** command.

Examples

The following example shows how to log out from all console ports on stack units that are not the Active Controller.

```
device# kill console all
```

The following example shows how to terminate an active SSH connection.

```
device# kill ssh 1
```

lacp-timeout

Configures the timeout mode for the port.

Syntax

```
lacp-timeout { long | short }  
no lacp-timeout { long | short }
```

Command Default

Begins with the short timeout period. Moves to the long timeout period after the LAG is established.

Parameters

long
Specifies a long timeout period for the port which is 120 seconds.

short
Specifies a short timeout period for the port which is 3 seconds.

Modes

LAG configuration mode

Usage Guidelines

After you configure a port timeout mode, the port remains in that timeout mode whether it is up or down and whether or not it is part of a LAG. All the ports in a LAG must have the same timeout mode. This requirement is checked when the LAG is enabled on the ports.

With the long timeout configuration, an LACPDU is sent every 30 seconds. If no response comes from its partner after three LACPDUs are sent, a timeout event occurs, and the LACP state machine transitions to the appropriate state based on its current state.

In the short timeout configuration, an LACPDU is sent every second. If no response comes from its partner after three LACPDUs are sent, a timeout event occurs, and the LACP state machine transitions to the appropriate state based on its current state. If you do not include **long** or **short**, the device operates based on the IEEE specification standards.

NOTE

The configuration of lacp-timeout is applicable to dynamic or keep-alive LAGs only.

The **no** form of the command resets the timeout mode to short.

Examples

The following example shows how to configure a port for a short LACP timeout.

```
device(config)# lag blue dynamic  
device(config-lag-blue)# lacp-timeout short
```

lag

Creates a Link Aggregation Group (LAG).

Syntax

```
lag lag-name [ dynamic [ id number ] ]  
no lag lag-name [ dynamic [ id number ] ]  
lag lag-name [ static [ id number ] ]  
no lag lag-name [ static [ id number ] ]  
lag lag-name keep-alive  
no lag lag-name keep-alive
```

Command Default

LAG is not configured.

Parameters

lag-name

Specifies the name of the LAG as an ASCII string. The LAG name can be up to 64 characters in length.

dynamic

Configures a dynamic LAG.

static

Configures a static LAG.

id number

Specifies a LAG ID. The value ranges from 1 through 2047.

keep-alive

Configures a keep-alive LAG.

Modes

Global configuration mode

Usage Guidelines

The keep-alive LAG configuration can be used to configure a LAG for use in keep-alive applications similar to the UDLD.

A keep-alive LAG contains only one port while static and dynamic LAGs can have 1 to 8 or 1 to 12 ports depending on the device.

If you do not enter a LAG ID, the system automatically generates an ID. LAG IDs are unique for each LAG in the system. A LAG ID cannot be assigned to more than one LAG. If a LAG ID is already used, the CLI will reject the new LAG configuration and display an error message that suggests the next available LAG ID that can be used.

NOTE

The LAG ID parameter is for static and dynamic LAGs only. No explicit configuration of a LAG ID is allowed on keep-alive LAGs.

The **no** form of the command removes the LAG.

Examples

The following example shows how to configure a static LAG.

```
device(config)# lag blue static
device(config-lag-blue)#
```

The following example shows how to explicitly assign an ID to a LAG.

```
device(config)# lag blue static id 1
device(config-lag-blue)#
```

learn-default

Configures the device to learn default RIP routes, either globally or at the interface level.

Syntax

learn-default

ip rip learn-default

no learn-default *device/slot/port*

no ip rip learn-default *device/slot/port*

Command Default

By default, the device does not learn default RIP routes.

Modes

RIP router configuration mode or interface configuration mode.

Usage Guidelines

The **no** form of the command disables learning of default RIP routes.

The configurations at the global level and interface level are independent. Disabling or enabling one will not affect the other. When global level configuration is enabled, default routes are learned from all the interfaces. If global "learn-default" is not enabled but the interface-level "learn-default" is enabled, default routes are allowed from that rip interface. If "learn default" is not enabled for an interface, then the learned default routes for that interface are discarded.

Examples

The following example enables learning of default RIP routes globally.

```
device# configure terminal
device(config)# router rip
device(config-rip-router)# learn-default
```

The following command output shows RIP default routes are learned globally.

```
device(config)# show ip rip
RIP Summary
Default port 520
Administrative distance is 120
Updates every 30 seconds, expire after 180
Holddown lasts 180 seconds, garbage collect after 120
Last broadcast 28, Next Update 30
Need trigger update 0, Next trigger broadcast 4
Minimum update interval 25, Max update Offset 5
Split horizon is on; poison reverse is off
Import metric 1
Default routes are accepted
Prefix List, Inbound : Not set
Prefix List, Outbound : Not set
Route-map, Inbound : Not set
Route-map, Outbound : Not set
Redistribute:
No Neighbors are configured in RIP Neighbor Filter Table
```

The following example enables learning of default RIP routes on Ethernet interface 1/1/6.

```
device# configure terminal
device(config)# interface ethernet 1/1/6
device(config-if-e10000-1/1/6)# ip rip learn-default
```

The following command output shows that RIP default routes are learned for the interface.

```
device(config)# show ip rip interface ethernet 1/1/16
Interface e 1/1/16
RIP Mode : Version2 Running: TRUE
Route summarization disabled
Split horizon is on; poison reverse is off
Default routes are accepted
Metric-offset, Inbound 1
Metric-offset, Outbound 0
Prefix List, Inbound : Not set
Prefix List, Outbound : Not set
Route-map, Inbound : Not set
Route-map, Outbound : Not set
RIP Sent/Receive packet statistics:
Sent : Request 0 Response 0
Received : Total 0 Request 0 Response 0 UnRecognised 0
RIP Error packet statistics:
Rejected 0 Version 0 RespFormat 0 AddrFamily 0
Metric 0 ReqFormat 0
```

lease

Specifies the lease period for the DHCP address pool.

Syntax

lease *days hours minutes*

Parameters

days hours minutes

Specifies the lease duration in days, hours, and minutes.

Modes

DHCP server pool configuration mode.

Usage Guidelines

Examples

The following example specifies the lease period as one day, four hours and 32 minutes.

```
device(config)# ip dhcp-server-pool cabo  
device(config-dhcp-cabo)# lease 1 4 32
```

legacy-inline-power

Enables support for Power over Ethernet (PoE) legacy power-consuming devices.

Syntax

legacy-inline-power

no legacy-inline-power

Command Default

PoE devices automatically support most legacy power-consuming devices (devices not compliant with 802.3af and 802.3at), as well as all 802.3af- and 802.3at-compliant devices.

Modes

Global configuration mode

Stack configuration mode

Usage Guidelines

The command does not require a software reload if it is entered prior to connecting the Powered Devices (PDs). If the command is entered after the PDs are connected, the configuration must be saved (**write memory**) and the software must be reloaded after the change goes into effect.

By default, the **legacy-inline-power** command reserves 30 watts.

When you disable legacy support, 802.3af- and 802.3at-compliant devices are not affected.

The **no** form of the command disables support for PoE legacy power-consuming devices.

Examples

The following example enables support for legacy power-consuming devices on a nonstackable device.

```
device(config)# legacy-inline-power
```

license delete unit

Deletes all license files for a specific unit.

Syntax

license delete unit *unit_id* [**all** | **index** *license_index*]

Parameters

unit_id

Specifies the unit ID number.

all

Allows you to delete all license files for a specific unit.

index *license_index*

Specifies the software license file, and is generated by the member unit. The license index number is the license file you want to delete from a unit. The license index number is not unique across stack units, and you must specify both the unit number and the index number to delete a license from a specific unit. For example, an ICX7250-8X10G-LIC-POD license is installed on both stack unit 3, index 1, and stack unit 5, index 1. Because the index numbers are the same, you must specify both the unit number and the index number to delete a license from a specific unit.

Modes

Privileged EXEC level.

Usage Guidelines

On the ICX 7450 and ICX 7250 devices, if more than one non-node locked license file is installed, the deletion of the license file sequence should start from the software license file identified by index 1. If this is not done, any attempt to delete the license file returns an error 141 (LICENSE_IN_USE).

Examples

The following example delete the license file as specified.

```
device# license delete unit 1 index 1  
device# license delete unit 1 index 2
```

Use the all option to delete all license files for a specific unit.

```
device# license delete unit 1 all
```

History

Release version	Command history
07.1.00	This command was introduced.

lifetime (IKEv2)

Configures the lifetime period of an Internet Key Exchange version 2 (IKEv2) security association (SA) for an IKEv2 profile.

Syntax

lifetime *minutes*
no lifetime *minutes*

Command Default

The default lifetime period for an IKEv2 SA is 43200 minutes (30 days).

Parameters

minutes
Specifies the lifetime period (in minutes) for an IKEv2 SA. The range is from 10 through 43200.

Modes

IKEv2 profile configuration mode

Usage Guidelines

The **no** form of the command resets the IKEv2 SA lifetime period to the default value.

NOTE

During rekey, minor traffic loss is possible due to hardware programming delays.

Examples

The following example shows how to set the IKEv2 SA lifetime value to 15000 minutes for an IKEv2 profile named prof-mktg.

```
device(config)# ikev2 profile prof-mktg
device(config-ike-profile-prof-mktg)# lifetime 15000
```

History

Release version	Command history
8.0.50	This command was introduced.

lifetime (IPsec)

Configures the lifetime period of an IPsec security association (SA) for an IPsec profile.

Syntax

lifetime *minutes*
no lifetime *minutes*

Command Default

The default lifetime period for an IPsec SA is 480 minutes (8 hours).

Parameters

minutes
Specifies the lifetime period (in minutes) for an IPsec SA. The range is from 10 through 1440.

Modes

IPsec profile configuration mode

Usage Guidelines

Five minutes before an IPsec SA is due to expire, a new IPsec SA is started.

The **no** form of the command resets the IPsec SA lifetime period to the default value.

Examples

The following example shows how to set the IPsec SA lifetime value to 720 minutes for an IPsec profile named prof-mktg.

```
device(config)# ipsec profile prof_mktg
device(config-ipsec-profile-prof_mktg)# lifetime 720
```

History

Release version	Command history
8.0.50	This command was introduced.

link-config gig copper autoneg-control

Configures the maximum advertised speed on a port that has auto-negotiation enabled.

Syntax

link-config gig copper autoneg-control { **100m-auto** | **10m-auto** } **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*] ...]

no link-config gig copper autoneg-control { **100m-auto** | **10m-auto** } **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*] ...]

Command Default

The maximum port speed advertisement is not configured.

Parameters

100m-auto

Configures a port to advertise a maximum speed of 100 Mbps.

10m-auto

Configures a port to advertise a maximum speed of 10 Mbps.

ethernet *stack-id/slot/port*

Specifies the Ethernet interface.

Modes

Global configuration mode

Usage Guidelines

Maximum port speed advertisement is not supported on Brocade ICX 7750.

The maximum port speed advertisement works only when auto-negotiation is enabled (CLI command **speed-duplex auto**). If auto-negotiation is off, the device rejects the maximum port speed advertisement configuration.

You can enable the maximum port speed advertisement on one or two ports at a time.

The **no** form of the command disables the maximum port speed advertisement.

Examples

The following command configures a maximum port speed advertisement of 10 Mbps on a port that has auto-negotiation enabled.

```
device(config)# link-config gig copper autoneg-control 10m-auto ethernet 1/1/1
```

History

Release version	Command history
8.0.40	The downshift option was removed.
8.0.30	This command was introduced in Brocade ICX 7250, but the downshift option was not supported.
8.0.20	This command was introduced in Brocade ICX 7450, but the downshift option was not supported.

link-error-disable

Configures port flap dampening on an interface.

Syntax

link-error-disable *toggle-threshold sampling-time-in-sec wait-time-in-sec*

no link-error-disable *toggle-threshold sampling-time-in-sec wait-time-in-sec*

Command Default

Port flap dampening is not configured.

Parameters

toggle-threshold

Specifies the number of times a port link state goes from up to down and down to up before the wait period is activated. The value ranges from 1 through 50.

sampling-time-in-sec

Specifies the amount of time, in seconds, during which the specified toggle threshold can occur before the wait period is activated. The default value is 0 and indicates that the time is forever. The value ranges from 0 through 65535.

wait-time-in-sec

Specifies the amount of time, in seconds, for which the port remains disabled (down) before it becomes enabled. The value ranges from 0 through 65535. A value of 0 indicates that the port will stay down until an administrative override occurs.

Modes

Interface configuration mode

Usage Guidelines

A Brocade device counts the number of times a port link state toggles from "up to down", and not from "down to up".

The sampling time or window (the time during which the specified toggle threshold can occur before the wait period is activated) is triggered when the first "up to down" transition occurs.

If the port link state toggles from up to down for a specified number of times within a specified period, the interface is physically disabled for the specified wait period. Once the wait period expires, the port link state is re-enabled. However, if the wait period is set to zero (0) seconds, the port link state will remain disabled until it is manually re-enabled.

When a flap dampening port becomes a member of a Link Aggregation (LAG), that port, as well as all other member ports of that LAG, inherit the primary port configuration. This means that the member ports will inherit the primary port flap dampening configuration, regardless of any previous configuration.

You can configure the port flap dampening feature on the primary port of a LAG using the **link-error-disable** command. Once configured on the primary port, the feature is enabled on all ports that are members of the LAG. You cannot configure port flap dampening on port members of the LAG.

The **no** form of the command re-enables a port that was disabled by port flap dampening once the wait period expires.

Examples

The following example configures port flap dampening on an interface.

```
device(config)# interface ethernet 1/1/1
device(config-if-e10000-1/1/1)# link-error-disable 10 3 10
```

link-fault-signal

Enables Link Fault Signaling (LFS) between 10 Gbps Ethernet devices.

Syntax

link-fault-signal

no link-fault-signal

Command Default

LFS is disabled by default on all Brocade FastIron devices.

Modes

Interface configuration mode

Usage Guidelines

When configured on a Brocade 10 Gbps Ethernet port, the port can detect and report fault conditions on transmit and receive ports. Brocade recommends enabling LFS on both ends of a link.

Enable LFS on any device prior to connecting the device to FastIron platforms. Any connecting device must have LFS currently enabled to ensure interoperability. When LFS is enabled on an interface, syslog messages are generated when the link goes up or down, or when the TX or RX fiber is removed from one or both sides of the link that has LFS enabled.

You can view the status of an LFS-enabled link using the **show interface** command.

The **no** form of the command disables the Link Fault Signaling (LFS).

Examples

The following example enables LFS.

```
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# link-fault-signal
```

link-keepalive ethernet

Enables UDLD for tagged and untagged control packets.

Syntax

link-keepalive ethernet *stackid/slot/port* [[**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port to stackid/slot/port* | **ethernet** *stackid/slot/port*]...] | **vlan** *vlan-ID*]

no link-keepalive ethernet *stackid/slot/port* [[**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port to stackid/slot/port* | **ethernet** *stackid/slot/port*]...] | **vlan** *vlan-ID*]

Command Default

UDLD is not enabled.

Parameters

ethernet *stackid/slot/port*

Specifies the Ethernet interface on which to enable UDLD.

to *stackid/slot/port*

Specifies the end range of the Ethernet interface on which to enable UDLD.

vlan *vlan-ID*

Specifies the ID of the VLAN that the UDLD control packets can contain.

Modes

Global configuration mode

Usage Guidelines

UDLD is supported only on Ethernet ports.

If you are specifying a VLAN ID, make sure that the VLAN ID is configured. A VLAN is specified when UDLD is configured. The port belongs to the configured VLAN as a tagged member. All the devices across the UDLD link are in the same VLAN. UDLD can be enabled on only one VLAN for a tagged port.

You must configure the same VLANs that will be used for UDLD on all devices across the network; otherwise, the UDLD link cannot be maintained.

Dynamic LAG is not supported with UDLD. If you want to configure a LAG that contains ports on which UDLD is enabled, you must remove the UDLD configuration from the ports. After you create the LAG, you can re-add the UDLD configuration.

The **no** form of the command disables UDLD for tagged and untagged control packets.

Examples

The following example shows how to enable UDLD for untagged ports.

```
device(config)# link-keepalive ethernet 1/1/1
```

The following example shows how to configure UDLD on multiple ports.

```
device(config)# link-keepalive ethernet 1/1/1 ethernet 1/2/2
```

The following example shows how to configure UDLD on a range of ports.

```
device(config)# link-keepalive ethernet 1/1/1 to 1/1/5
```

The following example enables ports to receive and send UDLD control packets tagged with a specific VLAN ID.

```
device(config)# link-keepalive ethernet 1/1/8 vlan 22
```

link-keepalive interval

Enables the interval time that UDLD sends health-check packets.

Syntax

link-keepalive interval *time*

no link-keepalive interval *time*

Command Default

By default, ports enabled for UDLD send a health-check packet once every 500 milliseconds (ms).

Parameters

time

Specifies the time that UDLD sends the health-check packets, in milliseconds. You can specify from 1 through 60, in 100 ms increments (1 is 100 ms, 2 is 200 ms, and so on). The default is 5 (500 ms).

Modes

Global configuration mode

Usage Guidelines

A low UDLD link-keepalive interval is not recommended because low UDLD link-keepalive intervals are more sensitive and prone to flaps.

The **no** form of the command resets the interval to the default value.

Examples

The following example shows the UDLD interval configuration.

```
device(config)# link-keepalive interval 4
```

link-keepalive retries

Configures the maximum number of keep-alive attempts a port waits to receive a health-check reply packet from the port at the other end of the link.

Syntax

link-keepalive retries *number*
no link-keepalive retries *number*

Command Default

The default value is 7.

Parameters

number

Specifies the number of keep-alive retries to receive a health-check reply packet. The valid range is from 3 through 64.

Modes

Global configuration mode

Usage Guidelines

By default, a port waits one second to receive a health-check reply packet from the port at the other end of the link. If the port does not receive a reply, the port tries six more times by sending up to six more health-check packets. If the port still does not receive a reply after the maximum number of retries, the port goes down.

The **no** form of the command changes the number of retries to the default value.

Examples

The following example shows how to configure 10 retries as the maximum number of keep-alive attempts a port waits to receive a health-check reply packet.

```
device(config)# link-keepalive retries 10
```

link-oam

Enables the EFM-OAM protocol and enters EFM-OAM protocol configuration mode.

Syntax

link-oam

no link-oam

Command Default

The EFM-OAM protocol is not enabled.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command removes all the EFM-OAM configurations.

Examples

The following example enables EFM-OAM protocol configuration mode.

```
device(config)# link-oam
device(config-link-oam)#
```

History

Release version	Command history
08.0.30	This command was introduced.

Ildp advertise link-aggregation

Advertises link-aggregation information.

Syntax

lldp advertise link-aggregation ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

no lldp advertise link-aggregation ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

Command Default

Link-aggregation information is automatically advertised when Link Layer Discovery Protocol (LLDP) is enabled on a global basis.

Parameters

ports

Advertises link-aggregation information for the specified ports.

all

Advertises link-aggregation information for all LLDP-capable ports.

ethernet *stack-id/slot/port*

Advertises link-aggregation information for the specified Ethernet port.

to *stack-id/slot/port*

Advertises link-aggregation information for a range of Ethernet ports.

Modes

Global configuration mode

Usage Guidelines

The devices advertise link-aggregation information about standard link aggregation (LACP) as well as static Link Aggregation (LAG) configuration.

The link-aggregation time, length, value (TLV) indicates the following:

- Whether the link is capable of being aggregated
- Whether the link is currently aggregated
- The primary LAG port

The **no** form of the command disables the link-aggregation advertisement.

Examples

The following example enables advertisement of link-aggregation information for a specific Ethernet port.

```
device(config)# lldp advertise link-aggregation ports ethernet 1/1/1
```

Ildp advertise mac-phy-config-status

Advertises the MAC/PHY configuration and status.

Syntax

lldp advertise mac-phy-config-status ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

no lldp advertise mac-phy-config-status ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

Command Default

The MAC/PHY configuration and status are automatically advertised when Link Layer Discovery Protocol (LLDP) is enabled on a global basis.

Parameters

ports

Advertises MAC/PHY configuration and status for the specified ports.

all

Advertises MAC/PHY configuration and status for all LLDP-capable ports.

ethernet *stack-id/slot/port*

Advertises MAC/PHY configuration and status for a specified Ethernet port.

to *stack-id/slot/port*

Advertises MAC/PHY configuration and status for a range of Ethernet ports.

Modes

Global configuration mode

Usage Guidelines

The MAC and PHY configuration and status of time, length, and value (TLV) includes the following information:

- Auto-negotiation capability and status.
- Speed and duplex mode.
- Flow control capabilities for auto-negotiation.
- Maximum port speed advertisement.
- If applicable, whether the above settings are the result of auto-negotiation during link initiation or a manual set override action.

The **no** form of the command disables the MAC/PHY advertisement.

Examples

The following example enables the advertisement of MAC/PHY configuration and status for a specific Ethernet port.

```
device(config)# lldp advertise mac-phy-config-status ports ethernet 1/1/1
```

Ildp advertise management-address

Advertises a management address.

Syntax

lldp advertise management-address { **ipv4** *ipv4-address* | **ipv6** *ipv6-address* } **ports** { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

no lldp advertise management-address { **ipv4** *ipv4-address* | **ipv6** *ipv6-address* } **ports** { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

Command Default

Management address advertising has two modes: default and explicitly configured.

Parameters

ipv4 *ipv4-address*

Specifies an IPv4 management address to advertise.

ipv6 *ipv6-address*

Specifies an IPv6 management address to advertise.

ports

Advertises the configured management address for the specified ports.

all

Advertises the configured management address for all LLDP-capable ports.

ethernet *stack-id/slot/port*

Advertises the configured management address for the specified Ethernet port.

to *stack-id/slot/port*

Advertises the configured management address for a range of Ethernet ports.

Modes

Global configuration mode

Usage Guidelines

The default mode is used when no addresses are configured to be advertised for a given port. If no management address is explicitly configured to be advertised, the device uses the first available IPv4 address and the first available IPv6 address (so it may advertise IPv4, IPv6 or both). If any addresses are configured to be advertised for a given port, then only those addresses are advertised. If no IP address is configured on any of the above, the port's current MAC address will be advertised.

If a management address is not explicitly configured to be advertised, the device uses the first available IPv4 address and the first available IPv6 address. A Layer 3 switch selects the first available address of each type from those configured on the following types of interfaces, in the following order of preference:

- Physical port on which LLDP will be transmitting the packet
- Virtual router interface (VE) on a VLAN that the port is a member of
- Dedicated management port
- Loopback interface
- Virtual router interface (VE) on any other VLAN
- Other physical port
- Other interface

For IPv6 addresses, link-local and anycast addresses are excluded from these searches.

If no IP address is configured on any of the listed interface types, the port's current MAC address is advertised.

The **no** form of the command stops the advertisement of the management interface IP address.

Examples

The following example advertises an IPv4 management address.

```
device(config)# lldp advertise management-address ipv4 10.157.2.1 ports ethernet 1/1/4
```

The following example advertises an IPv6 management address.

```
device(config)# lldp advertise management-address ipv6 2001:DB8::90 ports ethernet 1/1/7
```

Ildp advertise max-frame-size

Advertises the maximum frame size capability of the port.

Syntax

lldp advertise max-frame-size ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

no lldp advertise max-frame-size ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

Command Default

The maximum frame size is automatically advertised when Link Layer Discovery Protocol (LLDP) is enabled on a global basis.

The maximum frame size is 1522 octets.

Parameters

ports

Advertises the maximum frame size for the specified ports.

all

Advertises the maximum frame size for all LLDP-capable ports.

ethernet *stack-id/slot/port*

Advertises the maximum frame size for a specific Ethernet port.

to *stack-id/slot/port*

Advertises the maximum frame size for a range of Ethernet ports.

Modes

Global configuration mode

Usage Guidelines

The maximum frame size TLV provides the maximum 802.3 frame size capability of the port. This value is expressed in octets and includes the four-octet Frame Check Sequence (FCS). The default maximum frame size is 1522. The advertised value may change if the **aggregated-vlan** or **jumbo** command is configured.

NOTE

On 48GC modules in nonjumbo mode, the maximum size of ping packets is 1486 bytes and the maximum frame size of tagged traffic is no larger than 1581 bytes.

The **no** form of the command disables the advertisement.

Examples

The following example enables the maximum frame size advertisement on a range of Ethernet ports.

```
device(config)# lldp advertise max-frame-size ports ethernet 1/1/4 to 1/1/12
```

Ildp advertise med-capabilities

Advertises information about Link Layer Discovery Protocol-Media Endpoint Discovery (LLDP-MED) capabilities.

Syntax

lldp advertise med-capabilities ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

no lldp advertise med-capabilities ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

Command Default

LLDP-MED information is automatically advertised when LLDP-MED is enabled.

Parameters

ports

Advertises LLDP-MED capabilities information for the specified ports.

all

Advertises LLDP-MED capabilities information for all LLDP-capable ports.

ethernet *stack-id/slot/port*

Advertises LLDP-MED capabilities information for a specific Ethernet port.

to *stack-id/slot/port*

Advertises LLDP-MED capabilities information for a range of Ethernet ports.

Modes

Global configuration mode

Usage Guidelines

The LLDP-MED capabilities advertisement includes the following information:

- The supported LLDP-MED TLVs
- The device type (network connectivity device or endpoint [Class 1, 2, or 3])

NOTE

Disabling the LLDP-MED capabilities disables LLDP-MED.

The **no** form of the command disables the advertisement.

Examples

The following example enables the advertisement of LLDP-MED capabilities information on a range of Ethernet ports.

```
device(config)# lldp advertise med-capabilities ports ethernet 1/1/1 to 1/1/6
```

Ildp advertise med-power-via-mdi

Advertises endpoint IEEE 802.3af power-related information. Enables advanced power management between LLDP-MED endpoints and network connectivity devices.

Syntax

lldp advertise med-power-via-mdi ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

no lldp advertise med-power-via-mdi ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

Command Default

LLDP-MED power-via-MDI information is automatically advertised when LLDP-MED is enabled, when the port is a PoE port, and when PoE is enabled on the port.

Parameters

ports

Advertises LLDP-MED power-via-MDI information for the specified ports.

all

Advertises LLDP-MED power-via-MDI information for all LLDP-capable ports.

ethernet *stack-id/slot/port*

Advertises LLDP-MED power-via-MDI information for a specific Ethernet interface.

to *stack-id/slot/port*

Advertises LLDP-MED power-via-MDI information for a range of Ethernet interfaces.

Modes

Global configuration mode

Usage Guidelines

The LLDP-MED Power-via-MDI TLV advertises an endpoint's IEEE 802.3af power-related information, including the following:

- Power type—whether the LLDP-MED device transmitting the LLDPDU is a power-sourcing device or a powered device.
- Power source—The power source being utilized by a PSE or PD, for example, the primary power source, backup power source, or unknown.
- Power priority—The inline power priority level for the PSE or PD.
- Power level—The total power, in tenths of watts, required by a PD from a PSE or the total power that a PSE is capable of sourcing over a maximum length cable based on its current configuration.

The **no** form of the command disables the advertisement.

Examples

The following example enables the advertisement of LLDP-MED power-via-MDI information for a range of Ethernet interfaces.

```
device(config)# lldp advertise med-power-via-mdi ports ethernet 1/1/1 to 1/1/5
```

Ildp advertise port-description

Identifies the port from which the Link Layer Discovery Protocol (LLDP) agent transmitted the advertisement.

Syntax

lldp advertise port-description ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

no lldp advertise port-description ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

Command Default

The port description is automatically advertised when LLDP is enabled on a global basis.

Parameters

ports

Advertises the port description for the specified ports.

all

Advertises the port description for all LLDP-capable ports.

ethernet *stack-id/slot/port*

Advertises the port description for a specific Ethernet port.

to *stack-id/slot/port*

Advertises the port description for a range of Ethernet ports.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command disables the advertisement.

The port description is taken from the ifDescr MIB object from MIB-II.

Examples

The following example enables the advertisement of the port description on a range of Ethernet ports.

```
device(config)# lldp advertise port-description ports ethernet 1/1/4 to 1/1/9
```

Ildp advertise port-id-subtype

Specifies the Link Layer Discovery Protocol (LLDP) port ID subtype information to advertise as the port ID.

Syntax

```
lldp advertise port-id-subtype num ports { all | ethernet stack-id/slot/port [ to stack-id/slot/port ] [ ethernet ... ] }
no lldp advertise port-id-subtype num ports { all | ethernet stack-id/slot/port [ to stack-id/slot/port ] [ ethernet ... ] }
```

Command Default

By default, the port ID subtype to advertise is set to 3.

Parameters

num

Specifies the port ID subtype to advertise. The subtype determines the specific information that is advertised as the port ID.

1

Causes interface alias information, taken from the ifAlias MIB object, to be advertised as the port ID.

3

Causes the MAC address to be advertised as the port ID. This is the default value.

5

Causes interface name information, taken from the ifName MIB object, to be advertised as the port ID.

7

Causes a locally assigned value (as defined by RFC 2863) to be displayed as the port ID. Ruckus devices display information taken from the ifIndex MIB object.

ports

Specifies the LLDP-capable ports for which the LLDP port ID subtype is to be advertised.

all

Causes the advertisement of the port ID subtype for all LLDP-capable ports on the device.

ethernet *stack-id/slot/port*

Causes the advertisement of the port ID subtype for a specific Ethernet port. When immediately followed by the **to** option, this option specifies the first port in a range of Ethernet ports.

to *stack-id/slot/port*

Causes the advertisement of the port ID subtype for a range of Ethernet ports and specifies the last port in the range.

NOTE

You can specify the advertisement of an LLDP port ID subtype for a range of Ethernet ports (for example, ethernet 1/1/1 to ethernet 1/1/4), or for a list of Ethernet ports (for example, ethernet 1/2/1 ethernet 1/2/2), or you can combine a range with a list (for example, ethernet 1/1/1 to ethernet 1/1/4 ethernet 1/1/1 ethernet 1/1/2).

Modes

Global configuration mode

Usage Guidelines

NOTE

The port ID subtype to advertise is only configurable on Ruckus ICX 7750, Ruckus ICX 7450, and Ruckus ICX 7250 devices.

The LLDP port ID subtype advertises previously configured information. To ensure that the physical location of a port is available for advertisement when the port ID subtype to advertise is set to 1, 5, or 7, the port location must first be configured by using the **lldp med location-id civic-address**, **lldp med location-id coordinate-based**, or **lldp med location-id ecs-elin** command.

The **no** form of the command restores the port ID subtype advertised to the default value for specific ports.

Examples

The following example shows how to advertise the interface alias (port ID subtype 1) as the port ID for two individual ports (1/2/1 and 1/2/2) and for a range of ports (1/1/1 to 1/1/4).

```
device(config)# lldp advertise port-id-subtype 1 ports ethernet 1/2/1 ethernet 1/2/2 ethernet 1/1/1 to 1/1/4
```

History

Release version	Command history
08.0.50	This command was introduced.

Ildp advertise port-vlan-id

Advertises the port VLAN identifier (PVID) that is associated with untagged or priority-tagged frames.

Syntax

lldp advertise port-vlan-id ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

no lldp advertise port-vlan-id ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

Command Default

The port VLAN ID is automatically advertised when Link Layer Discovery Protocol (LLDP) is enabled on a global basis.

Parameters

ports

Advertises the port VLAN ID for the specified ports.

all

Advertises the port VLAN ID for all LLDP-capable ports.

ethernet *stack-id/slot/port*

Advertises the port VLAN ID for a specific Ethernet port.

to *stack-id/slot/port*

Advertises the port VLAN ID for a range of Ethernet ports.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command disables the advertisement.

Examples

The following example enables the advertisement of the port VLAN ID on a range of ports.

```
device(config)# lldp advertise port-vlan-id ports ethernet 1/1/2 to 1/1/5
```

Ildp advertise power-via-mdi

Advertises general information about Power over Ethernet (PoE) capabilities and the status of the port.

Syntax

lldp advertise power-via-mdi ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

no lldp advertise power-via-mdi ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

Command Default

Information about PoE capabilities and port status is not advertised.

Parameters

ports

Advertises Power via Media Dependent Interface (power-via-MDI) information for the specified ports.

all

Advertises power-via-MDI information for all LLDP-capable ports.

ethernet *stack-id/slot/port*

Advertises power-via-MDI information for a specific Ethernet port.

to *stack-id/slot/port*

Advertises power-via-MDI information for a range of Ethernet ports.

Modes

Global configuration mode

Usage Guidelines

The power-via-MDI information includes the following:

- PoE capability (supported or not supported)
- PoE status (enabled or disabled)
- Power Sourcing Equipment (PSE) power pair—Indicates which pair of wires is in use and whether the pair selection can be controlled. The Brocade implementation always uses pair A and cannot be controlled.
- Power class—Indicates the range of power that the connected powered device has negotiated or requested.

The **no** form of the command disables the advertisement.

Examples

The following example advertises the power-via-MDI information on a range of ports.

```
device(config)# lldp advertise power-via-mdi ports ethernet 1/1/1 to 1/1/10
```

Ildp advertise system-capabilities

Advertises the primary functions of the device and indicates whether these primary functions are enabled.

Syntax

lldp advertise system-capabilities ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*] ...] }

no lldp advertise system-capabilities ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*] ...] }

Command Default

The system capabilities are automatically advertised when Link Layer Discovery Protocol (LLDP) is enabled on a global basis.

Parameters

ports

Advertises the system capabilities for the specified ports.

all

Advertises the system capabilities for all LLDP-capable ports.

ethernet *stack-id/slot/port*

Advertises the system capabilities for the specified Ethernet port.

to *stack-id/slot/port*

Advertises the system capabilities for a range of Ethernet ports.

Modes

Global configuration mode

Usage Guidelines

System capabilities are based on the type of software image in use (Layer 2 switch or Layer 3 router). The enabled capabilities are the same as the available capabilities, except that when using a router image (base or full Layer 3), if the global route-only feature is turned on, the bridge capability is not included, since no bridging occurs.

The **no** form of the command disables the advertisement.

Examples

The following example advertises the system capabilities information on a range of ports.

```
device(config)# lldp advertise system-capabilities ports ethernet 1/1/1 to 1/1/10
```

Ildp advertise system-description

Advertises information such as the product name or model number, the version of the system hardware, the software operating system level, and the networking software version.

Syntax

lldp advertise system-description ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

no lldp advertise system-description ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

Command Default

The system description is not advertised.

Parameters

ports

Advertises the system information for the specified ports.

all

Advertises the system information for all Link Layer Discovery Protocol (LLDP) capable ports.

ethernet *stack-id/slot/port*

Advertises the system information for a specific Ethernet port.

to *stack-id/slot/port*

Advertises the system information for a range of Ethernet ports.

Modes

Global configuration mode

Usage Guidelines

The system description is the network entity, which can include information such as the product name or model number, the version of the system hardware, the software operating system level, and the networking software version. The information corresponds to the sysDescr MIB object in MIB-II.

The **no** form of the command disables the advertisement.

Examples

The following example advertises the system description information.

```
device(config)# lldp advertise system-description ports ethernet 1/1/1 to 1/1/5
```

Ildp advertise system-name

Advertises the name assigned to the system.

Syntax

lldp advertise system-name ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

no lldp advertise system-name ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

Command Default

The system name is automatically advertised when Link Layer Discovery Protocol (LLDP) is enabled on a global basis.

Parameters

ports

Advertises the system name for the specified ports.

all

Advertises the system name for all LLDP-capable ports.

ethernet *stack-id/slot/port*

Advertises the system name for a specific Ethernet port.

to *stack-id/slot/port*

Advertises the system name for a range of Ethernet ports.

Modes

Global configuration mode

Usage Guidelines

The system name is the name that is administratively assigned to the system and is taken from the sysName MIB object in MIB-II. The sysName MIB object corresponds to the name defined with the CLI command **hostname**.

The **no** form of the command disables the advertisement.

Examples

The following example advertises the system name information.

```
device(config)# lldp advertise system-name ports ethernet 1/1/1 to 1/1/0
```

Ildp enable ports

Enables the receipt and transmission of Link Layer Discovery Protocol (LLDP) packets on ports.

Syntax

lldp enable ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

no lldp enable ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

Command Default

When LLDP is enabled on a global basis, by default, each port on a Brocade device is capable of transmitting and receiving LLDP packets.

Parameters

ports

Enables LLDP for the specified ports.

all

Enables LLDP for all LLDP-capable ports.

ethernet *stack-id/slot/port*

Enables LLDP for a specific Ethernet port.

to *stack-id/slot/port*

Enables LLDP for a range of Ethernet ports.

Modes

Global configuration mode

Usage Guidelines

When a port is configured to both receive and transmit LLDP packets and the MED capabilities TLV is enabled, LLDP-MED is enabled as well. LLDP-MED is not enabled if the operating mode is set to receive only or transmit only.

The **no** form of the command disables the receipt and transmission of LLDP packets on the specified ports.

Examples

The following example enables LLDP on one port.

```
device(config)# lldp enable ports ethernet 1/1/1
```

Ildp enable receive

Changes the Link Layer Discovery Protocol (LLDP) operating mode of specified ports from receive-and-transmit mode to receive-only mode.

Syntax

lldp enable receive ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

no lldp enable receive ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

Command Default

When LLDP is enabled on a global basis, each port on the device is capable of transmitting and receiving LLDP packets.

Parameters

ports

Changes the LLDP operating mode to receive-only mode for the specified ports.

all

Changes the LLDP operating mode to receive-only mode for all LLDP-capable ports.

ethernet *stack-id/slot/port*

Changes the LLDP operating mode to receive-only mode for a specific Ethernet port.

ethernet *stack-id/slot/port*

Changes the LLDP operating mode to receive-only mode for a range of Ethernet ports.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command changes the LLDP operating mode to transmit-only mode if the device is in both transmit and receive mode, and it disables the LLDP receive-only operating mode if receive-only mode was enabled.

To change the LLDP operating mode to transmit-only mode, disable the receive mode using the **no lldp enable transmit** command.

NOTE

LLDP-MED is not enabled when you enable the receive-only operating mode. To enable LLDP-MED, you must configure the port to both receive and transmit LLDP packets.

NOTE

To change a port's LLDP operating mode from transmit-only to receive-only, first disable the transmit-only mode, and then enable the receive-only mode. If you do not disable transmit-only mode, you will configure the port to both receive and transmit LLDP packets.

Examples

The following example changes the LLDP operating mode of three ports to receive-only mode.

```
device(config)# lldp enable receive ports ethernet 1/1/1 ethernet 1/1/5 ethernet 1/1/7
```

lldp enable snmp med-topo-change-notifications

Enables SNMP notifications and syslog messages for LLDP-MED topology changes.

Syntax

lldp enable snmp med-topo-change-notifications ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

no lldp enable snmp med-topo-change-notifications ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

Command Default

SNMP notifications and corresponding syslog messages are disabled.

Parameters

ports

Enables LLDP-MED SNMP notifications and syslog messages for ports.

all

Enables LLDP-MED SNMP notifications and syslog messages for all LLDP-capable ports.

ethernet *stack-id/slot/port*

Enables LLDP-MED SNMP notifications and syslog messages for a specific Ethernet port.

to *stack-id/slot/port*

Enables LLDP-MED SNMP notifications and syslog messages for a range of Ethernet ports.

Modes

Global configuration mode

Usage Guidelines

When you enable LLDP-MED SNMP notifications, corresponding syslog messages are enabled as well. When you enable LLDP-MED SNMP notifications, the device sends traps and syslog messages when an LLDP-MED endpoint neighbor entry is added or removed.

The **no** form of the command disables LLDP-MED SNMP notifications and syslog messages.

Examples

The following example enables LLDP-MED SNMP notifications and syslog messages for a range of ports.

```
device(config)# lldp enable snmp med-topo-change-notifications ports ethernet 1/1/4 to 1/1/6
```

Ildp enable snmp notifications

Enables LLDP SNMP notifications and syslog messages.

Syntax

lldp enable snmp notifications ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

no lldp enable snmp notifications ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

Command Default

LLDP SNMP notifications and corresponding syslog messages are disabled.

Parameters

ports

Enables LLDP SNMP notifications and syslog messages for ports.

all

Enables LLDP SNMP notifications and syslog messages for all LLDP-capable ports.

ethernet *stack-id/slot/port*

Enables LLDP SNMP notifications and syslog messages for a specific Ethernet port.

to *stack-id/slot/port*

Enables LLDP SNMP notifications and syslog messages for a range of Ethernet ports.

Modes

Global configuration mode

Usage Guidelines

When you enable LLDP SNMP notifications, the device sends traps and corresponding syslog messages whenever there is a change in the LLDP data received from neighboring devices.

The **no** form of the command disables LLDP SNMP notifications and syslog messages.

Examples

The following example enables LLDP SNMP notifications and syslog messages for a range of ports.

```
device(config)# lldp enable snmp notifications ports ethernet 1/1/1 to 1/1/6
```

Ildp enable transmit

Changes the Link Layer Discovery Protocol (LLDP) operating mode to transmit-only mode.

Syntax

lldp enable transmit ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port to* *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

no lldp enable transmit ports { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port to* *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

Command Default

When LLDP is enabled on a global basis, each port on the device is capable of transmitting and receiving LLDP packets.

Parameters

ports

Changes the LLDP operating mode to transmit-only mode for ports.

all

Changes the LLDP operating mode to transmit-only mode for all LLDP-capable ports.

ethernet *stack-id/slot/port*

Changes the LLDP operating mode to transmit-only mode for the specified Ethernet interface.

to *stack-id/slot/port*

Changes the LLDP operating mode to transmit-only mode for a range of Ethernet interfaces.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command changes the LLDP operating mode to receive-only mode if the device is in both transmit and receive mode, and it disables the LLDP transmit-only operating mode if transmit-only mode was enabled.

NOTE

To change a port's LLDP operating mode from receive-only to transmit-only, first disable receive-only mode, and then enable transmit-only mode. If you do not disable receive-only mode, you will configure the port to both receive and transmit LLDP packets.

Examples

The following example sets the LLDP operating mode to transmit-only mode.

```
device(config)# no lldp enable receive ports ethernet 1/1/1 ethernet 1/1/8
device(config)# lldp enable transmit ports ethernet 1/1/1 ethernet 1/1/8
```

Ildp max-neighbors-per-port

Specifies the maximum number of Link Layer Discovery Protocol (LLDP) neighbors per port.

Syntax

lldp max-neighbors-per-port *value*

no lldp max-neighbors-per-port

Command Default

The default number of LLDP neighbors per port is 4.

Parameters

value

Specifies the number of LLDP neighbors for which LLDP data is retained for each port. The value can range from 1 through 64. The default value is 4.

Modes

Global configuration mode

Usage Guidelines

You can use the **show lldp** command to view the current configuration.

The **no** form of the command removes the configured value and restores the default value of 4.

Examples

The following example sets the number of LLDP neighbors per port to 6.

```
device(config)# lldp max-neighbors-per-port 6
```

Ildp max-total-neighbors

Specifies the maximum number of Link Layer Discovery Protocol (LLDP) neighbors for which LLDP data is retained for the entire system.

Syntax

lldp max-total-neighbors *value*

no lldp max-total-neighbors

Command Default

The default number of LLDP neighbors per device is 392.

Parameters

value

Specifies the number of LLDP neighbors per device. The value can range from 16 through 8192. The default value is 392.

Modes

Global configuration mode

Usage Guidelines

You can use the **show lldp** command to view the current configuration.

The **no** form of the command removes the configured value and restores the default value of 392 LLDP neighbors.

Examples

The following example sets the number of LLDP neighbors per device to 100.

```
device(config)# lldp max-total-neighbors 100
```

Ildp med fast-start-repeat-count

Configures the Link Layer Discovery Protocol Media Endpoint Device (LLDP-MED) fast-start transmit count.

Syntax

lldp med fast-start-repeat-count *value*
no lldp med fast-start-repeat-count

Command Default

The device sends three packets at 1-second intervals.

Parameters

value

Specifies the number of LLDP packets that are sent during the LLDP-MED fast-start period. The value can range from 1 through 10. The default value is 3.

Modes

Global configuration mode

Usage Guidelines

The LLDP-MED fast-start repeat count specifies the number of LLDP packets that are sent during the LLDP-MED fast-start period.

The fast-start feature enables a network connectivity device to initially advertise itself at a faster rate for a limited time when an LLDP-MED endpoint has been newly detected or has newly connected to the network. This feature is important within a VoIP network, for example, where rapid availability is crucial for applications such as emergency call service location (E911). The fast-start timer starts when a network connectivity device receives the first LLDP frame from a newly detected endpoint.

NOTE

The LLDP-MED fast-start mechanism is intended to run only on links between network connectivity devices and endpoint devices. It does not apply to links between LAN infrastructure elements, including between network connectivity devices or to other types of links.

The **no** form of the command removes the configured value and restores the default value of 3 packets per second.

Examples

The following example sets the LLDP-MED fast-start transmit count to 6.

```
device(config)# lldp med fast-start-repeat-count 6
```

Ildp med location-id civic-address

Configures a civic-address-based location for Link Layer Discovery Protocol-Media Endpoint Discovery (LLDP-MED).

Syntax

lldp med location-id civic-address refers-to *reference* **country** *country-code* { **elem** *CA-type value* [**elem** *CA-type value*] ... | **ports** { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port to stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

no lldp med location-id civic-address refers-to *reference* **country** *country-code* { **elem** *CA-type value* [**elem** *CA-type value*] ... | **ports** { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port to stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

Command Default

An LLDP-MED civic address is not configured.

Parameters

refers-to *reference*

Specifies the location that the entry refers to. Specify one of the following: **client**, **dhcp-server**, or **network-element**.

NOTE

The **dhcp-server** or **network-element** keywords should be used only if it is known that the endpoint is in close physical proximity to the DHCP server or network element.

country *country-code*

Specifies a two-letter ISO 3166 country code in capital ASCII letters as follows:

- **CA** (Canada)
- **DE** (Germany)
- **JP** (Japan)
- **KR** (Korea)
- **US** (United States)

elem *CA-type*

Specifies the civic address element. This a value from 0 to 255 that describes the civic address element. Refer to the usage guidelines.

value

Specifies the actual value of the element CA type.

ethernet *stackid/slot/port*

Specifies the Ethernet port.

to *stackid/slot/port*

Specifies a range of Ethernet ports.

Modes

Global configuration mode

Usage Guidelines

If the value of an element contains one or more spaces, use double quotation marks ("") at the beginning and end of the string. For example, **elem 3 "Santa Clara"**.

TABLE 6 Elements used with a civic address

Civic address (CA) type	Description	Acceptable values / examples
0	Language	The ISO 639 language code used for presenting the address information.
1	National subdivisions (state, canton, region, province, or prefecture)	Examples: Canada - Province Germany - State Japan - Metropolis Korea - Province United States - State
2	County, parish, gun (JP), or district (IN)	Examples: Canada - County Germany - County Japan - City or rural area Korea - County United States - County
3	City, township, or shi (JP)	Examples: Canada - City or town Germany - City Japan - Ward or village Korea - City or village United States - City or town
4	City division, borough, city district, ward, or chou (JP)	Examples: Canada - N/A Germany - District Japan - Town Korea - Urban district United States - N/A

TABLE 6 Elements used with a civic address (continued)

Civic address (CA) type	Description	Acceptable values / examples
5	Neighborhood or block	Examples: Canada - N/A Germany - N/A Japan - City district Korea - Neighborhood United States - N/A
6	Street	Examples: Canada - Street Germany - Street Japan - Block Korea - Street United States - Street
16	Leading street direction	N (north), E (east), S (south), W (west), NE, NW, SE, SW
17	Trailing street suffix	N (north), E (east), S (south), W (west), NE, NW, SE, SW
18	Street suffix	Acceptable values for the United States are listed in the United States Postal Service Publication 28 [18], Appendix C. Example: Ave, Place
19	House number	The house number (street address) Example: 1234
20	House number suffix	A modifier to the house number. It does not include parts of the house number. Example: A, 1/2
21	Landmark or vanity address	A string name for a location. It conveys a common local designation of a structure, a group of buildings, or a place that helps to locate the place. Example: UC Berkeley
22	Additional location information	An unstructured string name that conveys additional information about the location. Example: west wing
23	Name (residence and office occupant)	Identifies the person or organization associated with the address. Example: Textures Beauty Salon
24	Postal / zip code	The valid postal / zip code for the address. Example: 95054-1234
25	Building (structure)	The name of a single building if the street address includes more than one building or if the building name is helpful in identifying the location. Example: Law Library

TABLE 6 Elements used with a civic address (continued)

Civic address (CA) type	Description	Acceptable values / examples
26	Unit (apartment, suite)	The name or number of a part of a structure where there are separate administrative units, owners, or tenants, such as separate companies or families who occupy that structure. Common examples include suite or apartment designations. Example: Apt 27
27	Floor	Example: 4
28	Room number	The smallest identifiable subdivision of a structure. Example: 7A
29	Place type	The type of place described by the civic coordinates. For example, a home, office, street, or other public space. Example: Office
30	Postal community name	When the postal community name is defined, the civic community name (typically CA type 3) is replaced by this value. Example: Alviso
31	Post office box (P.O. box)	When a P.O. box is defined, the street address components (CA types 6, 16, 17, 18, 19, and 20) are replaced with this value. Example: P.O. Box 1234
32	Additional code	An additional country-specific code that identifies the location. For example, for Japan, this is the Japan Industry Standard (JIS) address code. The JIS address code provides a unique address inside of Japan, down to the level of indicating the floor of the building.
128	Script	The script (from ISO 15924 [14]) used to present the address information. Example: Latn NOTE If not manually configured, the system assigns the default value Latn .
255	Reserved	

The **no** form of the command removes the LLDP-MED civic address.

Examples

The following example configures a civic-address-based location.

```
device(config)# lldp med location-id civic-address refers-to client country US elem 1 CA elem 3 "Santa Clara" elem 6 "4980 Great America Pkwy" elem 24 95054 elem 27 5 elem 28 551 elem 29 office elem 23 "John Doe"
```

Ildp med location-id coordinate-based

Configures a coordinate-based location for an endpoint device.

Syntax

```
lldp med location-id coordinate-based latitude degrees resolution bits longitude degrees resolution bits altitude  
{ floors number resolution bits | meters number resolution bits } datum ports { all | ethernet stack-id/slot/port  
[ to stack-id/slot/port | [ ethernet stack-id/slot/port to stack-id/slot/port | ethernet stack-id/slot/port ]... ] }
```

```
no lldp med location-id coordinate-based latitude degrees resolution bits longitude degrees resolution bits altitude  
{ floors number resolution bits | meters number resolution bits } datum ports { all | ethernet stack-id/slot/port  
[ to stack-id/slot/port | [ ethernet stack-id/slot/port to stack-id/slot/port | ethernet stack-id/slot/port ]... ] }
```

Command Default

A coordinate-based location for an endpoint device is not configured.

Parameters

latitude *degrees*

Specifies the angular distance north or south from the earth equator, measured through 90 degrees. Positive numbers indicate a location north of the equator and negative numbers indicate a location south of the equator.

resolution *bits*

Specifies the precision of the value given for latitude. A smaller value increases the area within which the device is located. For latitude, the value can range from 1 to 34.

longitude *degrees*

Specifies the angular distance from the intersection of the zero meridian. Positive values indicate a location east of the prime meridian and negative numbers indicate a location west of the prime meridian.

resolution *bits*

Specifies the precision of the value given for longitude. A smaller value increases the area within which the device is located. For longitude resolution, enter a number between 1 and 34.

altitude

Specifies the vertical elevation of a building above the ground.

floors *number*

Specifies the vertical elevation of a building above the ground, where 0 represents the floor level associated with the ground level at the main entrance and larger values represent floors that are above (higher in altitude) floors with lower values. Subfloors can be represented by noninteger values.

resolution *bits*

Specifies the precision of the value given for altitude. A smaller value increases the area within which the device is located. For floor resolution, enter the value 0 if the floor is unknown or 30 if a valid floor is being specified.

meters *number*

Specifies the vertical elevation, in meters, as opposed to floors.

resolution *bits*

Specifies the precision of the value given for altitude. A smaller value increases the area within which the device is located. For meter resolution, enter a value from 0 to 30.

datum

Specifies the map used as the basis for calculating the location. The value can be one of the following:

wgs84

World Geodesic System 1984, CRS Code 4327, Prime Meridian Name: Greenwich.

nad83-navd88

North American Datum 1983, CRS Code 4269, Prime Meridian Name: Greenwich. The associated vertical datum is the North American Vertical Datum of 1988 (NAVD88). Use this value when referencing locations on land. If land is near tidal water, use **nad83-mllw**.

nad83-mllw

North American Datum 1983, CRS Code 4269, Prime Meridian Name: Greenwich. The associated vertical datum is mean lower low water (MLLW). Use this value when referencing locations on water, sea, or ocean.

ethernet *stackid/slot/port*

Specifies the Ethernet port.

to *stackid/slot/port*

Specifies a range of Ethernet ports.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command removes a coordinate-based location for an Endpoint device.

Examples

The following example configures a coordinate-based location.

```
device(config)# lldp med location-id coordinate-based latitude -78.303 resolution 20 longitude 34.27  
resolution 18 altitude meters 50 resolution 16 wgs84
```

Ildp med location-id ecs-elin

Configures an Emergency Call Service (ECS) based location for Link Layer Discovery Protocol Media Endpoint Device (LLDP-MED).

Syntax

lldp med location-id ecs-elin *numeric-string* **ports** { **all** | **ethernet** *stack-id/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stackid/slot/port*]...] }

no lldp med location-id ecs-elin *numeric-string* **ports** { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

Parameters

numeric-string

Specifies the Emergency Location Identification Number (ELIN) from the North America Numbering Plan format, supplied to the Public Safety Answering Point (PSAP) for ECS purposes. The value can range from 10 to 25 digits in length.

ports

Configures an ECS-based location for ports.

all

Configures an ECS-based location for all LLDP-capable ports.

ethernet *stack-id/slot/port*

Configures an ECS-based location for a specific Ethernet port.

to *stack-id/slot/port*

Configures an ECS-based location for a range of Ethernet ports.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command removes the configured ECS-based location.

Examples

The following example configures an ECS-based location for LLDP-MED.

```
device(config)# lldp med location-id ecs-elin 4082071700
```

Ildp med network-policy application

Defines an Link Layer Discovery Protocol-Media Endpoint Discovery (LLDP-MED) network policy for an endpoint.

Syntax

lldp med network-policy application *application-type* **tagged vlan** *vlan-id* **priority** *priority-value* **dscp** *dscp-value* **ports** { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port to stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

no lldp med network-policy application *application-type* **tagged vlan** *vlan-id* **priority** *priority-value* **dscp** *dscp-value* **ports** { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port to stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

lldp med network-policy application *application-type* **untagged dscp** *dscp-value* **ports** { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port to stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

no lldp med network-policy application *application-type* **untagged dscp** *dscp-value* **ports** { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port to stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

lldp med network-policy application *application-type* **priority-tagged priority** *priority-value* **dscp** *dscp-value* **ports** { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port to stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

no lldp med network-policy application *application-type* **priority-tagged priority** *priority-value* **dscp** *dscp-value* **ports** { **all** | **ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port to stack-id/slot/port* | **ethernet** *stack-id/slot/port*]...] }

Command Default

An LLDP-MED network policy is not defined.

Parameters

application-type

Configures the primary function of the applications defined by this network policy. The application type can be one of the following:

guest-voice

Limited voice service for guest users and visitors with their own IP telephony handsets or similar devices that support interactive voice services.

guest-voice-signaling

Limited voice service for use in network topologies that require a different policy for guest voice signaling than for guest voice media.

softphone-voice

Softphone voice service for use with multimedia applications that work in association with VoIP technology, enabling phone calls direct from a PC or laptop. Softphones do not usually support multiple VLANs and are typically configured to use an untagged VLAN or a single tagged data-specific VLAN. Note that when a network policy is defined for use with an untagged VLAN, the Layer 2 priority field is ignored and only the DSCP value is relevant.

streaming-video

Applies to broadcast- or multicast-based video content distribution and similar applications that support streaming video services requiring specific network policy treatment. Video applications that rely on TCP without buffering would not be an intended use of this application type.

video-conferencing

Applies to dedicated video conferencing equipment and similar devices that support real-time interactive video/audio services.

video-signaling

For use in network topologies that require a separate policy for video signaling than for video media. Note that this application type should not be advertised if all the same network policies apply as those advertised in the video conferencing policy TLV.

voice

For use by dedicated IP telephony handsets and similar devices that support interactive voice services.

voice-signaling

For use in network topologies that require a different policy for voice signaling than for voice media. Note that this application type should not be advertised if all the same network policies apply as those advertised in the voice policy TLV.

tagged vlan *vlan-id*

Specifies the tagged VLAN that the specified application type will use.

untagged

Configures the device to use an untagged frame format.

priority-tagged

Configures the device to use priority-tagged frames. In this case, the device uses the default VLAN (PVID) of the ingress port.

priority *priority-value*

Configures the Layer 2 priority value to be used for the specified application type. Enter 0 to use the default priority. Valid values are 0 through 7.

dscp *dscp-value*

Configures the Layer 3 differentiated services codepoint priority value to be used for the specified application type. Enter 0 to use the default priority. Valid values are 0 through 63.

ports

Specifies the ports.

ethernet *stack-id/slot/port*

Configures the network policy on the specified Ethernet interface.

to *stack-id/slot/port*

Configures the network policy on a range of Ethernet interfaces.

Modes

Global configuration mode

Usage Guidelines

An LLDP-MED network policy defines an endpoint VLAN configuration (VLAN type and VLAN ID) and associated Layer 2 and Layer 3 priorities that apply to a specific set of applications on a port.

NOTE

This feature applies to applications that have specific real-time network policy requirements, such as interactive voice or video services. It is not intended to run on links other than links between network connectivity devices and endpoints, and therefore does not advertise the multitude of network policies that frequently run on an aggregated link.

The **no** form of the command removes the defined LLDP-MED network policy for an Endpoint.

Examples

The following example defines an LLDP-MED network policy for an endpoint.

```
device(config)# lldp med network-policy application voice tagged vlan 99 priority 3 dscp 22 ports  
ethernet 1/1/1
```

Ildp reinit-delay

Configures the minimum time between port reinitializations.

Syntax

lldp reinit-delay *seconds*
no lldp reinit-delay

Command Default

When LLDP is enabled, the default time between port reinitializations is set to 2 seconds.

Parameters

seconds

Specifies the time between port reinitializations. The value can range from 1 through 10 seconds. The default is 2 seconds.

Modes

Global configuration mode

Usage Guidelines

The LLDP re-initialization delay timer specifies the minimum number of seconds the device will wait from when LLDP is disabled on a port, until it will honor a request to re-enable LLDP on that port.

The **no** form of the command removes the configured value and restores the interval between port reinitializations to the default of 2 seconds.

Examples

The following example sets the reinitialization delay timer to 5 seconds.

```
device(config)# lldp reinit-delay 5
```

Ildp run

Enables Link Layer Discovery Protocol (LLDP) globally.

Syntax

lldp run

no lldp run

Command Default

LLDP is disabled globally.

Modes

Global configuration mode

Usage Guidelines

To enable LLDP on individual ports, first LLDP must be enabled globally (on the entire device).

The **no** form of the command disables LLDP globally, with the exception of enabled SPX (802.1br) ports.

When the **spx cb-enable** command is entered, LLDP is automatically enabled on SPX ports (802.1br communication ports, not to be confused with PE unit data ports). Enabling or disabling LLDP on data ports has no impact on SPX ports. When the **no spx cb-enable** command is entered, SPX ports follow the LLDP global state; that is, if LLDP is disabled on data ports, it is also disabled on the SPX (802.1br) ports.

Examples

The following example enables LLDP globally.

```
device(config)# lldp run
```

History

Release version	Command history
8.0.40a	Global default behavior changes to disabled for data ports. SPX (802.1br) ports are enabled separately with the spx cb-enable command.

Ildp snmp-notification-interval

Configures the minimum time between SNMP traps and syslog messages.

Syntax

lldp snmp-notification-interval *seconds*
no lldp snmp-notification-interval

Command Default

The default time between transmission of SNMP traps and syslog messages is 5 seconds.

Parameters

seconds

Configures the time, in seconds, between transmission of SNMP traps and syslog messages. The value can range from 5 through 3600. The default is 5.

Modes

Global configuration mode

Usage Guidelines

When SNMP notifications and syslog messages for LLDP are enabled, the device will send no more than one SNMP notification and corresponding syslog message within a 5-second period.

The **no** form of the command removes the configured value and restores the time between transmission of SNMP traps and syslog messages to the default of 5 seconds.

Examples

The following example sets the minimum time interval between traps and syslog messages to 60 seconds.

```
device(config)# lldp snmp-notification-interval 60
```

Ildp tagged-packets

Enables support for tagged Link Layer Discovery Protocol (LLDP) packets.

Syntax

```
lldp tagged-packets process  
no lldp tagged-packets [ process ]
```

Command Default

By default, devices do not accept tagged LLDP packets from other vendor devices.

Parameters

process
Enables processing of tagged LLDP packets.

Modes

Global configuration mode

Usage Guidelines

When support for tagged LLDP packets is enabled, the device accepts incoming LLDP tagged packets if the VLAN tag matches any of the following:

- A configured VLAN on the port
- The default VLAN for a tagged port
- The configured untagged VLAN for a dual-mode port

The **no** form of the command disables support for tagged LLDP packets.

Examples

The following example enables support for tagged LLDP packets.

```
device(config)# lldp tagged-packets process
```

Ildp transmit-delay

Configures the minimum time between Link Layer Discovery Protocol (LLDP) transmissions.

Syntax

lldp transmit-delay *seconds*
no lldp transmit-delay

Command Default

When LLDP is enabled, the system automatically sets the LLDP transmit delay to 2 seconds.

Parameters

seconds

Configures the LLDP transmit delay, in seconds. The value can range from 1 through 8192. The default value is 2.

Modes

Global configuration mode

Usage Guidelines

The LLDP transmit delay must not be greater than one quarter of the LLDP transmission interval (CLI command **lldp transmit-interval**).

The LLDP transmit delay prevents an LLDP agent from transmitting a series of successive LLDP frames during a short time period, when rapid changes occur in LLDP. It also increases the probability that multiple changes, rather than a single change, will be reported in each LLDP frame.

The **no** form of the command removes the configured value and restores the default value of 2 seconds.

Examples

The following example sets the LLDP transmit delay to 7 seconds.

```
device(config)# lldp transmit-delay 7
```

Ildp transmit-hold

Configures the transmit holdtime multiplier for time to live (TTL).

Syntax

lldp transmit-hold *value*

no lldp transmit-hold [*value*]

Command Default

When LLDP is enabled, the device automatically sets the holdtime multiplier for TTL to 4.

Parameters

value

Configures the transmit holdtime multiplier. The value can range from 2 to 10. The default is 4.

Modes

Global configuration mode

Usage Guidelines

The transmit holdtime multiplier for TTL is used to compute the actual TTL value used in an Link Layer Discovery Protocol (LLDP) frame. The TTL value is the length of time for which the receiving device maintains information in its MIB.

NOTE

Setting the transmit interval or transmit holdtime multiplier, or both, to inappropriate values can cause the LLDP agent to transmit LLDP PDUs with TTL values that are excessively high. This, in turn, can affect how long a receiving device retains information if it is not refreshed.

The **no** form of the command removes the configured value and restores the holdtime multiplier for TTL to the default value 4.

Examples

The following example sets the holdtime multiplier to 6.

```
device(config)# lldp transmit-hold 6
```

Ildp transmit-interval

Sets the interval between regular Link Layer Discovery Protocol (LLDP) packet transmissions.

Syntax

lldp transmit-interval *seconds*
no lldp transmit-interval

Command Default

When LLDP is enabled, the transmit interval between LLDP packets is set to 30 seconds.

Parameters

seconds

Configures the time interval, in seconds, between LLDP packet transmissions. The value can range from 5 through 32768.

Modes

Global configuration mode

Usage Guidelines

Setting the transmit interval or transmit holdtime multiplier, or both, to inappropriate values can cause the LLDP agent to transmit LLDP PDUs with TTL values that are excessively high. This in turn can affect how long a receiving device retains the information if it is not refreshed.

The **no** form of the command removes the configured value and sets the time interval between LLDP packet transmissions to 30 seconds.

Examples

The following example sets the time interval between LLDP packet transmissions to 100 seconds.

```
device(config)# lldp transmit-interval 40
```

load-balance symmetric

Enables symmetric load balancing for IPv4 and IPv6 data traffic on Brocade FastIron devices.

Syntax

load-balance symmetric

no load-balance symmetric

Modes

Global configuration mode

Usage Guidelines

This command configuration affects selection of LAG member port after symmetric load balancing is enabled. For a bidirectional (forward and reverse direction) traffic flow, same port in the LAG and/or same next hop for ECMP is chosen.

The **no** form of the command disables symmetric load balancing in the system.

Examples

The following example enables symmetric load balancing for IPv4 and IPv6 data traffic on a Brocade FastIron device.

```
device(config)# load-balance symmetric
```

History

Release version	Command history
8.0.30b	This command was introduced.

local-as

Specifies the BGP autonomous system number (ASN) where the device resides.

Syntax

local-as *num*

no local-as *num*

Parameters

num

The local ASN. The range is from 1 through 4294967295.

Modes

BGP configuration mode

Usage Guidelines

Use the **no** form of this command to remove the ASN from the device.

ASNs in the range from 64512 through 65535 are private numbers that are not advertised to the external community.

Examples

This example assigns a separate local AS number.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# local-as 777
```

local-userdb

Creates a local user database.

Syntax

local-userdb *db-name*

no local-userdb *db-name*

Command Default

No local user databases exists.

Parameters

db-name

Configures the name of the local user database. The name can be up to 31 alphanumeric characters.

Modes

Global configuration mode

Usage Guidelines

Brocade supports a maximum of ten local user databases, each containing up to 50 user records. Each user record consists of a username and password.

The **no** form of the command removes a local database.

Examples

The following example shows how to configure a local user database.

```
device(config)# local-userdb userdb1  
device(config-localuserdb-userdb1)#
```

log (OSPFv2)

Controls the generation of OSPFv2 logs.

Syntax

```
log { adjacency [ dr-only ] | all | bad_packet [ checksum ] | database | memory | retransmit }  
no log { adjacency [ dr-only ] | all | bad_packet [ checksum ] | database | memory | retransmit }
```

Command Default

Only OSPFv2 messages indicating possible system errors are logged. Refer to the Parameters section for specific defaults.

Parameters

adjacency

Specifies the logging of essential OSPFv2 neighbor state changes. This option is disabled by default.

dr-only

Specifies the logging of essential OSPF neighbor state changes where the interface state is designated router (DR).

all

Specifies the logging of all syslog messages.

bad-packet

Specifies the logging of bad OSPFv2 packets. This option is enabled by default.

checksum

Specifies all OSPFv2 packets that have checksum errors.

database

Specifies the logging of OSPFv2 LSA-related information. This option is disabled by default.

memory

Specifies the logging of OSPFv2 memory issues. This option is enabled by default.

retransmit

Specifies the logging of OSPFv2 retransmission activities. This option is disabled by default.

Modes

OSPF router configuration mode

OSPF router VRF configuration mode

Usage Guidelines

Use this command to disable or re-enable the logging of specific events related to OSPFv2. If this command is not enabled only OSPFv2 messages indicating possible system errors are logged.

For interfaces where the designated router state is not applicable, such as point-to-point and virtual links, OSPF neighbor state changes are always logged irrespective of the setting of the **dr-only** sub-option.

A limitation with the **dr-only** sub-option is that when a DR/BDR election is underway, OSPF neighbor state changes pertaining to non-DR/BDR routers are not logged. Logging resumes once a DR is elected on that network.

The **no** form of the command restores the default settings. Use the **no log all** command to return all OSPFv2 logging options to the default settings.

Examples

The following example enables the logging of all OSPFv2-related syslog events.

```
device# configure terminal
device(config)# router ospf
device(config-ospf-router)# log all
```

The following example enables the logging of OSPFv2 retransmission activities.

```
device# configure terminal
device(config)# router ospf
device(config-ospf-router)# log retransmit
```

local-identifier

Configures the local system identifier for an Internet Key Exchange version 2 (IKEv2) profile.

Syntax

local-identifier { **address** *ip-address* | **email** *email-address* | **fqdn** *fqdn-name* | **key-id** *key-id* }

no local-identifier { **address** *ip-address* | **email** *email-address* | **fqdn** *fqdn-name* | **key-id** *key-id* }

Command Default

The device IP address is used as the local identifier.

Parameters

address *ip-address*

Specifies an IPV4 address as the local system identifier.

email *email-address*

Specifies an email address as the local system identifier.

fqdn *fqdn-name*

Specifies a fully qualified domain name (FQDN) as the local system identifier.

key-id *key-id*

Specifies a key ID as the local system identifier.

Modes

IKEv2 profile configuration mode

Usage Guidelines

The **no** form of the command removes the specified local identifier.

Examples

The following example shows how to configure IP address 10.3.3.3 as the local system identifier for an IKEv2 profile named prof_mktg.

```
device# configure terminal
device(config)# ikev2 profile prof-mktg
device(config-ike-profile-prof-mktg)# local-identifier address 10.3.3.3
device(config-ike-profile-prof-mktg)# exit
```

History

Release version	Command history
8.0.50	This command was introduced.

log-status-change

Controls the generation of all OSPFv3 logs.

Syntax

log-status-change
no log-status-change

Command Default

Disabled

Modes

OSPFv3 router configuration mode
OSPFv3 router VRF configuration mode

Usage Guidelines

Use this command to disable or re-enable the logging of events related to OSPFv3, such as neighbor state changes and database overflow conditions.

The **no** form of this command disables the logging of events.

Examples

The following example disables the logging of events.

```
device# configure terminal
device(config)# ipv6 router ospf
device(config-ospf6-router)# no log-status-change
```

The following example enables the logging of events.

```
device# configure terminal
device(config)# ipv6 router ospf
device(config-ospf6-router)# log-status-change
```

logging

Enables logging on the Router Advertisement (RA) guard policy.

Syntax

logging
no logging

Modes

RA guard policy configuration mode

Usage Guidelines

The **no** form of this command disables logging on the policy.

Logging cannot be modified if the RA guard policy is in use.

You can verify the logs for RA guard, such as RAs dropped, permitted, count for dropped packets, and reasons for the drop.

Logging increases the CPU load and for higher traffic rates, RA packets drop due to congestion if they are received at the line rate. For less load on the CPU, logging can be disabled on the RA guard policy.

Examples

The following example enables logging on an RA guard policy:

```
Brocade(config)# ipv6 raguard policy p1  
Brocade(config-ipv6-RAG-policy p1)# logging
```

logging buffered

Enables logging of specific messages or changes the number of entries that the local syslog buffer can store.

Syntax

logging buffered { *level* | *num-entries* }

no logging buffered { *level* | *num-entries* }

Command Default

The number of entries that the local syslog buffer can store is 50.

Parameters

level

Specifies the message level. The level parameter can have one of the following values: **alerts, critical, debugging, emergencies, errors, informational, notifications, warnings**.

num-entries

Configures the number of entries that the local syslog buffer can store. The value can range from 1 through 1000.

Modes

Global configuration mode

Usage Guidelines

The software does not log informational or debugging messages.

To change the message level, disable logging of specific message levels. You must disable the message levels on an individual basis.

For logging buffered num-entries:

- You must save the configuration and reload the software to effect the change.
- If you decrease the size of the buffer, the software clears the buffer before effecting the change.
- If you increase the size of the syslog buffer, the software clears some of the older locally buffered syslog messages.

The **no** form of the command with the *num-entries* option resets the syslog buffer size to the default of 50 and with the *level* option disables logging of the specified message level.

Examples

The following example enables the logging of debugging messages.

```
device(config)# logging buffered debugging
```

The following example sets the number of entries that the local syslog buffer can store to 1000.

```
device(config)# logging buffered 1000
```

logging console

Enables the real-time display of syslog messages.

Syntax

logging console
no logging console

Command Default

To view syslog messages generated by a device, you need to display the syslog buffer or the log on a syslog server used by the device.

Modes

Global configuration mode

Usage Guidelines

You can enter this command from the serial console or from a Telnet or SSH session.

You can enable the real-time display of syslog messages on the management console. When you enable this command, the software displays a syslog message on the management console when the message is generated. However, to enable the display of real-time syslog messages in Telnet or SSH sessions, you must also enable the display within the individual sessions.

The **no** form of the command disables the real-time display of syslog messages.

Examples

The following example enables the real-time display of syslog messages.

```
device(config)# logging console
```

logging cli-command

Enables logging of all syntactically valid CLI commands from each user session into the system log.

Syntax

logging cli-command

no logging cli-command

Command Default

Logging of CLI commands is not enabled.

Modes

Global configuration mode

Usage Guidelines

If the **logging cli-command** command is configured, all the CLI commands executed by the user are logged in the system log and are displayed in the **show logging** command output.

The **no** form of the command disables the logging of CLI commands from each user session into the system log.

Examples

The following example enables the logging of CLI commands on the device.

```
device(config)# logging cli-command
```

The following example shows the system log records which are displayed in the **show logging** command output. The system log contains the valid commands that are executed by the user.

```
Brocade (config)#show logging
Syslog logging: enabled (0 messages dropped, 0 flushes, 5 overruns)
    Buffer logging: level ACMEINW, 50 messages logged
    level code: A=alert C=critical D=debugging M=emergency E=error I=informational
N=notification W=warning
Dynamic Log Buffer (50 lines):
8d02h28m43s:I:CLI CMD: "ip route 0.0.0.0 0.0.0.0 10.20.64.1" by un-authenticated
user from console
8d02h28m24s:I:System: Interface ethernet 1/1, state up
8d02h28m22s:I:CLI CMD: "enable" by un-authenticated user from console
8d02h28m22s:I:PORT: 1/1 enabled by un-authenticated user from console session
8d02h28m19s:I:CLI CMD: "disable" by un-authenticated user from console
8d02h28m19s:I:PORT: 1/1 disabled by un-authenticated user from console session
8d02h28m16s:I:CLI CMD: "interface ethernet 1/1" by un-authenticated user from
console
```

logging-enable

Enables logging for rules within an specified IPv6 ACL that include the **log** keyword.

Syntax

logging-enable

no logging-enable

Command Default

IPv6 ACL logging is not enabled.

Modes

ACL configuration mode (IPv6)

Usage Guidelines

The **log** parameter is effective in both deny rules and permit rules.

The **log** parameter is effective in both ingress and egress ACLs.

This command enables logging for IPv6 ACLs. For IPv4 ACLs, refer to the **acl-logging** command topic.

To disable logging for the specified IPv6 ACL, use the **no** form of this command.

Examples

The following example enables logging for the rules within an specified IPv6 ACL that include the **log** keyword; then applies that ACL to an interface to filter incoming traffic.

```
device# configure terminal
device(config)# ipv6 access-list ACL6_log
device(config-ipv6-access-list ACL6_log)# logging-enable
device(config-ipv6-access-list ACL6_log)# remark The following rule permits ipv6 packets from
2001:DB8::2 to any destination
device(config-ipv6-access-list ACL6_log)# permit ipv6 host 2001:DB8::2 any log
device(config-ipv6-access-list ACL6_log)# remark The following rule denies udp packets from any source
to any destination
device(config-ipv6-access-list ACL6_log)# deny udp any any log
device(config-ipv6-access-list ACL6_log)# remark The following rule denies IPv6 packets from any source
to any destination
device(config-ipv6-access-list ACL6_log)# deny ipv6 any any
device(config-ipv6-access-list ACL6_log)# interface ethernet 1/9/12
device(config-if-e1000-1/9/12)#ipv6 traffic-filter ACL_log_v6 in
```

History

Release version	Command history
8.0.50	This command was modified to support permit rules (in addition to deny rules) and egress ACLs (in addition to ingress ACLs).

logging enable config-changed

Configures a device to generate syslog messages when the startup-config file is changed.

Syntax

logging enable config-changed

no logging enable config-changed

Command Default

The trap is enabled by default.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command disables the generation of the syslog messages when the startup-config file is changed.

Examples

The following example enables syslog messages when the startup-config file is changed.

```
device(config)# logging enable config-changed
```

logging enable ikev2

Enables system log messages and traps for IKEv2 events.

Syntax

logging enable ikev2

no logging enable ikev2

Command Default

Log messages for IKEv2 events are enabled.

Modes

Global configuration mode.

Usage Guidelines

The **no** form of the command disables the generation of the specified syslog messages and traps.

This command is supported on the Brocade FastIron ICX 7450, with an FPGA-based add-on crypto card.

Examples

The following example configures syslog generation for IKEv2 events.

```
device(config)# logging enable ikev2
```

History

Release version	Command history
8.0.50	This command was introduced.

logging enable ipsec

Enables system log messages and traps for IPsec events.

logging enable ipsec

no logging enable ipsec

Log messages for IPsec events are enabled.

Global configuration mode.

The **no** form of the command disables the generation of the specified syslog messages and traps.

This command is supported on the Brocade FastIron ICX 7450, with an FPGA-based add-on crypto card.

The following example configures syslog generation for IPsec events.

```
device(config)# logging enable ipsec
```

Release version	Command history
8.0.50	This command was introduced

logging enable rfc5424

Enables Syslog logging in accordance with RFC 5424 which provides the maximum amount of information in every Syslog in a structured format.

Syntax

logging enable rfc5424

no logging enable rfc5424

Command Default

Syslog is generated in accordance with RFC 3164.

Modes

Global configuration mode

Usage Guidelines

The Logging buffer must be cleared before enabling Syslog specific to RFC 5424, otherwise system throws an error.

If the **logging cli-command** command is present in the running configuration, switching between the default RFC 3164 Syslog logging and the RFC 5424-specific Syslog logging is not supported.

The **no** form of the command enables Syslog logging in accordance with RFC 3164.

Examples

The following example enables Syslog logging in accordance with RFC 5424.

```
device(config)# clear logging
device(config)# logging enable rfc5424
```

The following example removes the configuration to enable Syslog logging specific to RFC 5424 and enables Syslog logging in accordance with RFC 3164.

```
device(config)# clear logging
device(config)# no logging enable rfc5424
```

History

Release version	Command history
8.0.40	This command was introduced.

logging enable user-login

Enables viewing user login details in syslog messages and traps.

Syntax

logging enable user-login

no logging enable user-login

Command Default

User login details in syslog messages and traps are not enabled by default.

Modes

Global configuration mode

Usage Guidelines

Brocade devices send syslog messages and SNMP traps when a user logs in to or out of user EXEC or privileged EXEC mode in the CLI. The feature applies to users whose access is authenticated by an authentication method list based on a local user account, RADIUS server, or TACACS/TACACS+ server.

The **no** form of the command disables the user login details from syslog messages and traps.

Examples

The following example enables viewing the user login details.

```
device(config)# logging enable user-login
```

logging facility

Configures the log facility to log messages from the device.

Syntax

logging facility *facility-name*

no logging facility

Command Default

The default facility for messages that the device sends to the syslog server is "user".

Parameters

facility-name

Specifies the facility to log the messages from the device. The facility name can be one of the following:

auth

Security or authorization messages.

cron

cron/at subsystem.

daemon

System daemons.

kern

Kernel messages.

local0

Reserved for local use.

local1

Reserved for local use.

local2

Reserved for local use.

local3

Reserved for local use.

local4

Reserved for local use.

local5

Reserved for local use.

local6

Reserved for local use.

local7

Reserved for local use.

lpr	Line printer subsystem.
mail	Mail system.
news	Netnews subsystem.
syslog	Messages generated internally by syslog.
sys9	Reserved for system use.
sys10	Reserved for system use.
sys11	Reserved for system use.
sys12	Reserved for system use.
sys13	Reserved for system use.
sys14	Reserved for system use.
user	Random user-level messages.
uucp	UUCP subsystem.

Modes

Global configuration mode

Usage Guidelines

The syslog daemon on the syslog server uses a facility to determine where to log the messages from the Brocade device. You can specify only one facility. If you configure the device to use two syslog servers, the device uses the same facility on both servers.

The **no** form of the command restores the default facility.

Examples

The following example changes the log facility.

```
device(config)# logging facility local0
```

logging host

Configures a syslog server.

Syntax

logging host { *ipv4-addr* | *server-name* | **ipv6** *ipv6-addr* } [**udp-port** *number*]

no logging host { *ipv4-addr* | *server-name* | **ipv6** *ipv6-addr* } [**udp-port** *number*]

Command Default

Syslog server is not configured.

Parameters

ipv4-addr

Configures a syslog server with the specified IPv4 address.

server-name

Configures a syslog server with the specified name..

ipv6 *ipv6-addr*

Configures a syslog server with the specified IPv6 address.

udp-port *number*

Specifies the UDP port number.

Modes

Global configuration mode

Usage Guidelines

You can specify up to six syslog servers by configuring the command.

The **no** form of the command removes the syslog server configuration.

Examples

The following example configures a syslog server with IP address 10.0.0.99.

```
device(config)# logging host 10.0.0.99
```

To specify an additional syslog server, enter the **logging host** command again.

```
device(config)# logging host 10.0.0.100
```

logging on

Enables local syslog logging.

Syntax

logging on

no logging on

Command Default

Local syslog logging is enabled by default.

Modes

Global configuration mode

Usage Guidelines

This command enables local syslog logging with the following defaults:

- Messages of all severity levels (Emergencies through Debugging) are logged.
- Up to 50 messages are retained in the local syslog buffer.
- No syslog server is specified.

The **no** form of the command disables local syslog logging.

Examples

The following example enables local syslog logging.

```
device(config)# logging on
```

logging persistence

Configures the device to save system log messages after a soft reboot.

Syntax

logging persistence

no logging persistence

Command Default

Logging persistence is not configured.

Modes

Global configuration mode

Usage Guidelines

If the syslog buffer size was set to a different value using the command **logging buffered**, the system log will be cleared after a soft reboot, even if this feature is enabled. This clearing will occur only with a soft reboot immediately following a syslog buffer size change. A soft reboot by itself will not clear the system log. To prevent the system from clearing the system log, leave the number of entries allowed in the syslog buffer unchanged.

Enabling logging persistence does not save syslog messages after a hard reboot. When the device is power-cycled, the syslog messages are cleared.

If logging persistence is enabled and you load a new software image on the device, you must first clear the log if you want to reload the device.

The **no** form of the command disables the device from saving system log messages after a soft reboot.

Examples

The following example configures the device to save system log messages after a soft reboot.

```
device(config)# logging persistence
```

login-page

Configures the login page details to redirect the client to the login page hosted on the external captive portal server.

Syntax

login-page *page-name*
no login-page *page-name*

Command Default

Login page for redirecting the client is not configured.

Parameters

page-name
 Specifies the login page created on the Aruba ClearPass server.

Modes

Captive portal configuration mode

Usage Guidelines

The login page details must be same as the login page hosted on the Aruba ClearPass server.
 The **no** form of the command removes the login page configuration.

Examples

The following example configures the login page details to redirect the client to the login page hosted on the Aruba ClearPass server.

```
device(config)# captive-portal cp_brocade
device(config-cp-cp_brocade)# login-page brocade_clearpass_guest.php
```

History

Release version	Command history
8.0.40	This command was introduced.

loop-detection

Enables loop detection on a physical port (Strict Mode) or on a VLAN (Loose Mode).

Syntax

loop-detection [**shutdown-disable**]

no loop-detection [**shutdown-disable**]

Command Default

Loop detection is disabled by default.

Parameters

shutdown-disable

Disables shutdown of a port due to loop detection.

Modes

Interface configuration mode

VLAN configuration mode

Usage Guidelines

By default, the port sends test packets every one second, or the number of seconds specified by the **loop-detection-interval** command.

The **no** form of the command disables loop detection.

Examples

The following example enables loop detection on a physical port.

```
device(config)# interface ethernet 1/1/1  
device(config-if-e1000-1/1/1)# loop-detection
```

The following example enables loop detection on a VLAN.

```
device(config)# vlan 20  
device(config-vlan-20)# loop-detection
```

loop-detection-interval

Configures how often a test packet is sent on a port.

Syntax

loop-detection-interval *number*

no loop-detection-interval *number*

Command Default

Loop detection time is set to 1 second.

Parameters

number

Specifies a value from 1 to 100 seconds. The system multiplies the entry by 0.1 to calculate the interval at which test packets are sent.

Modes

Global configuration mode

Usage Guidelines

When loop detection is enabled, the loop-detection time unit is 0.1 second, with a default of 10 (1 second). The range is from 1 (one tenth of a second) to 100 (10 seconds). You can use the **show loop-detection status** command to view the loop-detection interval.

The **no** form of the command sets the loop detection interval to the default global loop-detection interval of 1 second.

Examples

The following example sets the loop-detection interval to 5 seconds (50*0.1).

```
device(config)# loop-detection-interval 50
```

loop-detection shutdown-disable

Disables shutdown of a port when a loop detection probe packet is received on an interface.

Syntax

loop-detection shutdown-disable
no loop-detection shutdown-disable

Command Default

Loop detection shutdown is enabled on the interface.

Modes

Interface configuration

Usage Guidelines

The **no** form of this command disables loop detection shutdown.

Shutdown prevention for loop-detect functionality allows users to disable shut down of a port when the loop detection probe packet is received on an interface. This provides control over deciding which port is allowed to enter in to an error-disabled state and go into a shutdown state when a loop is detected.

Examples

The following example disables loop detection shutdown on an interface.

```
device(config)# interface ethernet 1/7  
device(config-if-e1000-1/7)# loop-detection shutdown-disable
```

History

Release version	Command history
08.0.20	This command was introduced.

loop-detection-syslog-interval

Specifies the interval (in minutes) at which a syslog is generated.

Syntax

loop-detection-syslog-interval *num*
no loop-detection-syslog-interval *num*

Command Default

The syslog interval is 5 minutes.

Parameters

num
 Specifies the syslog interval in minutes. The interval can range from 1 through 1440 minutes.

Modes

Global configuration

Usage Guidelines

The **no** form of this command restores the default settings.

You can specify the interval at which the loop detection syslog message is generated if the **loop-detection-shutdown-disable** command is configured for the port. This configuration applies to all the ports that have loop detection shutdown prevention configured.

Examples

The following example shows the loop detection syslog interval set to 1 hour.

```
device(config)# loop-detection-syslog-interval 60
```

History

Release version	Command history
08.0.20	This command was introduced.

mac-age-time

Configures the MAC address age timer.

Syntax

mac-age-time *seconds*

no mac-age-time *seconds*

Command Default

The default MAC address age timeout is 300 seconds.

Parameters

seconds

Timeout value in seconds. The timeout value range is 0 (disabled) or from 10 through 86,400 seconds.

Modes

Global configuration mode

Usage Guidelines

To disable the MAC address age timer, set the timeout value to 0.

If the total number of MAC addresses in the system is more than 16, 000, Brocade recommends a MAC address age timer greater than 60 seconds. If the total number of MAC addresses in the system is more than 64, 000, Brocade recommends a MAC address age timer greater than 120 seconds.

Usually, the actual MAC address age time is from one to two times the configured value. For example, if you set the MAC address age timer to 60 seconds, learned MAC address entries age out after remaining unused for between 60 and 120 seconds. However, if all of the following conditions are met, then the MAC address entries age out after a longer than expected duration:

- The MAC address age timer is set to greater than 630 seconds.
- The number of MAC address entries is over 6, 000.
- All MAC address entries are learned from the same packet processor.
- All MAC address entries age out at the same time.

The **no** form of the command resets the MAC address age timeout value to the default value.

Examples

The following example configures the MAC address age timeout to 570 seconds.

```
device(config)# mac-age-time 570
```

mac-authentication auth-filter

Applies the specified filter on the interface and the MAC addresses defined in the filter (MAC filter) do not have to go through authentication.

Syntax

mac-authentication auth-filter *filter-id* *vlan-id*
no mac-authentication auth-filter *filter-id* *vlan-id*

Command Default

There are no filters applied on the interface.

Parameters

filter-id
 Specifies the identification number of the filter to be applied on the interface.

vlan-id
 Specifies the identification number of the VLAN to which the filter is applied.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of this command disables this functionality.

A client can be authenticated in an untagged VLAN or tagged VLAN using the MAC address filter for MAC authentication. If auth-filter has tagged VLAN configuration, the clients are authenticated in auth-default VLAN and tagged VLAN provided in auth-filter. The clients authorized in auth-default VLAN allow both untagged and tagged traffic.

If the VLAN is not specified in the command, the auth-default VLAN is used.

Examples

The following example applies the MAC address filter on VLAN 2.

```
device(config)# authentication
device(config-authen)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# mac-auth auth-filter 1 2
```

History

Release version	Command history
08.0.20	This command was introduced.

mac-authentication dot1x-override

Configures the device to perform 802.1X authentication when MAC authentication fails when the authentication sequence is configured as MAC authentication followed by 802.1X authentication.

Syntax

mac-authentication dot1x-override

no mac-authentication dot1x-override

Command Default

802.1X authentication is not performed when MAC authentication fails.

Modes

Authentication configuration mode

Usage Guidelines

This command is applicable only when the authentication sequence is configured as MAC authentication followed by 802.1X authentication.

If the **mac-authentication dot1x-override** command is configured, the clients that failed MAC authentication undergoes 802.1X authentication if the failure action is configured as restricted VLAN.

The **no** form of the command disables MAC authentication dot1x override functionality.

Examples

The following example enables MAC authentication dot1x override when MAC authentication fails.

```
device(config)# authentication
device(config-authen)# mac-authentication dot1x-override
```

History

Release version	Command history
08.0.20	This command was introduced.

mac-authentication enable (Flexible authentication)

Enables MAC authentication globally or on a specific interface.

Syntax

mac-authentication enable [**all** | **ethernet** *device/slot/port*]

no mac-authentication enable [**all** | **ethernet** *device/slot/port*]

Command Default

MAC authentication is not enabled.

Parameters

all

Enables MAC authentication on all interfaces.

ethernet *device/slot/port*

Enables MAC authentication on a specific interface.

Modes

Authentication configuration mode

Usage Guidelines

The **mac-authentication enable** command without any options initializes MAC authentication feature globally. The **mac-authentication enable** command with the **all** or **ethernet** options, enables MAC authentication on all or a specific interface respectively. After initializing MAC authentication feature using the **mac-authentication enable** command, you must enable MAC authentication on all or a specific interface.

The **no** form of the command disables MAC authentication.

Examples

The following example globally enables MAC authentication.

```
device(config)# authentication
device(config-authen)# mac-authentication enable
device(config-authen)# mac-authentication enable all
```

The following example enables MAC authentication on an interface.

```
device(config)# authentication
device(config-authen)# mac-authentication enable
device(config-authen)# mac-authentication enable ethernet 1/1/11
```

Commands K - S

mac-authentication enable (Flexible authentication)

History

Release version	Command history
08.0.20	This command was introduced.

mac-authentication password-format

Configures the MAC authentication password format.

Syntax

```
mac-authentication password-format { xx-xx-xx-xx-xx-xx | xxxx.xxxx.xxxx | xxxxxxxxxxxxxx } [ upper-case ]
no mac-authentication password-format { xx-xx-xx-xx-xx-xx | xxxx.xxxx.xxxx | xxxxxxxxxxxxxx } [ upper-case ]
```

Command Default

By default, the MAC address is sent to the RADIUS server in the format xxxxxxxxxxxxxx in lower case.

Parameters

xx-xx-xx-xx-xx-xx

Specifies the MAC authentication password format as xx-xx-xx-xx-xx-xx.

xxxx.xxxx.xxxx

Specifies the MAC authentication password format as xxxx.xxxx.xxxx.

xxxxxxxxxxxxxx

Specifies the MAC authentication password format as xxxxxxxxxxxxxx.

upper-case

Converts the password to uppercase.

Modes

Authentication configuration mode

Usage Guidelines

The **no** form of the command restores the default.

You can configure the device to send the MAC address to the RADIUS server in the format xx-xx-xx-xx-xx-xx, xxxx.xxxx.xxxx, or xxxxxxxxxxxxxx. Use the **upper-case** password format option to send the password in uppercase.

Examples

The following example configures the MAC authentication password format as xx-xx-xx-xx-xx-xx.

```
device(config)# authentication
device(config-authen)# mac-authentication password-format xx-xx-xx-xx-xx-xx
```

The following example configures the MAC authentication password format as xx-xx-xx-xx-xx-xx in upper case.

```
device(config)# authentication
device(config-authen)# mac-authentication password-format xx-xx-xx-xx-xx-xx upper-case
```

History

Release version	Command history
08.0.20	This command was introduced.
08.0.20c	The upper-case option was added.

mac-authentication password-override (Flexible authentication)

Enables password override for MAC authentication and specifies a user-defined password instead of the MAC address for MAC authentication.

Syntax

mac-authentication password-override *password*
no mac-authentication password-override *password*

Command Default

MAC authentication password override is not enabled.

Parameters

password

Specifies the password to be used for MAC authentication. The password can contain up to 32 alphanumeric characters, but cannot include blank spaces.

Modes

Authentication configuration mode

Usage Guidelines

The **no** form disables MAC authentication password override.

The MAC address is still the user name and cannot be changed.

Examples

The following example enables MAC authentication password override on the device.

```
device(config)# authentication  
device(config-authen)# mac-authentication password-override password
```

History

Release version	Command history
08.0.20	This command was introduced.

mac filter

Configures MAC address filters.

Syntax

```
mac filter filter-num { permit | deny } { source-mac source-mask | any } { destination-mac destination-mask | any }  
[ mirror ]
```

```
no mac filter filter-num { permit | deny } { source-mac source-mask | any } { destination-mac destination-mask | any }  
[ mirror ]
```

Command Default

MAC address filters are not configured.

Parameters

filter-num

Configures the MAC address filter ID. You can configure up to 507 MAC address filters. The default value is 512.

permit

Permits the traffic.

deny

Denies the traffic.

source-mac

Configures the source Ethernet MAC address.

source-mask

Specifies the mask using f (ones) and zeros.

any

Configures the filter to match all source MAC addresses.

destination-mac

Configures the destination Ethernet MAC address.

destination-mask

Specifies the mask using f (ones) and zeros.

any

Configures the filter to match all destination MAC addresses.

mirror

Mirrors traffic that matches against configured entry.

Modes

Global configuration mode

Usage Guidelines

Once the MAC address filters are configured, you must apply the MAC address filters to a port.

The **no** form of the command removes the MAC address filters.

Examples

The following example shows how to configure and apply MAC address filters. In this example, filter 1 is configured to deny traffic with a source MAC address that begins with "3565" to any destination, and filters 2 through 5 are configured to deny traffic with the specified destination MAC addresses. Filter 1024 permits all traffic that is not denied by any other filter.

```
device(config)# mac filter 1 deny 0000.0075.3676 ffff.0000.0000
device(config)# mac filter 2 deny any ffff.ffff.ffff ffff.ffff.ffff
device(config)# mac filter 3 deny any 0180.c200.0000 ffff.ffff.fff0
device(config)# mac filter 4 deny any 0000.0034.5678 ffff.ffff.ffff
device(config)# mac filter 5 deny any 0000.0045.6789 ffff.ffff.ffff
device(config)# mac filter 1024 permit any any
```

mac filter enable-accounting

Enables access control list (ACL) accounting on Layer 2 MAC filters.

Syntax

mac filter *num* **enable-accounting**

no mac filter *num* **enable-accounting**

Command Default

This option is disabled.

Parameters

num

Specifies the MAC filter ID.

enable-accounting

Enables MAC filter accounting on the specified interface.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command disables ACL accounting on the associated Layer 2 MAC filter interface.

Examples

The following example enables ACL accounting on a Layer 2 MAC filter.

```
device(config)# mac filter 1 permit 0000.0000.0001 ffff.ffff.ffff any
device(config)# mac filter 1 enable-accounting
device(config)# interface ethernet 3/21
device(config-if-e1000-3/21)# mac filter-group 1
```

History

Release version	Command history
08.0.10	This command was introduced.

mac filter-group

Applies a group of MAC address filters to a port.

Syntax

mac filter-group *filter-num* [[*filter-num to filter-num* | *filter-num*] ...]

no mac filter-group *filter-num* [[*filter-num to filter-num* | *filter-num*] ...]

Command Default

MAC address filters are not applied to any port.

Parameters

filter-num

Specifies the MAC address filter ID.

to *filter-num*

Specifies the range of MAC address filter IDs.

Modes

Interface configuration mode

Usage Guidelines

When applying the filter group to the interface, specify each line to be applied separately or use the **to** keyword to apply a consecutive range of filter lines, for example, 1 3 to 8 10.

The filters must be applied as a group. For example, if you want to apply four filters to an interface, they must all appear on the same command line.

You cannot add or remove individual filters in the group. To add or remove a filter on an interface, apply the filter group again containing all the filters you want to apply to the port. If you apply a filter group to a port that already has a filter group applied, the older filter group is replaced by the new filter group.

The **no** form of the command removes the MAC address filters configured on a port.

Examples

The following example configures MAC address filters and applies them to a port.

```
device(config)# mac filter 1 deny 0000.0075.3676 ffff.0000.0000
device(config)# mac filter 2 deny any ffff.ffff.ffff ffff.ffff.ffff
device(config)# mac filter 3 deny any 0180.c200.0000 ffff.ffff.fff0
device(config)# mac filter 4 deny any 0000.0034.5678 ffff.ffff.ffff
device(config)# mac filter 5 deny any 0000.0045.6789 ffff.ffff.ffff
device(config)# mac filter 1024 permit any any
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# mac filter-group 1 to 5 1024
```

mac filter-group log-enable

Enables logging for MAC address filtered packets on a specific port.

Syntax

mac filter-group log-enable

no mac filter-group log-enable

Command Default

Logging for MAC address filtered packets on specific ports is disabled.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of the command disables logging for MAC address filtered packets on specific ports.

When a MAC address filter is applied to or removed from an interface, a syslog message is generated.

Examples

The following example enables logging for filtered packets on the Ethernet interface 1/1/1.

```
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# mac filter-group log-enable
```

mac filter log-enable

Globally enables logging for MAC address filtered packets.

Syntax

mac filter log-enable

no mac filter log-enable

Command Default

Logging is disabled.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command disables logging of MAC address filtered packets.

Examples

The following example globally enables logging for MAC address filtered packets.

```
device(config)# mac filter log-enable
```

mac-learn-disable

Disables a physical port from automatic learning the source MAC address.

Syntax

mac-learn-disable
no mac-learn-disable

Command Default

By default, when a packet with an unknown source MAC address is received on a port, the Brocade device learns this MAC address on the port.

Modes

Interface configuration mode

Usage Guidelines

This command is not available on virtual routing interfaces. Also, if this command is configured on the primary port of a LAG, MAC address learning (source MAC address) will be disabled on all the ports in the LAG.

Entering the command on a tagged ports disables source MAC address learning for that port in all VLANs of which that port is a member. For example, if tagged port 1/1/1 is a member of VLAN 10, 20, and 30 and you issue the **mac-learn-disable** command on port 1/1/1, port 1/1/1 will not learn source MAC addresses, even if it is a member of VLAN 10, 20, and 30.

The **no** form of the command allows a physical port to learn source MAC addresses.

Examples

The following example disables the automatic learning of the source MAC address.

```
device(config)# interface ethernet 1/1/1  
device(config-if-e1000-1/1/1)# mac-learn-disable
```

mac-notification interval

Configures the MAC-notification interval between each set of generated traps.

Syntax

mac-notification interval *secs*
no mac-notification interval *secs*

Command Default

No interval for MAC-notification is configured.

Parameters

secs

Specifies the MAC-notification interval in seconds between each set of traps that are generated. The range is from 1 through 3600 seconds (1 hour). The default interval is 3 seconds.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command sets the interval to its default value, which is 3 seconds.

A trap is sent aggregating the MAC events such as addition or deletion depending on the interval you specify.

Examples

The following example configures an interval of 40 seconds.

```
device(config)# mac-notification interval 40
```

The following example sets the interval to its default value:

```
device(config)# no mac-notification interval 3
```

History

Release version	Command history
08.0.10	This command was introduced.

mac-movement notification

Enables movement notifications and collects statistics for the movement of MAC addresses.

Syntax

mac-movement notification { **interval-history** *seconds* | **threshold-rate** *moves* **sampling-interval** *seconds* }

no mac-movement notification { **interval-history** *seconds* | **threshold-rate** *moves* **sampling-interval** *seconds* }

Parameters

interval-history *seconds*

Configures the time interval during which the MAC address movement notification data is collected and enables a corresponding SNMP trap.

threshold-rate *moves*

Configures the number of times a MAC address can move within the specified period until an SNMP trap is sent.

sampling-interval *seconds*

Configures the sampling interval.

Modes

Global configuration mode

Usage Guidelines

The interval history includes statistical information such as the number of MAC addresses that move over the specified period, the total number of MAC address moves, which MAC addresses have moved, and how many times a MAC address has moved.

There is an upper limit on the number of MAC addresses for which MAC address-specific data is collected. This limit is necessary because it is not possible to report on all MAC addresses when many move.

Avoid threshold rates and sampling intervals that are too small. If you choose a small threshold and a sampling interval that is also small, an unnecessary high number of traps could occur.

The **no** form of the command disables movement notifications and stops collecting statistics for the movement of MAC addresses.

Examples

The following example sets the notification interval to 300 seconds.

```
device(config)# mac-movement notification interval-history 300
```

The following example sets the notification for 500 moves and a sampling interval of 400 seconds.

```
device(config)# mac-movement notification threshold-rate 500 sampling-interval 400
```

macsec cipher-suite

Enables GCM-AES-128 bit encryption or GCM-AES-128 bit integrity checks on MACsec frames transmitted between group members.

Syntax

```
macsec cipher-suite { gcm-aes-128 | gcm-aes-128 integrity-only }
no macsec cipher-suite { gcm-aes-128 | gcm-aes-128 integrity-only }
```

Command Default

GCM-AES-128 bit encryption or integrity checking is not enabled. Frames are encrypted starting with the first byte of the data packet, and ICV checking is enabled.

Parameters

gcm-aes-128
Enables GCM-AES-128 bit encryption.

gcm-aes-128 integrity-only
Enables GCM-AES-128 bit integrity checks.

Modes

dot1x-mka-cfg-group mode

Usage Guidelines

The **no** form of the command restores the default encryption and integrity checking.

MACsec commands are supported only on the ICX 7450.

The **macsec cipher-suite** command can be used in conjunction with an encryption offset configured with the **macsec confidentiality-offset** command.

Examples

The following example enables GCM-AES-128 encryption on group test1.

```
device(config)# dot1x-mka-enable
device(config-dot1x-mka)# mka-cfg-group test1
device(config-dot1x-mka-group-test1)# macsec cipher-suite gcm-aes-128
```

The following example enables GCM-AES-128 bit integrity checking on test1.

```
device(config)# dot1x-mka-enable
device(config-dot1x-mka)# mka-cfg-group test1
device(config-dot1x-mka-group-test1)# macsec cipher-suite gcm-aes-128 integrity-only
```

History

Release version	Command history
08.0.20	This command was introduced.
08.0.30	Support for this command was added on the ICX 7450 device.

macsec confidentiality-offset

Configures the offset size for MACsec encryption.

Syntax

macsec confidentiality-offset *size*

no macsec confidentiality-offset *size*

Command Default

The default value for the MACsec encryption offset size is zero (0).

Parameters

size

Determines where encryption begins. Valid values are:

30	Encryption begins at byte 31 of the data packet.
50	Encryption begins at byte 51 of the data packet.

Modes

dot1x-mka-cfg-group mode

Usage Guidelines

MACsec commands are supported only on the ICX 7450.

The **no** form of the command disables encryption offset on all interfaces in the MACsec MKA group.

This command is only meaningful when encryption is enabled for the MACsec group using the **macsec cipher-suite** command.

Examples

The following example configures a 30-byte offset on encrypted transmissions as part of group test1 parameters.

```
device(config)# dot1x-mka-enable
device(config-dot1x-mka)# mka-cfg-group test1
device(config-dot1x-mka)# macsec cipher-suite gcm-aes-128
device(config-dot1x-mka-group-test1)# macsec confidentiality-offset 30
```

History

Release version	Command history
08.0.20	This command was introduced.
08.0.30	Support for this command was added on the ICX 7450 device.

macsec frame-validation

Enables validation checks for frames with MACsec headers and configures the validation mode (strict or not strict).

Syntax

macsec frame-validation { **disable** | **check** | **strict** }

no macsec frame-validation { **disable** | **check** | **strict** }

Command Default

MACsec frame validation is disabled (not visible in configuration).

Parameters

disable

Disables validation checks for frames with MACsec headers.

check

Enables validation checks for frames with MACsec headers and configures non-strict validation mode. If frame validation fails, counters are incremented but packets are accepted.

strict

Enables validation checks for frames with MACsec headers and configures strict validation mode. If frame validation fails, counters are incremented and packets are dropped.

Modes

dot1x-mka-cfg-group mode

Usage Guidelines

MACsec commands are supported only on the ICX 7450.

The **no** form of the restores the default (validation checks for frames with MACsec headers is disabled).

Examples

The following example enables validation checks for frames with MACsec headers on group test1 and configures strict validation mode.

```
device(config)# dot1x-mka-enable
device(config-dot1x-mka)# mka-cfg-group test1
device(config-dot1x-mka-group-test1)# macsec frame-validation strict
```

History

Release version	Command history
08.0.20	This command was introduced.
08.0.30	Support for this command was added on the ICX 7450 device.

macsec replay-protection

Specifies the action to be taken when packets are received out of order, based on their packet number. If replay protection is configured, you can specify the window size within which out-of-order packets are allowed.

Syntax

```
macsec replay-protection { strict | out-of-order | window-size size } [ disable ]
```

```
no macsec replay-protection { strict | out-of-order window-size size } [ disable ]
```

Command Default

Parameters

strict

Does not allow out-of-order packets.

out-of-order window-size

Allows out-of-order packets within a specific window size.

size

Specifies the allowable window within which an out-of-order packet can be received. Allowable range is from 0 through 4294967295.

disable

Available only for the ICX 7450. Disables replay protection.

Modes

dot1x-mka-cfg-group mode

Usage Guidelines

This command is supported only on ICX 7450.

The **no** form of the command disables macsec replay protection.

Examples

The following example configures group test1 to accept packets in exact sequence only.

```
device(config)# dot1x-mka-enable
device(config-dot1x-mka)# mka-cfg-group test1
device(config-dot1x-mka-group-test1)# macsec replay-protection strict
device(config-dot1x-mka-group-test1)#
```

The following example configures group test1 to accept out-of-order MACsec frames within a window size of 2000.

```
device(config)# dot1x-mka-enable
device(config-dot1x-mka)# mka-cfg-group test1
device(config-dot1x-mka-group-test1)# macsec replay-protection out-of-order window-size 2000
```

History

Release version	Command history
08.0.20	This command was introduced.
08.0.30	The disable option for the macsec replay-protection command was introduced. Support for this command was added on ICX 7450 device.

management exclude

Excludes in-band and out-of-band (OOB) interfaces from management traffic.

Syntax

```
management exclude { all | http | ipv6ra | ntp | ssh | telnet [ inband | oob ] }  
no management exclude
```

Command Default

None

Parameters

all

Specifies ingress traffic for all applications. (Applicable to both switch and router images.)

http

Specifies requests for HTTP ingress connections. (Applicable to router images only.)

ipv6ra

Specifies IPv6 ingress Router Advertisement (RA) traffic. (Applicable to both switch and router images.)

ntp

Specifies NTP ingress traffic. (Applicable to router images only.)

ssh

Specifies requests for SSH ingress connections. (Applicable to router images only.)

telnet

Specifies requests for Telnet ingress connections. (Applicable to router images only.)

inband

Specifies in-band traffic only.

oob

Specifies OOB traffic only.

Modes

Global configuration mode

Usage Guidelines

The **management exclude** command is mutually exclusive with respect to either the **ip ssh strict-management-vrf** or the **telnet strict-management-vrf** commands. If the **management exclude** command is also configured, outbound SSH or Telnet connections are not blocked.

Use the **no** form of this command to remove all or one or more traffic types.

Examples

To exclude OOB traffic for all applications:

```
device# configure terminal
device(config)# management exclude all oob
```

History

Release version	Command history
8.0.50	This command was introduced.

Related Commands

[ip ssh strict-management-vrf](#), [telnet strict-management-vrf](#)

management-vlan

Configures a VLAN to be a part of the management VLAN.

Syntax

management-vlan

no management-vlan

Command Default

VLAN configuration mode

Modes

VLAN configuration mode

Usage Guidelines

When this command is used, the out-of-band (OOB) interface port is not disabled. The port remains accessible to management even if in-band interface ports are busy forwarding packets at line rate. No packets are shared between the OOB management port and the in-band port.

The port is treated as an untagged port.

The **management-vlan** command is available only in the FastIron switch image.

Use the **no** form of the command to remove the VLAN from the management VLAN.

Examples

To specify a VLAN and assign it to the management VLAN:

```
device# configure terminal
device(config)# vlan 20
device(config-vlan-20)# management-vlan
```

To remove the VLAN from the management VLAN:

```
device(config-vlan-20)# no management-vlan
```

History

Release version	Command history
8.0.30	This command was introduced.

management-vrf

Configures a Virtual Routing and Forwarding (VRF) as a global management VRF.

Syntax

management-vrf *vrf-name*

no management-vrf *vrf-name*

Command Default

A management VRF is not configured.

Parameters

vrf-name

Specifies the name of a preconfigured VRF.

Modes

Global configuration mode

Usage Guidelines

If the VRF is not preconfigured, command execution fails, and an error message is displayed. If you try to delete a management VRF that was not configured, the system displays an error message.

If a VRF is currently configured as the management VRF, it cannot be deleted or modified. Attempting to do so causes the system to return an error message. If a management VRF is already configured, you must remove the configuration before configuring a new one.

The **no** form of the command removes the management VRF. When the management VRF is deleted, a syslog message is displayed.

Examples

The following example configures a management vrf.

```
device(config)# management-vrf mvrf
```

master

Configures the device as a Network Time Protocol (NTP) master clock to which peers synchronize themselves when an external NTP source is not available.

Syntax

master [**stratum** *number*]

no master [**stratum** *number*]

Command Default

The master clock is disabled by default.

Parameters

stratum *number*

Specifies the NTP stratum number that the system will claim. The number can range from 2 to 15. The default value is 8.

Modes

NTP configuration mode

Usage Guidelines

Local time and time zone have to be configured before configuring the **master** command.

Use the **master** command with caution. It is very easy to override valid time sources using this command, especially if a low stratum number is configured. Configuring multiple machines in the same network with the **master** command can cause instability in timekeeping if the machines do not agree on the time.

NOTE

This command is not effective if NTP is enabled in client-only mode.

The **no** form of the command disables the master clock function.

Examples

The following example configures the NTP master clock.

```
device(config)# ntp
device(config-ntp)# master stratum 5
```

master (MRP)

Configures a node as the master node for the metro ring.

Syntax

master

no master

Command Default

A master node is not configured.

Modes

MRP configuration mode

Usage Guidelines

The **no** form of the command returns a master node a normal node.

Any node on a metro ring that does not have a shared interface can be designated as the ring master node. A master node can be the master node of more than one ring. However, if all nodes on the ring have shared interfaces, a node that does not have tunnel ports can be designated as the master node of that ring. If none of the nodes meet these criteria, you must change the priorities of the ring by reconfiguring the ring ID.

Examples

The following example shows how to set a node as a master node.

```
device(config)# vlan 2
device(config-vlan-2)# metro-ring 1
device(config-vlan-2-mrp-1)# name CustomerA
device(config-vlan-2-mrp-1)# master
device(config-vlan-2-mrp-1)# ring-interface ethernet 1/1/1 ethernet 1/1/2
device(config-vlan-2-mrp-1)# enable
```

master-vlan

Adds the master VLAN to the topology group.

Syntax

master-vlan *vlan-id*

no master-vlan *vlan-id*

Command Default

A master VLAN is not configured.

Parameters

vlan-id

Specifies the VLAN ID of the master VLAN.

Modes

Topology group configuration mode

Usage Guidelines

To configure a master VLAN, the VLAN must already be configured. Make sure all the Layer 2 protocol settings in the VLAN are correct for your configuration before you add the VLAN to the topology group. A topology group can have only one master VLAN. If you add a new master VLAN to a topology group that already has a master VLAN, the new master VLAN replaces the older master VLAN. All member VLANs and VLAN groups follow the Layer 2 protocol settings of the new master VLAN.

If you remove the master VLAN (by entering the **no master-vlan** command), the software selects the new master VLAN from member VLANs. A new candidate master VLAN is configured as a member VLAN so that the first added member VLAN will be a new candidate master VLAN. Once you save and reload, a member VLAN with the youngest VLAN ID will be the new candidate master. The new master VLAN inherits the Layer 2 protocol settings of the older master VLAN.

When removing the master VLAN from the topology group, Spanning Tree Protocol (STP) must be disabled on the master VLAN.

The **no** form of the command removes the master VLAN from the topology group.

Examples

The following example adds the master VLAN 2 to the topology group 2.

```
device(config)# topology-group 2
device(config-topo-group-2)# master-vlan 2
```

master-vlan (STP)

Adds the master VLAN to the STP group.

Syntax

master-vlan *vlan-id*

no master-vlan *vlan-id*

Command Default

The master VLAN is not configured.

Parameters

vlan-id

Specifies the VLAN ID of the master VLAN.

Modes

STP group configuration mode

Usage Guidelines

To configure a master VLAN, the VLAN must already be configured. The master VLAN contains the STP settings for all the VLANs in the STP per VLAN group. An STP group can have only one master VLAN. If you add a new master VLAN to an STP group that already has a master VLAN, the new master VLAN replaces the older master VLAN.

If you remove the master VLAN (by entering the **no master-vlan** command), the software selects the new master VLAN from member VLANs. A new candidate master VLAN will be in configured as a member VLAN so that the first added member VLAN will be a new candidate master VLAN. Once you save and reload, a member VLAN with the youngest VLAN ID will be the new candidate master.

The **no** form of the command removes the master VLAN from the STP group.

Examples

The following example adds the master VLAN 2 to the STP group 2.

```
device(config)# stp-group 2
device(config-stp-group-2)# master-vlan 2
```

match address-local

Configures matching an Internet Key Exchange version 2 (IKEv2) policy based on local IPv4 address.

Syntax

match address-local { *ip-address mask* }
no match address-local { *ip-address mask* }

Command Default

The IKEv2 policy matches all local IPv4 addresses.

Parameters

ip-address mask
Specifies a local IPv4 address and mask in dotted-decimal format.

Modes

IKEv2 policy configuration mode

Usage Guidelines

The **no** form of the command restores the default value of the policy matching all local IPv4 addresses.

Examples

The following example configures an IKEv2 policy named pol-mktg to use an KEv2 proposal named prop-mktg and match the local IPv4 address 10.3.3.3 255.255.255.0.

```
device(config)# ikev2 policy pol-mktg
device(config-ike-policy-pol-mktg)# proposal prop-mktg
device(config-ike-policy-pol-mktg)# match address-local 10.3.3.3 255.255.255.0
device(config-ike-policy-pol-mktg)# exit
```

History

Release version	Command history
8.0.50	This command was introduced.

match fvrf

Configures matching an Internet Key Exchange version 2 (IKEv2) policy based on a front-door virtual routing forwarding (fvrf) instance.

Syntax

```
match fvrf { vrf-name vrf | any }  
no match fvrf { vrf-name vrf | any }
```

Command Default

An IKEv2 policy matches any VRF.

Parameters

vrf-name *vrf*
Specifies matching a specific VRF.

any
Specifies matching any VRF.

Modes

IKEv2 policy configuration mode

Usage Guidelines

The **no** form of the command removes the specified forwarding VRF configuration.

Examples

The following example shows how to create an IKEv2 policy named pol-mktg and configure it to use IKEv2 proposal prop-mktg and to match the policy based on a front-door VRF named mktg-vrf.

```
device(config)# ikev2 policy pol-mktg  
device(config-ike-policy-pol-mktg)# proposal prop-mktg  
device(config-ike-policy-pol-mktg)# match fvrf vrf-name mktg-vrf  
device(config-ike-policy-pol-mktg)# exit
```

History

Release version	Command history
8.0.50	This command was introduced.

match-identity

Configures match options for an Internet Key Exchange version 2 (IKEv2) profile based on local or remote identity parameters.

Syntax

```
match-identity local { address ip-address | email email-address | fqdn fqdn-name | key-id key-id }  
match-identity remote { address ip-address | email email-address | fqdn fqdn-name | key-id key-id }  
no match-identity local { address ip-address | email email-address | fqdn fqdn-name | key-id key-id }  
no match-identity remote { address ip-address | email email-address | fqdn fqdn-name | key-id key-id }
```

Command Default

A match identity is not configured.

Parameters

local

Specifies matching based on local identity.

remote

Specifies matching based on remote identity.

address *ip-address*

Specifies matching based on a specific IP address.

email *email-address*

Specifies matching based on a specific email address.

fqdn *fqdn-name*

Specifies matching based on a specific fully qualified domain name (FQDN).

key-id *key-id*

Specifies matching based on a specific key ID.

Modes

IKEv2 profile configuration mode

Usage Guidelines

An IKEv2 profile must contain an identity to match. When a match identity is not configured, the profile is considered incomplete and is not used. An IKEv2 profile can have more than one match identity. When multiple match statements of the same type are configured, a match occurs when any statement is matched.

The **no** form of the command removes the specified match identity configuration.

Examples

The following example shows how to configure two match identities for an IKEv2 profile named prof-mktg, which is matched when the local IP address is 10.3.3.3, or the remote IP address is 10.2.2.1.

```
device# configure terminal
device(config)# ikev2 profile prof-mktg
device(config-ike-profile-prof-mktg)# match-identity local address 10.3.3.3
device(config-ike-profile-prof-mktg)# match-identity remote address 10.2.2.1
device(config-ike-profile-prof-mktg)# exit
```

History

Release version	Command history
8.0.50	This command was introduced.

match ip address

Matches IP address conditions in a route map instance.

Syntax

match ip address { *acl-name* | *acl-num* }

no match ip address { *acl-name* | *acl-num* }

Command Default

By default, match statements are not configured.

Parameters

acl-name

Specifies the ACL name.

acl-num

Specifies the ACL number.

Modes

Route map configuration mode

Usage Guidelines

When a route map is used in the PBR, the PBR policy uses up to five ACLs in a matching policy of each route map instance.

The **no** form of the command removes the configuration.

Examples

The following example configures a PBR route map that matches the standard ACL number 99 and sets routing information in the IP traffic.

```
device(config)# route-map test-route permit 99
device(config-routemap test-route)# match ip address 99
device(config-routemap test-route)# set ip next-hop 192.168.2.1
```

History

Release version	Command history
8.0.40a	The support for the command was added on Brocade ICX 7250.

match ipv6 address

Matches IPv6 address conditions in a route map instance.

Syntax

```
match ipv6 address { prefix-list prefix-list-name }  
no match ipv6 address
```

Command Default

No routes are distributed based on destination network number.

Parameters

prefix-list *prefix-list-name*
Specifies the name of an IPv6 prefix list.

Modes

Route-map configuration mode

Usage Guidelines

Use the **no** form of this command to remove the **match ipv6 address** entry.

Examples

This example matches IPv6 routes that have addresses specified by the prefix list named "myprefixlist".

```
device# configure terminal  
device(config)# route-map extComRmap permit 10  
device(config-route-map-sendExtComRmap)# match ipv6 address prefix-list myprefixlist
```

maximum (Port Security)

Configures the maximum number of secure MAC addresses an interface can store when MAC port security is enabled.

Syntax

maximum *max-num*
no maximum *max-num*

Command Default

By default, when MAC port security is enabled, an interface can store one secure MAC address.

Parameters

max-num

The maximum number of secure MAC addresses that can be configured. The range is from 0 through 64, plus the total number of global resources available. The default is 1.

Modes

Port security configuration mode
Port security interface configuration mode

Usage Guidelines

Besides the maximum of 64 local resources available to an interface, there are additional global resources. Depending on flash memory size, a device can have 1024, 2048, or 4096 global resources available. When an interface has secured enough MAC addresses to reach its limit for local resources, it can secure additional MAC addresses by using global resources. Global resources are shared among all the interfaces on a first-come, first-served basis.

The **no** form of the command sets the maximum number of secure MAC addresses an interface can store to one.

Examples

The following example configures the maximum number of secure MAC addresses an interface can store as 50.

```
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# port security
device(config-port-security-e1000-1/1/1)# maximum 50
```

maximum-paths (BGP)

Sets the maximum number of BGP4 and BGP4+ shared paths.

Syntax

maximum-paths *num* | **use-load-sharing**
no maximum-paths

Parameters

num

Specifies the maximum number of paths across which the device balances traffic to a given BGP destination. Valid values range is from 1 through 32. The default is 1.

use-load-sharing

Uses the maximum IP ECMP path value that is configured by means of the **ip load-sharing** command.

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

BGP address-family IPv4 unicast VRF configuration mode

BGP address-family IPv6 unicast VRF configuration mode

Usage Guidelines

Use this command to change the maximum number of BGP4 shared paths, either by setting a value or using the value configured by the **ip load-sharing** command.

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

The **no** form of the command restores the default.

Examples

The following example sets the maximum number of BGP4 shared paths to 8.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# maximum-paths 8
```

The following example sets the maximum number of BGP4+ shared paths to that of the value already configured using the **ip load-sharing** command.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast
device(config-bgp-ipv6u)# maximum-paths use-load-sharing
```

Commands K - S

maximum-paths (BGP)

The following example sets the maximum number of BGP4 shared paths to 2 in a nondefault VRF instance in the IPv4 address family.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv4 unicast vrf red
device(config-bgp-ipv4u-vrf)# maximum-paths 2
```

History

Release version	Command history
8.0.30	Support was added for the BGP address-family IPv6 unicast VRF configuration mode.

maximum-paths ebgp ibgp

Specifies the number of equal-cost multipath eBGP or iBGP routes or paths that are selected.

Syntax

```
maximum-paths { ebgp num | ibgp num }
no maximum-paths
```

Parameters

ebgp

Specifies eBGP routes or paths.

ibgp

Specifies iBGP routes or paths.

num

The number of equal-cost multipath routes or paths that are selected. Range is from 1 through 8. 1 disables equal-cost multipath.

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

BGP address-family IPv4 unicast VRF configuration mode

BGP address-family IPv6 unicast VRF configuration mode

Usage Guidelines

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

Enhancements to BGP load sharing support the load sharing of BGP4 and BGP4+ routes in IP Equal-Cost Multipath (ECMP), even if the BGP multipath load-sharing feature is not enabled by means of the **use-load-sharing** option to the **maximum-paths** command. You can set separate values for IGMP and ECMP load sharing. Use this command to specify the number of equal-cost multipath eBGP or iBGP routes or paths that are selected.

Examples

The following example sets the number of equal-cost multipath eBGP routes or paths that will be selected to 6 in the IPv4 address family.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# maximum-paths ebgp 6
```

Commands K - S

maximum-paths ebgp ibgp

The following example sets the number of equal-cost multipath iBGP routes or paths that will be selected to 4 in the IPv6 address family.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast
device(config-bgp-ipv6u)# maximum-paths ibgp 4
```

The following example sets the number of equal-cost multipath eBGP routes or paths that will be selected to 3 in a nondefault VRF instance in the IPv4 address family.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv4 unicast vrf red
device(config-bgp-ipv4u-vrf)# maximum-paths ebgp 3
```

History

Release version	Command history
8.0.30	Support was added for the BGP address-family IPv6 unicast VRF configuration mode.

maximum-preference

Configures the Router Advertisement (RA) guard policy to accept RAs based on a router preference setting.

Syntax

```
maximum-preference { high | low | medium }  
no maximum-preference { high | low | medium }
```

Command Default

The router preference setting for the RA guard policy is high (allows all RAs).

Parameters

high

Configures the router preference of RAs for the RA guard policy to high (allows all RAs). This is the default.

low

Allows RAs of low router preference.

medium

Allows RAs of low and medium router preference.

Modes

RA guard policy configuration mode

Usage Guidelines

If a very low value is set, the RAs expected to be forwarded might get dropped.

The **no** form of this command removes the router preference for an RA guard policy.

Examples

The following example configures the RA guard policy router preference to low:

```
Brocade(config)# ipv6 raguard policy p1  
Brocade(config-ipv6-RAG-policy p1)# maximum-preference low
```

max-hw-age

Enables and configures the maximum hardware age for denied MAC addresses.

Syntax

max-hw-age *age*

no max-hw-age *age*

Command Default

The default hardware aging time is 70 seconds.

Parameters

age

Specifies the maximum hardware age in seconds. The possible values range from 1 to 65535 seconds.

Modes

Authentication mode

Usage Guidelines

Once the hardware aging period ends, the blocked MAC address ages out, and can be authenticated again if the Brocade device receives traffic from the MAC address.

The **no** form of this command disables maximum hardware age.

Examples

The following example enables maximum hardware age and sets it to 160 seconds.

```
device(config)# authentication
device(config-authen)# max-hw-age 160
```

History

Release version	Command history
08.0.20	This command was introduced.

max-mcache

Configures the maximum number of PIM cache entries.

Syntax

max-mcache *num*

no max-mcache *num*

Command Default

If this command is not configured, the maximum value is determined by the **system max pim-hw-mcache** command or by available system resources.

Parameters

num

Specifies the maximum number of multicast cache entries for PIM.

Modes

PIM router configuration mode

PIM router VRF mode

Usage Guidelines

The **no** form of this command removes the configuration and resets the command to its default behavior.

Configure the **max-mcache** command to define the maximum number of repeated cache entries for PIM traffic being sent from the same source address and being received by the same destination address. To define this maximum for the default VRF, configure the command in router PIM configuration mode; to define the maximum for a specific VRF, first configure the **router pim vrf** command.

Examples

This example configures the maximum number of PIM cache entries for the default VRF to 999.

```
device(config)# router pim
device(config-pim-router)# max-mcache 999
```

This example configures the maximum number of PIM cache entries for the VRF, VPN1, to 999.

```
device(config)# router pim vrf vpn1
device(config-pim-router-vrf-vpn1)# max-mcache 999
```

max-sw-age

Configures the maximum software aging.

Syntax

max-sw-age *age*
no max-sw *age*

Command Default

The default is 120 seconds.

Parameters

age
You can specify from 1 - 65535 seconds.

Modes

Authentication mode

Usage Guidelines

Aging for a permitted or non-blocked MAC address occurs in two phases, known as MAC aging interval configured using the **mac-age-time** command and software aging. After normal MAC aging period for permitted clients (or clients in restricted VLAN), the software aging period begins. After the software aging period ends, the client session ages out and can be authenticated again if the Brocade device receives traffic from the MAC address.

Software aging is not applicable for blocked MAC addresses.

The **no** form of this command disables maximum software age.

Examples

The following example configures the maximum software age to 170 seconds.

```
device(config)# authentication
device(config-authen)# max-sw-age 170
```

History

Release version	Command history
08.0.20	This command was introduced.

max-vlan (SPX)

Configures the maximum number of VLANs of which an 802.1br port extender (PE) port can be a member.

Syntax

max-vlan *value*

no max-vlan *value*

Command Default

By default, a port can be member of up to four VLANs.

Parameters

value

Specifies the number of VLANs of which the port can be a member. The number of VLANs ranges from from 5 through 16.

Modes

Interface configuration mode

Usage Guidelines

The command allows you to add up to 128 PE ports to as many as 16 VLANs.

You can configure a higher or lower **max-vlan** value for the PE port. The new value must be greater than or equal to the current number of VLANs of which the port is a member.

If you try to add a PE port to more than the maximum number of allowed VLANs for that port, the system will throw an error such as "Error: maximum number of vlans allowed for PE port (x/y/z),vlans allowed (<max-vlan>) has been reached. Cannot add this port to vlan xxx."

The **no** form of the command restores the default number of VLANs.

NOTE

This command is applicable to 802.1br PE virtual ports only. The command does not apply to physical ports.

Examples

The following example configures the maximum number of VLANs of which a port can be a member to 12.

```
device(config)# interface ethernet 17/1/1
device(config-if-e1000-17/1/1)# max-vlan 12
```

History

Release version	Command history
8.0.40	This command was introduced.

med-missing-as-worst

Configures the device to favor a route that has a Multi-Exit Discriminator (MED) over a route that does not have one.

Syntax

med-missing-as-worst

no med-missing-as-worst

Modes

BGP configuration mode

Usage Guidelines

When MEDs are compared, by default the device favors a low MED over a higher one. Because the device assigns a value of 0 to a route path MED if the MED value is missing, the default MED comparison results in the device favoring the route paths that do not have MEDs.

The **no** form of the command restores the default where a device does not favor a route that has a MED over other routes.

Examples

The following example configures the device to favor a route containing a MED.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# med-missing-as-worst
```

member-group

Adds the member VLAN group to the topology group.

Syntax

member-group *number*

no member-group *number*

Command Default

A member VLAN group is not added to the topology group.

Parameters

number

Specifies the member VLAN group ID.

Modes

Topology group configuration mode

Usage Guidelines

The **no** form of the command removes the member VLAN group.

The VLAN group must already be configured.

Once you add a VLAN group as a member of a topology group, all the Layer 2 protocol configuration information for the VLAN group is deleted. For example, if STP is configured on a VLAN and you add the VLAN to a topology group, the STP configuration is removed from the VLAN. Once you add the VLAN to a topology group, the VLAN uses the Layer 2 protocol settings of the master VLAN. If you remove a member VLAN group from a topology group, you must reconfigure the Layer 2 protocol information in the VLAN group.

Examples

The following example shows how to add a member VLAN group:

```
device(config)# topology-group 2  
device(config-topo-group-2)# member-group 2
```

member-group (STP)

Adds the member VLAN group to the STP group.

Syntax

member-group *number*

no member-group *number*

Command Default

A member VLAN group is not added to the STP group.

Parameters

number

Specifies the member VLAN group ID.

Modes

STP group configuration mode

Usage Guidelines

The VLAN group must already be configured. All the VLANs in the member group inherit the STP settings of the master VLAN in the group.

The **no** form of the command removes the member VLAN group.

Examples

The following example shows how to add a member VLAN group.

```
device(config)# stp-group 2
device(config-stp-group-2)# member-group 2
```

member-vlan

Adds members to the VLAN topology group.

Syntax

member-vlan *vlan-id* [**to** *vlan-id* | [*vlan-id* **to** *vlan-id* | *vlan-id*]...]

no member-vlan *vlan-id* [**to** *vlan-id* | [*vlan-id* **to** *vlan-id* | *vlan-id*]...]

Command Default

Member VLANs are not added to the VLAN topology group.

Parameters

vlan-id

Adds a member VLAN ID to the topology group.

to *vlan-id*

Adds the range of member VLANs to the topology group.

Modes

Topology group configuration mode

Usage Guidelines

The member VLAN group must be configured before adding it to the topology group.

Each topology group can control up to 4096 VLANs. The VLANs within a VLAN group have the same ports and use the same values for other VLAN parameters.

Once you add a VLAN as a member of a topology group, all the Layer 2 protocol configuration information for the VLAN is deleted. For example, if STP is configured on a VLAN and you add the VLAN to a topology group, the STP configuration is removed from the VLAN. Once you add the VLAN to a topology group, the VLAN uses the Layer 2 protocol settings of the master VLAN. If you remove a member VLAN from a topology group, you must reconfigure the Layer 2 protocol information in the VLAN or VLAN group.

The **no** form of the command removes the member VLANs from the topology group.

Examples

The following example adds the members to the VLAN topology group.

```
device(config)# topology-group 2
device(config-topo-group-2)# member-vlan 4
device(config-topo-group-2)# member-vlan 5
```

member-vlan (STP)

Adds member VLANs to the STP group.

Syntax

member-vlan *vlan-id* [**to** *vlan-id* | [*vlan-id* **to** *vlan-id* | *vlan-id*]...]

no member-vlan *vlan-id* [**to** *vlan-id* | [*vlan-id* **to** *vlan-id* | *vlan-id*]...]

Command Default

Member VLANs are not added to the STP group.

Parameters

vlan-id

Adds a member VLAN ID to the STP group.

to *vlan-id*

Adds the range of member VLANs to the STP group.

Modes

STP group configuration mode

Usage Guidelines

The member VLAN group must be configured before adding it to the STP group.

All the VLANs in the member group inherit the STP settings of the master VLAN in the group.

The **no** form of the command removes the member VLANs from the STP group.

Examples

The following example adds the member VLANs to the STP group.

```
device(config)# stp-group 2
device(config-stp-group-2)# member-vlan 4
device(config-stp-group-2)# member-vlan 5
```

mesh-group

Configures a multicast source discovery protocol (MSDP) mesh group from several rendezvous points (RPs).

Syntax

mesh-group *group-name* *peer-address*

no mesh-group *group-name* *peer-address*

Command Default

Mesh groups are not configured.

Parameters

group-name

Specifies the mesh group as alphabetic characters. The limit is 31 characters.

peer-address

Specifies the IP address of the MSDP peer that is being placed in the mesh group. Each mesh group can include up to 32 peers.

Modes

MSDP VRF configuration mode

Usage Guidelines

The **no** form of this command removes mesh groups.

You must configure the **msdp-peer** command to configure the MSDP peers by assigning their IP addresses and the loopback interfaces before you configure a mesh group.

You can have up to four mesh groups in a multicast network. Each mesh group can include up to 15 peers.

Each device that will be part of a mesh group must have a mesh group definition for all the peers in the mesh-group.

Examples

This example configures an MSDP mesh group on each device that will be included in the mesh group.

```
Device(config)# router msdp
Device(config-msdp-router)# msdp-peer 206.251.18.31 connect-source loopback 2
Device(config-msdp-router)# msdp-peer 206.251.19.31 connect-source loopback 2
Device(config-msdp-router)# msdp-peer 206.251.20.31 connect-source loopback 2
Device(config-msdp-router)# mesh-group GroupA 206.251.18.31
Device(config-msdp-router)# mesh-group GroupA 206.251.19.31
Device(config-msdp-router)# mesh-group GroupA 206.251.20.31
Device(config-msdp-router)# exit
```

message-interval

Changes the default PIM Sparse join or prune message interval.

Syntax

message-interval [**vrf** *vrf-name*] *interval*

no message-interval [**vrf** *vrf-name*] *interval*

Parameters

vrf *vrf-name*

Specifies a VRF instance.

interval

Specifies the join or prune message interval in seconds. The range is 10 through 18724; the default is 60.

Command Default

The join or prune interval is 60 seconds.

Modes

PIM router configuration mode

PIM router VRF configuration mode

Usage Guidelines

The **no** form of this command restores the default; the join-prune interval is 60 seconds.

PIM Sparse join and prune messages inform other PIM Sparse routers about clients who want to become receivers (join) or stop being receivers (prune) for PIM Sparse groups.

NOTE

Configure the same join or prune message interval on all the PIM Sparse routers in the PIM Sparse domain. The performance of PIM Sparse can be adversely affected if the routers use different timer intervals.

Examples

This example changes the PIM join or prune interval to 30 seconds.

```
Device(config)# ipv6 router pim
Device(config-ipv6-pim-router)# message-interval 30
```

This example changes the PIM join or prune interval on a VRF to 30 seconds.

```
Device(config)# ipv6 router pim vrf blue
Device(config-ipv6-pim-router-vrf-blue)# message-interval 30
```

metric-type

Configures the default metric type for external routes.

Syntax

```
metric-type { type1 | type2 }  
no metric-type { type1 | type2 }
```

Command Default

Type 2

Parameters

type1

The metric of a neighbor is the cost between itself and the device plus the cost of using this device for routing to the rest of the world.

type2

The metric of a neighbor is the total cost from the redistributing device to the rest of the world.

Modes

OSPF router configuration mode
OSPFv3 router configuration mode
OSPF router VRF configuration mode
OSPFv3 router VRF configuration mode

Usage Guidelines

The **no** form of the command restores the default setting. You must specify a type parameter when using the **no** form.

Examples

The following example sets the default metric type for external routes to type 1.

```
device# configure terminal  
device(config)# router ospf  
device(config-ospf6-router)# metric-type type1
```

The following example sets the default metric type for external routes to type 2.

metro-ring

Adds a metro ring to a port-based VLAN and enters MRP configuration mode.

Syntax

metro-ring *ring-id*

no metro-ring *ring-id*

Command Default

A metro ring is not added to a port-based VLAN.

Parameters

ring-id

Specifies the ID of the metro ring. The ring ID ranges from 1 through 1023. 256 is reserved for VSRP.

Modes

VLAN configuration mode

Usage Guidelines

If you plan to use a topology group to add VLANs to the ring, make sure you configure MRP on the topology group master VLAN.

If you want to add more than one metro ring to a port-based VLAN, use the **metro-rings** command.

The **no** form of the command removes the metro ring from the port-based VLAN.

Examples

The following example shows how to add the metro ring to a port-based VLAN.

```
device(config)# vlan 2
device(config-vlan-2)# metro-ring 1
device(config-vlan-2-mrp-1)#
```

mdi-mdix

Enables or disables Media Dependent Interface (MDI) and Media Dependent Interface Crossover (MDIX) detection on all Gigabit Ethernet Copper ports.

Syntax

```
mdi-mdix { mdi | mdix | auto }  
no mdi-mdix [ mdi | mdix | auto ]
```

Command Default

The auto MDI/MDIX detection feature is enabled on all Gigabit Ethernet copper ports.

Parameters

- mdi**
Turns off automatic MDI/MDIX detection and defines a port as an MDI-only port.
- mdix**
Turns off automatic MDI/MDIX detection and defines a port as an MDIX-only port.
- auto**
Enables automatic MDI/MDIX detection on a port.

Modes

Interface configuration mode

Usage Guidelines

The auto MDI/MDIX detection feature can automatically correct errors in cable selection, making the distinction between a straight-through cable and a crossover cable insignificant. The command applies to copper ports only.

NOTE

The **mdi-mdix mdi** and **mdi-mdix mdix** commands work independently of auto-negotiation. Thus, these commands work whether auto-negotiation is turned on or off.

The **no** form of the command disables the specified mode.

Examples

The following example turns off automatic MDI/MDIX detection and defines a port as an MDI-only port.

```
device(config)# interface ethernet 1/1/1  
device(config-if-e1000-1/1/1)# mdi-mdix mdi
```

The following example turns on automatic MDI/MDIX detection on a port that was previously set as an MDI or MDIX port.

```
device(config)# interface ethernet 1/1/1  
device(config-if-e1000-1/1/1)# mdi-mdix auto
```

mirror-port

Configures port mirroring on individual ports.

Syntax

mirror-port ethernet *stackid/slot/port* [**input** | **output**]

no mirror-port ethernet *stackid/slot/port* [**input** | **output**]

Command Default

Ports are not mirrored.

Parameters

ethernet *stackid/slot/port*

Specifies the Ethernet port to which mirrored traffic is copied.

input

Copies the ingress traffic.

output

Copies the egress traffic.

Modes

Global configuration mode

Usage Guidelines

Use this command to configure ports to which the monitored traffic is copied. If you do not specify the traffic type, both types of traffic apply. The input and output mirroring ports can be on different ports.

All FastIron devices can have one mirroring port that monitors multiple ports, but cannot have multiple mirror ports for one monitored port. If the mirror port and the monitored ports are on different stack units, only one active mirror port is allowed for the entire traditional stack. If the mirror port and the monitored ports are on the same port region, multiple active mirror ports are allowed for the entire traditional stack. Devices in a traditional stack support 24 ports per port region.

NOTE

Port-based mirroring and VLAN-based mirroring cannot be enabled on a port at the same time.

The **no** form of the command removes the mirrored ports.

Examples

The following example shows the port mirroring configuration.

```
device(config)# mirror-port ethernet 1/2/4
```

mka-cfg-group

Creates and names a MACsec Key Agreement (MKA) configuration group.

Syntax

mka-cfg-group *group-name*

no mka-cfg-group *group-name*

Command Default

No MACsec options are configured for an MKA configuration group. All related parameters retain their default settings.

Parameters

group-name

Provides a name for an MKA configuration group that can be applied to ports.

Modes

dot1x-mka configuration mode

dot1x-mka-interface configuration mode

Usage Guidelines

MACsec commands are supported only on the ICX 7450.

The **no** form of this command deletes the MKA configuration group. MACSec is disabled on the ports where the group is configured.

The **dot1x-mka-enable** command must be executed before the **mka-cfg-group** command can be used.

After the MACsec Key Agreement (MKA) configuration group is created, you can apply the configured group and its settings to an interface being configured using the **mka-cfg-group** command in the dot1x-mka-interface configuration mode.

Examples

The following example creates the MKA configuration group test1.

```
device(config)# dot1x-mka
    dot1x-mka-enable          Enable MACsec
device(config)# dot1x-mka-enable
device(config-dot1x-mka)#
device(config-dot1x-mka)# mka-cfg-group
    ASCII string      Name for this group
device(config-dot1x-mka)# mka-cfg-group test1
device(config-dot1x-mka-group-test1)#

device(config-dot1x-mka-group-test1)# key-server-priority
    DECIMAL      Priority of the Key Server. Valid values should be between 0 and 255
device(config-dot1x-mka-group-test1)# key-server-priority 5
device(config-dot1x-mka-group-test1)#

device(config-dot1x-mka-group-test1)# macsec cipher-suite
    gcm-aes-128      GCM-AES-128 Cipher suite
device(config-dot1x-mka-group-test1)# macsec cipher-suite gcm-aes-128
device(config-dot1x-mka-group-test1)#

device(config-dot1x-mka-group-test1)# macsec confidentiality-offset
    30      Confidentiality offset of 30
    50      Confidentiality offset of 50
device(config-dot1x-mka-group-test1)# macsec confidentiality-offset 30
device(config-dot1x-mka-group-test1)#

device(config-dot1x-mka-group-test1)# macsec frame-validation
    check      Validate frames with secTAG and accept frames without secTAG
    disable    Disable frame validation
    strict     Validate frames with secTAG and discard frames without secTAG
device(config-dot1x-mka-group-test1)# macsec frame-validation strict
device(config-dot1x-mka-group-test1)#

device(config-dot1x-mka-group-test1)# macsec replay-protection
    out-of-order  Validate MACsec frames arrive in the given window size
    strict        Validate MACsec frames arrive in a sequence
device(config-dot1x-mka-group-test1)# macsec replay-protection strict
device(config-dot1x-mka-group-test1)#
```

The following example applies the previously configured MKA group test1 to ethernet interface 1/3/3.

```
device(config)# dot1x-mka-enable
device(config-dot1x-mka)# enable-mka ethernet 1/3/3
device(config-dot1x-mka-1/3/3)# mka-cfg-group test1
```

History

Release version	Command history
08.0.20	This command was introduced.
08.0.20a	This command was expanded to support the association of a configured MKA group and its settings to an interface at the interface configuration level. The mka-group command was deprecated as part of this change.
08.0.30	Support for this command was added on ICX 7450 device.

module (SPX)

Manually configures SPX module information.

Syntax

module *id module-name*

no module *id module-name*

Command Default

SPX module information is learned and system-generated by default.

Parameters

id

Identifies the module. Must be a number from 1 through 4.

module-name

Identifies the module type, for example, icx7450-24-port-management-module.

Modes

SPX unit configuration mode (CB only)

Usage Guidelines

The **no** form of the command followed by the module number and the exact module name removes the module from the SPX configuration.

When you create a reserved SPX unit, you must configure modules for the unit. The base module 1 must be configured before other modules.

When you configure a reserved SPX unit, the system will not generate default SPX ports or SPX LAGs for the unit.

The CB can add or remove a reserved module for a live PE unit.

Examples

The following example configures module 1 for SPX unit 21.

```
device# configure terminal
device(config)# spx unit 21
device(config-spx-unit-21)# module 1 icx7450-48f-sf-port-management-module
device(config-spx-unit-21)# spx-port 21/2/4
device(config-spx-unit-21)# exit
device(config)# exit
```

Release version	Command history
8.0.40	This command was introduced.

monitor (ERSPAN)

Configures ERSPAN monitoring.

Syntax

monitor profile *profile-number* { **both** | **input** | **output** }

no monitor profile *profile-number* { **both** | **input** | **output** }

Command Default

Ports are not monitored.

Parameters

profile *profile-number*

Specifies the ERSPAN profile to be used. The monitor port is specified in the profile.

both

Monitors both incoming and outgoing traffic on the monitor port.

input

Monitors the ingress traffic on the monitor port.

output

Monitors the egress traffic on the monitor port.

Modes

Interface configuration mode

Usage Guidelines

You must configure an ERSPAN profile before you can enable ERSPAN monitoring.

ERSPAN does not support VLAN monitoring.

The **no** form of the command disables ERSPAN monitoring on the port.

Examples

The following example shows how to enable ERSPAN monitoring for ingress and egress traffic. The monitor port is 1/1/1, and the ERSPAN profile is 1.

```
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# monitor profile 1 both
```

History

Release version	Command history
8.0.40	This command was introduced.

monitor (LAG)

Monitors an individual port in a deployed LAG.

Syntax

```
monitor { ethe-port-monitored stackid/slot/port | named-port-monitored name } [ ethernet stackid/slot/port ] { input | output | both }
```

```
no monitor{ ethe-port-monitored stackid/slot/port | named-port-monitored name } [ ethernet stackid/slot/port ] { input | output | both }
```

Command Default

Traffic is not monitored on ports.

Parameters

ethe-port-monitored *stackid/slot/port*

Specifies the Ethernet port to be monitored.

named-port-monitored *name*

Specifies the named port that you want to monitor.

ethernet *stackid/slot/port*

Specifies the mirror ports to be used and specifies the port to which the traffic analyzer is attached.

input

Monitors the incoming packets.

output

Monitors the outgoing packets.

both

Monitors both incoming and outgoing packets.

Modes

LAG configuration mode

Usage Guidelines

By default, when you monitor the primary port in a LAG group, aggregated traffic for all the ports in the LAG is copied to the mirror port.

You can configure the device to monitor individual ports in a LAG including Ethernet ports or named ports. You can monitor the primary port or another member port individually. Once a LAG is deployed and a primary port is specified using the **primary-port** command, monitoring across all ports of the LAG can be configured at the primary port. If a new port is added to a deployed LAG and if the entire LAG is monitored, the new port will also be mirrored by the same port monitoring traffic across the entire LAG.

NOTE

You can use only one mirror port for each monitored LAG port. You cannot configure mirroring on an undeployed LAG.

The **no** form of the command stops monitoring the traffic.

Examples

The following is an example of monitoring traffic on an individual Ethernet port within a LAG.

```
device(config)# lag test2 dynamic
device(config-lag-test2)# ports ethernet 1/1/1 ethernet 1/1/9
device(config-lag-blue)# primary-port 1/1/1
device(config-lag-blue)# deploy
device(config-lag-test2)# monitor ethe-port-monitored 1/1/1 ethernet 1/1/9 input
```

The following example shows the monitoring of traffic on a named port.

```
device(config)# lag test2 dynamic
device(config-lag-test2)# ports ethernet 1/1/1 ethernet 1/1/9
device(config-lag-test2)# monitor named-port-monitored port1 both
```

monitor

Configures monitoring of the mirrored ports.

Syntax

```
monitor [ ethernet stackid/slot/port ] { both | input | output }
```

```
no monitor [ ethernet stackid/slot/port ] { both | input | output }
```

Command Default

Ports are not monitored.

Parameters

ethernet *stackid/slot/port*

Specifies the mirror port to be used.

both

Monitors both incoming and outgoing traffic on the mirrored port.

input

Monitors the ingress traffic on the mirrored port.

output

Monitors the egress traffic on the mirrored port.

Modes

Interface configuration mode

VLAN configuration mode

Usage Guidelines

If you configure both ACL mirroring and ACL-based rate limiting on the same port, then all packets that match are mirrored, including the packets that exceed the rate limit. The same port cannot be both a monitored port and the mirror port. The same port can be monitored by one mirror port for ingress traffic and another mirror port for egress traffic. The mirror port cannot be a LAG port. More than one monitored port can be assigned to the same mirror port.

For stacked devices, if the ingress and egress analyzer ports are always network ports on the local device, each device may configure the ingress and egress analyzer port independently. However, if you need to mirror to a remote port, then only one ingress and one egress analyzer port are supported for the entire system.

The **no** form of the command stops monitoring the mirrored ports.

Examples

The following example shows how to monitor the mirrored ports.

```
device(config)# interface ethernet 1/2/11
device(config-if-e1000-1/2/11)# monitor ethernet 1/2/4 both
```

The following example shows how to configure VLAN-based mirroring.

```
device(config)# mirror-port ethernet 1/1/21 input
device(config)# vlan 10
device(config-vlan-10)# monitor ethernet 1/1/21
device(config-vlan-10)# exit
device(config)# vlan 20
device(config-vlan-20)# monitor ethernet 1/1/21
device(config-vlan-20)# end
```

monitor-profile

Configures a monitor port profile.

Syntax

monitor-profile *profile-number* **type** **erspan**
no monitor-profile *profile-number*

Command Default

ERSPAN is not configured.

Parameters

profile-number

Specifies the profile number to configure. If the profile is new, assigns this number to the profile. Valid values are from 1 through 4.

type erspan

Specifies the type of profile. The only supported profile is **erspan**.

Modes

Global configuration mode

Usage Guidelines

The source IP can be any port on the router. The destination IP is the port on the destination host.

The **no** form of the command deletes the ERSPAN profile.

Examples

The following example configures an ERSPAN profile. This profile sends mirrored traffic from a port on switch 2.2.2.2 to the host 1.1.1.1.

```
device(config)# monitor-profile 1 type erspan
device(config-monitor-profile 1)# source-ip 2.2.2.2
device(config-monitor-profile 1)# destination-ip 1.1.1.1
device(config-monitor-profile 1)# exit
```

The following example modifies the destination host in an ERSPAN profile.

```
device(config)# monitor-profile 1 type erspan
device(config-monitor-profile 1)# no destination-ip 1.1.1.1
device(config-monitor-profile 1)# destination-ip 3.3.3.3
device(config-monitor-profile 1)# exit
```

The following example deletes an ERSPAN profile.

```
device(config)# no monitor-profile 1
```

History

Release version	Command history
8.0.40	This command was introduced.

mount disk0

Mounts the filesystem of the external USB.

Syntax

mount disk0

Modes

User EXEC mode.

Examples

This example mounts the filesystem of the external USB.

```
device# mount disk0
```

History

Release version	Command history
08.0.30	This command was introduced.

msdp-peer

Configures a multicast source discovery protocol (MSDP) peer.

Syntax

```
msdp-peer ip-address [ connect-source loopback num | shutdown ]
```

```
no msdp-peer ip-address [ connect-source loopback num | shutdown ]
```

Parameters

ip-address

Specifies the IP address of the MSDP peer.

connect-source loopback

Specifies the loopback interface you want to use as the source for sessions with the neighbor; it must be reachable within the VRF.

shutdown

Disables the MSDP peer. Configure this keyword at the MSDP router configuration mode level.

Modes

MSDP router configuration mode

VRF configuration mode

Usage Guidelines

The **no** form of the command with deletes the MSDP peer configuration. You should provide the IP address to identify the MSDP peer configuration that needs deletion. Use the **shutdown** option to disable the MSDP peer.

NOTE

The PIM Sparse rendezvous point (RP) is also an MSDP peer.

NOTE

Devices that run MSDP usually also run BGP. The source address used by the MSDP device is normally configured to be the same source address used by BGP.

It is strongly recommended that you specify the **connect-source loopback** keyword when you configure the **msdp-peer** command. If you do not, the device uses the IP address of the outgoing interface. You should also make sure that the IP address of the connect-source loopback is the source IP address used by the PIM RP and the BGP device.

Examples

The following example configures a device with the address 205.216.162.1 as an MSDP peer.

```
device(config)# router msdp
device(config-msdp-router)# msdp-peer 205.216.162.1
```

Commands K - S

msdp-peer

The following example configures an MSDP peer on a VRF.

```
device(config)# router msdp
device(config-msdp-router)# msdp-peer 205.216.162.1
```

The following example adds an MSDP peer and specifies a loopback interface as the source interface for sessions with the peer. By default, the device uses the subnet address configured on the physical interface where you configure the peer as the source address for sessions with the peer.

```
device(config)# interface loopback 1
device(config-lbif-1)# ip address 9.9.9.9/32
device(config)# router msdp
device(config-msdp-router)# msdp-peer 2.2.2.99 connect-source loopback 1
```

mstp admin-edge-port

Configures ports as operational edge ports.

Syntax

mstp admin-edge-port ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]

no mstp admin-edge-port ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]

Command Default

Ports are not configured as edge ports.

Parameters

ethernet *stackid/slot/port*

Configures the specified Ethernet port as the edge port.

to *stackid/slot/port*

Configures the specified range of Ethernet ports as edge ports.

Modes

Global configuration mode

Usage Guidelines

You can define specific ports as edge ports for the region in which they are configured to connect to devices (such as a host) that are not running STP, RSTP, or MSTP. If a port is connected to an end device such as a PC, the port can be configured as an edge port.

The **no** form of the command removes a port from being an edge port.

Examples

The following example shows how to configure an Ethernet port as an edge port.

```
device(config)# mstp admin-edge-port ethernet 1/3/1
```

mstp admin-pt2pt-mac

Creates a point-to-point link between ports to increase the speed of convergence.

Syntax

mstp admin-pt2pt-mac ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]

no mstp admin-pt2pt-mac ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]

Command Default

By default, a point-to-point link is not available between ports.

Parameters

ethernet *stackid/slot/port*

Configures the specified Ethernet port to be a point-to-point link.

to *stackid/slot/port*

Configures the range of specified Ethernet ports to be point-to-point link.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command removes the point-to-point link on the ports.

Examples

The following example shows how to create point-to-point link.

```
device(config)# mstp admin-pt2pt-mac ethernet 1/2/5 ethernet 1/4/5
```

mstp disable

Disables MSTP on Ethernet interfaces.

Syntax

mstp disable ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port to stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]

no mstp disable ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port to stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]

Command Default

MSTP is not enabled by default.

Parameters

ethernet *stackid/slot/port*
Disables MSTP on the specified Ethernet interface.

to *stackid/slot/port*
Disables MSTP on a range of Ethernet interfaces.

Modes

Global configuration mode

Usage Guidelines

When a port is disabled for MSTP, the port blocks all the VLAN traffic that is controlled by Multiple Spanning Tree Protocol (MSTP) instance and the Common and Internal Spanning Tree (CIST) instances.

The **no** form of the command enables MSTP.

Examples

The following example shows how to disable MSTP.

```
device(config)# mstp disable ethernet 1/2/1
```

mstp edge-port-auto-detect

Automatically sets a port as an operational edge port.

Syntax

mstp edge-port-auto-detect
no mstp edge-port-auto-detect

Command Default

Ports are not automatically set as edge ports.

Modes

Global configuration mode

Usage Guidelines

You can configure a Layer 3 switch to automatically set a port as an operational edge port if the port does not receive any BPDUs from the time of link-up. If the port receives a BPDU later, the port is automatically reset to become an operational non-edge port.

NOTE

After configuring, it takes the port about three seconds longer to come to the enable state.

The **no** form of the command resets the port as a non-operational edge port.

Examples

The following example shows how to automatically set ports as edge ports.

```
device(config)# mstp edge-port-auto-detect
```

mstp force-migration-check

Triggers a port to force transmit an MSTP BPDU.

Syntax

mstp force-migration-check ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]

no mstp force-migration-check ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]

Command Default

Ports are not configured to force transmit MSTP BPDUs.

Parameters

ethernet *stackid/slot/port*

Configures the specified Ethernet port to force transmit an MSTP BPDU.

to *stackid/slot/port*

Configures the specified range of the Ethernet interfaces to force transmit MSTP BPDUs.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command disables the force transmit of an MSTP BPDU.

Examples

The following example triggers the port to transmit an MSTP BPDU.

```
device(config)# mstp force-migration-check ethernet 1/3/1
```

mstp force-version

Configures the bridge to send BPDUs in a specific format.

Syntax

mstp force-version *mode*

no mstp force-version *mode*

Command Default

By default, the bridge sends the BPDUs in MSTP mode (3).

Parameters

mode

Forces the bridge to send BPDUs in a specific format: 0 for STP compatibility mode, 2 for RSTP compatibility mode, and 3 for MSTP mode.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command resets the mode to MSTP mode.

Examples

The following example configures the bridge to forward BPDUs in STP compatibility mode.

```
device(config)# mstp force-version 0
```

mstp forward-delay

Configures the length of time a port waits before it forwards an RST BPDU after a topology change.

Syntax

mstp forward-delay *time*

no mstp forward-delay *time*

Command Default

The default is 15 seconds.

Parameters

time

Configures the time period a port waits before it forwards an RST BPDU after a topology change. The period ranges from 4 through 30 seconds.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command resets the value to the default value of 15 seconds.

Examples

The following example configures the time period the port waits before it forwards an RST BPDU after a topology change to 10 seconds.

```
device(config)# mstp forward-delay 10
```

mstp hello-time

Configures the interval between two Hello packets.

Syntax

mstp hello-time *time*

no mstp hello-time *time*

Command Default

By default, the interval is 2 seconds.

Parameters

time

The time interval between two Hello packets. The value ranges from 1 through 10 seconds.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command resets the interval to the default (2 seconds).

Examples

The following example configures the interval between two Hello packets to 5 seconds.

```
device(config)# mstp hello-time 5
```

mstp instance

Configures a Multiple Spanning Tree Protocol (MSTP) instance that allows multiple VLANs to be managed by a single STP instance and supports per-VLAN STP. This allows you to use fewer spanning-tree instances to map to VLANs.

Syntax

mstp instance *number* { **priority** *priority-num* | **vlan** *vlan-id* [**to** *vlan-id*] | **vlan-group** *group-id* | **ethernet** *stackid/slot/port* { **path-cost** *cost-value* [**priority** *priority-value*] | **priority** *priority-value* [**path-cost** *cost-value*] }

no mstp instance *number* { **priority** *priority-num* | **vlan** *vlan-id* [**to** *vlan-id*] | **vlan-group** *group-id* | **ethernet** *stackid/slot/port* { **path-cost** *cost-value* [**priority** *priority-value*] | **priority** *priority-value* [**path-cost** *cost-value*] }

Command Default

No MSTP instances are configured. Any VLANs remain in the common, internal spanning tree (CIST) or are free.

Parameters

number

Specifies the number for the instance of MSTP that you are configuring. You can specify up to 15 instances, identifying each, in MSTP mode, by a number in the range 1 through 4094. In MSTP mode, you cannot specify the value 0, which identifies the CIST. In MSTP+ mode, the range is 0 through 4094.

priority *priority-num*

Configures the priority for an MSTP instance. Valid values are from 0 through 61440 in increments of 4096. The default value is 32768.

vlan *vlan-id*

Assigns one or more VLANs or a range of VLANs to the MSTP instance.

to *vlan-id*

Assigns a range of VLANs to the MSTP instance.

vlan-group *group-id*

Assigns one or more VLAN groups to the MSTP instance.

ethernet *stackid/slot/port*

Configures port parameters for the MSTP instance.

path-cost *cost-value*

Configures MSTP port path cost. Valid values are from 1 through 200000000.

priority *priority-value*

Specifies the forwarding preference for instances within a VLAN or on the device. You can specify a numeric value in the range 0 to 61440 in increments of 4096. A higher priority variable means a lower forwarding priority. The default value is 32768.

Modes

Global configuration mode

Usage Guidelines

The Brocade implementation of MSTP allows you to assign VLANs or ranges of VLANs to an MSTP instance before or after they have been defined. If predefined, a VLAN will be placed in the MSTI that it was assigned to immediately when the VLAN is created. Otherwise, the default operation is to assign all new VLANs to the CIST. VLANs assigned to the CIST by default can be moved later to a specified MSTI.

The system does not allow an MSTI without any VLANs mapped to it. Consequently, removing all VLANs from an MSTI, deletes the MSTI from the system. The CIST by contrast will exist regardless of whether or not any VLANs are assigned to it. Consequently, if all VLANs are moved out of a CIST, the CIST will still exist and remain functional.

You can set a priority to the instance that gives it forwarding preference over lower priority instances within a VLAN or on the switch. A higher number for the priority variable means a lower forwarding priority.

The system does not allow an MSTP instance without any VLANs mapped to it; removing all VLANs from an MSTP instance deletes the instance from the system.

In MSTP+ mode, you can specify an instance number value of 0 because MSTP+ mode allows you to add VLANs to and remove VLANs from the CIST.

In MSTP mode, the **no** form of this command moves a VLAN or VLAN group from its assigned MSTP back into the CIST. In MSTP+ mode, the **no** form of this command assigns any VLAN as a free VLAN.

Examples

The following example configures an MSTP instance and map VLANs 1 to 7 to it.

```
Device(config)# mstp instance 7 vlan 4 to 7
```

The following example specifies a priority of 8192 to MSTP instance 1.

```
Device(config)# mstp instance 1 priority 8192
```

mstp max-age

Configures the amount of time the device waits to receive a Hello packet before it initiates a topology change.

Syntax

mstp max-age *time*

no mstp max-age *time*

Command Default

The default is 20 seconds.

Parameters

time

The time period a device waits to receive a Hello packet before it initiates a topology change. The period ranges from 6 through 40 seconds.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command resets the maximum age to the default value.

Examples

The following example configures the maximum age to 20.

```
device(config)# mstp max-age 20
```

mstp max-hops

Configures the maximum hop count.

Syntax

mstp max-hops *count*

no mstp max-hops *count*

Command Default

The default is 20 hops.

Parameters

count

The maximum hop count. The number of hops ranges from 1 through 40.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command resets the maximum hop count to the default value.

Examples

The following example configures the maximum hop count to 20.

```
device(config)# mstp max-hops 20
```

mstp name

Configures the MSTP name for the device.

Syntax

mstp name *name*

no mstp name *name*

Command Default

The default name for the device is blank (no name).

Parameters

name

The MSTP name for the device.

Modes

Global configuration mode

Usage Guidelines

Each switch that is running MSTP should be configured with a name. The name applies to the switch that can have many different VLANs that can belong to many different MSTP regions.

The **no** form of the command resets the MSTP name to blank (no name).

Examples

The following example configures the MSTP name as Device1.

```
device(config)# mstp name Device1
```

mstp revision

Configures an MSTP revision number for the device.

Syntax

mstp revision *number*

no mstp revision*number*

Command Default

The default MSTP revision number for a device is 0.

Parameters

number

The revision level for MSTP. The MSTP revision number ranges from 0 through 65535.

Modes

Global configuration mode

Usage Guidelines

The MSTP revision number applies to the device that can have many different VLANs that can belong to many different MSTP regions.

The **no** form of the command sets the revision level to 0.

Examples

The following example shows how to set the MSTP revision number for a device.

```
device(config)# mstp revision 4
```

mstp scope

Configures VLANs in Multiple Spanning Tree Protocol (MSTP) mode.

Syntax

```
mstp scope { all | pvst }
no mstp scope { all | pvst }
```

Command Default

No VLAN is under direct MSTP control.

Parameters

- all**
Configures MSTP on all VLANs.
- pvst**
Configures MSTP in per-VLAN spanning tree (PVST) mode.

Modes

Global configuration mode

Usage Guidelines

MSTP is not operational until the **mstp start** command is configured. You cannot start MSTP+ unless at least one MSTP+ instance of MSTP+ is configured.

The **no** form of this command removes the MSTP PVST mode and restores the device to non-MSTP mode.

Examples

The following example configures MSTP mode on all VLANs.

```
device(config)# mstp scope all
```

The following example enables MSTP in PVST mode.

```
device(config)# mstp scope pvst
```

History

Release version	Command history
08.0.20	This command was modified to support the pvst keyword.

mstp start

Enables MSTP on the device.

Syntax

mstp start

no mstp start

Command Default

MSTP is disabled by default.

Modes

Global configuration mode

Usage Guidelines

MSTP scope must be enabled on the device before MSTP can be enabled.

The **no** form of the command disables MSTP on a device.

Examples

The following example shows how to start MSTP on the device.

```
device(config)# mstp start
```

mtu-exceed

Configures a port to forward traffic to a port with a smaller MTU size.

Syntax

```
mtu-exceed { forward | hard-drop }
```

```
no mtu-exceed { forward | hard-drop }
```

Command Default

Port does not forward traffic to a port with a smaller MTU size (hard-drop).

Parameters

forward

Configures the port to fragment and forward a packet from a port with a larger MTU to a port with a smaller MTU.

hard-drop

Configures the port to resets to the default and removes the forward function.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command configures the port not to forward traffic to a port with smaller MTU size.

Examples

The following example configures the port to fragment and forward a packet from a port with a larger MTU to a port with a smaller MTU.

```
device(config)# mtu-exceed forward
```

multicast disable-igmp-snoop

Disables IGMP snooping for a specific VLAN when snooping is enabled globally.

Syntax

multicast disable-igmp-snoop

no multicast disable-igmp-snoop

Command Default

The global IGMP snooping setting applies.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of the command enables IGMP snooping on VLAN when IGMP snooping is enabled globally.

Examples

The following example disables IGMP snooping on VLAN 20.

```
device(config)# vlan 20
device(config-vlan-20)# multicast disable-igmp-snoop
```

multicast disable-pimsm-snoop

Disables PIM Sparse mode (SM) snooping for a specific VLAN when snooping is enabled globally.

Syntax

multicast disable-pimsm-snoop
no multicast disable-pimsm-snoop

Command Default

The global PIM SM snooping setting applies.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of this command restores the global PIM SM snooping setting.

Examples

This example disables PIM SM snooping on VLAN 20.

```
Device(config)#config vlan 20  
Device(config-vlan-20)#multicast disable-pimsm-snoop
```

multicast fast-convergence

Configures a device to listen to topology change events in Layer 2 protocols such as spanning tree, and then send general queries to shorten the convergence time.

Syntax

multicast fast-convergence

no multicast fast-convergence

Command Default

Fast convergence is not configured.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of this command restores the default; fast convergence is not configured.

If the Layer 2 protocol cannot detect a topology change, fast convergence may not work in some cases. For example, if the direct connection between two devices switches from one interface to another, the Rapid Spanning Tree protocol (802.1w) considers this optimization rather than a topology change. In this example, other devices do not receive topology change notifications, and cannot send queries to speed up the convergence. Fast convergence works well with the regular spanning tree protocol in this case.

Examples

This example configures fast convergence on VLAN 70.

```
Device(config)#vlan 70
Device(config-vlan-70)#multicast fast-convergence
```

multicast fast-leave-v2

Configures fast leave for IGMP V2.

Syntax

multicast fast-leave-v2

no multicast fast-leave-v2

Command Default

Fast leave for IGMP V2 is not configured.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of this command restores the default; fast leave for IGMP V2 is not configured.

When a device receives an IGMP V2 leave message, it sends out multiple group-specific queries. If no other client replies within the waiting period, the device stops forwarding traffic. When the **multicast fast-leave-v2** command is configured, and when the device receives a leave message, it immediately stops forwarding to that port. The device does not send group specific-queries. When the **multicast fast-leave-v2** command is configured on a VLAN, you must not have multiple clients on any port that is part of the VLAN.

In a scenario where two devices connect, the querier device should not be configured for fast-leave-v2 because the port might have multiple clients through the non-querier.

You can configure the **ip multicast leave-wait-time** command to set the number of queries and the waiting period.

Examples

This example configures fast leave for IGMP on VLAN 10.

```
Device(config)#vlan 10
Device(config-vlan-10)#multicast fast-leave-v2
```

multicast limit (enable)

Configures the maximum number of multicast packets allowed per second.

Syntax

multicast limit *num* **kbps**
no multicast limit *num* **kbps**

Command Default

Multicast rate limiting is disabled.

Parameters

num
Specifies the maximum number of multicast packets per second. The value can be 1 to 8388607.

kbps
Enables byte-based limiting. The value can be 1 to Max Port Speed.

Modes

Interface configuration mode

Usage Guidelines

Use 0 or the **no** form of the command to disable limiting.

Examples

The following example enables a multicast limit of 131072 kbps.

```
device(config)# interface ethernet 9/1/1  
device(config-if-e1000-9/1/1)# multicast limit 131072 kbps
```

History

Release version	Command history
8.0.10	The command was introduced.

multicast limit (logging)

Enables Syslog logging of multicast packets.

Syntax

multicast limit *num* **kbps** [**log**]

no multicast limit *num* **kbps** [**log**]

Parameters

num

Specify a range of 1 through 8388607 packets per second or 1 for Max Port Speed.

kbps

Enables byte-based limiting. The value can be 1 to Max Port Speed.

log

Enables Syslog logging when the multicast limit exceeds *num* **kbps** .

Command Default

Multicast rate logging is disabled.

Modes

Interface configuration mode

Usage Guidelines

Use 0 or the **no** form of the command to disable limiting.

Examples

The following example enables multicast logging when the configured limit exceeds 100 Kbps.

```
device(config)# interface ethernet 1/2/1
device(config-if-e1000-1/2/1)# multicast limit 100 kbps log
```

History

Release version	Command history
8.0.10	The command was introduced.
8.0.40a	The command was modified to include the keyword log .

multicast pimsm-snooping prune-wait

Configures the amount of time a device waits after receiving a PIM prune message before removing the outgoing interface (OIF) from the forwarding entry.

Syntax

multicast pimsm-snooping prune-wait *seconds*
no multicast pimsm-snooping prune-wait *seconds*

Command Default

The prune-wait time is 5 seconds.

Parameters

seconds
The time to wait, in seconds. The range is 0 to 65535; the default is 5.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of this command restores the default prune-wait time (5 seconds).

The prune-wait time is necessary on a LAN where multiple receivers could be listening to the group; it gives them time to override the prune message. Configure the **multicast pimsm-snooping prune-wait** command to modify the prune-wait time according to topology and PIM router configurations.

In accordance with RFC 4601, PIM routers delay pruning for 3.5 seconds by default, so configuring a lower prune-wait value may cause traffic disruption. You should configure a prune-wait value lower than 3.5 seconds only if the topology supports it, for example, if the group has only one receiver, and an immediate prune is needed.

Examples

The following example configures the prune-wait time to 7 seconds.

```
Device(config)#vlan 10  
Device(config-vlan-10)#multicast pimsm-snooping prune-wait 7
```

History

Release version	Command history
8.0.20	This command was introduced.

multicast port-version

Configures the IGMP version on individual ports in a VLAN.

Syntax

multicast port-version { 2 | 3 } ethernet *port* [ethernet *port* | to *port*]

no multicast port-version { 2 | 3 } ethernet *port* [ethernet *port* | to *port*]

Command Default

The port uses the IGMP version configured globally or for the VLAN.

Parameters

2

Configures IGMP version 2.

3

Configures IGMP version 3.

ethernet *port*

Specifies the port to configure the version on.

to

Specifies a range of ports.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of this command restores the IGMP version configured globally or for the VLAN.

You can specify a list of ports, separated by a space, or a range of ports, or you can combine lists and ranges.

See the description of the **ip multicast version** command for information on how to configure the IGMP version globally.

See the description of the **multicast version** command for information on how to configure the IGMP version on a VLAN.

Examples

This example configures ports 4, 5, and 6 to use IGMP version 3.

```
Device(config)#config vlan 20
(config-vlan-20)#multicast port-version 3 ethernet 2/4 to 2/6
```

multicast proxy-off

Turns off proxy activity for static groups.

Syntax

multicast proxy-off
no multicast proxy-off

Command Default

Proxy activity is on.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of this command restores the default; proxy activity is on.

When a device is configured for static groups, it acts as a proxy and sends membership reports for the static groups when it receives general or group-specific queries. When a static group configuration is removed, the group is deleted from the active group table immediately. However, leave messages are not sent to the querier, and the querier must age out the group. You can configure the **multicast proxy-off** command to turn off proxy activity.

Examples

This example turns off proxy activity for VLAN 20.

```
Device(config)#vlan 20  
Device(config-vlan-20)#multicast proxy-off
```

multicast querier-address

Configures the IPv4 querier address per VLAN.

Syntax

multicast querier-address *A.B.C.D*

no multicast querier-address *A.B.C.D*

Parameters

A.B.C.D

Specifies an IPv4 address as the multicast querier address.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of this command disables the IPv4 querier address functionality.

Examples

The following example specifies an IPv4 address as the multicast querier address for the VLAN.

```
device# configure terminal
device(config)# vlan 100
device(config-vlan-100)# multicast querier-address 2.2.2.2
```

History

Release version	Command history
08.0.50	This command was introduced.

multicast router-port

Configures a static router Ethernet port to receive multicast control and data packets.

Syntax

multicast router-port ethernet *stackid/slot/portnum* [**ethernet** *stackid/slot/portnum* | **to** *stackid/slot/portnum*]

multicast router-port ethernet *stackid/slot/portnum* [**ethernet** *stackid/slot/portnum* | **to** *stackid/slot/portnum*]

Command Default

The device forwards all multicast control and data packets only to router ports that receive queries.

Parameters

stackid/slot/portnum

Specifies the Ethernet port you want to force traffic to. On standalone devices specify the interface ID in the format slot/port-id; on stacked devices you must also specify the stack ID, in the format stack-id/slot/port-id. You can configure a single port or a list of ports, separated by a space.

to

Specifies a range of ports.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of this command restores the default, that is, the device forwards all multicast control and data packets only to router ports that receive queries.

Examples

This example configures a static port on Ethernet 1/1/3 on VLAN 70.

```
device#configure terminal
device(config)#vlan 70
device(config-vlan-70)#multicast router-port ethernet 1/1/3
```

This example configures a list of static ports on VLAN 70.

```
device#configure terminal
device(config)#vlan 70
device(config-vlan-70)#multicast router-port ethernet 1/1/24 ethernet 1/6/24 ethernet 1/8/17
```

This example configures a range of static ports on VLAN 70.

```
device#configure terminal
device(config)#vlan 70
device(config-vlan-70)#multicast router-port ethernet 1/1/1 to 1/1/8
```

This example configures a combined range and list of static ports on VLAN 70.

```
device#configure terminal
device(config)#vlan 70
device(config-vlan-70)#multicast router-port ethernet 1/1/1 to 1/1/8 ethernet 1/1/24 ethernet 1/6/24
ethernet 1/8/17
```

multicast static-group

Configures a static IGMP group for a VLAN.

Syntax

multicast static-group *ipv4-address* [**count** *num*] [**ethernet** *stackid/slot/portnum* | **drop**]

no multicast static-group *ipv4-address* [**count** *num*] [**ethernet** *stackid/slot/portnum* | **drop**]

Command Default

The VLAN cannot forward multicast traffic to ports that do not receive IGMP membership reports.

Parameters

ipv4-address

Specifies the address of the static group.

count *num*

Specifies a contiguous range of groups.

ethernet *stackid/slot/portnum*

Specifies the ports to be included in the group. On standalone devices specify the interface ID in the format slot/port-ID; on stacked devices you must also specify the stack ID, in the format stack-ID/slot/port-ID.

drop

Specifies discarding data traffic to a group in hardware.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of this command removes the static group from the VLAN.

A snooping-enabled VLAN cannot forward multicast traffic to ports that do not receive IGMP membership reports. You can configure the **multicast static-group** command to create a static group that applies to specific ports, allowing packets to be forwarded to them even though they have no client membership reports.

Configuring the **drop** keyword discards data traffic to a group in hardware. The group can be any multicast group including groups in the reserved range of 224.0.0.X. Configuring the **drop** keyword does not affect IGMP packets, which are always trapped to CPU when snooping is enabled. It applies to the entire VLAN, and cannot be configured for a port list. When the **drop** keyword is not configured, the group must exist outside the reserved range.

Examples

This example configures on VLAN 20 a static group containing ports 1/1/3 and 1/1/5 to 1/1/7.

```
device# configure terminal
device(config)# vlan 20
device(config-vlan-20)# multicast static-group 224.1.1.1 count 2 ethernet 1/1/3 ethernet 1/1/5 to 1/1/7
```

multicast tracking

Enables tracking and fast leave on VLANs.

Syntax

multicast tracking

no multicast tracking

Command Default

Tracking and fast leave are disabled.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of this command restores the default, that is, tracking and fast leave are disabled.

The membership tracking and fast leave features are supported for IGMP V3 only. If any port or any client is not configured for IGMP V3, the multicast tracking command is ignored.

Examples

This example enables tracking and fast leave on VLAN 20.

```
Device(config)#vlan 20  
Device(config-vlan-20)#multicast tracking
```

multicast version

Configures the IGMP version for snooping on a VLAN.

Syntax

multicast version [2 | 3]

no multicast version

Command Default

The globally-configured IGMP version is used.

Parameters

- 2**
Configures IGMP version 2.
- 3**
Configures IGMP version 3.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of this command restores the globally configured version.

If an IGMP version is configured for an individual port, that port uses the version configured for it, not the VLAN version.

See the description of the **ip multicast version** command for information on how to configure the IGMP version globally.

See the description of the **multicast port-version** command for information on how to configure the IGMP version on an individual port

Examples

This example configures IGMP version 3 on VLAN 20.

```
Device(config)#vlan 20
Device(config-vlan-20)#multicast version 3
```

multicast6

Configures the multicast listening discovery (MLD) mode on the device to active or passive.

Syntax

multicast6 [**active** | **passive**]

no multicast6 [**active** | **passive**]

Command Default

MLD mode is passive.

Parameters

active

Configures MLD active mode, that is, the device actively sends out MLD queries to identify IPv6 multicast groups on the network, and makes entries in the MLD table based on the group membership reports it receives from the network.

passive

Configures MLD passive mode, that is, the device forwards reports to router ports that receive queries. MLD snooping in the passive mode does not send queries. However, it does forward queries to the entire VLAN.

Modes

VLAN configuration mode

Usage Guidelines

The MLD mode configured on a VLAN overrides the mode configured globally.

The **no** form of this command returns the device to the previous MLD mode.

Examples

The following example configures MLD mode as active on VLAN 20.

```
device(config)# vlan 20
device(config-vlan-20)# multicast6 active
```

multicast6 disable-mld-snoop

Disables multicast listening discovery (MLD) snooping for a specific VLAN when snooping is enabled globally.

Syntax

multicast6 disable-multicast-snoop

no multicast6 disable-multicast-snoop

Command Default

The global MLD snooping setting applies.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of this command restores the global MLD snooping setting.

Examples

This example disables MLD snooping on VLAN 20.

```
Device(config)#vlan 20  
Device(config-vlan-20)#multicast6 disable-multicast-snoop
```

multicast6 disable-pimsm-snoop

When PIM6 SM snooping is enabled globally, overrides the global setting and disables it for a specific VLAN.

Syntax

multicast6 disable-pimsm-snoop

no multicast6 disable-pimsm-snoop

Command Default

The globally configured PIM6 SM snooping applies.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of this command restores the globally configured PIM6 SM snooping.

The device must be in multicast listening discovery (MLD) passive mode before PIM6 SM snooping can be disabled.

Examples

This example enables PIM6 SM traffic snooping on VLAN 20.

```
Device(config)# vlan 20  
Device(config-vlan-20)#multicast6 disable-pimsm-snoop
```

multicast6 fast-convergence

Configures a device to listen to topology change events in Layer 2 protocols such as spanning tree, and then send general queries to shorten the convergence time.

Syntax

multicast6 fast-convergence

no multicast6 fast-convergence

Command Default

Fast convergence is not configured.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of this command restores the default; fast convergence is not configured.

Configure the **multicast6 fast-convergence** command to allow a device to listen to topology change events in Layer 2 protocols, such as Spanning Tree, and send general queries to shorten the convergence time.

If the Layer 2 protocol cannot detect a topology change, fast convergence may not work in some cases. For example, if the direct connection between two devices switches from one interface to another, the Rapid Spanning Tree protocol (802.1w) considers this to be optimization rather than a topology change. In this case, other devices do not receive topology change notifications and cannot send queries to speed up convergence. The original spanning tree protocol does not recognize optimization actions, and fast convergence works in all cases.

Examples

This example configures fast convergence on VLAN 70.

```
device# configure terminal
device(config)# vlan 70
device(config-vlan-70)# multicast6 fast-convergence
```

multicast6 fast-leave-v1

Configures fast leave for multicast listening discovery Version 1 (MLDv1)

Syntax

multicast6 fast-leave-v1

no multicast6 fast-leave-v1

Command Default

The device forwards traffic to a port immediately upon receiving a leave message.

Modes

VLAN configuration mode

Usage Guidelines

When the **multicast6 fast-leave-v1** command is configured on a VLAN, make sure you do not have multiple clients on any port that is part of the VLAN. When two devices connect, the querier device should not have the **multicast6 fast-leave-v1** command configured because the port might have multiple clients through the non-querier.

You can configure the **ipv6 multicast leave-wait-time** command to configure the number of queries and the waiting period in seconds.

The **no** form of this command restores the device to forward traffic to a port immediately upon receiving a leave message. The device sends group-specific queries.

Examples

The following example configures fast leave for MLDv1 on VLAN 20.

```
device(config)# vlan 20
device(config-vlan-20)# multicast6 fast-leave-v1
```

multicast6 pimsm-snooping

Enables PIM6 SM traffic snooping on a VLAN.

Syntax

multicast6 pimsm-snooping [**prune-wait** *time*]

no multicast6 pimsm-snooping [**prune-wait** *time*]

Command Default

PIM6 SM traffic snooping is disabled.

Parameters

prune-wait *time*

Configures the amount of time a device waits after receiving a PIM prune message before removing the outgoing interface (OIF) from the forwarding entry. The value can be 0 to 30 seconds. The default is 5 seconds.

Modes

VLAN configuration mode

Usage Guidelines

The device must be in multicast listening discovery (MLD) passive mode before it can be configured for PIM6 sparse mode (SM) snooping.

When PIM6 SM snooping is enabled globally, you can override the global setting and disable it for a specific VLAN. You must configure the **multicast6 disable-pimsm-snoop** command to disable PIM6 SM snooping on a VLAN.

A smaller prune wait value reduces flooding of unwanted traffic. A prune wait value of zero causes the PIM device to stop traffic immediately upon receiving a prune message. If there are two or more neighbors on the physical port, then the **prune-wait** option should not be used because one neighbor may send a prune message while the other sends a join message at the same time, or within less than five seconds.

The **no** form of this command without options disables PIM6 SM traffic snooping on a VLAN. The **no** form of the command with the **prune-wait** option resets the prune-wait time as 5 seconds.

Examples

The following example first configures VLAN 20 and adds the ports that are connected to the device and host in the same port-based VLAN. Then it enables MLD snooping passive on VLAN 20 and enables PIM6 SM traffic snooping on it. The prune-wait timer is set as 10 seconds.

```
device(config)# vlan 20
device(config-vlan-20)# untagged ethernet 1/1/5 ethernet 1/1/7 ethernet 1/1/11
device(config-vlan-20)# multicast6 passive
device(config-vlan-20)# multicast6 pimsm-snooping
device(config-vlan-20)# multicast6 pimsm-snooping prune-wait 10
```

multicast6 port-version

Configures the multicast listening discovery (MLD) version on individual ports in a VLAN.

Syntax

multicast6 port-version { 1 | 2 } [**ethernet** *stackid/slot/portnum* [**ethernet** *stackid/slot/portnum* | **to** *port*]]

no multicast6 port-version { 1 | 2 } [**ethernet** *stackid/slot/portnum* [**ethernet** *stackid/slot/portnum* | **to** *port*]]

Command Default

The port uses the MLD version configured globally or for the VLAN.

Parameters

1

Configures MLD version 1.

2

Configures MLD version 2.

ethernet *stackid/slot/portnum*

Specifies the port to configure the version on. On standalone devices specify the interface ID in the format slot/port-id; on stacked devices you must also specify the stack ID, in the format stack-id/slot/port-id. You can specify a list of ports, separated by a space, or a range of ports, or you can combine lists and ranges.

to

Specifies a range of ports.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of this command restores the MLD version configured globally or for the VLAN.

When you configure the MLD version on a specified port or range of ports, the other ports use the MLD version specified with the **multicast6 version** command, or the globally configured MLD version.

Examples

This example configures ports 1/1/4, 1/1/5, 1/1/6, and 1/2/1 on VLAN 20 to use MLD version 2.

```
Device(config)#vlan 20
Device(config-vlan-20)#multicast6 port-version 2 ethernet 1/2/1 ethernet 1/1/4 to 1/1/6
```

multicast6 proxy-off

Turns off multicast listening discovery (MLD) proxy activity.

Syntax

multicast6 proxy-off

no multicast6 proxy-off

Command Default

MLD snooping proxy activity is on.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of this command restores the default; proxy activity is on.

When a device is configured for static groups, it acts as a proxy and sends membership reports for the static groups when it receives general or group-specific queries. When a static group configuration is removed, the group is deleted from the active group table immediately. However, leave messages are not sent to the querier, and the querier must age out the group. You can configure the **multicast proxy-off** command to turn off proxy activity.

Examples

This example turns off proxy activity for VLAN 20.

```
Device(config)#vlan 20
Device(config-vlan-20)#multicast6 proxy-off
```

multicast6 querier-address

Configures the IPv6 querier address per VLAN.

Syntax

multicast6 querier-address X:X::X:X

no multicast6 querier-address X:X::X:X

Parameters

X:X::X:X

Specifies an IPv6 link local address as the multicast querier address.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of this command disables the IPv6 querier address functionality.

Examples

The following example specifies an IPv6 address as the multicast querier address for the VLAN.

```
device# configure terminal
device(config)# vlan 100
device(config-vlan-100)# multicast6 querier-address FE80::44
```

History

Release version	Command history
08.0.50	This command was introduced.

multicast6 router-port

Configures a static router port to receive IPv6 multicast control and data packets.

Syntax

multicast6 router-port ethernet *stackid/slot/portnum* [**ethernet** *stackid/slot/portnum* | **to** *stackid/slot/portnum*]
no multicast6 router-port ethernet *stackid/slot/portnum* [**ethernet** *stackid/slot/portnum* | **to** *stackid/slot/portnum*]

Command Default

The device forwards all IPv6 multicast control and data packets only to router ports that receive queries.

Parameters

ethernet *stackid/slot/portnum*

Specifies the Ethernet port you want to force traffic to. On standalone devices specify the interface ID in the format slot/port-ID; on stacked devices you must also specify the stack ID, in the format stack-ID/slot/port-ID. You can configure a single port or a list of ports, separated by a space.

to

Specifies a range of ports.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of this command restores the default, that is, the device forwards all multicast control and data packets only to router ports that receive queries.

All multicast control and data packets are forwarded to router ports that receive queries. Although router ports are learned, you can configure static router ports to force multicast traffic to specific ports, even though these ports never receive queries.

Examples

This example configures a range and a list of static ports on VLAN 70.

```
device#configure terminal
device(config)#vlan 70
device(config-vlan-70)#multicast6 router-port ethernet 1/1/1 to 1/1/8 ethernet 1/1/24 ethernet 1/6/24
ethernet 1/8/17
```

multicast6 static-group

Configures a static multicast listening discovery (MLD) group for a VLAN.

Syntax

multicast6 static-group *ipv6-address* [**count** *num*] [**ethernet** *stackid/slot/portnum* | **to** *stackid/slot/ portnum*]

no multicast6 static-group *ipv6-address* [**count** *num*] [**ethernet** *stackid/slot/portnum* | **to** *stackid/slot/ portnum*]

Command Default

The VLAN cannot forward multicast traffic to ports that do not receive MLD membership reports.

Parameters

ipv6-address

Specifies the IPv6 address of the multicast group.

count *num*

Specifies a contiguous range of groups. The default is 1.

to

Specifies a range of ports.

ethernet *stackid/slot/portnum*

Specifies the Ethernet port you want to force traffic to. On standalone devices specify the interface ID in the format slot/port-ID; on stacked devices you must also specify the stack ID, in the format stack-ID/slot/port-ID. You can configure a single port or a list of ports, separated by a space.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of this command removes the static group fromr the VLAN.

A snooping-enabled VLAN cannot forward multicast traffic to ports that do not receive MLD membership reports. To allow clients to send reports, you can configure a static group that applies to individual ports on the VLAN. The static group forwards packets to the static group ports even if they have no client membership reports.

You cannot configure a static group that applies to an entire VLAN.

The maximum number of supported static groups in a VLAN is 512, and the maximum number of supported static groups for individual ports in a VLAN is 256.

Examples

This example configures on VLAN 20 a static group containing ports 0/1/3 and 0/1/5 to 0/1/7.

```
Device(config)#vlan 20  
(config-vlan-20)#multicast6 static-group ff05::100 count 2 ethernet 0/1/3 ethernet 0/1/5 to 0/1/7
```

multicast6 tracking

Enables tracking and fast leave for IPv6 multicast listening discovery Version 2 (MLDv2) on VLANs.

Syntax

multicast6 tracking

no multicast6 tracking

Command Default

Tracking and fast leave are disabled.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of this command restores the default, that is, tracking and fast leave are disabled.

The membership tracking and fast leave features are supported for MLDv2 only. If any port or any client is not configured for MLDv2, the multicast tracking command is ignored.

Examples

This example enables tracking and fast leave on VLAN 20.

```
Device(config)#vlan 20
Device(config-vlan-20)#multicast6 tracking
```

multicast6 version

Configures the multicast listening discovery (MLD) version for snooping on a VLAN.

Syntax

multicast6 version { 1 | 2 }

no multicast6 version { 1 | 2 }

Command Default

The globally configured MLD version is configured.

Parameters

- 1** Configures MLD Version 1.
- 2** Configures MLD Version 2.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the globally configured MLD version.

If an MLD version is specified for individual ports, these ports use that version instead of the version specified for the VLAN.

Examples

This example specifies MLD Version 2 on VLAN 20.

```
Device(config)# vlan 20
Device(config-vlan-20)#multicast6 version 2
```

multipath

Changes load sharing to apply to only iBGP or eBGP paths, or to support load sharing among paths from different neighboring autonomous systems.

Syntax

```
multipath { ebgp | ibgp | multi-as }
```

```
no multipath { ebgp | ibgp | multi-as }
```

Parameters

ebgp

Enables load sharing of eBGP paths only.

ibgp

Enables load sharing of iBGP paths only.

multi-as

Enables load sharing of paths from different neighboring autonomous systems.

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

BGP address-family IPv4 unicast VRF configuration mode

BGP address-family IPv6 unicast VRF configuration mode

Usage Guidelines

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

By default, when BGP load sharing is enabled, both iBGP and eBGP paths are eligible for load sharing, while paths from different neighboring autonomous systems are not.

The **no** form of the command restores the default.

Examples

The following example changes load sharing to apply to iBGP paths in the IPv4 address family.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# multipath ibgp
```

The following example enables load sharing of paths from different neighboring autonomous systems in the IPv6 address family.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast
device(config-bgp-ipv6u)# multipath multi-as
```

The following example changes load sharing to apply to eBGP paths in a nondefault VRF instance in the IPv4 address family.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv4 unicast vrf red
device(config-bgp-ipv4u-vrf)# multipath ebgp
```

History

Release version	Command history
8.0.30	Support was added for the BGP address-family IPv6 unicast VRF configuration mode.

multi-spx-lag

Changes both ends of live SPX ports to form an SPX LAG.

Syntax

multi-spx-lag *port-list1* and *port-list2*

Command Default

Individual SPX links, rather than an SPX LAG, exist before the command is executed.

Parameters

port-list1

Designates the ports that form one end of the SPX LAG.

port-list2

Designates the ports that form the other end of the SPX LAG.

Modes

CB configuration mode

SPX unit configuration mode

Usage Guidelines

NOTE

The **no** form of the command is not supported because it would make a PE chain unreachable.

The system blocks the **no multi-spx-lag** command.

The system blocks the **multi-spx-lag** command if executing the command would make any PE unreachable.

This command changes both ends of a live CB-to-PE or PE-to-PE link at the same time to form an SPX LAG. Using the command avoids generating transit port-to-LAG connections and breaking internal communication.

Both **multi-spx-port** and **multi-spx-lag** are available in CB configuration mode and SPX unit configuration modes.

Examples

The following example creates a live LAG in CB configuration mode between the designated ports on CB unit 3 and PE unit 24.

```
device# configure terminal
device(config)# spx cb-configure
device(config-spx-cb)# multi-spx-lag 3/1/6 3/1/8 and 24/3/1 24/4/1
spx-port 24/4/1 is replaced by spx-lag 24/3/1 24/4/1.
spx-port 3/1/8 is replaced by spx-lag 3/1/6 3/1/8.
```

The following example creates a live LAG between PE unit 17 and PE unit 24 as part of configuring PE unit 24 from the CB in SPX unit configuration mode. In this case, the command could be configured either under spx unit 17 or spx unit 24.

```
device# configure terminal
device(config)# spx unit 24
device(config-spx-unit-24)# multi-spx-lag 24/2/1 to 24/2/2 and 17/2/1 to 17/2/2
spx-port 17/2/1 is replaced by spx-lag 17/2/1 to 17/2/2.
spx-port 24/2/1 is replaced by spx-lag 24/2/1 to 24/2/2.
```

History

Release version	Command history
08.0.40	This command was introduced.

multi-spx-port

Changes both ends of a live SPX LAG into SPX ports.

Syntax

multi-spx-port *port1* and *port2*

Command Default

By default, no SPX LAG exists. The command is used to transform an SPX LAG that has been previously configured.

Parameters

port1

Designates the interface on one side of the live SPX LAG.

port2

Designates the interface on the other side of the live SPX LAG.

Modes

CB configuration mode or SPX unit configuration mode.

Usage Guidelines

The command is used only on CB units.

NOTE

The **no** form of the command is not supported, and it returns a system error.

The system blocks the **multi-spx-port** command if the command would make any PE unreachable.

The command can be used to change an SPX LAG to an SPX port when the SPX LAG is active. The command can be applied to a link between a CB and a PE unit or between two PE units.

Examples

The following example converts a live SPX lag into a live SPX port between CB unit 3 and PE unit 24.

```
device# configure terminal
device(config)# spx cb-config
device(config-spx-cb)# multi-spx-port 3/1/8 and 24/4/1
spx-lag 3/1/6 3/1/8 is replaced by spx-port 3/1/8.
spx-lag 24/3/1 24/4/1 is replaced by spx-port 24/4/1.
```

The following example creates a live link between PE unit 17 and PE unit 24.

```
device# configure terminal
device(config)# spx cb-config
device(config-spx-cb)# multi-spx-port 24/2/1 and 17/2/1
spx-lag 17/2/1 to 17/2/2 is replaced by spx-port 17/2/1.
spx-lag 24/2/1 to 24/2/2 is replaced by spx-port 24/2/1.
```

History

Release version	Command history
08.0.40	This command was introduced.

name (MRP)

Configures the name for the metro ring.

Syntax

name *string*

no name *string*

Command Default

Metro ring names are not configured.

Parameters

string

Specifies the name for the metro ring. The name is an ASCII string and can be up to 64 characters in length and include blank spaces.

Modes

MRP configuration mode

Usage Guidelines

The name is optional for a metro ring. If you use a name that has blank spaces, enclose the name in double quotation marks, for example, "Customer A".

The **no** form of the command removes the name for the metro ring.

Examples

The following example configures the name for a metro ring.

```
device(config)# vlan 2
device(config-vlan-2)# metro-ring 1
device(config-vlan-2-mrp-1)# name CustomerA
```

nbr-timeout

Configures the interval after which a PIM device considers a neighbor to be absent.

Syntax

nbr-timeout *seconds*

no nbr-timeout *seconds*

Command Default

The timeout interval is 105 seconds.

Parameters

seconds

Specifies the interval, in seconds. The range is 35 through 65535 seconds. The default is 105 seconds.

Modes

PIM router configuration mode

Usage Guidelines

The **no** form of this command restores the default timeout interval, 105 seconds.

You should set the interval to be not less than 3.5 times the hello timer value.

Examples

This example configures a PIM neighbor timeout value of 360 seconds on all ports on a device operating with PIM.

```
Device(config)# router pim
Device(config-pim-router)# nbr-timeout 360
```

neighbor (RIP)

Configures RIP neighbor filter to specify RIP routes to be learned and advertised.

Syntax

```
neighbor filter-num { permit | deny } { any | ip-address }
```

```
no neighbor filter-num { permit | deny } { any | ip-address }
```

Command Default

Initially, by default, the device learns all RIP routes from all neighbors and advertises all routes to all neighbors. Once you have defined a filter that permits learning from a RIP neighbor, the default changes so that the device denies all other RIP neighbors except those specified.

Parameters

filter-num

Filter index number, a decimal value from 1 through 64.

permit

Allows routes to be learned and advertised for designated IP address or for any IP address, depending on configuration.

deny

Prevents routes from being learned or advertised for designated IP address or for any IP address, depending on configuration.

any

Indicates configured action is to be applied to all IP addresses.

ip-address

Specifies an IP address to which the filter applies.

Modes

RIP router configuration mode.

Usage Guidelines

The **no** form of the command deactivates the filter.

You may require more than one filter to obtain the results you want. For example, if you create a filter to allow or deny a specific IP address, you must create additional filters to allow route learning and advertisement for any other IP addresses.

To avoid conflicting actions, give the filter with the highest priority the highest filter number. Typically, you would add the priority filter last. For example, if you want to deny only one IP address, you must create a second filter with a higher number (priority) to allow any others.

Examples

The following example configures the RIP router so that no RIP routes are learned or advertised for any neighbor.

```
device# configure terminal
device(config)# router rip
device(config-rip-router)# neighbor 1 deny any
```

The following example configures the RIP router to learn and advertise routes for all neighbors except neighboring IP address 10.70.12.104. Note the second filter is required and must have a higher filter number.

```
device# configure terminal
device(config)# router rip
device(config-rip-router)# neighbor 2 deny 10.70.12.104
device(config-rip-router)# neighbor 64 permit any
```

neighbor activate

Enables the exchange of information with BGP neighbors and peer groups.

Syntax

neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **activate**

no neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **activate**

Command Default

Enabling address exchange for the IPv6 address family is disabled.

Parameters

ip-address

Specifies the IPv4 address of the neighbor.

ipv6-address

Specifies the IPv6 address of the neighbor.

peer-group-name

Specifies a peer group.

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

BGP address-family IPv4 unicast VRF configuration mode

BGP address-family IPv6 unicast VRF configuration mode

Usage Guidelines

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

The **no** form of the command disables the exchange of an address with a BGP neighbor or peer group.

Examples

The following example establishes a BGP session with a neighbor with the IPv6 address 2001:2018:8192::125.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast
device(config-bgp-ipv6u)# neighbor 2001:2018:8192::125 activate
```

The following example establishes a BGP session with a neighbor with the IPv6 address 2001:2018:8192::125 for VRF instance "red".

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast vrf red
device(config-bgp-ipv6u-vrf)# neighbor 2001:2018:8192::125 activate
```

History

Release version	Command history
8.0.30	Support was added for the BGP address-family IPv6 unicast VRF configuration mode.

neighbor advertisement-interval

Enables changes to the interval over which a specified neighbor or peer group holds route updates before forwarding them.

Syntax

neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **advertisement-interval** *seconds*

no neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **advertisement-interval**

Parameters

ip-address

IPv4 address of the neighbor.

ipv6-address

IPv6 address of the neighbor.

peer-group-name

Peer group name configured by the **neighbor** *peer-group-name* command.

seconds

Range is from 0 through 3600. The default is 0.

Modes

BGP configuration mode

BGP address-family IPv4 unicast VRF configuration mode

BGP address-family IPv6 unicast VRF configuration mode

Usage Guidelines

The **no** form of the command restores the default interval.

Examples

The following example changes the BGP4 advertisement interval from the default to 60 seconds.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# neighbor 10.11.12.13 advertisement-interval 60
```

The following example changes the BGP4+ advertisement interval from the default for VRF instance "red".

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast vrf red
device(config-bgp-ipv6u-vrf)# neighbor 2001:2018:8192::125 advertisement-interval 60
```

History

Release version	Command history
8.0.30	Support was added for the BGP address-family IPv6 unicast VRF configuration mode.

neighbor allowas-in

Disables the AS_PATH check function for routes learned from a specified location so that BGP does not reject routes that contain the recipient BGP speaker's AS number.

Syntax

neighbor {*ip-address* | *ipv6-address* | *peer-group-name* } **neighbor allowas-in** *number*

no neighbor allowas-in {*ip-address* | *ipv6-address* | *peer-group-name* } **neighbor allowas-in** *number*

Command Default

The AS_PATH check function is enabled and any route whose path contains the speaker's AS number is rejected as a loop.

Parameters

ip-address

Specifies the IP address of the neighbor.

ipv6-address

Specifies the IPv6 address of the neighbor.

peer-group-name

Specifies a peer group.

number

Specifies the number of times that the AS path of a received route may contain the recipient BGP speaker's AS number and still be accepted. Valid values range from 1 through 10.

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

Usage Guidelines

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

The **no** form of the command re-enables the AS_PATH check function.

Examples

The following example specifies that the AS path of a received route may contain the recipient BGP speaker's AS number three times and still be accepted.

```
device#configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast
device(config-bgp-ipv6u)# neighbor 2001:2018:8192::125 allowas-in 3
```

neighbor as-override

Replaces the autonomous system number (ASN) of the originating device with the ASN of the sending BGP device.

Syntax

neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **as-override**

no neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **as-override**

Parameters

ip-address

IPv4 address of the neighbor.

ipv6-address

IPv6 address of the neighbor.

peer-group-name

Peer group name configured by the **neighbor** *peer-group-name* command.

Modes

BGP configuration mode

Usage Guidelines

BGP loop prevention verifies the ASN in the AS path. If the receiving router sees its own ASN in the AS path of the received BGP packet, the packet is dropped. The receiving router assumes that the packet originated from its own AS and has reached the place of origination. This can be a significant problem if the same ASN is used among various sites, preventing sites with identical ASNs from being linked by another ASN. In this case, routing updates are dropped when another site receives them.

Examples

The following example replaces the ASN globally.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# neighbor 10.11.12.13 as-override
```

neighbor capability as4

Enables or disables support for 4-byte autonomous system numbers (ASNs) at the neighbor or peer-group level.

Syntax

neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **capability as4** [**disable** | **enable**]

no neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **capability as4** [**disable** | **enable**]

Command Default

4-byte ASNs are disabled by default.

Parameters

ip-address

Specifies the IPv4 address of the neighbor.

ipv6-address

Specifies the IPv6 address of the neighbor.

peer-group-name

Specifies the peer group name configured by the **neighbor** *peer-group-name* command.

disable

Disables 4-byte numbering.

enable

Enables 4-byte numbering.

Modes

BGP configuration mode

Usage Guidelines

4-byte ASNs are first considered at the neighbor, then at the peer group, and finally at the global level.

The **disable** keyword or the **no** form of the command removes all neighbor capability for 4-byte ASNs.

Examples

The following example enables 4-byte ASNs globally.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# neighbor 10.11.12.13 capability as4 enable
```

neighbor capability orf prefixlist

Advertises outbound route filter (ORF) capabilities to peer routers.

Syntax

```
neighbor { ip_address | ipv6_address | peer-group-name } capability orf prefixlist [ receive | send ]  
no neighbor { ip_address | ipv6_address | peer-group-name } capability orf prefixlist [ receive | send ]
```

Command Default

ORF capabilities are not advertised to a peer device.

Parameters

- ip_address*
Specifies the IPv4 address of the neighbor.
- ipv6_address*
Specifies the IPv6 address of the neighbor.
- peer-group-name*
Specifies a peer group.
- receive**
Enables the ORF prefix list capability in receive mode.
- send**
Enables the ORF prefix list capability in send mode.

Modes

- BGP configuration mode
- BGP address-family IPv6 unicast configuration mode
- BGP address-family IPv4 unicast VRF configuration mode
- BGP address-family IPv6 unicast VRF configuration mode

Usage Guidelines

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

The **no** form of the command disables ORF capabilities.

Examples

The following example advertises the ORF send capability to a neighbor with the IP address 10.11.12.13.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# neighbor 10.11.12.13 capability orf prefixlist send
```

The following example advertises the ORF receive capability to a neighbor with the IPv6 address 2001:2018:8192::125.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast
device(config-bgp-ipv6u)# neighbor 2001:2018:8192::125 capability orf prefixlist receive
```

History

Release version	Command history
8.0.30	Support was added for the BGP address-family IPv6 unicast VRF configuration mode.

neighbor default-originate

Configures the device to send the default route 0.0.0.0 to a neighbor.

Syntax

neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **default-originate** [**route-map** *map-name*]
no neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **default-originate** [**route-map** *map-name*]

Parameters

ip-address

Specifies the IPv4 address of the neighbor.

ipv6-address

Specifies the IPv6 address of the neighbor.

peer-group-name

Specifies the peer group name.

route-map

Optionally injects the default route conditionally, depending on the match conditions in the route map.

map-name

Specifies a route map.

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

Usage Guidelines

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

Examples

The following example sends the default route to a BGP4 neighbor.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# neighbor 10.11.12.13 default-originate route-map myroutemap
```

The following example sends the default route for a BGP4+ neighbor.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast
device(config-bgp-ipv6u)# neighbor 2001:2018:8192::125 default-originate route-map myroutemap22
```

neighbor description

Specifies a name for a neighbor.

Syntax

neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **description** *string*

no neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **description**

Parameters

ip-address

IPv4 address of the neighbor.

ipv6-address

IPv6 address of the neighbor.

peer-group-name

Peer group name configured by the **neighbor** *peer-group-name* command.

description *string*

Specifies the name of the neighbor, an alphanumeric string up to 220 characters long.

Modes

BGP configuration mode

BGP address-family IPv4 unicast VRF configuration mode

BGP address-family IPv6 unicast VRF configuration mode

Usage Guidelines

The **no** form of the command removes the name.

Examples

The following example specifies a BGP4 neighbor name.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# neighbor 10.11.12.13 description mygoodneighbor
```

The following example specifies a BGP4+ neighbor name for VRF instance "red".

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast vrf red
device(config-bgp-ipv6u-vrf)# neighbor 2001:2018:8192::125 default-originate route-map myroutemap
```

History

Release version	Command history
8.0.30	Support was added for the BGP address-family IPv6 unicast VRF configuration mode.

neighbor ebgp-btsh

Enables BGP time to live (TTL) security hack protection (BTSH) for eBGP.

Syntax

neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **ebgp-btsh**

no neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **ebgp-btsh**

Command Default

Disabled.

Parameters

ip-address

Specifies the IPv4 address of the neighbor.

ipv6-address

Specifies the IPv6 address of the neighbor.

peer-group-name

Specifies a peer group.

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

BGP address-family IPv4 unicast VRF configuration mode

BGP address-family IPv6 unicast VRF configuration mode

Usage Guidelines

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations. To maximize the effectiveness of this feature, the **neighbor ebgp-btsh** command should be executed on each participating device.

The **neighbor ebgp-btsh** command is supported for both directly connected peering sessions and multihop eBGP peering sessions. When the **neighbor ebgp-btsh** command is used, BGP control packets sent by the device to a neighbor have a TTL value of 255. In addition, the device expects the BGP control packets received from the neighbor to have a TTL value of either 254 or 255. For multihop peers, the device expects the TTL for BGP control packets received from the neighbor to be greater than or equal to 255, minus the configured number of hops to the neighbor. If the BGP control packets received from the neighbor do not have the anticipated value, the device drops them.

The **no** form of the command disables BTSH for eBGP.

Examples

The following example enables GTSM between a device and a neighbor with the IP address 10.10.10.1.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# neighbor 10.1.1.1 ebgp-btsh
```

The following example enables GTSM between a device and a neighbor with the IPv6 address 2001:2018:8192::125.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast
device(config-bgp-ipv6u)# neighbor 2001:2018:8192::125 ebgp-btsh
```

History

Release version	Command history
8.0.30	Support was added for the BGP address-family IPv6 unicast VRF configuration mode.

neighbor ebgp-multihop

Allows eBGP neighbors that are not on directly connected networks and sets an optional maximum hop count.

Syntax

```
neighbor { ip-address | ipv6-address | peer-group-name } ebgp-multihop [ max-hop-count ]  
no neighbor { ip-address | ipv6-address | peer-group-name } ebgp-multihop
```

Parameters

ip-address

IPv4 address of the neighbor

ipv6-address

IPv6 address of the neighbor

peer-group-name

Peer group name configured by the **neighbor** *peer-group-name* command.

max-hop-count

Maximum hop count. Range is from 1 through 255.

Modes

BGP configuration mode

BGP address-family IPv4 unicast VRF configuration mode

BGP address-family IPv6 unicast VRF configuration mode

Examples

The following example enables eBGP multihop and sets the maximum hop count to 20.

```
device# configure terminal  
device(config)# router bgp  
device(config-bgp-router)# neighbor 10.11.12.13 ebgp-multihop 20
```

The following example enables BGP4+ eBGP multihop for VRF instance "red" and sets the maximum hop count to 40.

```
device# configure terminal  
device(config)# router bgp  
device(config-bgp-router)# address-family ipv6 unicast vrf red  
device(config-bgp-ipv6u-vrf)# neighbor 2001:2018:8192::125 ebgp-multihop 40
```

History

Release version	Command history
8.0.30	Support was added for the BGP address-family IPv6 unicast VRF configuration mode.

neighbor enforce-first-as

Ensures that a device requires the first ASN listed in the AS_SEQUENCE field of an AS path-update message from eBGP neighbors to be the ASN of the neighbor that sent the update.

Syntax

neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **enforce-first-as** [**disable** | **enable**]

no neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **enforce-first-as** [**disable** | **enable**]

Parameters

ip-address

Specifies the IPv4 address of the neighbor.

ipv6-address

Specifies the IPv6 address of the neighbor.

peer-group-name

Specifies the peer group name configured by the **neighbor** *peer-group-name* command.

disable

Disables this feature.

enable

Enables this feature.

Modes

BGP configuration mode

Usage Guidelines

The **no** form of the command disables this requirement globally for the device.

Examples

The following example enables the enforce-first-as feature for a specified neighbor.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# neighbor 10.11.12.13 enforce-first-as enable
```

neighbor filter-list

Specifies a filter list to be applied to updates from or to the specified neighbor.

Syntax

```
neighbor { ip-address | ipv6-address | peer-group-name } filter-list ip-prefix-list-name { in | out }  
no neighbor { ip-address | ipv6-address | peer-group-name } filter-list ip-prefix-list-name { in | out }
```

Parameters

ip-address

Specifies the IPv4 address of the neighbor.

ipv6-address

Specifies the IPv6 address of the neighbor.

peer-group-name

Specifies the peer group name configured by the **neighbor** *peer-group-name* command.

ip-prefix-list-name

Specifies the name of the filter list.

in

Specifies that the list is applied on updates received from the neighbor.

out

Specifies that the list is applied on updates sent to the neighbor.

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

Usage Guidelines

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

Examples

The following example specifies that filter list "myfilterlist" be applied to updates to a neighbor with the IP address 10.11.12.13.

```
device# configure terminal  
device(config)# router bgp  
device(config-bgp-router)# neighbor 10.11.12.13 filter-list myfilterlist out
```

Commands K - S

neighbor filter-list

The following example specifies that filter list "2" be applied to updates from a neighbor with the IPv6 address 2001:2018:8192::125.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast
device(config-bgp-ipv6u)# neighbor 2001:2018:8192::125 filter-list 2 in
```

neighbor local-as

Causes the device to prepend the local autonomous system number (ASN) automatically to routes received from an eBGP peer.

Syntax

```
neighbor { ip-address | ipv6-address | peer-group-name } local-as num [ no-prepend ]  
no neighbor { ip-address | ipv6-address | peer-group-name } local-as num [ no-prepend ]
```

Parameters

ip-address

Specifies the IPv4 address of the neighbor.

ipv6-address

Specifies the IPv6 address of the neighbor.

peer-group-name

Specifies the peer group name configured by the **neighbor** *peer-group-name* command.

num

Specifies the local ASN. Range is from 1 through 4294967295.

no-prepend

Causes the device to stop prepending the selected ASN.

Modes

BGP configuration mode

Usage Guidelines

The **no** form of the command removes the local ASN.

Examples

The following example ensures that a device prepends the local ASN.

```
device# configure terminal  
device(config)# router bgp  
device(config-bgp-router)# neighbor 10.11.12.13 local-as 100
```

The following example stops the device from prepending the selected ASN.

```
device# configure terminal  
device(config)# router bgp  
device(config-bgp-router)# neighbor 10.11.12.13 local-as 100 no-prepend
```

neighbor maxas-limit in

Causes the device to discard routes received in UPDATE messages if those routes exceed a maximum AS path length.

Syntax

```
neighbor { ip-address | ipv6-address | peer-group-name } maxas-limit in { num | disable }  
no neighbor { ip-address | ipv6-address | peer-group-name } maxas-limit in
```

Parameters

ip-address

Specifies the IPv4 address of the neighbor.

ipv6-address

Specifies the IPv6 address of the neighbor.

peer-group-name

Specifies the peer group name.

num

Specifies the maximum length of the AS path. Valid values range from 0 through 300. The default is 300.

disable

Prevents a neighbor from inheriting the configuration from the peer group or global configuration and instead uses the default system value.

Modes

BGP configuration mode

Examples

The following example changes the length of the maximum allowed AS path length from the default.

```
device# configure terminal  
device(config)# router bgp  
device(config-bgp-router)# neighbor 10.11.12.13 maxas-limit in 200
```

The following example prevents a neighbor from inheriting the configuration from the peer group or global configuration and instead use the default system value.

```
device# configure terminal  
device(config)# router bgp  
device(config-bgp-router)# neighbor 2001:2018:8192::125 maxas-limit in disable
```

neighbor maximum-prefix

Specifies the maximum number of IP network prefixes (routes) that can be learned from a specified neighbor or peer group.

Syntax

```
neighbor { ip-address | ipv6-address | peer-group-name } maximum-prefix num [ threshold ] [ teardown ]  
no neighbor { ip-address | ipv6-address | peer-group-name } maximum-prefix num [ threshold ] [ teardown ]
```

Parameters

ip-address

Specifies the IPv4 address of the neighbor.

ipv6-address

Specifies the IPv6 address of the neighbor.

peer-group-name

Specifies the peer group name configured by the **neighbor** *peer-group-name* command.

num

Specifies the maximum number of IP prefixes that can be learned. Range is from 0 through 4294967295. Default is 0 (unlimited).

threshold

Specifies the percentage of the value specified by *num* that causes a syslog message to be generated. Range is from 1 through 100. Default is 100.

teardown

Tears down the neighbor session if the maximum number of IP prefixes is exceeded.

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

Usage Guidelines

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

Examples

The following example sets the maximum number of prefixes that will be accepted from the neighbor with the IP address 10.11.12.13 to 100000, and sets the threshold value to 80%.

```
device# configure terminal  
device(config)# router bgp  
device(config-bgp-router)# neighbor 10.11.12.13 maximum-prefix 100000 threshold 80
```

neighbor next-hop-self

Causes the device to list itself as the next hop in updates that are sent to the specified neighbor.

Syntax

neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **next-hop-self** [**always**]

no neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **next-hop-self** [**always**]

Parameters

ip-address

Specifies the IPv4 address of the neighbor.

ipv6-address

Specifies the IPv6 address of the neighbor.

peer-group-name

Specifies the peer group name configured by the **neighbor** *peer-group-name* command.

always

Enables this feature for route reflector (RR) routes.

Modes

BGP configuration mode

BGP address-family IPv4 unicast VRF configuration mode

BGP address-family IPv6 unicast VRF configuration mode

Usage Guidelines

The **no** form of the command disables this feature.

Examples

The following example causes all updates destined for the neighbor with the IP address 10.11.12.13 to advertise this device as the next hop.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# neighbor 10.11.12.13 next-hop-self
```

The following example, for the VRF instance "red," causes all updates destined for the neighbor with the IPv6 address 2001:2018:8192::125 to advertise this device as the next hop.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast vrf red
device(config-bgp-ipv6u-vrf)# neighbor 10.11.12.13 next-hop-self
```

History

Release version	Command history
8.0.30	Support was added for the BGP address-family IPv6 unicast VRF configuration mode.

neighbor password

Specifies an MD5 password for securing sessions between the device and a neighbor.

Syntax

neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **password** *string*
no neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **password**

Command Default

No password is set.

Parameters

ip-address

Specifies the IPv4 address of the neighbor.

ipv6-address

Specifies the IPv6 address of the neighbor.

peer-group-name

Specifies the peer group name configured by the **neighbor** *peer-group-name* command.

string

Password of up to 63 characters in length that can contain any alphanumeric character.

Modes

BGP configuration mode

BGP address-family IPv4 unicast VRF configuration mode

BGP address-family IPv6 unicast VRF configuration mode

Usage Guidelines

The **no** form of the command removes a configured MD5 password.

Examples

The following example specifies a password for securing sessions with a specified neighbor.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# neighbor 10.11.12.13 password s0M3P@55W0Rd
```

The following BGP4+ example, for VRF instance "red," specifies a password for securing sessions with a specified neighbor.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast vrf red
device(config-bgp-ipv4u-vrf)# neighbor 2001:2018:8192::125 password s0M3P@55W0Rd
```

History

Release version	Command history
8.0.30	Support was added for the BGP address-family IPv6 unicast VRF configuration mode.

neighbor peer-group

Configures a BGP neighbor to be a member of a peer group.

Syntax

```
neighbor { ip-address | ipv6-address } peer-group string  
no neighbor { ip-address | ipv6-address } peer-group string
```

Parameters

ip-address

Specifies the IPv4 address of the neighbor.

ipv6-address

Specifies the IPv6 address of the neighbor.

peer-group *string*

Specifies the name of a BGP peer group. The name can be up to 63 characters in length and can be composed of any alphanumeric character.

Modes

BGP configuration mode

BGP address-family IPv4 unicast VRF configuration mode

BGP address-family IPv6 unicast VRF configuration mode

Usage Guidelines

The **no** form of the command removes a neighbor from the peer group.

Examples

The following example assigns a specified neighbor to a peer group called "mypeergroup1".

```
device# configure terminal  
device(config)# router bgp  
device(config-bgp-router)# neighbor 10.11.12.13 peer-group mypeergroup1
```

The following BGP4+ example, for VRF instance "red," assigns a specified neighbor to a peer group called "mypeergroup1".

```
device# configure terminal  
device(config)# router bgp  
device(config-bgp-router)# address-family ipv6 unicast vrf red  
device(config-bgp-ipv4u)# neighbor 2001:2018:8192::125 peer-group mypeergroup1
```

History

Release version	Command history
8.0.30	Support was added for the BGP address-family IPv6 unicast VRF configuration mode.

neighbor prefix-list

Filters the outgoing and incoming route updates to or from a particular BGP neighbor according to IP address and mask length.

Syntax

neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **prefix-list** *string* { **in** | **out** }

no neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **prefix-list** *string* { **in** | **out** }

Parameters

ip-address

Specifies the IPv4 address of the neighbor

ipv6-address

Specifies the IPv6 address of the neighbor

peer-group-name

Specifies the peer group name configured by the **neighbor** *peer-group-name* command.

string

Specifies the name of the prefix list.

in

Applies the filter in incoming routes.

out

Applies the filter in outgoing routes.

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

Usage Guidelines

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

Examples

The following example applies the prefix list "myprefixlist" to incoming advertisements to neighbor 10.11.12.13.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# neighbor 10.11.12.13 prefix-list myprefixlist in
```

The following example applies the prefix list "myprefixlist" to outgoing advertisements to neighbor 2001:2018:8192::125.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast
device(config-bgp-ipv6u)# neighbor 2001:2018:8192::125 prefix-list myprefixlist out
```

Related Commands

[prefix-list](#)

neighbor remote-as

Specifies the autonomous system (AS) in which a remote neighbor resides.

Syntax

neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **remote-as** *num*
no neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **remote-as**

Command Default

No AS is specified.

Parameters

ip-address

IPv4 address of the neighbor

ipv6-address

IPv6 address of the neighbor

peer-group-name

Peer group name configured by the **neighbor** *peer-group-name* command.

num

Remote AS number (ASN). Range is from 1 through 4294967295.

Modes

BGP configuration mode

BGP address-family IPv4 unicast VRF configuration mode

BGP address-family IPv6 unicast VRF configuration mode

Usage Guidelines

The **no** form of the command removes the neighbor from the AS.

Examples

The following example specifies AS 100 for a neighbor.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# neighbor 10.11.12.13 remote-as 100
```

The following BGP4+ example, for VRF instance "red," specifies AS 100 for a neighbor.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast vrf red
device(config-bgp-ipv6u-vrf)# neighbor 2001:2018:8192::125 remote-as 100
```

History

Release version	Command history
8.0.30	Support was added for the BGP address-family IPv6 unicast VRF configuration mode.

neighbor remove-private-as

Configures a device to remove private autonomous system numbers (ASNs) from UPDATE messages that the device sends to a neighbor.

Syntax

```
neighbor { ip-address | ipv6-address | peer-group-name } remove-private-as  
no neighbor { ip-address | ipv6-address | peer-group-name } remove-private-as
```

Parameters

ip-address

IPv4 address of the neighbor

ipv6-address

IPv6 address of the neighbor

peer-group-name

Peer group name configured by the **neighbor** *peer-group-name* command.

Modes

BGP configuration mode

BGP address-family IPv4 unicast VRF configuration mode

BGP address-family IPv6 unicast VRF configuration mode

Usage Guidelines

The device will remove ASNs 64512 through 65535 (the well-known BGP4 private ASNs) from the AS-path attribute in UPDATE messages that the device sends to a neighbor.

The **no** form of the command restores the default so that private ASNs are not removed from UPDATE messages sent to a neighbor by a device.

Examples

The following example removes private ASNs globally.

```
device# configure terminal  
device(config)# router bgp  
device(config-bgp-router)# neighbor 10.11.12.13 remove-private-as
```

The following example removes private ASNs for VRF instance "red".

```
device# configure terminal  
device(config)# router bgp  
device(config-bgp-router)# address-family ipv6 unicast vrf red  
device(config-bgp-ipv6u-vrf)# neighbor 10.11.12.13 remove-private-as
```

History

Release version	Command history
8.0.30	Support was added for the BGP address-family IPv6 unicast VRF configuration mode.

neighbor route-map

Filters the outgoing and incoming route updates to or from a particular BGP neighbor according to a set of attributes defined in a route map.

Syntax

```
neighbor { ip-address | ipv6-address | peer-group-name } route-map { in string | out string }  
no neighbor { ip-address | ipv6-address | peer-group-name } route-map { in string | out string }
```

Parameters

ip-address

Specifies the IPv4 address of the neighbor

ipv6-address

Specifies the IPv6 address of the neighbor

peer-group-name

Specifies the peer group name configured by the **neighbor** *peer-group-name* command.

in

Applies the filter on incoming routes.

string

Name of the route map.

out

Applies the filter on outgoing routes.

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

Usage Guidelines

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

Examples

The following example applies a route map named "myroutemap" to an outgoing route from 10.11.12.13.

```
device# configure terminal  
device(config)# router bgp  
device(config-bgp-router)# neighbor 10.11.12.13 route-map myroutemap out
```

neighbor route-reflector-client

Configures a neighbor to be a route-reflector client.

Syntax

neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **route-reflector-client**

no neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **route-reflector-client**

Parameters

ip-address

Specifies the IPv4 address of the neighbor

ipv6-address

Specifies the IPv6 address of the neighbor

peer-group-name

Specifies the peer group name configured by the **neighbor** *peer-group-name* command.

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

Usage Guidelines

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

Use this command on a host device to configure a neighbor to be a route-reflector client. Once configured, the host device from which the configuration is made acts as a route-reflector server.

Examples

The following example configures a neighbor to be a route-reflector client.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# neighbor 10.11.12.13 route-reflector-client
```

neighbor send-community

Enables sending the community attribute in updates to the specified BGP neighbor.

Syntax

neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **send-community** [**both** | **extended** | **standard**]

no neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **send-community** [**both** | **extended** | **standard**]

Command Default

The device does not send community attributes.

Parameters

ip-address

Specifies the IPv4 address of the neighbor

ipv6-address

Specifies the IPv6 address of the neighbor

peer-group-name

Specifies the peer group name configured by the **neighbor** *peer-group-name* command.

both

Sends both standard and extended attributes.

extended

Sends extended attributes.

standard

Sends standard attributes.

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

Usage Guidelines

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

Examples

The following example sends standard community attributes to a neighbor.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# neighbor 10.11.12.13 send-community standard
```

neighbor shutdown

Causes a device to shut down the session administratively with its BGP neighbor.

Syntax

```
neighbor { ip-address | ipv6-address | peer-group-name } shutdown [ generate-rib-out ]
no neighbor { ip-address | ipv6-address | peer-group-name } shutdown [ generate-rib-out ]
```

Parameters

ip-address

IPv4 address of the neighbor

ipv6-address

IPv6 address of the neighbor

peer-group-name

Peer group name configured by the **neighbor** *peer-group-name* command.

generate-rib-out

When a peer is put into the shutdown state, Routing Information Base (RIB) outbound routes are not produced for that peer. Use this option to produce those routes.

Modes

BGP configuration mode

BGP address-family IPv4 unicast VRF configuration mode

BGP address-family IPv6 unicast VRF configuration mode

Usage Guidelines

Shutting down a session lets you configure the neighbor and save the configuration without the need to establish a session with that neighbor.

Examples

The following example causes a device to shut down the session administratively with its neighbor.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# neighbor 10.11.12.13 shutdown
```

The following example causes a device to shut down the session administratively with its neighbor and generate RIB outbound routes for VRF instance "red".

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast vrf red
device(config-bgp-ipv6u-vrf)# neighbor 2001:2018:8192::125 shutdown generate-rib-out
```

History

Release version	Command history
8.0.30	Support was added for the BGP address-family IPv6 unicast VRF configuration mode.

neighbor soft-reconfiguration inbound

Stores all the route updates received from a BGP neighbor.

Syntax

neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **soft-reconfiguration inbound**

no neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **soft-reconfiguration inbound**

Parameters

ip-address

Specifies the IPv4 address of the neighbor

ipv6-address

Specifies the IPv6 address of the neighbor

peer-group-name

Specifies the peer group name.

Modes

BGP configuration mode

BGP address-family IPv4 unicast VRF configuration mode

BGP address-family IPv6 unicast VRF configuration mode

Usage Guidelines

Soft reconfiguration stores all the route updates received from a neighbor. If you request a soft reset of inbound routes, the software compares the policies against the stored route updates, instead of requesting the neighbor's BGP4 or BGP4+ route table or resetting the session with the neighbor.

Examples

The following example globally stores route updates from a BGP4 neighbor.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# neighbor 10.11.12.13 soft-configuration inbound
```

The following example stores route updates from a BGP4+ neighbor for VRF instance "red".

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast vrf red
device(config-bgp-ipv6u-vrf)# neighbor 2001:2018:8192::125 soft-configuration inbound
```

Commands K - S
neighbor soft-reconfiguration inbound

History

Release version	Command history
8.0.30	Support was added for the BGP address-family IPv6 unicast VRF configuration mode.

neighbor timers

Specifies how frequently a device sends KEEPALIVE messages to its BGP neighbors, as well as how long the device waits for KEEPALIVE or UPDATE messages before concluding that a neighbor is dead.

Syntax

```
neighbor { ip-address | ipv6-address | peer-group-name } timers keep-alive keepalive_interval hold-time holdtime_interval  
no neighbor { ip-address | ipv6-address | peer-group-name } timers keep-alive keepalive_interval hold-time  
holdtime_interval
```

Parameters

ip-address

IPv4 address of the neighbor

ipv6-address

IPv6 address of the neighbor

peer-group-name

Peer group name configured by the **neighbor** *peer-group-name* command.

keep-alive *keepalive_interval*

Frequency (in seconds) with which a device sends keepalive messages to a peer. Range is from 0 through 65535 seconds. The default is 60.

hold-time *holdtime_interval*

Interval in seconds that a device waits to receive a keepalive message from a peer before declaring that peer dead. Range is from 0 through 65535 seconds. The default is 180.

Modes

BGP configuration mode

BGP address-family IPv4 unicast VRF configuration mode

BGP address-family IPv6 unicast VRF configuration mode

Usage Guidelines

The **no** form of the command restores the defaults.

Examples

The following example sets the keepalive timer for a device to 120 seconds and the hold-timer to 360 seconds.

```
device# configure terminal  
device(config)# router bgp  
device(config-bgp-router)# neighbor 10.11.12.13 timers keep-alive 120 hold-time 360
```

Commands K - S

neighbor timers

The following example sets the keepalive timer to 120 seconds and the hold-timer to 360 seconds for VRF instance "red".

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast vrf red
device(config-bgp-ipv6u-vrf)# neighbor 10.11.12.13 timers keep-alive 120 hold-time 360
```

History

Release version	Command history
8.0.30	Support was added for the BGP address-family IPv6 unicast VRF configuration mode.

neighbor update-source

Configures the device to communicate with a neighbor through a specified interface.

Syntax

neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **update-source** { *ip-address* | *ipv6-address* | **ethernet** | **loopback** *num* | **ve** *vlan_id* }

no neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **update-source** { *ip-address* | *ipv6-address* | **ethernet** | **loopback** *num* | **ve** *vlan_id* }

Parameters

ip-address

IPv4 address of the neighbor

ipv6-address

IPv6 address of the neighbor

peer-group-name

Peer group name configured by the **neighbor** *peer-group-name* command.

ip-address

IP address of the update source.

ipv6-address

IPv6 address of the update source.

ethernet *stackid/slot/portnum*

Specifies the physical interface. On standalone devices specify the interface ID in the format slot/port-id; on stacked devices you must also specify the stack ID, in the format stack-id/slot/port-id.

loopback *num*

Specifies a loopback interface.

ve *vlan_id*

Specifies a virtual Ethernet VLAN interface.

Modes

BGP configuration mode

BGP address-family IPv4 unicast VRF configuration mode

BGP address-family IPv6 unicast VRF configuration mode

Usage Guidelines

Use the **no** form of the command to restore the defaults.

Commands K - S
neighbor update-source

Examples

This example configures the device globally to communicate with a neighbor through the specified IPv4 address and port.

```
device#configure terminal
device#(config)# router bgp
device(config-bgp)# neighbor 10.11.12.13 update-source ethernet 15/1/1
```

History

Release version	Command history
8.0.30	Support was added for the BGP address-family IPv6 unicast VRF configuration mode.

neighbor weight

Specifies a weight that the device will add to routes that are received from the specified BGP neighbor.

Syntax

neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **weight** *num*

no neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } **weight** *num*

Parameters

ip-address

Specifies the IPv4 address of the neighbor.

ipv6-address

Specifies the IPv6 address of the neighbor

peer-group-name

Specifies the name of the peer group.

num

Specifies a value. Valid values range from 1 through 65535. The default is 0.

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

Usage Guidelines

BGP prefers larger weights over smaller weights.

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

Examples

The following example changes the weight from the default.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# neighbor 10.11.12.13 weight 100
```

netbios-name-server

Specifies the IP address of a NetBIOS WINS server or servers available to Microsoft DHCP clients.

Syntax

```
netbios-name-server address [address2, address3]
```

Parameters

address

Specifies the IP address of the NetBIOS WINS server.

Modes

DHCP server pool configuration mode.

Examples

The following example specifies the IP address of a NetBIOS WINS server.

```
device(config)# ip dhcp-server-pool cabo  
device(config-dhcp-cabo)# netbios-name-server 192.168.1.55
```

netbios-proto

Configures the NetBIOS protocol-based VLAN and enters NetBIOS protocol VLAN configuration mode.

Syntax

netbios-proto [**name** *string*]

no netbios-proto [**name** *string*]

Command Default

An NetBIOS protocol-based VLAN is not configured.

Parameters

name *string*

Specifies the name of the NetBIOS protocol configuration. The name can be up to 32 characters in length.

Modes

VLAN configuration mode

IP protocol VLAN configuration mode

IPX protocol VLAN configuration mode

IPv6 protocol VLAN configuration mode

DECnet protocol VLAN configuration mode

AppleTalk protocol VLAN configuration mode

Other protocol VLAN configuration mode

Usage Guidelines

The **no** form of the command disables the NetBIOS protocol-based VLANs.

Examples

The following example shows how to configure the NetBIOS protocol-based VLAN.

```
device(config)# ipx-proto name Brown
device(config-vlan-ipx-proto)# netbios-proto name protol
device(config-vlan-netbios-proto)# no dynamic
```

network

Configures the device to advertise a network.

Syntax

network *network/mask* [**backdoor** | **route-map** *map-name* | **weight** *num*]

no network *network/mask* [**backdoor** | **route-map** *map-name* | **weight** *num*]

Command Default

No network is advertised.

Parameters

network/mask

Network and mask in CIDR notation.

backdoor

Changes administrative distance of the route to this network from the EBGp administrative distance (the default is 20) to the local BGP4 weight (the default is 200), tagging the route as a backdoor route.

route-map *map-name*

Specifies a route map with which to set or change BGP4 attributes for the network to be advertised.

weight*num*

Specifies a weight to be added to routes to this network. Range is 0 through 65535. The default is 0.

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

BGP address-family IPv4 unicast VRF configuration mode

BGP address-family IPv6 unicast VRF configuration mode

Usage Guidelines

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

Examples

The following example imports the IPv4 network 10.11.12.12/30 into the route map "myroutemap".

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# network 10.11.12.13/30 route-map myroutemap
```

The following example imports the IPv6 prefix 2001:db8::/32 into the BGP4+ database and sets a weight of 300.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast
device(config-bgp-ipv6u)# network 2001:db8::/32 weight 300
```

History

Release version	Command history
8.0.30	Support was added for the BGP address-family IPv6 unicast VRF configuration mode.

network (dhcp)

Configures the subnet network and mask of the DHCP address pool.

Syntax

network *subnet/mask*

Parameters

subnet/mask

Specifies the subnet network and mask of the address pool.

Modes

DHCP server pool configuration mode

Examples

The following command specifies the subnet network and mask of the DHCP address pool.

```
device(config)# ip dhcp-server-pool cabo  
device(config-dhcp-cabo)# network 10.2.3.44/24
```

next-bootstrap-server

Specifies the IP address of the next server the client should use for bootup.

Syntax

next-bootstrap-server *ip-address*

Parameters

ip-address

Specifies the IP address of the next bootstrap server.

Modes

DHCP server pool configuration mode.

Examples

The following example specifies the next bootstrap server.

```
device(config)# ip dhcp-server-pool cabo  
device(config-dhcp-cabo)# next-bootstrap-server 10.2.5.44
```

next-hop-enable-default

Configures the device to use the default route as the next hop.

Syntax

next-hop-enable-default

no next-hop-enable-default

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

Usage Guidelines

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

Examples

The following example configures the device to use the default route as the next hop for the IPv4 unicast address family.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# next-hop-enable-default
```

The following example configures the device to use the default route as the next hop for the IPv6 unicast address family.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast
device(config-bgp-ipv6u)# next-hop-enable-default
```

next-hop-recursion

Enables BGP recursive next-hop lookups.

Syntax

next-hop-recursion

no next-hop-recursion

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

Usage Guidelines

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

If the BGP next hop is not the immediate next hop, a recursive route lookup in the IP routing information base (RIB) is needed. With recursion, a second routing lookup is required to resolve the exit path for destination traffic. Use this command to enable recursive next-hop lookups.

Examples

The following example enables recursive next-hop lookups for BGP4 for the IPv4 unicast address family.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# next-hop-recursion
```

The following example enables recursive next-hop lookups for the IPv6 unicast address family.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast
device(config-bgp-ipv6u)# next-hop-recursion
```

no-dynamic-aging

Disables aging of ports that are dynamically assigned to the protocol or subnet-based VLANs.

Syntax

no-dynamic-aging

no no-dynamic-aging

Command Default

The dynamic protocol VLAN ages out after 10 or 20 minutes, if no packets are received.

Modes

IP protocol VLAN configuration mode

IPX protocol VLAN configuration mode

AppleTalk protocol VLAN configuration mode

DECnet protocol VLAN configuration mode

NetBIOS protocol VLAN configuration mode

Other protocol VLAN configuration mode

IPV-6 protocol VLAN configuration mode

Usage Guidelines

NOTE

Configure the command only if your configuration includes dynamically assigned VLAN memberships for protocol or subnet VLANs.

The **no** form of the command enables aging of the dynamic protocol VLAN.

Examples

The following example shows how to configure dynamic aging.

```
device(config)# vlan 10 by port
device(config-vlan-10)# interface ethernet 1/1/1 to 1/1/5
device(config-vlan-10)# ip-proto name IP_Prot_VLAN
device(config-vlan-ip-proto)# no-dynamic-aging
```

non-preempt-mode

Enables the non-preempt mode on all backups.

Syntax

non-preempt-mode
no non-preempt-mode

Command Default

By default, the non-preempt mode is disabled; preemption is enabled.

Modes

VRID configuration mode

Usage Guidelines

By default, a backup that has a higher priority than another backup that has become the master can preempt the master, and take over the role of master. If you want to prevent this behavior, disable preemption.

Preemption applies only to backups and takes effect only when the master has failed and a backup has assumed ownership of the VRID. The **non-preempt-mode** command prevents a backup with a higher priority from taking over as master from another backup that has a lower priority but has already become the master of the VRID.

Preemption is especially useful for preventing flapping in situations where there are multiple backups and a backup with a lower priority than another backup has assumed ownership, because the backup with the higher priority was unavailable when ownership changed.

If you enable the non-preempt mode (thus disabling the preemption feature) on all the backups, the backup that becomes the master following the disappearance of the master continues to be the master. The new master is not preempted.

The **no** form of the command disables the non-preempt mode.

Examples

The following example enables the non-preemption mode.

```
device(config)# vlan 200
device(config-vlan-200)# vsrp vrid 1
device(config-vlan-200-vrid-1)# non-preempt-mode
```

non-preempt-mode (VRRP)

Disables preempt mode for a Virtual Router Redundancy Protocol (VRRP) or VRRP Extended (VRRP-E) backup device.

Syntax

non-preempt-mode
no non-preempt-mode

Command Default

Preemption is enabled by default.

Modes

VRID interface configuration mode

Usage Guidelines

This command is supported in VRRP and VRRP-E. When the **non-preempt-mode** command is entered, a backup device with a higher VRRP priority is prevented from taking control of the virtual router ID (VRID) from another backup device that has a lower priority, but has already assumed control of the VRID. Disabling preemption is useful to prevent flapping when there are multiple backup devices and a backup with a lower priority assumes the role of master. When other backup devices with a higher priority are back online, the role of master can flap between devices.

In VRRP, the owner device always assumes the role of master when it comes back online, regardless of the preempt mode setting.

Enter **no non-preempt-mode** to re-enable preemption.

Examples

The following example disables preempt mode for the virtual-router ID 1 session:

```
device# configure terminal
device(config)# router vrrp
device(config)# interface ethernet 1/1/5
device(config-if-e1000-1/1/5)# ip address 10.53.5.3/24
device(config-if-e1000-1/1/5)# ip vrrp vrid 1
device(config-if-e1000-1/1/5-vrid-1)# non-preempt-mode
```

ntp

Enables the Network Time Protocol (NTP) client and server mode.

Syntax

ntp

no ntp

Command Default

NTP services are disabled on all interfaces by default.

Modes

Global configuration mode

Usage Guidelines

Before you begin to configure NTP, you must use the **clock set** command to set the time on your device to within 1000 seconds of the Coordinated Universal Time (UTC).

Disable SNTP by removing all SNTP configurations.

NOTE

NTP and SNTP implementations cannot operate simultaneously. You cannot configure the **ntp** command if SNTP is enabled. If SNTP is enabled, configuring the **ntp** command will display the following message: "SNTP is enabled. Disable SNTP before using NTP for time synchronization."

The **no** form of the command disables NTP and removes the NTP configuration. The **no ntp** command removes all the static configuration and learned associations from NTP neighbors.

Examples

The following example enables the NTP client and server mode.

```
device(config)# ntp
device(config-ntp)#
```

ntp-interface

Enters Network Time Protocol (NTP) interface configuration mode.

Syntax

ntp-interface { **management** *port* | **ethernet** *stack-id/slot/port* | **ve** *id* }

no ntp-interface { **management** *port* | **ethernet** *stack-id/slot/port* | **ve** *id* }

Parameters

management *port*

Specifies the management interface.

ethernet *stack-id/slot/port*

Specifies the Ethernet interface.

ve *id*

Specifies the Virtual Ethernet interface.

Modes

NTP configuration mode

Usage Guidelines

The broadcast server or client is configured on selected interfaces. To remove the NTP broadcast configurations on the specified interface, use the **no** form of this command.

The **no** form of the command returns to NTP configuration mode.

The **ntp-interface** command is a mode-change command.

Examples

The following example enters the NTP interface configuration mode for Ethernet interface 1/1/1.

```
device(config)# ntp
device(config-ntp)# ntp-interface ethernet 1/1/1
device(config-ntp-if-e1000-1/1/1)#
```

The following example enters the NTP interface configuration mode for management interface 1.

```
device(config)# ntp
device(config-ntp)# ntp-interface management 1
device(config-ntp-mgmt-1)# exit
```

openflow enable

Enables or disables the OpenFlow hybrid port-mode on the port.

Syntax

```
openflow enable [ layer2 | layer3 | layer23 [hybrid-mode ] ]
no openflow enable [ layer2 | layer3 | layer23 [hybrid-mode ] ]
```

Parameters

layer2

Enables Layer 2 matching mode for flows.

layer3

Enables Layer 3 matching mode for flows.

layer23 hybrid-mode

Enables Layer 2 and Layer 3 matching mode for flows with an option for hybrid port-mode.

Modes

Interface configuration mode

Usage Guidelines

In interface configuration mode, this command enables Layer 2 or Layer 3 matching mode for flows with an optional enabling of hybrid port-mode.

NOTE

OpenFlow must be globally enabled before the Layer 2 or Layer 3 matching modes can be specified.

Examples

After OpenFlow 1.3 is enabled, the following example configures Layer 2 and Layer 3 matching mode for flows.

```
device# configure terminal
device(config)# openflow enable ofv130
device (config)# interface ethernet 1/1/1
device (config-if-1/1/1)# openflow enable layer 23
```

History

Release	Command History
08.0.20	This command was introduced.

openflow purge-time

Configures the maximum amount of time (in seconds) before stale flows are purged from the OpenFlow flow table after a switchover, failover, or OS upgrade.

Syntax

openflow purge-time seconds

no openflow purge-time seconds

Command Default

The value of the OpenFlow purge timer is the default value for normal circumstances.

Parameters

seconds

Specifies the maximum amount of time (in seconds), before stale flows are purged. The range is from 1 through 600. The default is 240 seconds.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Usage Guidelines

You can configure a larger value for the OpenFlow purge timer, if delay is anticipated in learning the flows from controller after switch-over.

Examples

The following example sets the OpenFlow purge time to 500 seconds:

```
device(config)# openflow purge-time 500
```

History

Release version	Command history
08.0.30	This command was introduced.

optical-monitor

Configures the device to monitor optical transceivers in the system.

Syntax

optical-monitor [*alarm-interval*]

no optical-monitor [*alarm-interval*]

Command Default

The default and minimum timer for the ICX 7450 and ICX 7750 devices is 8 minutes.

The default timer for the ICX 7250 device is 3 minutes but can be set as low as 1 minute.

Parameters

alarm-interval

Specifies the interval between at which alarms and warning messages are sent.

Modes

Global configuration mode

Interface configuration mode

Usage Guidelines

You can configure your Brocade device to monitor optical transceivers in the system. When Digital Optical Monitoring (DOM) is enabled, the system monitors the temperature and signal power levels for the optical transceivers. Console messages and syslog messages are sent when optical operating conditions fall below or rise above the QSFP+, SFP, or SFP+ manufacturer-recommended thresholds.

The commands **no optical-monitor** and **optical-monitor 0** perform the same function; that is, they both disable DOM.

Examples

The following example enables optical monitoring on all Brocade-qualified optics installed in the device.

```
device(config)# optical-monitor
```

The following example enables optical monitoring on a specific port.

```
device(config)# interface ethernet 1/1/1
device(config-if-e10000-1/1/1)# optical-monitor
```

The following example sets the alarm interval to 10 minutes.

```
device(config)# interface ethernet 1/1/1 to 1/1/4
device(config-mif-e10000-1/1/1-1/1/4)# optical-monitor 10
```

originator-id

Configures MSDP to use the specified interface IP address as the IP address of the rendezvous point (RP) in a source-active (SA) message.

Syntax

originator-id *type number*

no originator-id *type number*

Command Default

MSDP uses the IP address of the originating RP in the RP address field of the SA message.

Parameters

type

Specifies the type of interface used by the RP. You can use Ethernet, loopback, and virtual routing interfaces (ve).

number

Specifies the interface number. For example, the Ethernet port number, loopback number, or virtual routing interface number.

Modes

MSDP router configuration mode

MSDP router VRF configuration mode

Usage Guidelines

The **no** form of this command restores the default

Examples

This example configures an interface IP address to be the IP address of the RP.

```
Device(config)# interface loopback 2
Device(config-lbif-2)# ip address 2.2.1.99/32
Device(config)# router msdp
Device(config-msdp-router)# originator-id loopback 2
Device(config-msdp-router)# exit
```

This example configures an interface IP address to be the IP address of the RP on a VRF named blue.

```
Device(config)# interface loopback 2
Device(config-lbif-2)# ip address 2.2.1.99/32
Device(config)# router msdp vrf blue
Device(config-msdp-router-vrf blue)# originator-id loopback 2
Device(config-msdp-router-vrf blue)# exit
```

other-proto

Configures the other protocol VLAN and enters the other protocol VLAN configuration mode.

Syntax

other-proto [**name** *string*]

no other-proto [**name** *string*]

Command Default

IP protocol VLANs are configured.

Parameters

name *string*

Specifies the name of the other protocol VLAN configuration. The name can be up to 32 characters in length.

Modes

VLAN configuration mode

IP protocol VLAN configuration mode

IPX protocol VLAN configuration mode

IPv6 protocol VLAN configuration mode

DECnet protocol VLAN configuration mode

NetBIOS protocol VLAN configuration mode

AppleTalk protocol VLAN configuration mode

Usage Guidelines

The **no** form of the command removes the other protocol VLANs.

Examples

The following example shows how to configure the other protocol VLAN.

```
device(config)# ipx-proto name Brown
device(config-vlan-ipx-proto)# other-proto name Block_other_proto
device(config-vlan-other-proto)# no dynamic
```

owner

Designates a virtual router as the Virtual Router Redundancy Protocol (VRRP) owner and configures priority and track values.

Syntax

owner [**priority** *value*] [**track-priority** *value*]

no owner [**priority** *value*] [**track-priority** *value*]

Command Default

No virtual routers are designated as the VRRP owner.

Parameters

priority *value*

Abdicates owner status by setting a value that is lower than the backup default priority value. Value can be from 1 to 254. Default is 100.

track-priority *value*

Sets the priority value if the tracked port fails. Value can be from 1 to 254. Default is 2.

Modes

VRID interface configuration mode

Usage Guidelines

This command specifies that the device on which it is configured owns the IP address that is associated with the virtual router; making this device the default VRRP master router with its priority set to 255.

This command must be entered before the **ip-address** command can be configured for a VRRP virtual router ID (VRID).

The **no** form of this command removes the virtual router configuration.

Examples

The following example configures the device as the VRRP owner.

```
device# configure terminal
device(config)# router vrrp
device(config)# interface ethernet 1/1/6
device(config-if-e1000-1/1/6)# ip address 10.53.5.1/24
device(config-if-e1000-1/1/6)# ip vrrp vrid 1
device(config-if-e1000-1/1/6-vrid-1)# owner
device(config-if-e1000-1/1/6-vrid-1)# ip-address 10.53.5.1
device(config-if-e1000-1/1/6-vrid-1)# activate
```

The following example configures the device as the VRRP owner and sets the track priority to 10.

```
device# configure terminal
device(config)# router vrrp
device(config)# interface ethernet 1/1/6
device(config-if-e1000-1/1/6)# ip address 10.53.5.1/24
device(config-if-e1000-1/1/6)# ip vrrp vrid 1
device(config-if-e1000-1/1/6-vrid-1)# owner track-priority 10
device(config-if-e1000-1/1/6-vrid-1)# ip-address 10.53.5.1
device(config-if-e1000-1/1/6-vrid-1)# activate
```

packet-inerror-detect

Enables the monitoring of a port for inError packets and defines the maximum number of inError packets allowed for the port during the configured sampling interval.

Syntax

packet-inerror-detect *inError-count*

no packet-inerror-detect *inError-count*

Command Default

The Packet InError Detect feature is disabled for the port.

Parameters

inError-count

Specifies the maximum number of inError packets that are allowed for a port during the configured sampling interval. The value can range from 10 through 4294967295.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of this command disable monitoring of inError packets for the port.

If the number of inError packets received at a port exceeds the default value for two consecutive sampling windows, the port is set to the error-disabled state.

NOTE

To enable monitoring of inError packets for the port only, you must first use the **errdisable packet-inerror-detect** command in global configuration mode to globally enable monitoring for inError packets on the device.

Examples

The following example displays the maximum number of allowed inError packets for a port set to the value 10.

```
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# packet-inerror-detect 10
```

History

Release version	Command history
07.3.00g	This command was introduced.

pass-through

Enables pass-through which allows certain protocol packets to pass through ports that are enabled for Flexible authentication.

Syntax

```
pass-through { cdp | fdp | lldp }  
no pass-through { cdp | fdp | lldp }
```

Command Default

Pass-through is not enabled.

Parameters

- cdp**
Specifies the Cisco Discovery Protocol to pass through.
- fdp**
Specifies the Foundry Discovery Protocol to pass through.
- lldp**
Specifies the Link Layer Discovery Protocol to pass through.

Modes

Authentication mode

Usage Guidelines

This command specifies the protocols to be passed through even though the client is not authenticated. The **no** form of the command disables pass-through.

Examples

The example enables LLDP for pass-through.

```
device(config)# authentication  
device(config-authen)# pass-through lldp
```

History

Release version	Command history
08.0.20	This command was introduced.

peer

Configures the software clock to synchronize a peer or to be synchronized by a peer.

Syntax

```
peer { ipv4-address | ipv6-address } [ key key-id ] [ maxpoll interval ] [ minpoll interval ] [ version version-number ]  
[ burst ]
```

```
no peer { ipv4-address | ipv6-address } [ key key-id ] [ maxpoll interval ] [ minpoll interval ] [ version version-number ]  
[ burst ]
```

Command Default

A peer is not configured.

Parameters

ipv4-address

Specifies the IPv4 address of the peer providing the clock synchronization.

ipv6-address

Specifies the IPv6 address of the peer providing the clock synchronization.

key *key-id*

Specifies the authentication key. The value can range from 1 through 65535. By default, no authentication key is configured.

maxpoll *interval*

Specifies the longest polling interval. The range is from 4 through 17. The default is 10. The interval argument is a power of 2 (4=16, 5=32, 6=64, 7=128, 8=256, 9=512, and so on).

minpoll *interval*

Specifies the shortest polling interval. The range is from 4 through 17. The default is 6. The interval argument is a power of 2 (4=16, 5=32, 6=64, 7=128, 8=256, 9=512, and so on).

version *version-number*

Specifies the Network Time Protocol (NTP) version number. Valid values are 3 and 4. The default value is 4.

burst

Sends a burst of packets to the server at each polling interval.

Modes

NTP configuration mode

Usage Guidelines

NTP peer mode is intended for configurations where a group of devices operate as mutual backups for each other. If one of the devices loses a reference source, the time values flow from the surviving peers to all the others.

A maximum of eight NTP peers can be configured.

NOTE

The **peer** command is not effective if NTP is enabled in client-only mode.

NOTE

If the peer is a member of a symmetric passive association, configuring the **peer** command will fail.

The **no** form of the command disables the software clock to synchronize a peer.

Examples

The following example configures the software clock.

```
device(config)# ntp  
device(config-ntp)# peer 10.2.2.2 key 23 maxpoll 15 minpoll 7 version 4 burst
```

peer disable-fast-failover

Disables the MCT fast-failover mode.

Syntax

peer *peer-ip* **disable-fast-failover**

no peer *peer-ip* **disable-fast-failover**

Command Default

Fast-failover is configured on the device.

Parameters

peer-ip

Specifies the IP address of the peer device.

Modes

Cluster configuration mode

Usage Guidelines

The following failover modes can be configured with MCT:

- Fast-failover (default) - As soon as the ICL interface goes down, the MCT control path between the two peer devices goes down. All the remote MAC addresses are flushed.
- Slow-failover - Even if the ICL interface goes down, the CCP waits for the hold-time before taking the MCT control path between the two peer devices down. Remote MAC addresses are flushed only when the MCT control path between the two peer devices is down.

The **no** form of the command re-enables fast-failover.

Examples

The following example shows how to disable fast-failover.

```
device(config)# cluster SX  
device(config-cluster-SX)# peer 10.1.1.3 disable-fast-failover
```

peer rbridge-id

Configures the MCT cluster peer.

Syntax

```
peer peer-ip rbridge-id peer-rbridge icl map-icl  
no peer peer-ip rbridge-id peer-rbridge icl map-icl
```

Command Default

MCT cluster peer information is not configured.

Parameters

peer-ip
Specifies the IP address of the peer device.

rbridge-id *peer-rbridge*
Specifies the cluster RBridge ID. The value can be from 1 through 4095.

icl *map-icl*
Specifies the mapped cluster ICL name. The name is an ASCII string up to 64 characters in length.

Modes

Cluster configuration mode

Usage Guidelines

Configuration of the peer device involves the peer's IP address, RBridge ID, and ICL specification. The RBridge ID must be different from the cluster RBridge ID and any other client in the cluster. The MCT member VLAN is defined as any VLAN of which the ICL is a member.

The **no** command removes the MCT cluster peer.

Examples

The following example shows how to configure cluster peer information.

```
device(config)# cluster SX 4000  
device(config-cluster-SX)# rbridge-id 3  
device(config-cluster-SX)# session-vlan 3000  
device(config-cluster-SX)# keep-alive-vlan 3001  
device(config-cluster-SX)# icl SX-MCT ethernet 1/1/7  
device(config-cluster-SX)# peer 10.1.1.2 rbridge-id 2 icl SX-MCT  
device(config-cluster-SX)# deploy
```

peer timers

Configures the keep-alive and hold-time timers for peer devices.

Syntax

peer *peer-ip* **timers keep-alive** *keep-alive-timer* **hold-time** *hold-timer*

no peer *peer-ip* **timers keep-alive** *keep-alive-timer* **hold-time** *hold-timer*

Command Default

The default value for the keep-alive timer is 10 seconds.

The default value for the hold-time timer is 90 seconds.

Parameters

peer-ip

Specifies the IP address of the cluster peer.

keep-alive *keep-alive-timer*

Specifies the keep-alive interval in seconds. The value can range from 0 through 21845 seconds.

hold-time *hold-timer*

Specifies the hold-time interval in seconds. The value can range from 3 through 65535 seconds (or 0 if the keep-alive timer is set to 0).

Modes

Cluster configuration mode

Usage Guidelines

The *peer-ip* parameter should be in the same subnet as the cluster management interface. The hold-time must be at least three times the keep-alive time.

NOTE

The keep-alive VLAN and keep-alive timers are not related. The keep-alive timer is used by CCP.

The **no** form of the command sets the timers to the default values.

Examples

The following example shows how to configure the peer timers.

```
device(config)# cluster SX 400
device(config-cluster-SX)# peer 10.1.1.3 timers keep-alive 40 hold-time 120
```

peer-info

Configures the peer system ID and system key for a single dynamic Link Aggregation Group (LAG).

Syntax

peer-info sys-mac *mac-address* **sys-pri** *number* **key** *key number*

no peer-info sys-mac *mac-address* **sys-pri** *number* **key** *key number*

Command Default

The peer information of any one of the ports of a dynamic LAG that forms the first LACP trunk within that dynamic LAG, is considered as the peer information.

Parameters

sys-mac *mac-address*

Specifies the system's peer Ethernet MAC address.

sys-pri *number*

Specifies the LACP system priority for the system's peer. Valid numbers range from 0 through 65535.

key *key number*

Specifies the LACP key value. Valid key numbers range from 1 through 65535.

Modes

LAG configuration mode

Usage Guidelines

The **no** form of the command removes the peer information configuration for the dynamic LAG.

Examples

The following example configures the peer system with a system priority of 10 and an LACP key value of 10000.

```
device(config)# lag R4-dyn2
device(config-lag-R4-dyn2)# peer-info sys-mac 0000.0000.0003 sys-pri 10 key 10000
```

History

Release version	Command history
8.0.30d	This command was introduced.

pe-id

Assigns and reserves an ID for an SPX port extender (PE) unit.

Syntax

pe-id *port unit-id* [*port* | *name*]

no pe-id *port unit-id* [*port* | *name*]

pe-id *name unit-id1* [*unit-id2 unit-id3 unit-id4*] [*port* | *name*]

no pe-id *name unit-id1* [*unit-id2 unit-id3 unit-id4*] [*port* | *name*]

Command Default

By default, the system generates the PE IDs for attached PE units.

Parameters

port

In the form *unit/slot/port*, designates the CB SPX port or a port in the CB SPX LAG that links to the PE *unit-id*.

name

The PE group name for an SPX port or SPX LAG that is associated with the ID or IDs that follow. Up to four IDs may be associated with the PE group name. The PE group name must also be defined in CB configuration mode.

unit-id

Designates the PE ID or IDs associated with the port or the PE group name. PE ID values range from 17 through 56.

Modes

CB configuration mode

Usage Guidelines

The **no** form of the command removes the PE ID and any associated configuration.

The second set of [*port* | *name*] parameters after the *unit-ids* provides an option to specify a ring topology. (Although a ring topology is not supported in FastIron 8.0.40, the configuration is allowed for compatibility with future releases.)

The output of the **show running-config** command shows the merged result of system-generated PE IDs and the user's reserved PE ID configuration. The system overwrites user entries if there is a conflict.

If a reserved stack unit is removed, its associated SPX port configuration and PE ID configuration are removed.

Users are allowed to change the PE ID configuration of live PE units as long as the new configuration does not alter the topology of the live units.

Examples

The following example assigns the PE ID 20 to the first PE that attaches to SPX port 2/1/15. The next PE unit that links to PE unit 20 is assigned PE ID 22.

```
device# configure terminal
device(config)# spx cb-configure
device(config-spx-cb)# spx-port 2/1/15 pe-group bld1-f13-stk2
device(config-spx-cb)# pe-id bld1-f13-stk2 20 22
```

The PE group name or any port in a LAG can be used to reserve the PE ID. The following three examples configure the same PE ID, assuming both ports 1/1/10 and 1/1/11 are in the same SPX LAG and have the PE group name shown.

```
device(config)# pe-id 1/1/10 20
device(config)# pe-id 1/1/11 20
device(config)# pe-id bld1-f13-stk7 20
```

History

Release version	Command history
8.0.40	This command was introduced.

pe-name

Assigns a name to the PE unit.

Syntax

pe-name *string*

no pe-name

Command Default

By default, no name is assigned to the PE unit.

Parameters

string

Character string that specifies the name for this PE unit.

Modes

PE configuration mode

Provisional-PE configuration mode

Usage Guidelines

The **no** form of the command removes the name assigned to the PE (no string match is required).

The PE name must be unique within the SPX domain.

The PE name is an identifier only; it cannot be used as a replacement, for example, for a port number, to change other configuration.

Examples

In the following example, a CB gives a name to PE unit 18.

```
device# configure terminal
device(config)# spx unit 18
device(config-spx-unit-18)# pe-name bldg2-floor2-stk 18
device(config-spx-unit-18)# exit
device(config)# exit
```

History

Release version	Command history
8.0.40	This command was introduced.

pdu-rate (EFM-OAM)

Configures the number of Protocol Data Units (PDUs) to be transmitted per second by the Data Terminal Equipment (DTE).

Syntax

pdu-rate *value*
no pdu-rate *value*

Command Default

The default value is one PDU per second.

Parameters

value
Specifies the number of PDUs to be sent per second. The value range can be from 1 through 10 PDUs per second.

Modes

EFM-OAM protocol configuration mode

Usage Guidelines

If the PDU rate is configured as 10 packets per second, PDUs may not get transmitted in a timely manner according to the configured PDU rate.

The **no** form of the command restores the default value of one PDU per second.

Examples

The following example configures the PDU rate as 6 PDUs per second.

```
device(config)# link-oam
device(config-link-oam)# pdu-rate 6
```

History

Release version	Command history
08.0.30	This command was introduced.

phy cable diagnostics tdr

Runs the VCT TDR test on the specified port.

Syntax

phy cable-diagnostics tdr *stackid/slot/port*

Parameters

stackid/slot/port

Specifies the interface (port), by device, slot, and port number.

Modes

Privileged EXEC mode

Usage Guidelines

Use this command to clear TDR test registers before every TDR cable diagnostic test.

Before executing this command, use the **clear cable-diagnostics tdr** command to clear any previous TDR test results.

Display diagnostic test results using the **show cable-diagnostics tdr stackid/slot/port** command.

Examples

The following example clears test registers for the interface and then runs the TDR diagnostic test for port 3 on slot 2 of the first device in the stack.

```
device# clear cable-diagnostics tdr 1/2/3  
device# phy cable-diag tdr 1/2/3
```

History

Release version	Command history
08.0.20	This command was introduced for ICX 6610, ICX 6430, ICX 6430-C, ICX 6450, and ICX6450-C devices.

phy-fifo-depth

Configures the depth of the transmit and receive FIFOs.

Syntax

phy-fifo-depth *value*

no phy-fifo-depth *value*

Command Default

The default value is 0.

Parameters

value

Specifies the setting value. There are 4 settings 0 through 3 with 0 as the default.

Modes

Interface configuration mode

Usage Guidelines

PHY devices on Brocade devices contain transmit and receive synchronizing FIFOs to adjust for frequency differences between clocks. The **phy-fifo-depth** command allows you to configure the depth of the transmit and receive FIFOs. A higher setting indicates a deeper FIFO.

The default setting works for most connections. However, if the clock differences are greater than the default can handle, CRCs and errors will begin to appear on the ports. Raising the FIFO depth setting adjusts for clock differences.

It is recommend that you disable the port before applying this command, and then re-enable the port. Applying the command while traffic is flowing through the port can cause CRC and other errors for any packets that are passing through the PHY while the command is being applied.

This command can be issued for a single port from interface configuration mode or for multiple ports from MIF configuration mode.

The **no** form of the command removes the depth of the transmit.

Examples

The following example configures the FIFO depth for a single port.

```
device(config)# interface ethernet 1/1/21
device(config-if-e1000-1/1/21)# phy-fifo-depth 2
```

The following example configures the FIFO depth for multiple ports.

```
device(config)# interface ethernet 1/1/1 to 1/1/5
device(config-mif-1/1/1-1/1/5)# phy-fifo-depth 1
```

ping

Verifies whether a device can reach another device through the network.

Syntax

```
ping { ip-addr | host-name | vrf vrf-name | ipv6 [ ipv6-addr | host-name | vrf vrf-name ] [ outgoing-interface type number ] } [ source ip-addr ] [ count num ] [ timeout msec ] [ ttl num ] [ size num ] [ quiet ] [ numeric ] [ no-fragment ] [ verify ] [ data 1-to-4-byte-hex ] [ brief [ max-print-per-sec number ] ]
```

Parameters

ip-addr

Specifies the IP address of the device to be pinged.

host-name

Specifies the host name of the device to be pinged.

vrf *vrf-name*

Specifies the Virtual Routing and Forwarding (VRF) instance of the device to be pinged.

ipv6 *ipv6-addr*

Specifies the IPv6 address, host name or VRF instance of the device to be pinged.

outgoing-interface *type number*

Specifies an interface over which to verify connectivity.

source *ip-addr*

Specifies an IP address to be used as the origin of the ping packets.

count *num*

Specifies the number of ping packets that the device sends. The value can range from 1 to 4294967296. The default is 1.

timeout *msec*

Specifies the time, in milliseconds for which the device waits for a reply from the pinged device. The value can range from 1 to 4294967296. The default is 5000 (5 seconds).

ttl *num*

Specifies the time to live as a maximum number of hops. The value can range from 1 to 255. The default is 64.

size *num*

Specifies the size of the ICMP data portion of the packet, in bytes. This is the payload and does not include the header. The value can range from 0 to 10000. The default is 16.

no-fragment

Turns on the "don't fragment" bit in the IP header of the ping packet. This option is disabled by default.

quiet

Hides informational messages such as a summary of the ping parameters sent to the device and instead only displays messages indicating the success or failure of the ping. This option is disabled by default.

verify

Verifies that the data in the echo packet (the reply packet) is the same as the data in the echo request (the ping). By default the device does not verify the data.

data *1-to-4-byte-hex*

Specifies a data pattern for the payload instead of the default data pattern, "abcd", in the packet data payload. The pattern repeats itself throughout the ICMP message (payload) portion of the packet.

brief

Specifies that the ping test characters are to be displayed. For more information, refer to the Usage Guidelines section.

max-print-per-sec *number*

Specifies the maximum number of target responses that the device can display per second while in brief mode. The value can range from 0 to 2047. The default is 511.

Modes

All configuration modes

Usage Guidelines

The following ping test characters are supported:

- !—Indicates that a reply was received.
- .—Indicates that the network server timed out while waiting for a reply.
- U—Indicates that a destination unreachable error PDU was received.
- I—Indicates that the user interrupted the ping.

For numeric parameter values, the command does not check that the value you enter is within the allowed range. Instead, if you do exceed the range for a numeric value, the software rounds the value to the nearest valid value.

NOTE

If the device is a Layer 2 switch or Layer 3 switch, you can use the host name only if you have already enabled the Domain Name Server (DNS) resolver feature on the device from which you are sending the ping.

Examples

The following example checks the connectivity to the device at IP address 10.31.248.12.

```
device> ping 10.31.248.12
Sending 1, 16-byte ICMP Echo to 10.31.248.12, timeout 5000 msec, TTL 64
Type Control-c to abort
Reply from 10.31.248.12 : bytes=16 time=33ms TTL=63
Success rate is 100 percent (1/1), round-trip min/avg/max=33/33/33 ms.
```

poison-local-routes

Configures the device to avoid routing loops by advertising local RIP or RIPng routes with a cost of 16 (infinite or unreachable) when these routes go down.

Syntax

poison-local-routes
no poison-local-routes

Command Default

By default, RIP or RIPng routers add a cost of 1 to RIP or RIPng routes advertised to neighbors.

Modes

RIP router configuration mode or RIPng router configuration mode.

Usage Guidelines

Use the **no** form of the `poison-local-routes` command to disable these poison route updates for local routes that go down.

Examples

The following example configures the RIP router to trigger an update to advertise local RIP routes as unreachable when they go down.

```
device# configure terminal
device(config)# router rip
device(config-rip-router)# poison-local-routes
```

The following example configures the RIPng router to trigger an update when local routes go down to advertise them as unreachable.

```
device# configure terminal
device(config)# ipv6 router rip
device(config-ripng-router)# poison-local-routes
```

poison-reverse

Enables poison reverse loop prevention, either globally or on an individual interface, by assigning an "unreachable" cost to a route before advertising it on the interface where the route was learned. The global command can be used for RIP or RIPng routes.

Syntax

```
poison-reverse
ip rip poison-reverse
no poison-reverse
no ip rip poison-reverse
```

Command Default

By default, split horizon loop prevention is in effect. Split horizon does not advertise a route on the same interface as the one on which the device learned the route.

Modes

RIP router configuration mode, RIPng router configuration mode, or interface configuration mode.

Usage Guidelines

The **no** form of the command disables poison reverse loop prevention.

Either poison reverse or split horizon loop prevention is always in effect on an interface enabled for RIP. When poison reverse is disabled, split horizon loop prevention is applied.

Examples

The following command enables poison reverse loop prevention for RIP on a device.

```
device# configure terminal
device(config)# router rip
device(config-rip-router)# poison-reverse
```

The following example disables poison reverse and re-asserts split horizon loop prevention for RIP on the device.

```
device# configure terminal
device(config)# router rip
device(config-rip-router)# no poison-reverse
```

The following example enables poison reverse for RIP routes on Ethernet interface 1/2/3.

```
device# configure terminal
device(config)# interface ethernet 1/2/3
device(config-if-e10000-1/2/3)# poison-reverse
```

Commands K - S

poison-reverse

The following example enables poison reverse for RIPng on a device.

```
device# configure terminal
device(config)# ipv6 router rip
device(config-ripng-router)# poison-reverse
```

port-name

Configures the names of individual ports or a group of ports.

Syntax

port-name *text*

no port-name *text*

Command Default

A port name is not configured.

Parameters

text

Configures the name of the port or the name of a range of ports. The name is an alphanumeric string and can be up to 255 characters long.

Modes

Interface configuration mode

Usage Guidelines

You can assign a port name to physical ports, virtual interfaces, and loopback interfaces. The port name can contain blank spaces. The port name can also contain special characters, but the percentage character (%) is dropped if it is the last character in the port name.

The **no** form of the command removes the assigned port name.

Examples

The following example assigns a name to a port.

```
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# port-name Marsha
```

The following example assigns a name to a range of ports.

```
device(config)# interface ethernet 1/1/1 to 1/1/10
device(config-mif-1/1/1-1/1/10)# port-name connected-to-the nearest device
```

The following example assigns a name to multiple ports.

```
device(config)# interface ethernet 1/1/1 ethernet 1/1/5 ethernet 1/1/7
device(config-mif-1/1/1,1/1/5,1/1/7)# port-name connected-to-the nearest device
```

port-name (LAG)

Assigns a port name to an individual port in a LAG.

Syntax

port-name *name* **ethernet** *stackid/slot/port*

no port-name *name* **ethernet** *stackid/slot/port*

Command Default

A port name is not assigned to an individual port within a LAG.

Parameters

name

Specifies the name of an individual port in a LAG. The name can be up to 255 characters in length.

ethernet *stackid/slot/port*

Specifies the Ethernet port to which the name must be assigned.

Modes

LAG configuration mode

Usage Guidelines

When creating a port name in a LAG, you can use all uppercase or lowercase characters, as well as digits. Special characters (such as \$, %, ', -, ., @, ~, `!, (,), {, }, ^, #, and &) are valid. You can use spaces in the port name as long as you enclose the name in double quotation marks. For example, to specify a port name that contains spaces, enter a string similar to the following example: "a long and lengthy port name".

NOTE

A port name with spaces must be enclosed within double quotation marks.

The **no** form of the command removes the name assigned to the individual port.

Examples

The following example shows how to assign a name to a port in a LAG.

```
device(config)# lag "test" dynamic id 1
device(config-lag-test)# ports ethernet 1/1/1 to 1/1/3
device(config-lag-test)# port-name "Brocade lag" ethernet 1/1/1
device(config-lag-test)# primary-port 1/1/1
device(config-lag-test)# deploy
```

port security

Enters port security configuration mode.

Syntax

port security

Modes

Global configuration mode

Usage Guidelines

Use the **enable** command to enable port security.

Examples

The following example shows how to enter port security configuration mode.

```
device(config)# port security  
device(config-port-security)#
```

port-down-authenticated-mac-cleanup

Enables forced reauthentication of the hosts if all the ports on the device go down.

Syntax

port-down-authenticated-mac-cleanup

no port-down-authenticated-mac-cleanup

Command Default

Forced reauthentication of hosts is enabled.

Modes

Web Authentication configuration mode

Usage Guidelines

When the command is enabled, the device checks the link state of all ports that are members of the Web Authentication VLAN. If the state of all the ports is down, then the device forces all authenticated hosts to reauthenticate. However, hosts that were authenticated using the **add mac** command will remain authenticated; they are not affected by the **port-down-authenticated-mac-cleanup** command.

The **no** form of the command removes forced reauthentication of the hosts.

Examples

The following example enables forced reauthentication of all hosts when all the ports are down.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# port-down-authenticated-mac-cleanup
```

ports

Adds ports in a LAG.

Syntax

ports ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port to stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]

no ports ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port to stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]

Command Default

No ports are added to the LAG.

Parameters

ethernet *stackid/slot/port*

Adds an Ethernet interface to a LAG.

to *stackid/slot/port*

Adds a range of Ethernet interfaces to the LAG.

Modes

LAG configuration mode

Usage Guidelines

A static or dynamic LAG can have 1 to 8 or 1 to 12 ports (depending on the device you are using) of the same type and speed that are on any interface module within the Brocade chassis. A keep-alive LAG consists of only one port.

Ports can be added to an undeployed LAG or to a currently deployed LAG. When deleting ports from a currently deployed LAG, the primary port cannot be removed. If removal of a port will result in the trunk threshold value becoming greater than the number of ports in the LAG, the port deletion will be rejected. When you remove a port from a deployed LAG, the port is disabled automatically.

NOTE

When a port is deleted from a currently deployed LAG, the MAC address of the port is changed back to its original value.

NOTE

In an operational dynamic LAG, removing an operational port causes port flapping for all LAG ports. This may cause loss of traffic.

The **no** form of the command removes the ports from a LAG.

Examples

The following example shows how to configure a static LAG with two ports.

```
device(config)# lag blue static
device(config-lag-blue)# ports ethernet 1/3/1 ethernet 1/3/2
```

The following example adds a range of ports to the LAG.

```
device(config)# lag blue static
device(config-lag-blue)# ports ethernet 1/3/1 to 1/3/4
```

The following example adds a range of ports from one interface module and an individual port from another interface module to the LAG.

```
device(config)# lag blue static
device(config-lag-blue)# ports ethernet 1/3/1 to 1/3/4 ethernet 1/2/2
```

port-statistics-reset-timestamp enable

Enables the display of the elapsed timestamp information in the output of the **show statistics** command.

Syntax

port-statistics-reset-timestamp enable

no port-statistics-reset-timestamp enable

Command Default

The elapsed time after the recent reset of the port statistics counters is not displayed in the **show statistics** command output.

Modes

Global configuration mode

Usage Guidelines

The elapsed time is calculated as the time between the most recent reset of the port statistics counters and the time when the **show statistics** command is executed.

The **port-statistics-reset-timestamp enable** command enables the display of the elapsed timestamp information for all the ports in the output of the **show statistics** command.

The **no** form of the command removes the display of the elapsed time after the most recent reset of the port statistics counters in the **show statistics** command output.

Examples

The following example enables the display of the elapsed time between the most recent reset of the port statistics counters and the time when the **show statistics** command is executed.

```
device (config)# port-statistics-reset-timestamp enable
```

History

Release version	Command history
08.0.30	This command was introduced.

prefix-list

Associates an IPv6 prefix list with a Router Advertisement (RA) guard policy.

Syntax

prefix-list *name*
no prefix-list *name*

Parameters

name
Specifies the name of the IPv6 prefix list to associate with the RA guard policy.

Modes

RA guard policy configuration mode

Usage Guidelines

This command associates an IPv6 prefix list with an RA guard policy so that only the RAs that have the given prefix are forwarded. You must provide the name of an IPv6 prefix list already configured using the **ipv6 prefix-list** command. For more information on configuring an IPv6 prefix list using the **ipv6 prefix-list** command, see the *FastIron Ethernet Switch Layer 3 Routing Configuration Guide* .

Only one prefix list can be associated with an RA guard policy. If the command is configured twice with different prefix lists, the latest configured prefix list is associated with the RA guard policy.

no

Examples

The following example associates an IPv6 prefix list with an RA guard policy:

```
Brocade(config)# ipv6 prefix-list raguard-prefix1  
Brocade(config)# ipv6 raguard policy p1  
Brocade(config-ipv6-RAG-policy p1)# prefix-list raguard-prefix1
```

Related Commands

[neighbor prefix-list](#)

prefix-list (RIP)

Applies a pre-configured prefix list to permit or deny RIP routes globally.

Syntax

```
prefix-list name { in | out }  
no prefix-list name { in | out }  
ip rip prefix-list name { in | out }  
no ip rip prefix-list name { in | out }
```

Parameters

name

Specifies the pre-configured prefix list to be applied.

in

Applies the specified prefix list to routes the device learns from its neighbors.

out

Applies the specified prefix list to routes the device advertises to its neighbors.

Modes

RIP router configuration mode.

Usage Guidelines

The **no** form of the command removes the prefix filter.

Prefix lists must be configured with the **ip prefix-list** command before they are applied.

The **ip rip prefix-list** command can be used to apply a prefix list at the interface level.

Examples

The following command globally applies the prefix list named list1 to routes that the RIP router learns from its neighbors.

```
device# configure terminal  
device(config)# router rip  
device(config-rip-router)# prefix-list list1 in
```

preforwarding-time

Configures the preforwarding time interval, the time a port will remain in the preforwarding state before changing to the forwarding state.

Syntax

preforwarding-time *milliseconds*

no preforwarding-time *milliseconds*

Command Default

The default preforwarding time interval is 300 milliseconds.

Parameters

milliseconds

The preforwarding time interval in milliseconds. The range is from 200 through 500 milliseconds.

Modes

MRP configuration mode

Usage Guidelines

The preforwarding time interval must be at least twice the value of the hello time or a multiple of the hello time.

When MRP is enabled, all ports begin in the preforwarding state.

An interface changes from the preforwarding state to the forwarding state when the port preforwarding time expires. This occurs if the port does not receive a Ring Health Packet (RHP) from the master, or if the forwarding bit in the RHPs received by the port is off (indicating a break in the ring). The port heals the ring by changing its state to forwarding. If a member port in the preforwarding state does not receive an RHP within the preforwarding time, the port assumes that a topology change has occurred and changes to the forwarding state.

The secondary port on the master node changes to the blocking state if it receives an RHP, but changes to the forwarding state if the port does not receive an RHP before the preforwarding time expires. A member node preforwarding interface also changes from preforwarding to forwarding if it receives an RHP whose forwarding bit is on.

If Unidirectional Link Detection (UDLD) is also enabled on the device, Brocade recommends that you set the MRP preforwarding time slightly higher than the default of 300 ms; for example, to 400 or 500 ms.

The **no** form of the command sets the preforwarding time interval to the default.

Examples

The following example shows how to configure the preforwarding time to 400 milliseconds.

```
device(config)# vlan 2
device(config-vlan-2)# metro-ring 1
device(config-vlan-2-mrp-1)# preforwarding-time 400
```

pre-shared-key

Configures the pre-shared MACsec key on the interface.

Syntax

pre-shared-key *key-id* **key-name** *hex-string*

no pre-shared-key *key-id* **key-name** *hex-string*

Command Default

No pre-shared MACsec key is configured on the interface.

Parameters

key-id

Specifies the 32 hexadecimal value used as the Connectivity Association Key (CAK).

key-name *hex-string*

Specifies the name for the CAK key. Use from 2 through 64 hexadecimal characters to define the key name.

Modes

dot1x-mka interface mode

Usage Guidelines

The **no** form of the command removes the pre-shared key from the interface.

MACsec commands are supported only on the ICX 7450.

The pre-shared key is required for communications between MACsec peers.

Examples

The following example configures MKA group test1 and assigns the MACsec pre-shared key with a name beginning with 96437a93 and with the value shown, to port 2, slot 3 on the first device in the stack.

```
device(config)#dot1x-mka-enable
device(config-dot1x-mka)# mka-cfg-group test1
device(config-dot1x-mka-group-test1)# key-server-priority 5
device(config-dot1x-mka-group-test1)# macsec cipher-suite gcm-aes-128
device(config-dot1x-mka-group-test1)# macsec confidentiality-offset 30
device(config-dot1x-mka-group-test1)# exit
device(config-dot1x-mka)# enable-mka ethernet 1/3/2
device(config-dot1x-mka-1/3/2)# mka-group test1
device(config-dot1x-mka-1/3/2)# pre-shared-key 135bd758b0ee5c11c55ff6ab19fdb199 key-name
96437a93ccf10d9dfe347846cce52c7d
```

History

Release version	Command history
08.0.20	This command was introduced.
08.0.30	Support for this command was added on the ICX 7450 device.

prf

Configures a pseudorandom function (PRF) for an Internet Key Exchange version 2 (IKEv2) proposal.

Syntax

```
prf { sha256 | sha384 }  
no prf { sha256 | sha384 }
```

Command Default

The default algorithm is SHA-384.

Parameters

- sha256**
Specifies SHA-2 family 256-bit (HMAC variant) as the hash algorithm.
- sha384**
Specifies SHA-2 family 384-bit (HMAC variant) as the hash algorithm.

Modes

IKEv2 proposal configuration mode

Usage Guidelines

This hash algorithm is used to generate key material during IKEv2 SA negotiations.

Both algorithms may be configured for an IKEv2 proposal.

When only one PRF algorithm is configured for an IKEv2 proposal, removing it restores the default configuration.

The **no** form of the command removes the specified PRF algorithm configuration.

Examples

The following example shows how to configure SHA-256 as the hash algorithm for an IKEv2 proposal named ikev2_prop.

```
device(config)# ikev2 proposal ikev2_prop  
device(config-ikev2-proposal-ikev2_prop)# prf sha256
```

History

Release version	Command history
8.0.50	This command was introduced.

primary-port

Configures the primary port in a LAG.

Syntax

primary-port *stackid/slot/port*

no primary-port *stackid/slot/port*

Command Default

The primary-port is not configured.

Parameters

stackid/slot/port

Designates the primary port in a LAG.

Modes

LAG configuration mode

Usage Guidelines

Once a primary port has been configured for a LAG, all configurations that apply to the primary port are applied to the other ports in the LAG.

NOTE

The primary port configuration is only applicable for static or dynamic LAGs.

The **no** form of the command removes the primary port.

Examples

The following example shows how to designate a primary port.

```
device(config)# lag blue static
device(config-lag-blue)# primary-port 1/1/2
```

priority

Configures a priority value for the device. This value is used along with other factors to determine controller election if a stack failover or merge occurs.

Syntax

priority *num*

no priority

Command Default

The priority value for the active controller and standby device is 128.

Parameters

num

Possible values are 0 to 255. Lower values assign a lower priority to the device, and higher values assign a higher priority to the device.

Modes

Stack unit configuration mode

Usage Guidelines

The **no** form of the command restores the default priority value to the device (128). You do not have to specify the default value when using the **no** form.

A unit that has a relatively high priority value is more likely to be elected to be the active controller.

When you change the priority value assigned to a stack unit, the value takes effect immediately but does not affect the active controller until the next reset.

When the active and standby controller have the same priority value, other factors affect controller election, such as up-time and number of members controlled.

Examples

The following example assigns a priority value of 130 to stack unit 1.

```
device(Config)# stack unit 1  
device(Config-unit-1)# priority 130
```

History

Release version	Command history
08.0.01	This command was introduced.

priority-flow-control

Enables priority flow control (PFC) on a priority group.

Syntax

priority-flow-control *priority-group-number*

no priority-flow-control *priority-group-number*

Command Default

PFC is globally disabled

Parameters

priority-group-number

Specifies a priority group. The range is 0-3.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the default flow-control settings.

To enable global PFC, symmetrical-flow-control must be disabled.

You must enable PFC globally before you configure it for priority groups.

Enabling PFC on a priority group enables PFC on all the ports.

PFC and 802.3x flow control are mutually exclusive. Configuring the **priority-flow-control** command disables 802.3x in both transmit and receive directions.

PFC is not supported for ports across stack units on ICX 7750 devices.

PFC is not supported on ICX 7450 devices.

Examples

The following example enables PFC for a priority group:

```
Device(config)# priority-flow-control enable
Device(config)# priority-flow-control 2
```

History

Release version	Command history
8.0.10	This command was introduced.

Commands K - S
priority-flow-control

Release version	Command history
8.0.20	This command was modified. Specifying a priority group no longer enables PFC on all ports.

priority-flow-control enable

Enables priority flow control (PFC) globally or on an individual port.

Syntax

priority-flow-control enable

no priority-flow-control enable

Command Default

PFC is disabled (globally and on all ports).

Modes

Global configuration mode

Interface configuration mode

Usage Guidelines

In global configuration mode, the **no** form of this command restores the default flow-control settings. In interface configuration mode, the **no** form of the command disables PFC on the interface.

To enable global PFC, symmetrical-flow-control must be disabled.

You must enable PFC globally before you configure it for priority groups.

In global configuration mode, configuring the **priority-flow-control enable** command enables PFC globally; in interface configuration mode, configuring it enables PFC on a port. You can configure the **priority-flow-control enable** command in interface configuration mode to enable both PFC transmit and receive, that means PFC is both honored and generated. PFC must be enabled on at least one priority group before you can configure the **priority-flow-control enable** command on an interface.

Priority flow control and 802.3x flow control are mutually exclusive; therefore, configuring the **priority-flow-control enable** command disables 802.3x in both transmit and receive directions.

Examples

The following example enables PFC globally.

```
Device(config)# priority-flow-control enable
```

The following example enables PFC on an interface.

```
Device(config-if-e10000-1/1/1)# priority-flow-control enable
```

Commands K - S
priority-flow-control enable

History

Release version	Command history
8.0.10	This command was introduced.
8.0.20	This command was modified to add enabling PFC on a port.

privilege

Configures the management privilege access level of a command.

Syntax

privilege *command-mode* **level** *privilege-level* *command-string*

no privilege *command-mode* **level** *privilege-level* *command-string*

Parameters

command-mode

Specifies the command mode of the command for which you are enhancing the privilege access level.
Enter ? to see which interface subtypes are available.

level *privilege-level*

Specifies the number of the management privilege level you are augmenting.
Valid values are 0 for Super User level (full read-write access), 4 for Port Configuration level, and 5 for Read Only level.

command-string

Specifies the command you want to allow with the specified privilege level to enter.
Enter ? at the command prompt of a CLI level to display the list of commands at that level.

Modes

Global configuration mode.

Usage Guidelines

Each management privilege level provides access to specific areas of the CLI by default. You can grant additional access to a privilege level on an individual command basis. To grant the additional access, you specify the privilege level you are enhancing, the CLI level that contains the command, and the individual command.

Super User management privilege level provides access to all commands and displays. Port Configuration management privilege level gives access to the User EXEC level, Privileged EXEC level, the port-specific parts of the CONFIG level, and all interface configuration levels. Read Only management privilege level gives access to the User EXEC and Privileged EXEC levels.

NOTE

This command applies only to management privilege levels on the CLI.

The **no** form of the command removes the configurations and resets to default.

Examples

The following example shows how to enhance the Port Configuration privilege level so users also can enter IP commands at the global CONFIG level.

All users with Port Configuration privileges will have the enhanced access. Executing this command will enable users who log in with valid Port Configuration level user names and passwords to execute commands that start with "ip" at the global configuration level.

```
device(config)# privilege configure 4 ip
```

profile-config

Configures the port buffer, queue buffer, port descriptor, and queue descriptor for a port.

Syntax

profile-config { **port-buffers** *buffer-number* | **port-descriptors** *descriptor-number* | **port-type** { **0** | **1** | **2** | **3** } | **queue-buffers** *egress-queue-number* *buffer-number* | **queue-descriptors** *egress-queue-number* *descriptor-number* }

no profile-config { **port-buffers** *buffer-number* | **port-descriptors** *descriptor-number* | **port-type** { **0** | **1** | **2** | **3** } | **queue-buffers** *egress-queue-number* *buffer-number* | **queue-descriptors** *egress-queue-number* *descriptor-number* }

Command Default

The default port type is set to 1 Gbps.

The default buffers and descriptors are set according to the port type.

Parameters

port-buffers *buffer-number*

Configures the maximum buffer limit for the port.

port-descriptors *descriptor-number*

Configures the maximum descriptor limit for the port.

port-type

The port type for the user-configurable buffer profile.

0

Specifies the port type as 1 Gbps, 10 Gbps, or 40 Gbps.

1

Specifies the port type as 1 Gbps.

2

Specifies the port type as 10 Gbps.

3

Specifies the port type as 40 Gbps.

queue-buffers

Configures the maximum buffer limit for the queues.

egress-queue-number

Specifies the egress queue number (0 through 7).

buffer-number

Specifies the buffer number.

queue-descriptors

Configures the maximum descriptor limit for the queues.

descriptor-number

Specifies the descriptor number.

Modes

Buffer profile configuration mode

Usage Guidelines

To configure a user-configurable profile for 10 Gbps ports, the 10 Gbps port type must be explicitly provided by the **port-type** option. Modifications to buffers and descriptors of a port and its queues take effect dynamically.

When the profile type is configured as all 1 Gbps, 10 Gbps, and 40 Gbps ports, the default buffers and descriptors will be set according to the port type; that is, all 1 Gbps ports use 1 Gbps defaults and 10 Gbps ports use 10 Gbps defaults. If you configure a port and its queue with egress buffer and descriptor limits, then the configured limits are used for both 1 Gbps and 10 Gbps ports.

Port type modification resets the profile to its default value. All the port and queue buffers and descriptors will be set to either 1 Gbps or 10 Gbps defaults as per the configuration, which means all the user configurations for the port and its queues will be lost.

NOTE

Port type modifications on an active profile are not allowed.

The **no** form of the command with the **port-type** option sets the profile port type to 1 Gbps.

Examples

The following example sets the port type to 10 Gbps.

```
device(config)# qd-buffer-profile 1
device(qd-profile-1)# profile-config port-type 3
```

The following example configures the port buffers.

```
device(config)# qd-buffer-profile 1
device(qd-profile-profile1)# profile-config port-buffers 8000
```

The following example configures the port descriptors.

```
device(config)# qd-buffer-profile 1
device(qd-profile-profile1)# profile-config port-descriptors 8000
```

The following example configures the queue buffer.

```
device(config)# qd-buffer-profile 1
device(qd-profile-profile1)# profile-config queue-buffers 2 600
```

The following example configures the queue descriptors.

```
device(config)# qd-buffer-profile 1
device(qd-profile-profile1)# profile-config queue-descriptors 2 600
```

proposal (IKEv2)

Configures an Internet Key Exchange version 2 (IKEv2) proposal for an IKEv2 policy.

Syntax

proposal *name*

no proposal *name*

Command Default

The default IKEv2 proposal (**def-ike-prop**) is configured for an IKEv2 policy.

Parameters

name

Specifies the name of an IKEv2 proposal.

Modes

IKEv2 policy configuration mode

Usage Guidelines

At least one IKEv2 proposal must be configured for an IKEv2 policy.

Multiple IKEv2 proposals may be configured for an IKEv2 policy.

When only one IKEv2 proposal is configured for an IKEv2 policy, removing it restores the default configuration.

The **no** form of the command removes the specified IKEv2 proposal from the IKEv2 policy configuration.

Examples

The following example shows how to configure an IKEv2 proposal named `ikev2_proposal1` for an IKEv2 policy named `ikev2_policy1`.

```
device# configure terminal
device(config)# ikev2 policy ikev2_policy1
device(config-ike-policy-ikev2_policy1)# proposal ikev2_proposal1
```

History

Release version	Command history
8.0.50	This command was introduced.

proposal (IPsec)

Configures an IP security (IPsec) proposal for an IPsec profile.

Syntax

proposal *name*

no proposal *name*

Command Default

The default IPsec proposal (**def-ipsec-prop**) is configured for an IPsec profile.

Parameters

name

Specifies the name of an IPsec proposal.

Modes

IPsec profile configuration mode

Usage Guidelines

Multiple IPsec proposals may be configured for an IPsec profile.

When only one IPsec proposal is configured for an IPsec profile, removing it restores the default configuration.

The **no** form of the command removes the specified IPsec proposal from the IPsec profile configuration.

Examples

The following example shows how to configure an IPsec proposal named ipsec_proposal1 for an IPsec profile named ipsec_profile1.

```
device# configure terminal
device(config)# ipsec profile ipsec_profile1
device(config-ipsec-profile-ipsec_profile1)# proposal ipsec_proposal1
```

History

Release version	Command history
8.0.50	This command was introduced.

protected

Configures VRF traffic protection for an Internet Key Exchange version 2 (IKEv2) profile.

Syntax

protected *vrf*

no protected *vrf*

Parameters

vrf

Specifies the name of the VRF to be protected.

Modes

IKEv2 profile configuration mode

Usage Guidelines

When the tunnel VRF and the protected VRF do not match, an IKEv2 session is not initiated.

The **no** form of the command removes the specified VRF traffic protection configuration for the IKEv2 profile.

Examples

The following example shows how to configure an IKEv2 profile named test to protect traffic for a VRF named red.

```
device(config)# ikev2 profile test
device(config-ikev2-profile-test)# protected red
```

History

Release version	Command history
8.0.50	This command was introduced.

prune-timer

Configures the time a PIM device maintains a prune state for a forwarding entry.

Syntax

prune-timer *seconds*
no prune-timer *seconds*

Command Default

The prune time is 180 seconds.

Parameters

seconds

Specifies the interval in seconds. The range is 60 through 3600 seconds. The default is 180 seconds.

Modes

PIM router configuration mode

Usage Guidelines

The **no** form of this command restores the default prune time, 180 seconds.

The first received multicast interface is forwarded to all other PIM interfaces on the device. If there is no presence of groups on that interface, the leaf node sends a prune message upstream and stores a prune state. This prune state travels up the tree and installs a prune state. A prune state is maintained until the prune timer expires or a graft message is received for the forwarding entry.

Examples

This example configures a PIM prune timer to 90 seconds.

```
Device(config)# router pim
Device(config-pim-router)# prune-timer 90
```

prune-wait

Configures the time a PIM device waits before stopping traffic to neighbor devices that do not want the traffic.

Syntax

prune-wait *seconds*

no prune-wait

Command Default

The prune wait time is 3 seconds.

Parameters

seconds

Specifies the wait time in seconds. The range is 0 through 30 seconds. The default is 3 seconds.

Modes

PIM router configuration mode

Usage Guidelines

A smaller prune wait value reduces flooding of unwanted traffic. A prune wait value of 0 causes the PIM device to stop traffic immediately upon receiving a prune message.

If there are two or more neighbors on the physical port, you should not configure the **prune-wait** command because one neighbor may send a prune message while the other sends a join message at the same time, or within less than 3 seconds.

The **no** form of this command restores the default prune wait time of 3 seconds.

Examples

This example configures the prune wait time to 0 seconds.

```
device(config)# router pim
device(config-pim-router)# prune-wait 0
```

pvlan mapping

Identifies the other PVLANS for which the VLAN is the primary.

Syntax

pvlan mapping *vlan-id* **ethernet** *stackid/slot/port*

no pvlan mapping *vlan-id* **ethernet** *stackid/slot/port*

Command Default

PVLAN mapping is not configured.

Parameters

vlan-id

Specifies the other configured PVLAN.

ethernet *stackid/slot/port*

Specifies the primary VLAN port to which you are mapping all the ports in the other PVLAN (the one specified by *vlan-id*).

Modes

VLAN configuration mode

Usage Guidelines

The command also specifies the primary VLAN ports to which you are mapping the other secondary VLANs. A primary VLAN can have multiple ports. All these ports are active, but the ports that will be used depends on the PVLAN mappings. Also, secondary VLANs (isolated and community VLANs) can be mapped to one primary VLAN port.

The **no** form of the command disables the PVLAN mapping.

Examples

The following example shows how to configure PVLAN mapping.

```
device(config)# vlan 7
device(config-vlan-7)# untagged ethernet 1/3/2
device(config-vlan-7)# pvlan type primary
device(config-vlan-7)# pvlan mapping 901 ethernet 1/3/2
```

pvlan pvlan-trunk

Identifies the inter-switch link for the PVLAN.

Syntax

pvlan pvlan-trunk *num* **ethernet** *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*]...]

no pvlan pvlan-trunk *num* **ethernet** *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*]...]

Command Default

The inter-switch link for the primary VLAN is not configured.

Parameters

num

Specifies the VLAN ID.

ethernet *stackid/slot/port*

Configures the specified Ethernet port as the inter-switch link.

to *stackid/slot/port*

Configures a range of specified Ethernet ports as the inter-switch links.

Modes

VLAN configuration mode

Usage Guidelines

As with regular VLANs, PVLANS can span multiple switches. The PVLAN is treated like any other VLAN by the PVLAN-trunk ports. The PVLAN-trunk port is added to both the primary and the secondary VLANs as a tagged member through the **pvlan-trunk** command.

The **no** command deletes the inter-switch link for the primary VLAN.

Examples

The following example shows how to identify inter-switch link in the PVLAN.

```
device(config)# vlan 100
device(config-vlan-100)# tagged ethernet 1/1/10 to 1/1/11
device(config-vlan-100)# untagged ethernet 1/1/4
device(config-vlan-100)# pvlan type primary
device(config-vlan-100)# pvlan mapping 101 ethernet 1/1/4
device(config-vlan-100)# pvlan mapping 102 ethernet 1/1/4
device(config-vlan-100)# pvlan pvlan-trunk 101 ethernet 1/1/10 to 1/1/11
```

pvlan type

Configures the PVLAN as a primary, isolated, or community PVLAN.

Syntax

pvlan type { **community** | **isolated** | **primary** }

no pvlan type { **community** | **isolated** | **primary** }

Command Default

The PVLAN type is not configured.

Parameters

community

Creates a community PVLAN.

isolated

Creates an isolated PVLAN.

primary

Creates a primary PVLAN.

Modes

VLAN configuration mode

Usage Guidelines

The command configures the following PVLAN types:

- Community - Broadcasts and unknown unicasts received on community ports are sent to the primary port and also are flooded to the other ports in the community VLAN.
- Isolated - Broadcasts and unknown unicasts received on isolated ports are sent only to the primary port. They are not flooded to other ports in the isolated VLAN
- Primary - The primary PVLAN ports are "promiscuous". They can communicate with all the isolated PVLAN ports and community PVLAN ports in the isolated and community VLANs that are mapped to the promiscuous port.

For the primary VLAN, map the other PVLANs to the ports in the primary VLAN. VLAN identifiers configured as part of a PVLAN (primary, isolated, or community) should be consistent across the switched network. The same VLAN identifiers cannot be configured as a normal VLAN or a part of any other PVLAN.

LAG ports are not allowed as member ports of an isolated VLAN or community VLAN.

The **no** form of the command disables the PVLAN type.

Examples

The following example shows how to configure the community PVLAN.

```
device(config)# vlan 901
device(config-vlan-901)# untagged ethernet 1/3/5 to 1/3/6
device(config-vlan-901)# pvlan type community
```

The following example shows how to configure a primary PVLAN.

```
device(config)# vlan 7
device(config-vlan-7)# untagged ethernet 1/3/2
device(config-vlan-7)# pvlan type primary
```

History

Release version	Command history
8.0.50	This command was modified.

pvst-mode

Enable PVST+ support on a port immediately.

Syntax

pvst-mode

no pvst-mode

Command Default

PVST+ support is automatically enabled when the port receives a PVST BPDU.

Modes

Interface configuration mode

Usage Guidelines

If you disable PVST+ support, the software still automatically enables PVST+ support if the port receives a BPDU with the PVST+ format.

The **no** form of the command disables the PVST+ support.

Examples

The following example shows how to enable the PVST+ mode.

```
device(config)# interface ethernet 1/1/1  
device(config-if-e1000-1/1/1)# pvst-mode
```

qd-buffer

Configures the port buffers.

Syntax

qd-buffer *device-num* *buffer-profile* *queue-depth* [*priority-queue*]

no qd-buffer *device-num* *buffer-profile* *queue-depth* [*priority-queue*]

Command Default

Port buffers are not configured.

Parameters

device-num

Specifies the device in the stacking unit. The device number starts from 1.

buffer-profile

Specifies the buffer profile: 1 for 1-Gbps ports, 2 for 10-Gbps ports, and 3 for VoIP ports.

queue-depth

Specifies the number of buffers to allocate.

priority-queue

Specifies the queue of the port. The range is from 0 through 7.

Modes

Global configuration mode

Usage Guidelines

The minimum limit for port buffers is 16. The maximum limit for the port buffer depends on the hardware device.

The **no** form of the command deletes the port buffers.

Examples

The following example configures the port buffers.

```
device(config)# qd-buffer 1 2 76
```

The following example configures the queue buffers.

```
device(config)# qd-buffer 1 2 76 2
```

qd-descriptor

Configures the allowable port descriptors.

Syntax

qd-descriptor *device-num* *buffer-profile* *num-of-descriptors* [*priority-queue*]

no qd-descriptor *device-num* *buffer-profile* *num-of-descriptors* [*priority-queue*]

Command Default

Port descriptors are not configured.

Parameters

device-num

Specifies the device in the stacking unit. The device number starts from 0.

buffer-profile

Specifies the buffer profile. 1 for 1-Gbps ports and 2 for 10-Gbps ports.

num-of-descriptors

Specifies the number of descriptors to allocate.

priority-queue

Specifies the queue of the port. The range is from 0 through 7.

Modes

Global configuration mode

Usage Guidelines

Port descriptors set the limit for the ports. The minimum limit for port descriptors is 16. The maximum limit of the port descriptors depends on the hardware device. The minimum limit for queue descriptors is 16. The system default queue descriptors are different for different platforms.

The **no** form of the command deletes the port descriptors.

Examples

The following example configures the port descriptors.

```
device(config)# qd-descriptor 1 2 76
```

The following example configures the queue descriptors.

```
device(config)# qd-descriptor 1 2 76 2
```

qos sflow-set-cpu-rate-limit

Sets the CPU rate limit for sFlow.

Syntax

qos sflow-set-cpu-rate-limit *packet-rate burst-size*

no qos sflow-set-cpu-rate-limit *packet-rate burst-size*

Command Default

A CPU rate limit for sFlow is configured with the default values of 100 sFlow sampled packets per second (PPS) and a burst size of 5000 B.

Parameters

packet-rate

Specifies the number of sFlow sampled PPS into the CPU. The value is measured in PPS and ranges from 1 to 1000.

burst-size

Specifies the burst size. The value is measured in bytes and ranges from 1 to 99999.

Modes

Global configuration mode

Usage Guidelines

If the burst size is set low more packets are subject to rate limiting. If the burst size is set too high fewer packets are subject to rate limiting.

You should not set the burst size less than 10 times the maximum transmission unit of the traffic.

The recommended settings are 1000 PPS with a maximum burst size of 5000 B.

The **no** form of this command returns the device to the default CPU rate limit for sFlow.

Examples

The following example uses the recommended settings to configure the CPU rate limit for sFlow.

```
device(config)# qos sflow-set-cpu-rate-limit 1000 5000
```

To view the CPU rate limit for sFlow use the following command.

```
device(config)# show qos sflow-rate-limit
Queue-Num      Rate-Limit      Burst-Size
Queue13        1000            5000
device(config)#
```

History

Release version	Command history
8.0.40	This command was introduced.

qos egress-buffer-profile

Configures an egress buffer profile.

Syntax

qos egress-buffer-profile *user-profile-name* **queue-share-level** *level* *queue-number*

no qos egress-buffer-profile *user-profile-name* **queue-share-level** *level* *queue-number*

Command Default

The egress buffer profile is:

Queue	Share level
0	level4-1/9
1	level3-1/16
2	level3-1/16
3	level3-1/16
4	level3-1/16
5	level3-1/16
6	level3-1/16
7	level3-1/16

Parameters

user-profile-name

Specifies the name of the egress buffer profile to be configured.

queue-share-level *level*

Specifies the number of buffers that can be used in a sharing pool. Eight levels are supported.

queue-number

Specifies the queue to apply the buffer limit to. There are eight hardware queues per port.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command deletes the egress buffer profile.

You can attach an egress buffer profile to a port.

You must configure the **no qos egress-buffer-profile** command to detach a profile from any ports that are using it before you can configure the **no qos egress-buffer-profile** command to delete it.

The higher the sharing level, the better the port absorb micro-burst. However, higher-sharing levels of 7 and 8 may compromise QoS functions and create uneven distribution of traffic during periods of congestion.

The following eight queue-share levels are supported:

Level	Sharing-pool buffers
level1-1/64	1/64 of buffers in the sharing pool
level2-1/32	1/32 of buffers in the sharing pool
level3-1/16	1/16 of buffers in the sharing pool
level4-1/9	1/9 of buffers in the sharing pool
level5-1/5	1/5 of buffers in the sharing pool
level6-1/3	1/3 of buffers in the sharing pool
level7-1/2	1/2 of buffers in the sharing pool
level8-2/3	2/3 of buffers in the sharing pool

Examples

The following example creates an egress buffer profile named port-40G.

```
Device(config)# qos egress-buffer-profile port-40G queue-share-level
  level1-1/64 1/64 of buffers in the sharing pool
  level2-1/32 1/32 of buffers in the sharing pool
  level3-1/16 1/16 of buffers in the sharing pool
  level4-1/9  1/9 of buffers in the sharing pool
  level5-1/5  1/5 of buffers in the sharing pool
  level6-1/3  1/3 of buffers in the sharing pool
  level7-1/2  1/2 of buffers in the sharing pool
  level8-2/3  2/3 buffers in the sharing pool
```

The following example configures queue 0 on the egress buffer profile named port-40G to use 1/5 of sharing pool.

```
Device(config)# qos egress-buffer-profile port-40G port-40G queue-share-level level5-1/5 0
```

The following example configures queue 1 on the egress buffer profile named port-40G to use 1/64 of the sharing pool.

```
Device(config)# qos egress-buffer-profile port-40G port-40G queue-share-level level1-1/64 1
```

The following example attaches the egress buffer profile named port-40G to ports 1/2/1 to 1/2/6.

```
Device(config)# interface ethernet 1/2/1 to 1/2/6
Device(config-mif-1/2/1-1/2/6)#egress-buffer-profile port-40G
Device(config-mif-1/2/1-1/2/6)#end
```

The following example shows the error if you try to delete a profile that is attached to a port.

```
Device(config)# no qos egress-buffer-profile port-40G
Error - Egress Profile port-40G is active on Port 1/2/1. It must be deactivated from port before deleting.
```

The following example detaches the egress buffer profile named port-40G from ports 1/2/1 to 1/2/6 and then delete the profile.

```
Device(config)# interface ethernet 1/2/1 to 1/2/6
Device(config-mif-1/2/1-1/2/6)# no egress-buffer-profile port-40G
Device(config-mif-1/2/1-1/2/6)#exit
Device(config)# no qos egress-buffer-profile port-40G
```

History

Release version	Command history
8.0.10	This command was introduced.

qos ingress-buffer-profile

Configures an ingress buffer profile.

Syntax

qos ingress-buffer-profile *user-profile-name* **priority-group** *priority-group-number* **xoff** *shared-level*
no qos ingress-buffer-profile *user-profile-name* **priority-group** *priority-group-number* **xoff** *shared-level*

Command Default

An ingress buffer profile is not configured.

Parameters

user-profile-name

Specifies the name of the ingress buffer profile to be configured.

priority-group *priority-group-number*

Specifies the priority group (PG) number whose XOFF threshold level has to be configured.

xoff *shared-level*

Specifies the per-PG buffer threshold to trigger sending of priority flow control (PFC).

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command deletes the ingress buffer profile.

You can attach an ingress buffer profile to a port.

You must configure the **no qos ingress-buffer-profile** command to detach a profile from any ports that are using it before you can configure the **no qos ingress-buffer-profile** command to delete it.

The higher the sharing level, the better the port absorbs micro-bursts, before reaching the XOFF threshold limit.

If PFC is enabled on PG and per-port with a user-defined ingress buffer profile attached to a port, port max XOFF is 50% of service pool 1. Port max is used as a cap to prevent a port from using too many buffers. Under normal conditions, the PG XOFF limit is reached first.

If a PG is not enabled to send globally, any XOFF value configured has no effect.

The default ingress buffer profiles are as follows:

- For PFC disabled ports, the default PG XOFF limit is level7-1/2
- For PFC enabled ports, the default PG XOFF limit is level2-1/32

The following six PG XOFF limits are supported:

Level	Sharing-pool buffers
level1-1/64	1/64 of buffers in the sharing pool
level2-1/32	1/32 of buffers in the sharing pool
level3-1/16	1/16 of buffers in the sharing pool
level4-1/9	1/9 of buffers in the sharing pool
level5-1/5	1/5 of buffers in the sharing pool
level6-1/3	1/3 of buffers in the sharing pool

Examples

The following example creates an ingress buffer profile for PG 0 with a PG XOFF limit of 1/3 of buffers in the sharing pool.

```
Device(config)#qos ingress-buffer-profile ing1 priority-group 0 xoff level6-1/3
```

History

Release version	Command history
8.0.20	This command was introduced.

qos-internal-trunk-queue

Modifies the dynamic buffer-share level of inter-packet-processor (inter-pp) HiGig links egress queues on ICX 7450 devices.

Syntax

qos-internal-trunk-queue *level queue*

no qos-internal-trunk-queue *level queue*

Command Default

The buffer share level defaults are:

Queue	Share level
0	level4-1/9
1	level3-1/16
2	level3-1/16
3	level3-1/16
4	level3-1/16
5	level3-1/16
6	level3-1/16
7	level3-1/16

Parameters

level

Specifies the number of buffers that can be used in a sharing pool. ICX 7450 devices support eight levels.

queue

Specifies the queue to apply the buffer limit to. Each port has eight hardware queues.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the default queue share level on the specified queue.

NOTE

This command is supported only on ICX 7450 devices or across stack units or for ports across master and slave packet-processor (pp) devices in ICX7450-48 units.

The following eight queue-share levels are supported:

Level	Sharing-pool buffers
level1-1/64	1/64 of buffers in the sharing pool
level2-1/32	1/32 of buffers in the sharing pool
level3-1/16	1/16 of buffers in the sharing pool
level4-1/9	1/9 of buffers in the sharing pool
level5-1/5	1/5 of buffers in the sharing pool
level6-1/3	1/3 of buffers in the sharing pool
level7-1/2	1/2 of buffers in the sharing pool
level8-2/3	2/3 of buffers in the sharing pool

Examples

The following example configures the buffer share level of inter-packet-processor (inter-pp) HiGig links egress queues.

```
ICX7450-48P Router(config)#qos-internal-trunk-queue
  level1-1/64  1/64 of buffers in the sharing pool
  level2-1/32  1/32 of buffers in the sharing pool
  level3-1/16  1/16 of buffers in the sharing pool
  level4-1/9   1/9 of buffers in the sharing pool
  level5-1/5   1/5 of buffers in the sharing pool
  level6-1/3   1/3 of buffers in the sharing pool
  level7-1/2   1/2 of buffers in the sharing pool
  level8-2/3   2/3 buffers in the sharing pool
```

History

Release version	Command history
08.0.20	This command was introduced.

qos mechanism

Configures the Quality of Service (QoS) queuing method.

Syntax

qos mechanism { **strict** | **weighted** | **mixed-sp-wrr** }

no qos mechanism { **strict** | **weighted** | **mixed-sp-wrr** }

Command Default

By default, devices use the Weighted Round Robin (WRR) method of packet prioritization. WRR ensures that all queues are serviced during each cycle

Parameters

strict

Changes the method to strict order scheduling (Strict Priority (SP)).

weighted

Changes the method to weighted scheduling (WRR).

mixed-sp-wrr

Changes the method to both strict scheduling and weighted scheduling.

Modes

Global configuration mode

Usage Guidelines

By default, when you select the combined Strict Priority (SP) and WRR queueing method, the device assigns strict priority to traffic in qosp6 and qosp7 and weighted round robin priority to traffic in qosp0 through qosp5.

The **no** form of the command configures the device to use the WRR method of packet prioritization.

Examples

The following example shows changes the method to strict priority scheduling.

```
device(config)# qos mechanism strict
```

qos name

Renames the queue.

Syntax

```
qos name old-name new-name
```

Command Default

The default queue names are qosp7, qosp6, qosp5, qosp4, qosp3, qosp2, qosp1, and qosp0.

Parameters

old-name

Specifies the name of the queue before the change.

new-name

Specifies the new name of the queue. The name can be an alphanumeric string up to 32 characters long.

Modes

Global configuration mode

Examples

The following example renames the queue qosp3 to 92-octane.

```
device(config)# qos name qosp3 92-octane
```

qos priority-to-pg

Configures priority-to-priority-group (PG) mapping for priority flow control (PFC).

Syntax

qos priority-to-pg qosp0 *priority-PG-map* **qosp1** *priority-PG-map* **qosp2** *priority-PG-map* **qosp3** *priority-PG-map* **qosp4** *priority-PG-map* **qosp5** *priority-PG-map* **qosp6** *priority-PG-map* **qosp7** *priority-PG-map*

no qos priority-to-pg

Command Default

Priority-to-PG mapping is not configured.

Parameters

qosp0-7

Configures the internal priority based on classification in the range 0 through 7.

priority-PG-map

Specifies the internal priority-to-PG mapping. The range is 0 through 3.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the default priority-to-PG map.

You must configure the **priority-flow-control enable** command to enable PFC globally before you configure priority-to-PG mapping.

NOTE

Default mapping, mapping priorities, and mapping restrictions changed in Brocade FastIron Release 8.0.20. The following restrictions apply:

- Priority 7, and only Priority 7, is always mapped to PG4.
- PG4 is always lossy.
- PFC cannot be enabled on PG4.
- Priorities 0 to 5 can be mapped to PG0, PG1, and PG2. They cannot be mapped to PG3 or PG4.

The default value of priority-to-PG maps is:

- QoS internal priority 0 is mapped to PG 0
- QoS internal priority 1 is mapped to PG 0
- QoS internal priority 2 is mapped to PG 1
- QoS internal priority 3 is mapped to PG 1

- QoS internal priority 4 is mapped to PG 1
- QoS internal priority 5 is mapped to PG 2
- QoS internal priority 6 is mapped to PG 2
- QoS internal priority 7 is mapped to PG 4

The default value of priority-to-PG maps in releases prior to Release 8.0.20 is:

- QoS internal priority 0 is mapped to PG 0
- QoS internal priority 1 is mapped to PG 0
- QoS internal priority 2 is mapped to PG 1
- QoS internal priority 3 is mapped to PG 1
- QoS internal priority 4 is mapped to PG 1
- QoS internal priority 5 is mapped to PG 2
- QoS internal priority 6 is mapped to PG 2
- QoS internal priority 7 is mapped to PG 2

In releases prior to Release 8.0.20, you can map QoS internal priority 7 to PG 3. You can also map any other priority to PG 3 if it meets these requirements:

- Lower priorities mapped to lower PGs.
- PGs are configured in ascending order.
- Multiple priorities in a single PG must be consecutive.

Priority-to-PG mapping is not configurable in other modes. Symmetrical and asymmetrical 802.3x flow control modes have their own default priority-to-PG mapping.

You must configure PGs in ascending order, 0 to 3. You can configure a higher-order PG only if all the lower-order PGs have some mapped priorities.

Examples

The following example configures a priority-to-PG map.

```
Device(config)# priority-flow-control enable
Device(config)# qos priority-to-pg qosp0 0 qosp1 1 qosp2 1 qosp3 1 qosp4 2 qosp5 2 qosp6 2 qosp7 4
```

The following example restores the default priority-to-PG map.

```
Device(config)# no qos priority-to-pg qosp0 0 qosp1 1 qosp2 1 qosp3 1 qosp4 2 qosp5 2 qosp6 2 qosp7 4
```

History

Release version	Command history
8.0.10	This command was introduced.
8.0.20	This command was modified to change priority 7-to-PG4 mapping and mapping restrictions for priorities 0 through 5.

qos profile

Changes the minimum bandwidth percentages of the eight Weighted Round Robin (WRR) queues.

Syntax

```
qos profile { name7 { sp | percentage } ... name0 { sp | percentage }
```

```
no qos profile { name7 { sp | percentage } ... name0 { sp | percentage }
```

Command Default

The eight QoS queues on FastIron devices receive the minimum guaranteed percentages of a port's total bandwidth, as shown in the following table. Note that the defaults differ when jumbo frames are enabled.

Parameters

name

Specifies the name of a queue. You can specify the queues in any order on the command line, *but you must specify each queue.*

sp

Changes the method to strict priority scheduling.

percentage

Specifies the percentage of the device outbound bandwidth that is allocated to the queue. QoS queues require a minimum bandwidth percentage of 3 percent for each priority. When jumbo frames are enabled, the minimum bandwidth requirement is 8 percent. If these minimum values are not met, QoS may not be accurate.

Modes

Global configuration mode

Usage Guidelines

When the queuing method is WRR, the software internally translates the percentages into weights. The weight associated with each queue controls how many packets are processed at a given stage through the weighted round robin algorithm.

TABLE 7 Default minimum bandwidth percentages

Queue	Default minimum percentage of bandwidth	
	Without jumbo frames	With jumbo frames
qosp7	75%	44%
qosp6	7%	8%
qosp5	3%	8%
qosp4	3%	8%
qosp3	3%	8%
qosp2	3%	8%

TABLE 7 Default minimum bandwidth percentages (continued)

Queue	Default minimum percentage of bandwidth	
qosp1	3%	8%
qosp0	3%	8%

The **no** form of the command restores the default bandwidth percentages.

Examples

The following example changes the bandwidth percentages for the queues.

```
device(config)# qos profile qosp7 25 qosp6 15 qosp5 12 qosp4 12 qosp3 10 qosp2
10 qosp1 10 qosp0 6
```

```
Profile qosp7 : Priority7 bandwidth requested 25% calculated 25%
Profile qosp6 : Priority6 bandwidth requested 15% calculated 15%
Profile qosp5 : Priority5 bandwidth requested 12% calculated 12%
Profile qosp4 : Priority4 bandwidth requested 12% calculated 12%
Profile qosp3 : Priority3 bandwidth requested 10% calculated 10%
Profile qosp2 : Priority2 bandwidth requested 10% calculated 10%
Profile qosp1 : Priority1 bandwidth requested 10% calculated 10%
Profile qosp0 : Priority0 bandwidth requested 6% calculated 6%
```

qos scheduler-profile

Configures a user-defined Quality of Service (QoS) scheduler profile.

Syntax

```
qos scheduler-profile user-profile-name { mechanism scheduling-mechanism | profile [ qosp0 wt0 | qosp1 wt1 | qosp2 wt2 | qosp3 wt3 | qosp4 wt4 | qosp5 wt5 | qosp6 wt6 | qosp7 wt7 ] }
```

```
no qos scheduler-profile user-profile-name
```

Command Default

A user-defined QoS scheduler profile is not configured.

Parameters

user-profile-name

Specifies the name of the scheduler profile to be configured.

mechanism *scheduling-mechanism*

Configures the queue assignment with the specified scheduling mechanism. The following scheduling mechanisms are supported:

mixed-sp-wrr

Specifies mixed strict-priority (SP) and weighted scheduling.

strict

Specifies SP scheduling.

weighted

Specifies weighted scheduling.

profile **qosp0-7**

Configures the profile based on classification in the range 0 through 7.

wt0-7

Specifies the bandwidth percentage for the corresponding QoS profile. The range is from 0 through 7.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command removes the scheduler profile configuration.

You can use the **scheduler-profile** command to attach a user scheduler profile to a port. If you want to remove a scheduler-profile you must ensure that it is not attached to any port.

On ICX 7750 and ICX 7450 devices, changing the global scheduler and port scheduler on running traffic may cause traffic loss.

The default QoS-profile weights for each queue using a weighted QoS mechanism are as follows:

Profile	Priority	Weighted bandwidth
Profile qosp7	Priority7(Highest)	Bandwidth requested 44% calculated 44%
Profile qosp6	Priority6	Bandwidth requested 8% calculated 8%
Profile qosp5	Priority5	Bandwidth requested 8% calculated 8%
Profile qosp4	Priority4	Bandwidth requested 8% calculated 8%
Profile qosp3	Priority3	Bandwidth requested 8% calculated 8%
Profile qos2	Priority2	Bandwidth requested 8% calculated 8%
Profile qosp1	Priority1	Bandwidth requested 8% calculated 8%
Profile qosp0	Priority0 (Lowest)	Bandwidth requested 8% calculated 8%

Per-queue details	Bandwidth percentage
Class 0	3
Class 1	3
Class 2	3
Class 3	3
Class 4	3
Class 5	3
Class 6	7
Class 7	75

The default QoS-profile weights for each queue using a mixed QoS mechanism are as follows:

Per-queue details	Bandwidth percentage
Class 0	15
Class 1	15
Class 2	15
Class 3	15
Class 4	15
Class 5	25
Class 6	sp
Class 7	sp

The total weight (wt0-wt7) in both weighted and mixed mechanism must be 100 percent.

The minimum value for any weight is 1.

A maximum of eight scheduler profiles are supported.

Examples

The following example configures a QoS scheduler profile named user1, with weighted scheduling, and specify the bandwidth percentage for each QoS class:

```
Device(config)# qos scheduler-profile user1 mechanism weighted
Device(config)# qos scheduler-profile user1 profile qosp0 1 qosp1 1 qosp2 10 qosp3 10 qosp4 10 qosp5 10
qosp6 20 qosp7 38
```

The following example configures a QoS scheduler profile named user2, with SP scheduling.

```
Device(config)# qos scheduler-profile user2 mechanism strict
```

The following example configures a QoS scheduler profile named user3, with mixed SP and weighted scheduling.

```
Device(config)# qos scheduler-profile user3 mechanism mixed-sp-wrr
```

The following example removes a QoS scheduler profile named user3.

```
Device(config)# no qos scheduler-profile user3
```

History

Release version	Command history
08.0.10	This command was introduced.

qos tagged-priority

Changes the VLAN priority of 802.1p to hardware forwarding queue mappings.

Syntax

qos tagged-priority *num queue*

no qos tagged-priority *num queue*

Parameters

num

Specifies the VLAN priority. The value can range from 0 to 7.

queue

Specifies the hardware forwarding queue on which you are reassigning the priority. The default queue names are as follows: qosp7, qosp6, qosp5, qosp4, qosp3, qosp2, qosp1, qosp0.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command sets the VLAN priority to 802.1p.

Examples

The following example maps VLAN priority 2 to hardware forwarding queue qosp0.

```
device(config)# qos tagged-priority 2 qosp0
```

qos-tos map dscp-priority

Changes the differentiated Services Code Point (DSCP)-to-internal-forwarding-priority mappings.

Syntax

qos-tos map dscp-priority *dscp-value1* [...*dscp-value8*] **to** *priority*

no qos-tos map dscp-priority *dscp-value1* [...*dscp-value8*] **to** *priority*

Command Default

Refer the Usage Guidelines.

Parameters

dscp-value

Specifies the DSCP value ranges that you are remapping. You can map up to eight DSCP values to the same forwarding priority in the same command.

to

Configures the DSCP value to the new internal forwarding priority.

priority

Specifies the internal forwarding priority.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command restores the default value.

TABLE 8 Default DSCP-to-internal-forwarding-priority mappings

Internal forwarding priority	DSCP value
0 [lowest priority queue]	0-7
1	8-15
2	16-23
3	24-31
4	32-39
5	40-47
6	48-55
7 [highest priority queue]	56-63

DSCP values range from 0 through 63, whereas the internal forwarding priority values range from 0 through 7. Any DSCP value within a given range is mapped to the same internal forwarding priority value. For example, any DSCP value from 8 through 15 maps to priority 1.

Examples

The following example changes the DSCP-to-internal-forwarding-priority mappings.

```
device(config)# qos-tos map dscp-priority 0 2 3 4 to 1
```

radius-client coa host

Configures the key to be used between the Change of Authorization (CoA) client and FastIron device.

Syntax

radius-client coa host { *addr* | *name* } [**key** *key-string*]
no radius-client coa host { *addr* | *name* } [**key** *key-string*]

Command Default

No key is configured between the CoA client and device.

Parameters

- addr*
Address of the CoA host.
- name*
Name of the CoA host.
- key** *key-string*
The key required to be used between the CoA client and FastIron device.

Modes

Global configuration mode

Usage Guidelines

no

RADIUS Change of Authorization (CoA) messages from clients configured through this command will be processed. CoA messages from unconfigured clients will be discarded.

Examples

The following example displays the configuration between CoA host and the device.

```
device(config)# radius-client coa host 10.21.240.46 key 0 Foundry1#
```

History

Release version	Command history
08.0.20	This command was introduced.

radius-client coa port

Changes the default CoA (Change of Authorization) port number.

Syntax

radius-client coa port *udp-port-number*

no radius-client coa port *udp-port-number*

Command Default

The CoA port number is 3799.

Parameters

udp-port-number

The number of the UDP port.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command restores the default port number (3799).

Examples

The following example changes the CoA port number to 3000.

```
device(config)# radius-client coa port 3000
```

History

Release version	Command history
08.0.20	This command was introduced.

radius-server accounting

Configures to send interim updates of accounting messages to the RADIUS server at regular intervals..

Syntax

```
radius-server accounting { interim-updates | interim-interval value }  
no radius-server accounting { interim-updates | interim-interval value }
```

Command Default

Accounting updates are disabled. The default interim interval is zero.

Parameters

interim-updates

Enables the interim accounting updates.

interim-interval *value*

Sets the interval between each interim update. Default value is 0. The range of valid values is from 5 through 1440 minutes.

Modes

Global configuration mode

Usage Guidelines

The RADIUS accounting for 802.1X authentication and MAC authentication accepts either the interim update interval value configured using the RADIUS attribute or the interval time value set on the device, whichever is higher.

The **no** form of the command resets the feature to the default values.

Examples

The following example enables interim updates and set accounting update intervals for 802.1X authentication accounting and MAC authentication accounting as 10 minutes.

```
device# configure terminal  
device(config)# radius-server accounting interim-updates  
device(config)# radius-server accounting interim-interval 10
```

History

Release version	Command history
08.0.50	This command was introduced.

radius-server dead-time

Configures the interval at which the test user message is sent to the server to check the status of non-responding servers that are marked as dead.

Syntax

radius-server dead-time *time*

no radius-server dead-time *time*

Command Default

RADIUS dead time is not enabled.

Parameters

time

The time interval between successive server requests to check the availability of the RADIUS server in minutes. The valid values are from 1 through 5 minutes.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command removes the dead time interval.

Examples

The following example configures the RADIUS server dead time as four minutes.

```
device(config)# radius-server deadtime 4
```

radius-server enable

Configures the device to allow RADIUS server management access only to clients connected to ports within the port-based VLAN.

Syntax

radius-server enable vlan *vlan-number*

no radius-server enable vlan *vlan-number*

Command Default

By default, access is allowed on all ports.

Parameters

vlan *vlan-number*

Configures access only to clients connected to ports within the VLAN.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command removes the restriction.

You can restrict management access to a Brocade device to ports within a specific port-based VLAN. VLAN-based access control works in conjunction with other access control methods. Clients connected to ports that are not in the VLAN are denied management access.

Examples

The following example shows how to allow RADIUS server access only to clients in a specific VLAN.

```
device(config)# radius-server enable vlan 10
```

ssl-auth-port *port-num*

Specifies that the server is a RADIUS server running over a TLS-encrypted TCP session. Only one of auth-port or ssl-auth-port can be specified. If neither is specified, it defaults to the existing default behavior, which uses the default auth-port of 1812 and 1813 for accounting with no TLS encryption. The default destination port number for RADIUS over TLS is TCP/2083. There are no separate ports for authentication, accounting, and dynamic authorization changes. The source port is arbitrary. TLS-encrypted sessions support both IPv4 and IPv6.

accounting-only

Configures the server to be used only for accounting.

authentication-only

Configures the server to be used only for authentication.

default

Configures the server to be used for any AAA operation.

port-only

The **port-only** parameter is optional and specifies that the server will be used only to authenticate users on ports to which it is mapped.

Modes

Global configuration mode

Usage Guidelines

Use the **radius-server host** command to identify a RADIUS server to authenticate access to a Brocade device. You can specify up to eight servers. If you add multiple RADIUS authentication servers to the Brocade device, the device tries to reach them in the order you add them. To use a RADIUS server to authenticate access to a Brocade device, you must identify the server to the Brocade device. In a RADIUS configuration, you can designate a server to handle a specific AAA task. For example, you can designate one RADIUS server to handle authorization and another RADIUS server to handle accounting. You can specify individual servers for authentication and accounting, but not for authorization. You can set the RADIUS key for each server.

TLS-encrypted TCP sessions are not supported by management VRF.

The **no** form of the command removes the configuration.

Examples

The following example shows how to configure a RADIUS server to authenticate access to a Brocade device.

```
device(config)# radius-server host 192.168.10.1
```

The following example configures non-default UDP ports for authorization and accounting.

```
device(config)#radius-server host 1.2.3.4 auth-port 100 acct-port 200
device(config)#sh aaa
***** TACACS server not configured
Radius default key: ...
Radius retries: 3
Radius timeout: 3 seconds
Radius Server:      IP=172.26.67.12 SSL Port=2083 Usage=any
                    Key=...
                    opens=0 closes=0 timeouts=0 errors=0
                    packets in=0 packets out=0
                    IPv4 Radius Source address: IP=0.0.0.0          IPv6 Radius Source
Address:            IP:::
Radius Server:      IP=1.2.3.4 Auth Port=100 Acct Port=200 Usage=any
                    Key=...
                    opens=0 closes=0 timeouts=0 errors=0
                    packets in=0 packets out=0
                    IPv4 Radius Source address: IP=0.0.0.0          IPv6 Radius Source
Address:            IP:::
```

The following example shows how to specify different RADIUS servers for authentication and accounting.

```
device(config)# radius-server host 10.2.3.4 auth-port 1800 acct-port 1850 default key abc
device(config)# radius-server host 10.2.3.5 auth-port 1800 acct-port 1850 authentication-only key def
device(config)# radius-server host 10.2.3.6 auth-port 1800 acct-port 1850 accounting-only key ghi
```

The following example shows how to map the 802.1X port to a RADIUS server.

```
device(config)# radius-server host 10.2.3.4 auth-port 1800 acct-port 1850 default key abc dot1x
```

The following example shows how to configure RADIUS server for TLS support.

```
device(config)# radius-server host 172.26.67.12 ssl-auth-port 2083 default key whatever
device(config)#sh aaa
***** TACACS server not configured
Radius default key: ...
Radius retries: 3
Radius timeout: 3 seconds
Radius Server:      IP=172.26.67.12 SSL Port=2083 Usage=any
                    Key=...
                    opens=0 closes=0 timeouts=0 errors=0
                    packets in=0 packets out=0
                    IPv4 Radius Source address: IP=0.0.0.0          IPv6 Radius Source
Address:            IP:::
```

History

Release version	Command history
08.0.50	This command was updated with mac-auth and web-auth options

radius-server key

Configures the value that the device sends to the RADIUS server when trying to authenticate user access.

Syntax

radius-server key *key-string*

no radius-server key *key-string*

Command Default

The RADIUS server key is not configured.

Parameters

key-string

Specifies the key as an ASCII string. The value for the key parameter on the Brocade device should match the one configured on the RADIUS server. The key can be from 1 through 64 characters in length and cannot include any space characters.

Modes

Global configuration mode

Usage Guidelines

The **radius-server key** command is used to encrypt RADIUS packets before they are sent over the network.

The **no** form of the command removes the RADIUS server key configuration.

Examples

The following example shows how to configure a RADIUS server key.

```
device(config)# radius-server key abc
```

radius-server retransmit

Configures the maximum number of retransmission attempts for a request when a RADIUS authentication request times out.

Syntax

radius-server retransmit *number*

no radius-server retransmit *number*

Command Default

The default retransmit number is three retries.

Parameters

number

The maximum number of retries the Brocade software retransmits the request. The valid values are from 1 through 5. The default is 3.

Modes

Global configuration mode

Usage Guidelines

When an authentication request times out, the Brocade software retransmits the request up to the maximum number of retransmission tries configured.

The **no** form of the command removes the configuration.

Examples

The following example shows how to set the retransmission number to 4.

```
device(config)# radius-server retransmission 4
```

radius-server test

Sets the user name to be used in the RADIUS request packets for RADIUS dead server detection.

Syntax

radius-server test *user-name*
no radius-server test

Command Default

There is no user name configured.

Parameters

user-name
The false user name used in the server test.

Modes

Global configuration mode

Usage Guidelines

The username should not be configured on the server, so that the server responds with Access-Reject message if the server is available.

If the Brocade device does not receive a response from a RADIUS server within a specified time limit and number of retries, the RADIUS server is marked as dead. The time limit and number of retries can be manually configured using the **radius-server timeout** and **radius-server retransmit** commands respectively.

The **no** form of the command disables the configuration to send RADIUS request packets with false usernames for RADIUS dead server detection.

Examples

The following example configures the user name as 'test-user' to test the availability of the server.

```
device# configure terminal  
device(config)# radius-server test test-user
```

History

Release version	Command history
08.0.50	This command was introduced.

radius-server timeout

Configures the number of seconds the Brocade device waits for a response from a RADIUS server before either retrying the authentication request, or determining that the RADIUS servers are unavailable and moving on to the next authentication method in the authentication method list.

Syntax

radius-server timeout *time*

no radius-server timeout *time*

Command Default

The default timeout value is 3 seconds.

Parameters

time

The timeout value in seconds. Valid values are from 1 through 15 seconds. The default is 3 seconds.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command sets the timeout value to the default.

Examples

The following example shows how to set the RADIUS server timeout value to 10 seconds.

```
device(config)# radius-server timeout 10
```

raguard

Configures the current interface as a trusted, untrusted, or host Router Advertisement (RA) guard port.

Syntax

```
raguard { trust | untrust | host }  
no raguard { trust | untrust | host }
```

Parameters

- trust**
Configures an interface as a trusted RA guard port.
- untrust**
Configures an interface as an untrusted RA guard port.
- host**
Configures an interface as a host RA guard port.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of this command removes the current trusted or untrusted configuration.

A trusted RA guard port forwards all the receive RA packets without inspecting. An untrusted port inspects the received RAs against the RA guard policy's whitelist, prefix list and preference maximum settings before forwarding the RA packets. If an RA guard policy is not configured on an untrusted or host port, all the RA packets are forwarded.

Examples

The following example configures an interface as a trusted RA guard port:

```
Brocade(config)# interface ethernet1/1/1  
Brocade(config-int-e1000-1/1/1)# raguard trust
```

The following example configures an interface as an untrusted RA guard port:

```
Brocade(config)# interface ethernet1/2/1  
Brocade(config-int-e1000-1/2/1)# raguard untrust
```

The following example configures an interface as a host RA guard port:

```
Brocade(config)# interface ethernet3/2/1  
Brocade(config-int-e1000-3/2/1)# raguard host
```

rarp

Assigns a static IP RARP entry for static routes.

Syntax

rarp *index mac-address ip-address*

no rarp *index mac-address ip-address*

Command Default

RARP entry is not configured.

Parameters

index

Specifies the static IP RARP entry's index. You can specify an unused number from 1 to the maximum number of RARP entries supported on the device.

mac-address

Specifies the static IP RARP entry's MAC address.

ip-address

Specifies the static IP RARP entry's IP address.

Modes

Global configuration mode

Usage Guidelines

You must configure the RARP entries for the RARP table. The Layer 3 switch can send an IP address in reply to a client RARP request only if create a RARP entry for that client.

The **no** form of the command removes the static IP RARP entry.

Examples

The following example creates a RARP entry for a client with MAC address 0000.0054.2348. When the Layer 3 switch receives a RARP request from this client, the Layer 3 switch replies to the request by sending IP address 192.53.4.2 to the client.

```
device(config)# rarp 1 0000.0054.2348 192.53.4.2
```

rate-limit-arp

Limits the number of ARP packets the Brocade device accepts during each second.

Syntax

rate-limit-arp *number*

no rate-limit-arp *number*

Command Default

ARP rate limiting is not enabled.

Parameters

number

Specifies the number of ARP packets and can be from 0 through 100. If you specify 0, the device will not accept any ARP packets.

Modes

Global configuration mode

Usage Guidelines

To prevent the CPU from becoming flooded by ARP packets in a busy network, you can restrict the number of ARP packets the device will accept each second. When you configure an ARP rate limit, the device accepts up to the maximum number of packets you specify, but drops additional ARP packets received during the one-second interval. When a new one-second interval starts, the counter restarts at zero, so the device again accepts up to the maximum number of ARP packets you specified, but drops additional packets received within the interval.

NOTE

If you want to change a previously configured the ARP rate limiting policy, you must remove the previously configured policy using the `no rate-limit-arp` command before entering the new policy.

The **no** form of the command disables ARP rate limiting.

Examples

The following example configures the device to accept up to 100 ARP packets each second.

```
device(config)# rate-limit-arp 100
```

rate-limit input

Configures a port-based rate-limiting policy.

Syntax

```
rate-limit input fixed average-rate [ burst burst-size ]  
no rate-limit input fixed average-rate [ burst burst-size ]  
rate-limit input fixed ethe stack/slot /port average-rate  
no rate-limit input fixed ethe stack/slot /port average-rate
```

Parameters

fixed

Configures fixed rate-limiting policy.

average-rate

Specifies the maximum number of kilobits per second (kbps).

burst *burst-size*

Specifies the burst size in kilobits.

Modes

Interface configuration mode

LAG configuration mode

Usage Guidelines

The **no** form of the command removes rate limiting.

Examples

The following example configures rate limiting on a port.

```
device(config)# interface ethernet 1/1/2  
device(config-if-e1000-1/1/2)# rate-limit input fixed 500
```

rate-limit output

Configures the maximum rate at which outbound traffic is sent on a port priority queue or on a LAG port.

Syntax

rate-limit output shaping *value* [**priority** *priority-queue*]

no rate-limit output shaping *value* [**priority** *priority-queue*]

rate-limit output shaping ethe *stack/slot/port value* [**priority** *priority-queue*]

no rate-limit output shaping ethe *stack/slot/port value* [**priority** *priority-queue*]

Parameters

shaping *value*

Specifies the rate-shaping limit.

ethernet *stack/slot/port*

Specifies the Ethernet port.

priority *priority-queue*

Specifies a rate-shaping priority. The value can range from 0 to 7.

Modes

Interface configuration mode

LAG configuration mode

Usage Guidelines

The **no** form of the command removes the output rate shaping.

Examples

The following example configures the maximum rate at which outbound traffic is sent on a port priority queue

```
device(config)# interface ethernet 1/2/1
device(config-if-e1000-1/2/1)# rate-limit output shaping 500 priority 7
```

The following example configures the maximum rate at which outbound traffic is sent on a LAG port.

```
device(config)# lag lag1 static
device(config-lag-lag1)# rate-limit output shaping ethe 1/1/15 651
```

rate-limit-log

Configures the global level BUM suppression logging interval.

Syntax

rate-limit-log [*minutes*]

[no] rate-limit-log [*minutes*]

Command Default

The default logging interval 5 minutes.

Parameters

minutes

Specifies the interval, in whole minutes, between Syslog notifications. The value can be any integer from 1 to 10.

Modes

Global configuration mode

Usage Guidelines

Use the **no** form of the command to return to the default value (5 minutes).

Examples

The following example shows how to set the BUM suppression notification Syslog logging interval to 3 minutes.

```
device(config)# rate-limit-log 3
```

History

Release version	Command history
8.0.40a	This command was introduced.

rbridge-id

Configures the cluster or cluster client RBridge ID.

Syntax

rbridge-id *rbridge-id*

no rbridge-id *rbridge-id*

Command Default

An RBridge ID is not configured.

Parameters

rbridge-id

Specifies the RBridge ID of the cluster or client. The valid values are from 1 through 4095.

Modes

Cluster configuration mode

Cluster client configuration mode

Usage Guidelines

Use this command to configure the cluster or cluster client RBridge ID. The RBridge ID is a value assigned to MCT cluster devices and clients that uniquely identifies them and helps associate the source MAC address with an MCT device.

The cluster RBridge ID and cluster client RBridge ID should be unique. The two IDs should not conflict with each other or with the cluster ID or client ID.

The **no** form of the command removes the RBridge ID.

Examples

The following example configures the cluster RBridge ID.

```
device(config)# cluster SX 4000
device(config-cluster-SX)# rbridge-id 3
```

rconsole

Use the **rconsole** command to establish a remote console session with a stack member.

Syntax

```
rconsole stack-unit
```

Command Default

N/A

Parameters

stack-unit

Stack-unit ID of the remote device

Modes

Privileged EXEC mode.

Usage Guidelines

You can terminate a session in any of these ways:

- by entering the **exit** command from the User EXEC level
- by entering the **logout** command at any level.

Examples

To establish an rconsole session, enter the **rconsole** command as shown:

```
device# rconsole 1
```

In the following example, a remote console session is established with stack unit 2.

```

device# rconsole 2
Connecting to unit 2... (Press Ctrl-O X to exit)
rconsole-2@device# show stack
ID   Type   Role   Mac Address   Prio State   Comment
2   S   ICX7450-24P   standby   0000.00e2.ba40   0   local   Ready
rconsole-2@device# exit
rconsole-2@device> exit
Disconnected. Returning to local session...

```

History

Release version	Command history
08.0.00a	This command was introduced.

rconsole (SPX)

Establishes a remote connection to a control bridge or port extender unit.

Syntax

```
rconsole { id | controller-bridge }
```

Command Default

By default, a stack member can use the **rconsole** command to connect to the console of the stack's active controller.

Parameters

id

Designates an SPX port extender (PE) unit or CB (core) stack member.

controller-bridge

Designates the active controller (master unit) for the CB (core) stack.

Modes

CB device mode

Stack member device mode

Provisional-PE mode

Usage Guidelines

The command is available in the same modes as the **show running-config** command.

Use the **rconsole id** command on a CB unit to access the local console of the designated PE or CB unit. Use **exit** to terminate the connection.

A stack member or a PE member in an 802.1br CB can access the console of the stack's active controller using the **rconsole controller-bridge** command. Terminate the connection from a stack member to the active controller by pressing **Control+Shift+x**.

Terminate an **rconsole** connection between a CB unit and a PE by entering **Control+o x**.

Examples

The following example creates a remote connection from the local PE to the active controller of the CB.

```
[PE]local-id@device# rconsole  
  controller-bridge  Connect to the active controller bridge  
[PE]local-id@device# rconsole controller-bridge  
Connecting to control-bridge 3 console... (Press Ctrl-o x to exit)  
controller-device>
```

History

Release version	Command history
8.0.40	This command was introduced.

rd

Distinguishes a route for Virtual Routing and Forwarding (VRF) instances.

Syntax

```
rd {ASN : nn | IP-address : nn }
```

Parameters

ASN:nn

Configures the RD as autonomous system number followed by a colon (:) and a unique arbitrary number.

IP-address:nn

Configures the RD as IP address followed by a colon (:) and a unique arbitrary number.

Modes

VRF configuration mode

Usage Guidelines

Each VRF instance is identified by a unique route distinguisher (RD). The RD is prepended to the address being advertised. Because the RD provides overlapping client address space with a unique identifier, the same IP address can be used in different VRFs without conflict. The RD can be an autonomous system number, followed by a colon (:) and a unique arbitrary number as in "10:11". Alternatively, it can be a local IP address followed by a colon (:) and a unique arbitrary number, as in "1.1.1.1:100".

Once the Route Distinguisher is configured for a VRF it cannot be changed or deleted. To remove the route distinguisher, you must delete the VRF.

Examples

The following example configures a Route Distinguisher.

```
device(config)# vrf red  
sevice(config-vrf-red)# rd 101:101
```

re-authentication (Flexible authentication)

Periodically re-authenticates clients connected to MAC authentication-enabled interfaces and 802.1X-enabled interfaces.

Syntax

re-authentication

no re-authentication

Command Default

Re-authentication is not enabled.

Modes

Authentication configuration mode

Usage Guidelines

The **no** form of this command disables re-authentication.

When periodic reauthentication is enabled, the device reauthenticates the clients every 3,600 seconds by default. The reauthentication interval configured using the **reauth-period** command takes precedence.

Examples

The following example configures periodic re-authentication using the default interval of 3,600 seconds.

```
device(config)# authentication  
device(config-authen)# re-authentication
```

History

Release version	Command history
08.0.20	This command was introduced.
8.0.40a	Reauthentication support was added to MAC authentication-enabled ports.

reauth-period

Configure the interval at which clients connected to MAC authentication-enabled ports and 802.1X authentication-enabled ports are periodically reauthenticated.

Syntax

reauth-period *seconds*

no reauth-period*seconds*

Command Default

The re-authentication period is 3600 seconds.

Parameters

seconds

Sets the re-authentication period. The range is 1 through 4294967295 seconds.

Modes

Authentication configuration mode

Usage Guidelines

While the **re-authentication** command configures periodic re-authentication using the default interval of 3600 seconds, the **reauth-period** command allows you to specify a value in seconds.

The reauthentication interval configured using the **reauth-period** command can be overwritten for each client by the RADIUS server through the Session-Timeout and Termination-Action attributes.

The **no** form of this command reverts the re-authentication period to the default interval of 3600 seconds.

Examples

The following example configures periodic re-authentication with an interval of 2,000 seconds.

```
device(config)# authentication
device(config-authen)# re-authentication
device(config-authen)# reauth-period 2000
```

History

Release version	Command history
08.0.20	This command was introduced.
8.0.40a	Reauthentication support was added to MAC authentication-enabled ports.
8.0.30j	Reauthentication support was added to MAC authentication-enabled ports.

reauth-time

Configures the number of seconds an authenticated user remains authenticated.

Syntax

reauth-time *seconds*

no reauth-time *seconds*

Command Default

The default is 28,800 seconds.

Parameters

seconds

The number of seconds an authenticated user remains authenticated. The valid values are from 0 through 128,000 seconds. The default is 28,800.

Modes

Web Authentication configuration mode

Usage Guidelines

After a successful authentication, a user remains authenticated for a duration of time. At the end of this duration, the host is automatically logged off. The user must be reauthenticated again.

Setting a value of 0 means the user is always authenticated and will never have to reauthenticate, except if an inactive period less than the reauthentication period is configured on the Web Authentication VLAN. If this is the case, the user becomes deauthenticated if there is no activity and the timer for the inactive period expires.

The **no** form of the command sets the value to the default.

Examples

The following example configures the reauthentication time as 300 seconds.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# reauth-time 300
```

redistribute

Configures the device to redistribute IPv4 and IPv6 routes from one routing domain to another.

Syntax

```
redistribute { ospf } [ match [ external1 | external2 | internal ] | metric num | route-map string ]
```

```
redistribute { source-protocol } [ metric num | metric-type { type1 | type2 } | route-map string ]
```

```
no redistribute { ospf } [ match [ external1 | external2 | internal ] ] [ metric num ] [ route-map string ]
```

```
no redistribute { source-protocol } [ metric num ] [ metric-type { type1 | type2 } ] [ route-map string ]
```

Command Default

The device does not redistribute routing information.

Parameters

match

Specifies the type of route.

external1

Specifies OSPF Type 1 external routes.

external2

Specifies OSPF Type 2 external routes.

internal

Specifies OSPF internal routes.

source-protocol

Specifies the source protocol from which routes are being redistributed. It can be one of the following keywords: **bgp**, **connected**, **ospf**, **rip**, or **static**.

metric *num*

Specifies a metric for redistributed routes. Range is from 0 through 65535. No value is assigned by default.

route-map *string*

Specifies a route map to be consulted before a route is added to the routing table.

metric-type

Specifies the external link type associated with the default route advertised into the OSPF routing domain.

type1

Specifies a type 1 external route.

type2

Specifies a type 2 external route.

level-1

Specifies level-1 routes.

level-1-2

Specifies both level-1 and level-2 routes.

level-2

Specifies level-2 routes.

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

BGP address-family IPv4 unicast VRF configuration mode

BGP address-family IPv6 unicast VRF configuration mode

OSPF router configuration mode

OSPFv3 router configuration mode

OSPF router VRF configuration mode

OSPFv3 router VRF configuration mode

Usage Guidelines

Routes can be filtered by means of an associated route map before they are distributed.

The **metric-type** { **type1** | **type2** } option is only available in OSPFv3 router configuration mode and OSPFv3 router VRF configuration mode.

[**match metric** **metric-type**

NOTE

The **default-metric** command does not apply to the redistribution of directly connected routes. Use a route map to change the default metric for directly connected routes.

The **no** form of the command restores the defaults.

Examples

The following example redistributes OSPF external type 1 routes.

```
device# configure terminal
device(config)# router bgp
device(config-bgp)# redistribute ospf match external1
```

The following example redistributes OSPF routes with a metric of 200.

```
device# configure terminal
device(config)# router bgp
device(config-bgp)# redistribute ospf metric 200
```

The following example redistributes OSPFv3 external type 2 routes in VRF instance "red".

```
device# configure terminal
device(config)# router bgp
device(config-bgp)# address-family ipv6 unicast vrf red
device(config-bgp-ipv6u-vrf)# redistribute ospf match external2
```

Commands K - S

redistribute

The following example redistributes static routes into BGP4+ and specifies a metric of 200.

```
device# configure terminal
device(config)# router bgp
device(config-bgp)# address-family ipv6 unicast
device(config-bgp-ipv6u)# redistribute static metric 200
```

The following example redistributes RIP routes and specifies that route-map "rm2" be consulted in BGP address-family IPv6 unicast configuration mode.

```
device# configure terminal
device(config)# router bgp
device(config-bgp)# address-family ipv6 unicast
device(config-bgp-ipv6u)# redistribute rip route-map rm2
```

The following example redistributes BGP routes and specifies that route-map "rm7" be consulted in OSPF router configuration mode.

```
device# configure terminal
device(config)# router ospf
device(config-ospf-router)# redistribute bgp route-map rm7
```

The following example redistributes OSPF routes and specifies a type1 external route in OSPFv3 VRF configuration mode.

```
device# configure terminal
device(config)# ipv6 router ospf
device(config-ospf6-router)# redistribute ospf metric-type type1
```

redistribute (BGP)

Configures the device to redistribute RIP routes, directly connected routes, or static routes into BGP4 and BGP4+.

Syntax

```
redistribute { connected | rip | static } [ metric num ] [ route-map string ]
```

```
no redistribute { connected | rip | static } [ metric num ] [ route-map string ]
```

Command Default

The device does not redistribute routing information between BGP4 or BGP4+ and the IP interior gateway protocol OSPF.

Parameters

connected

Redistributes connected routes.

rip

Redistributes Routing Information Protocol (RIP) routes.

static

Redistributes static routes.

metric

Metric for redistributed routes.

num

Specifies a metric number. The range is from 0 through 4294967297. No value is assigned by default.

route-map

Specifies that a route map be consulted before a route is added to the routing table.

string

Specifies a route map to be consulted before a route is added to the routing table.

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

BGP address-family IPv4 unicast VRF configuration mode

BGP address-family IPv6 unicast VRF configuration mode

Usage Guidelines

Use the **no** form of the command to restore the defaults. When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

Use this command to configure the device to redistribute RIP, directly connected routes, or static routes into BGP4 or BGP4+. The routes can be filtered by means of an associated route map before they are distributed.

NOTE

The **default-metric** command does not apply to the redistribution of directly connected routes into BGP4 or BGP4+. Use a route map to change the default metric for directly connected routes.

Examples

This example redistributes static routes into BGP4 and specifies a metric of 200.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# redistribute static metric 200
```

This example redistributes static routes into BGP4+ and specifies that route-map "rm5" be consulted.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast
device(config-bgp-ipv6u)# redistribute route-map rm5
```

This example redistributes directly connected routes into BGP4 in VRF instance "red".

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv4 unicast vrf red
device(config-bgp-ipv4u-vrf)# redistribute connected
```

History

Release version	Command history
8.0.30	Support was added for the BGP address-family IPv6 unicast VRF configuration mode.

redistribute (RIP)

Configures the device to redistribute connected routes, learned static routes, OSPF routes, or BGP4 routes through RIP. The RIP router can then advertise these routes to RIP neighbors.

Syntax

redistribute { **connected** | **bgp** | **ospf** | **static** [*metric value* | **route-map** *name*] }

no redistribute { **connected** | **bgp** | **ospf** | **static** [*metric value* | **route-map** *name*] }

Command Default

By default, redistribution of other routes is disabled. Once redistribution of a particular type of route is enabled, the default action is to permit redistribution, even with redistribution filters applied to the virtual routing interface.

Parameters

connected

Redistributes connected routes.

bgp

Redistributes BGP routes.

ospf

Redistributes OSPF routes.

static

Redistributes IP static routes.

metric

Sets a RIP route metric to the value specified.

value

Specifies the RIP route metric as a value from 1 through 15.

route-map

Applies the specified route map to routes designated for redistribution.

name

Specifies the route-map to be applied.

Modes

RIP router configuration mode.

Usage Guidelines

The **no** form of the command removes redistribution actions specified in the command.

To control redistribution tightly, apply a filter to deny all routes and give it the highest ID. Then apply filters to allow specific routes.

RIP redistribution filters apply to all interfaces. Use route maps to define where to deny or permit redistribution. Refer to the route-map command for information on configuring route maps for RIP.

Examples

The following example redistributes connected routes and adds 10 to the metric for each route.

```
device# configure terminal
device(config)# router rip
device(config-rip-router)# redistribute connected metric 10
```

The following example discontinues redistribution and the added metric applied in the previous example.

```
device# configure terminal
device(config)# router rip
device(config-rip-router)# no redistribute connected metric 10
```

The following example redistributes all connected route types based on the specifics of the route map named routemap1.

```
device# configure terminal
device(config)# router rip
device(config-rip-router)# redistribute connected route-map routemap1
```

redistribute (RIPng)

Configures RIPng to advertise routes from the specified protocol or connections.

Syntax

```
redistribute { bgp | connected | ospf | static [ metric value ] }  
no redistribute { bgp | connected | ospf | static [ metric value ] }
```

Command Default

By default, routes from these protocols are not shared between RIPng neighbors.

Parameters

connected

Redistributes directly connected IPv6 network routes.

bgp

Redistributes BGP4+ routes.

ospf

Redistributes OSPFv3 routes.

static

Redistributes IPv6 static routes.

metric

Sets a RIPng route metric to the value specified. When no metric is set, the default metric of one is used.

value

Specifies RIPng route metric as a value from 1 through 15.

Modes

RIPng router configuration mode.

Usage Guidelines

The **no** form of the command removes redistribution actions specified in the command.

Examples

The following example configures the RIPng router to redistribute OSPF routes.

```
device# configure terminal  
device(config)# ipv6 router rip  
device(config-ripng-router)# redistribute ospf
```

regenerate-seq-num

For a specified ACL, changes the sequence numbers of the rules within the ACL. This gives you flexibility in inserting new rules between existing rules.

Syntax

```
regenerate-seq-num [ start-sequence-value [ increment-value ] ]
```

Parameters

start-sequence-value

Specifies the sequence number assigned to the first rule. The default is 10, and values range from 1 through 65000. The maximum value of the sequence number of the last rule is 65000.

increment-value

Specifies the increment between the regenerated sequence numbers. The default is 10, and values range from 1 through 100.

Modes

ACL configuration mode

Usage Guidelines

This command is effective for all IPv4 ACL types: named or numbered; standard or extended.

This command is also effective for IPv6 ACLs.

After resequencing, you do not need to rebind the ACL.

Non-default sequence regeneration is not completely persistent following reload of the active unit. See relevant example below.

Examples

The following example regenerates sequence numbers for a standard numbered IPv4 ACL.

```
device# configure terminal
device(config)# ip access-list standard 18
device(config-std-nacl)# regenerate-seq-number
```

The following example regenerates sequence numbers for an extended named IPv4 ACL, specifying that the first rule be numbered 100, with an increment of 15 between each sequence number.

```
device# configure terminal
device(config)# ip access-list extended extACLtest_01
device(config-ext-nacl)# regenerate-seq-number 100 15
```

The following example regenerates sequence numbers for an IPv6 ACL.

```
device# configure terminal
device(config)# ipv6 access-list ACL6_01
device(config-ipv6-acces-list ACL6_01)# regenerate-seq-number
```

Non-default sequence regeneration is not completely persistent following reload of the active unit, as illustrated in the following example.

```

device# configure terminal
device(config)# ip access-list extended testACL
device(config-ext-nacl)# permit ip host 1.1.1.111 host 2.2.2.111
device(config-ext-nacl)# permit ospf any any
device(config-ext-nacl)# permit pim any any

device(config-ext-nacl)# show ip access-lists testACL
Extended IP access list testACL: 3 entries

160: permit ospf any any
170: permit pim any any

```

History

Release version	Command history
8.0.50	This command was introduced.

register-probe-time

Configures the time the PIM router waits for a register-stop from a rendezvous point (RP) before it generates another NULL register to the PIM RP

Syntax

register-probe-time *seconds*

no register-probe-time *seconds*

Command Default

The wait time is 10 seconds.

Parameters

seconds

Specifies the time, in seconds, between queries. The range is 10 through 50 seconds. The default is 10 seconds.

Modes

PIM router configuration mode

Usage Guidelines

The **no** form of this command restores the wait time to 10 seconds.

The register-probe time configuration applies only to the first-hop PIM router.

NOTE

When a PIM first-hop router has successfully registered with a PIM RP, the PIM first-hop router will not default back to the data registration. All subsequent registers will be in the form of the NULL registration.

Examples

This example configures the register-probe time to 20 seconds.

```
Device(config)#router pim
Device(config-pim-router)#register-probe-time 20
```

register-suppress-time

Configures the interval at which the PIM router triggers the NULL register message.

Syntax

register-suppress-time *seconds*

no register-suppress-time *seconds*

Command Default

The interval at which PIM router triggers the NULL register message is 60 seconds.

Parameters

seconds

Specifies the interval, in seconds, between queries. The range is 60 through 120 seconds. The default is 60 seconds.

Modes

PIM router configuration mode

Usage Guidelines

The **no** form of this command restores the register-suppress interval to 60 seconds.

The register-suppress interval configuration applies only to the first-hop PIM router.

Examples

The following example configures the interval at which PIM router triggers the NULL register message to 90 seconds.

```
Device(config)#router pim
Device(config-pim-router)#register-suppress-time 90
```

relative-utilization

Configures uplink utilization lists that display the percentage of a given uplink port's bandwidth that is used by a specific list of downlink ports.

Syntax

relative-utilization *number* **uplink ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*] ...] **downlink ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*] ...]

no relative-utilization *number* **uplink ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | [**ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*] ...] **downlink ethernet** *stack-id/slot/port* [**to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port* **to** *stack-id/slot/port* | **ethernet** *stack-id/slot/port*] ...]

Command Default

Relative utilization is not configured.

Parameters

number

Specifies the list number. The value can range from 1 to 4. You can specify up to four lists.

uplink ethernet *stack-id/slot/port*

Specifies the uplink Ethernet port.

to *stack-id/slot/port*

Specifies a range of Ethernet ports.

downlink ethernet *stack-id/slot/port*

Specifies the downlink Ethernet port.

Modes

Global configuration mode

Usage Guidelines

Each uplink utilization list consists of the following:

- Utilization list number (1, 2, 3, or 4).
- One or more uplink ports.
- One or more downlink ports.

Each list displays the uplink port and the percentage of that port's bandwidth that was utilized by the downlink ports over the most recent 30-second interval.

You can configure up to four bandwidth utilization lists.

You can specify a list or range of ports as uplink or downlink ports.

The **no** form of the command removes the uplink utilization list.

Examples

The following example configures an uplink utilization list.

```
device(config)# relative-utilization 1 uplink ethernet 1/1/1 downlink ethernet 1/2/2 to 1/3/2
```

remark

Adds a comment to describe entries in an IPv4 or IPv6 ACL.

Syntax

remark *comment-text*

no remark *comment-text*

Command Default

No comments are added to describe entries in an IPv4 or IPv6 ACL.

Parameters

comment-text

Specifies the comment for the ACL entry, up to 256 alphanumeric characters.

Modes

IPv4 access list configuration mode

IPv6 access list configuration mode

Usage Guidelines

You can add a comment by entering the **remark** command immediately preceding an ACL entry. The comment appears in the output of show commands that display ACL information.

The **no** form of the command deletes the comment text added for an ACL entry.

Examples

The following example configures remarks for an IPv4 ACL.

```
device(config)# ip access-list extended TCP/UDP
device(config-ext-nacl)# remark The following line permits TCP packets
device(config-ext-nacl)# permit tcp 192.168.4.40/24 2.2.2.2/24
device(config-ext-nacl)# remark The following permits UDP packets
device(config-ext-nacl)# permit udp 192.168.2.52/24 2.2.2.2/24
device(config-ext-nacl)# deny ip any any
```

The following example configures remarks for an IPv6 ACL.

```
device(config)# ipv6 access-list rtr
device(config-ipv6-access-list rtr)# remark This entry permits ipv6 packets from 2001:DB8::2 to any
destination
device(config-ipv6-access-list rtr)# permit ipv6 host 2001:DB8::2 any
device(config-ipv6-access-list rtr)# remark This entry denies udp packets from any source to any
destination
device(config-ipv6-access-list rtr)# deny udp any any
device(config-ipv6-access-list rtr)# remark This entry denies IPv6 packets from any source to any
destination
device(config-ipv6-access-list rtr)# deny ipv6 any
```

The following example shows the comment text for the ACL named "rtr" in a show running-config display.

```
device# show running-config
ipv6 access-list rtr
remark This entry permits ipv6 packets from 2001:DB8::2 to any destination permit ipv6 host 2001:DB8::2
any
remark This entry denies udp packets from any source to any destination deny udp any any
remark This entry denies IPv6 packets from any source to any destination deny ipv6 any any
```

The following example shows how to delete a comment from an IPv6 ACL entry.

```
device(config)# ipv6 access-list rtr
device(config-ipv6-access-list rtr)# no remark This entry permits ipv6 packets from 2001:DB8::2 to any
destination
```

remote-identifier

Configures a remote identifier for an Internet Key Exchange version 2 (IKEv2) profile.

Syntax

remote-identifier { **address** *ip-address* | **email** *email-address* | **fqdn** *fqdn-name* | **key-id** *key-id* }

no remote-identifier { **address** *ip-address* | **email** *email-address* | **fqdn** *fqdn-name* | **key-id** *key-id* }

Command Default

A remote identifier is not configured for an IKEv2 profile.

Parameters

address *ip-address*

Specifies an IPv4 address as the remote identifier.

email *email-address*

Specifies an email address as the remote identifier.

fqdn *fqdn-name*

Specifies a fully qualified domain name (FQDN) as the remote identifier.

key-id *key-id*

Specifies a key ID as the remote identifier.

Modes

IKEv2 profile configuration mode

Usage Guidelines

The **no** form of the command removes the remote identifier configuration.

Examples

The following example shows how to configure IPv4 address 10.2.2.1 as the remote identifier for an IKEv2 profile named prof_mktg.

```
device(config)# ikev2 profile prof-mktg
device(config-ike-profile-prof-mktg)# remote-identifier address 10.2.2.1
```

History

Release version	Command history
8.0.50	This command was introduced.

remote-loopback

Starts or stops the remote loopback procedure on a remote device.

Syntax

```
remote-loopback ethernet stackid/slot/port { start | stop }
```

Command Default

Remote loopback is not initiated on a remote device.

Parameters

ethernet *stackid/slot/port*

Specifies the Ethernet interface on which loopback is to be enabled.

start

Starts the remote loopback procedure on a remote device.

stop

Stops the remote loopback procedure on a remote device.

Modes

EFM-OAM protocol configuration mode

Usage Guidelines

The **remote-loopback ethernet** *stackid/slot/port* { **start** | **stop** } command is valid only on the Data Terminal Equipment (DTE) operating in the active mode.

When the remote loopback mode is enabled, all the non-OAMPDUs are looped back at the remote end.

A port ceases to be in the remote loopback mode if any event triggers a change in the port status (up or down).

If EEE is enabled globally, port ceases to be in the remote loopback mode.

Ethernet loopback and EFM-OAM remote loopback cannot be configured on the same interface.

NOTE

Brocade recommends to ensure that any higher layer protocol running over the local and remote loopback ports does not block the interfaces in the VLAN on which loopback traffic testing is being performed.

Examples

The following example initiates the remote loopback procedure on a remote DTE.

```
device(config)# link-oam  
device(config-link-oam)# remote-loopback ethernet 3/1/1 start
```

Commands K - S

remote-loopback

The following example stops the remote loopback procedure on a remote DTE.

```
device(config)# link-oam
device(config-link-oam)# remote-loopback ethernet 3/1/1 stop
```

History

Release version	Command history
08.0.30	This command was introduced.

remove-tagged-ports

Removes all tagged member ports from a VLAN or from multiple VLANs.

Syntax

remove-tagged-ports

Modes

VLAN configuration mode

Multiple VLAN configuration mode

Examples

The following example removes all tagged member ports from VLAN 2.

```
device(config)# show run vlan 2
vlan 2 by port
tagged ethernet 1/1/1 to 1/1/3
untagged ethernet 1/1/4 to 1/1/16
!
!
device(config)# vlan 2
device(config-vlan-2)# remove-tagged-ports
device(config-vlan-2)# show run vlan 2
vlan 2 by port
untagged ethernet 1/1/4 to 1/1/6
!
!
```

The following example removes all tagged member ports from a range of VLANs.

```
device(config)# show run vlan
vlan 1 name DEFAULT-VLAN by port
!
vlan 2 by port
tagged ethernet 1/1/1 to 1/1/5
untagged ethernet 1/1/6 to 1/1/7
!
vlan 3 by port
tagged ethernet 1/1/1 to 1/1/5
untagged ethernet 1/1/8 to 1/1/9
!
!
device(config)# vlan 2 3
device(config-mvlan-2-3)# remove-tagged-ports
device(config-mvlan-2-3)# show run vlan
vlan 2 by port
untagged ethernet 1/1/6 to 1/1/7
!
vlan 3 by port
untagged ethernet 1/1/8 to 1/1/9
!
!
```

History

Release version	Command history
08.0.40	This command was introduced.

remove-untagged-ports

Removes all untagged member ports from a VLAN or from multiple VLANs.

Syntax

remove-untagged-ports

Modes

VLAN configuration mode

Multiple VLAN configuration mode

Examples

The following example removes all untagged member ports from VLAN 2.

```
device(config)# show run vlan 2
vlan 2 by port
tagged ethernet 1/1/1 to 1/1/3
untagged ethernet 1/1/4 to 1/1/16
!
!
device(config)# vlan 2
device(config-vlan-2)# remove-untagged-ports
device(config-vlan-2)# show run vlan 2
vlan 2 by port
tagged ethernet 1/1/1 to 1/1/3
!
!
```

The following example removes all untagged member ports from a range of VLANs.

```
device(config)# show run vlan
vlan 2 by port
tagged ethernet 1/1/1 to 1/1/3
untagged ethernet 1/1/4 to 1/1/16
!
!
vlan 3 by port
tagged ethernet 1/1/1 to 1/1/3
untagged ethernet 1/1/4 to 1/1/16
!
!
device(config)# vlan 2 3
device(config-mvlan-2-3)# remove-untagged-ports
device(config-vlan-2-3)# show run vlan
vlan 2 by port
tagged ethernet 1/1/1 to 1/1/3
!
!
vlan 3 by port
tagged ethernet 1/1/1 to 1/1/3
!
!
```

History

Release version	Command history
08.0.40	This command was introduced.

remove-vlan(VLAN group)

Removes individual VLANs or a range of VLANs from a VLAN group.

Syntax

remove-vlan *vlan-id* [**to** *vlan-id*]

Parameters

vlan-id

Specifies the VLAN number to remove from a VLAN group.

to *vlan-id*

Specifies the range of VLAN numbers to remove from a VLAN group.

Modes

VLAN group configuration mode

Usage Guidelines

Use the **vlan-group** command to create a range of VLANs. To remove one or more VLANs from a VLAN group, use the **remove-vlan** command.

Examples

The following example removes the specified VLANs from vlan-group 1.

```
device(config)# vlan-group 1 vlan 10 to 15
device(config-vlan-group-1)# remove-vlan 10
device(config-vlan-group-1)# remove-vlan 11 to 12
device(config-vlan-group-1)# show vlan-group
vlan group 1 vlan 13 to 15
!
!
```

History

Release version	Command history
08.0.40	This command was introduced.
08.0.50	This command is no longer supported in Interface Configuration mode.

reserved-vlan-map

Assigns a different VLAN ID to the reserved VLAN.

Syntax

```
reserved-vlan-map vlan vlan-id new-vlan vlan-id  
no reserved-vlan-map vlan vlan-id new-vlan vlan-id
```

Command Default

The reserved VLAN ID are 4091 and 4092.

Parameters

vlan *vlan-id*
Specifies the default reserved VLAN ID.

new-vlan *vlan-id*
Specifies the new VLAN ID that you want to assign to the reserved VLAN.

Modes

Global configuration mode

Usage Guidelines

For *vlan-id*, enter a valid VLAN ID that is not already in use. Valid VLAN IDs are numbers from 1 through 4090, 4093, and 4095. VLAN ID 4094 is reserved for use by Single STP.

NOTE

You must save the configuration (**write memory**) and reload the software to place the change into effect.

The **no** form of the command resets the values back to the default reserved VLAN IDs.

Examples

The following example shows how to assign a new VLAN ID to the reserved VLAN IDs.

```
device(config)# reserved-vlan-map vlan 4091 new-vlan 10  
Reload required. Please write memory and then reload or power cycle.  
device(config)# write memory  
device(config)# exit  
device# reload
```

responder-only

Configures responder-only mode for an IKEv2 profile.

Syntax

responder-only
no responder-only

Command Default

The responder-only mode is disabled.

Modes

IKEv2 profile configuration mode

Usage Guidelines

By default responder-only mode is disabled and the device behaves as both initiator and responder so that IKEv2 negotiations start when the IKEv2 peer is reachable.

In responder-only mode, the device is passive and does not initiate negotiation or re-keying to establish an IKEv2 security association (SA).

The **no** form of the command disables responder-only mode.

Examples

The following example enables responder-only mode for an IKEv2 profile named ikev2_profile1.

```
device# configure terminal
device(config)# ikev2 profile ikev2_profile1
device(config-ike-profile-ikev2_profile1)# responder-only
```

History

Release version	Command history
8.0.50	This command was introduced.

restart-ports

Configures a VSRP-configured device to shut down its ports when a failover occurs and restart after a period of time.

Syntax

restart-ports [*seconds*]

no restart-ports *seconds*

Command Default

The default is 1 second.

Parameters

seconds

Specifies the time the VSRP master shuts down its port before it restarts. The range is from 1 through 120 seconds.

Modes

VSRP VRID configuration mode

Usage Guidelines

The VSRP fast start feature can be enabled on a VSRP-configured Brocade device, either on the VLAN to which the VRID of the VSRP-configured device belongs (globally) or on a port that belongs to the VRID. This command shuts down all the ports that belong to the VLAN when a failover occurs. All the ports will have the specified VRID.

The **no** form of the command resets the time to the default.

Examples

The following example configures the ports to restart in 5 seconds.

```
device(config)# vlan 100
device(config-vlan-100)# vsrp vrid 1
device(config-vlan-100-vrid-1)# restart-ports 5
```

restart-vsrp-port

Configures a single port on a VSRP-configured device to shut down when a failover occurs and restart after a period of time.

Syntax

restart-vsrp-port *seconds*

no restart-vsrp-port *seconds*

Command Default

The default is 1 second.

Parameters

seconds

Configures the VSRP master to shut down its port for the specified number of seconds before it restarts. The range is from 1 through 120 seconds.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of the command resets the time to the default.

Examples

The following example configures the VSRP port to restart in 5 seconds.

```
device(config)# interface ethernet 1/1/1
device(config-if-e-10000)# restart-vsrp-port 5
```

reverse-path-check

Enables uRPF for all Layer 3 routes.

Syntax

reverse-path-check

no reverse-path-check

Command Default

Reverse path check is not enabled on the device.

Modes

Global configuration mode

Usage Guidelines

On ICX devices, this command enables the uRPF command line interface and hardware settings.

You must reload the device for the reverse path check setting changes to take effect. Enabling reverse path check on ICX devices reduces the following system-max values by half:

- ip-route
- ip6-route
- ip-route-default-vrf
- ip6-route-default-vrf
- ip-route-vrf
- ip6-route-vrf

You should configure these values after reloading. You should adjust or remove the max-route configuration in VRFs before reload.

The **no** form of the command disables the reverse path check functionality.

NOTE

Disabling reverse path check doubles the system-max values on ICX devices.

Examples

The following example enables unicast Reverse Path Forwarding globally.

```
device(config)# reverse-path-check
```

History

Release version	Command history
08.0.30	This command was introduced.
8.0.40	Removed reference to ICX 6610 devices.
8.0.50	Removed reference to ICX 7750 devices, because uRPF is supported on all ICX devices.

restricted-vlan

Configures a specific VLAN as the restricted VLAN for all ports on the device to place the client port when the authentication fails.

Syntax

restricted-vlan *vlan-id*

no restricted-vlan *vlan-id*

Command Default

The restricted VLAN is not configured.

Parameters

vlan-id

Specifies the identification number of the restricted VLAN.

Modes

Authentication configuration mode

Usage Guidelines

When an authentication fails, the port can be moved into a configured restricted VLAN instead of blocking the client completely. The port is moved to the configured restricted VLAN only if the authentication failure action is set to place the port in a restricted VLAN using the **auth-fail-action** command at the global level or using the **authentication fail-action** command at the interface level. Else, when the authentication fails, the client's MAC address is blocked in the hardware (default action).

The **no** form of the command disables the restricted VLAN.

Examples

The following example creates a restricted VLAN with VLAN 4.

```
device(config)# authentication
device(config-authen)# restricted-vlan 4
```

History

Release version	Command history
08.0.20	This command was introduced.

rfc1583-compatibility (OSPF)

Configures compatibility with RFC 1583.

Syntax

rfc1583-compatibility

no rfc1583-compatibility

Command Default

OSPF is compatible with RFC 1583 (OSPFv2).

Modes

OSPF router configuration mode

OSPF router VRF configuration mode

Usage Guidelines

OSPF is compatible with RFC 1583 (OSPFv2) and maintains a single best route to an autonomous system (AS) boundary router in the OSPF routing table. Disabling this compatibility causes the OSPF routing table to maintain multiple intra-AS paths, which helps prevent routing loops.

Enter **no rfc1583-compatibility** to disable compatibility with RFC 1583.

Examples

The following example disables compatibility with RFC 1583.

```
device# configure terminal
device(config)# router ospf
device(config-ospf-router)# no rfc1583-compatibility
```

ring-interface

Configures the primary and secondary interfaces for the ring to control outward traffic flow.

Syntax

ring-interface ethernet *stackid/slot/port* **ethernet** *stackid/slot/port*

no ring-interface ethernet *stackid/slot/port* **ethernet** *stackid/slot/port*

Command Default

The primary and secondary interfaces are not configured.

Parameters

ethernet *stackid/slot/port*

Configures the primary and secondary interfaces.

Modes

MRP configuration mode

Usage Guidelines

On the master node, the primary interface is the one that originates Ring Health Packets (RHPs). Ring control traffic and Layer 2 data traffic will flow in the outward direction from this interface by default. On member nodes, the direction of traffic flow depends on the traffic direction selected by the master node. Therefore, on a member node, the order in which you enter the interfaces does not matter.

The **no** form of the command clears the primary and secondary interfaces.

Examples

The following example shows how to configure the primary and secondary interfaces on a ring.

```
device(config)# vlan 2
device(config-vlan-2)# metro-ring 1
device(config-vlan-2-mrp-2)# ring-interface ethernet 1/1/1 ethernet 1/1/2
```

rmon alarm

Configures an Remote Monitoring (RMON) alarm.

Syntax

rmon alarm *alarm-num mib-object sample-interval* { **absolute** | **delta** } **falling-threshold** *falling-threshold-value event*
rising-threshold *rising-threshold-value event* **owner** *alarm-owner*

no rmon alarm *alarm-num mib-object sample-interval* { **absolute** | **delta** } **falling-threshold** *falling-threshold-value event*
rising-threshold *rising-threshold-value event* **owner** *alarm-owner*

Command Default

An RMON alarm is not configured.

Parameters

alarm-num

Specifies the alarm number. The value can range from 1 to 65535.

mib-object

Specifies the MIB object to monitor.

sample-interval

Specifies the sample interval.

absolute

Configures testing each sample directly.

delta

Configures testing the delta between the samples.

falling-threshold

Configures the falling threshold.

falling-threshold-value

Specifies the falling threshold value. The value can range from 0 to 2147483647.

event

Specifies the action (event) to take to fire when the falling threshold crosses the configured value. The value can range from 1 through 65535.

rising-threshold

Configures the rising threshold.

rising-threshold-value

Specifies the threshold value. The value can range from 0 to 2147483647.

event

Specifies the event to fire when the rising threshold crosses the configured value. The value can range from 1 through 65535.

owner *alarm-owner*

Specifies the alarm owner.

Modes

Global configuration mode

Usage Guidelines

An Alarm is designed to monitor configured thresholds for any SNMP integer, time tick, gauge, or counter MIB object. Using the CLI, you can define what MIB objects are monitored, the type of thresholds that are monitored (falling, rising, or both), the value of those thresholds, and the sample type (absolute or delta).

An alarm event is reported each time that a threshold is exceeded. The alarm entry also indicates the action (event) to be taken if the threshold be exceeded.

You can configure both the falling threshold and the rising threshold and in any order.

The **no** form of the command removes the configured RMON alarm.

Examples

The following example configures an alarm.

```
device(config)# rmon alarm 1 ifInOctets.6 10 delta rising-threshold 100 1 falling-threshold 50 1 owner  
nyc02
```

rmon event

Defines the action to be taken when an alarm is reported and collects and stores reported events for retrieval by an Remote Monitoring (RMON) application.

Syntax

rmon event *event-entry* **description** *event-description* { **execute** | **log-and-execute** | **log-trap-and-execute** | **trap-and-execute** } [**argument** *string*] | **log** | **trap** | **log-and-trap** } **owner** *event-owner*

no rmon event *event-entry* **description** *event-description* { **execute** | **log-and-execute** | **log-trap-and-execute** | **trap-and-execute** } [**argument** *string*] | **log** | **trap** | **log-and-trap** } **owner** *event-owner*

Command Default

An RMON event is not configured.

Parameters

event-entry

Specifies the event number.

description *event-description*

Configures the event description.

execute

Executes a batch command when the event fires.

log-and-execute

Generates an RMON log and execute batch command when the event fires.

log-trap-and-execute

Generates an RMON log and SNMP trap and executes a batch command when the event fires.

trap-and-execute

Generates an SNMP trap and executes a batch command when the event fires.

argument *string*

Specifies the batch command argument.

log

Generates an RMON log when the event fires.

trap

Generates an SNMP trap when the event fires.

log-and-trap

Generates an RMON log and SNMP trap when the event fires.

owner *event-owner*

Specifies the batch command owner.

Modes

Global configuration mode

Usage Guidelines

There are two elements to the Event Group: the event control table and the event log table. The event control table defines the action to be taken when an alarm is reported. Defined events can be found by entering the CLI command **show event**. The event log table collects and stores reported events for retrieval by an RMON application.

The **no** form of the command removes the configured RMON event.

Examples

The following example configures an RMON event.

```
device(config)# rmon event 1 description 'testing a longer string' trap owner nyc02
```

rmon history

Configures an RMON history control.

Syntax

```
rmon history entry-number interface { ethernet stack-id/slot/port | management number } buckets number interval sampling-interval owner owner-name
```

```
no rmon history entry-number interface { ethernet stack-id/slot/port | management number } buckets number interval sampling-interval owner owner-name
```

Command Default

All active ports will generate two history control data entries per active Layer 2 switch port or Layer 3 switch interface.

Parameters

entry-number

Specifies the history number. The value can range from 1 to 65535.

interface ethernet *stack-id/slot/port*

Specifies the Ethernet interface to monitor.

interface management *number*

Specifies the management interface to monitor.

buckets *number*

Specifies the number of buckets. The value can range from 1 to 65535.

interval *sampling-interval*

Specifies the sample interval. The value can range from 1 to 3600.

owner *owner-name*

Specifies the history owner.

Modes

Global configuration mode

Usage Guidelines

An active port is defined as one with a link up. If the link goes down, the two entries are automatically deleted.

Two history entries are generated for each device:

- A sampling of statistics every 30 seconds
- A sampling of statistics every 30 minutes

The history data can be accessed and displayed using any of the popular RMON applications.

The **no** form of the command removes the configured RMON history control.

Examples

The following example configures the RMON history.

```
device(config)# rmon history 1 interface ethernet 1/1/1 buckets 10 interval 10 owner nyc02
```

route-only

Enables Brocade Layer 3 switches to support Layer 2 switching.

Syntax

route-only

no route-only

Command Default

By default, Brocade Layer 3 switches support Layer 2 switching.

Modes

Global configuration mode.

Interface configuration mode

Usage Guidelines

By default, Brocade Layer 3 switches support Layer 2 switching. These devices modify the routing protocols that are not supported on the devices. If you want to disable Layer 2 switching, you can do so globally or on individual ports, depending on the version of software your device is running.

Enabling or disabling Layer 2 switching is supported in Layer 3 software images only. Enabling or disabling Layer 2 switching is not supported on virtual interfaces.

The **no** form of the command enables Layer 2 switching on a Layer 3 switch.

To disable Layer 2 switching only on a specific interface, go to the interface configuration level for that interface, and then configure the command.

Examples

The following example globally disables Layer 2 switching on a Layer 3 switch.

```
device(config)# route-only
device(config)# exit
device# write memory
device# reload
```

The following example enables Layer 2 switching on a Layer 3 switch.

```
device(config)# no route-only
device(config)# exit
device# write memory
device# reload
```

Commands K - S

route-only

The following example disables Layer 2 switching on Ethernet interface 1/1/1.

```
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# route-only
device(config-if-e1000-1/1/1)# end
device# write memory
device# reload
```

route-precedence

Configures a table that defines the order (precedence) in which multicast routes are selected from the multicast routing table (mRTM) and unicast routing (uRTM) table.

Syntax

```
route-precedence { [ mc-non-default | none ] [ mc-default | none ] [ uc-non-default | none ] [ uc-default | none ] }
```

```
no route-precedence
```

Command Default

The default route precedence used to select routes is:

1. A non-default multicast route from the mRTM (**mc-non-default**).
2. A default multicast route from the mRTM (**mc-default**).
3. A non-default unicast route from the uRTM (**uc-non-default**).
4. A default unicast route from the uRTM (**uc-non-default**).

Parameters

mc-non-default

Specifies the precedence for the non-default multicast route table (mRTM).

none

Specifies that this type of route is to be ignored. You can specify this option for any of the multicast or unicast route types.

mc-default

Specifies the precedence for the multicast routing table (mRTM).

uc-non-default

Specifies the precedence for the non-default unicast route table (uRTM).

uc-default

Specifies the precedence for the default unicast route table (uRTM).

Modes

Router PIM configuration mode

Usage Guidelines

The order in which you place the keywords determines the route precedence.

The **no** form of this command restores the default route precedence settings.

You must configure four parameters indicating the four different route types. If you want to specify that a particular route type is not used, configure the **none** keyword to fill the precedence table.

Examples

The following example configures a route precedence in which a non-default multicast route has the highest precedence, and a default unicast route has the lowest precedence. The order used to select routes is:

1. A non-default multicast route from the mRTM.
2. A non-default unicast route from the uRTM.
3. A default multicast route from the mRTM.
4. A default unicast route from the uRTM.

```
device(config)# router pim
device(config-pim-router)# route-precedence mc-non-default uc-non-default mc-default uc-default
```

The following example configures a route precedence in which the unicast default route is ignored. The order used to select routes is:

1. A non-default multicast route from the mRTM.
2. A default multicast route from the mRTM.
3. A non-default unicast route from the uRTM.

```
device(config)# router pim
device(config-pim-router)# route-precedence mc-non-default mc-default uc-non-default none
```

History

Release version	Command history
8.0.10a	This command was introduced.

route-precedence admin-distance

Configures route precedence so that multicast routes are selected from the best route in the multicast routing table (mRTM) and unicast routing (uRTM) table.

Syntax

route-precedence admin-distance
no route-precedence admin-distance

Command Default

Multicast routes are not selected from the best route in the mRTM and uRTM. Routes are selected based on:

- The route precedence configured using the **route-precedence** command.
- The system route precedence default (if route precedence has not been configured using the **route-precedence** command).

the default route precedence settings.

Modes

PIM configuration mode

Usage Guidelines

The **no** form of this command restores the previous route precedence settings.

If the mRTM and the uRTM have routes of equal cost, the route from the mRTM is preferred.

Examples

The following example configures route precedence so that the best multicast route from the mRTM and uRTM tables is selected.

```
Device(config)#router pim
Device(config-pim-router)#route-precedence admin-distance
```

History

Release version	Command history
8.0.10a	This command was introduced.

router bgp

Enables BGP routing.

Syntax

router bgp
no router bgp

Command Default

BGP routing is not enabled.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command disables BGP routing.

Examples

The following example enables BGP routing.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)#
```

router-interface

Attaches a router interface to a Layer 2 VLAN.

Syntax

router-interface *ve num*

no router-interface *ve num*

Command Default

A router interface is not configured.

Parameters

ve *num*

Specifies a virtual router interface number.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of the command removes the router interface from the VLAN.

Examples

The following example shows how to attach the router interface to a Layer 2 VLAN.

```
device(config)# vlan 1 by port
device(config-vlan-1)# untagged ethernet 1/1/1
device(config-vlan-1)# tagged ethernet 1/1/8
device(config-vlan-1)# router-interface ve 1
```

router msdp

Enables multicast source discovery protocol (MSDP) on a router.

Syntax

```
router msdp [ vrf vrf-name ]
```

Command Default

MSDP is not enabled.

Parameters

vrf *vrf-name*
Specifies a virtual routing and forwarding (VRF) instance.

Modes

Global configuration mode

Usage Guidelines

When you configure the **no router msdp vrf** *vrf-name* command, the MSDP configuration is removed only from the specified VRF.

The PIM Sparse Rendezvous Point (RP) is also an MSDP peer.

Devices that run MSDP usually also run BGP. The source address used by the MSDP device is normally configured to be the same source address used by BGP.

All MSDP parameters available for the default router instance are configurable for a VRF-based MSDP instance.

Examples

The following example enables MSDP.

```
Device(config)# router msdp
```

The following example enables MSDP on a VRF named blue.

```
Device(config)# router msdp vrf blue
```

The following example removes the MSDP configuration only from the VRF named blue.

```
Device(config-msdp-router-vrf-blue)# no router msdp vrf blue
```

router ospf

Enables and configures the Open Shortest Path First version 2 (OSPFv2) routing protocol.

Syntax

```
router ospf [ vrf name ]  
no router ospf
```

Parameters

vrf *name*
Specifies a nondefault VRF.

Modes

Global configuration mode

Usage Guidelines

Use this command to enable the OSPFv2 routing protocol and enter OSPF router or OSPF router VRF configuration mode. OSPFv2 maintains multiple instances of the routing protocol to exchange route information among various VRF instances.

The **no** form of the command deletes all current OSPF configuration and blocks any further OSPFv2 configuration.

Examples

The following example enables OSPFv2 on a default VRF and enters OSPF VRF router configuration mode.

```
device# configure terminal  
device(config)# router ospf  
device(config-ospf-router)#
```

router pim

Configures basic global protocol-independent multicast (PIM) Sparse parameters on a device within the PIM Sparse domain and enters PIM-router configuration mode.

Syntax

router pim [**vrf** *vrf-name*]

no router pim [**vrf** *vrf-name*]

Command Default

PIM Sparse is not configured.

Parameters

vrf *vrf-name*

Specifies a virtual routing and forwarding (VRF) instance.

Modes

Global configuration mode

Interface configuration mode

Usage Guidelines

The **no** form of this command disables PIM and removes all configuration for PIM multicast on the device (**router pim** level) only.

Configuring the **no router pim vrf** *vrf-name* command removes all configuration for PIM multicast on the specified VRF.

You do not need to globally enable IP multicast routing when configuring PIM Sparse.

After you enable IP multicast routing and PIM Sparse at the global level, you must enable it on the individual interfaces connected to the PIM Sparse network.

If you configure PIM Sparse on an interface that is on the border of the PIM Sparse domain, you also must also configure the **ip pim border** command on the interface.

You must configure the **bsr-candidate ethernet** command to identify an interface on at least one device as a candidate PIM Sparse Bootstrap router (BSR) and candidate PIM Sparse Rendezvous Point (RP).

You can configure the **rp-address** command to explicitly identify an RP, including an ACL-based RP, by its IP address instead of having it identified by the RP election process.

Entering the **router pim vrf** command to enable PIM does not require a software reload.

All PIM parameters available for the default router instance are configurable for a VRF-based PIM instance.

Examples

This example configures basic global PIM Sparse parameters.

```
device(config)# router pim
```

This example configures PIM Sparse on a VRF named blue.

```
device(config)# router pim blue
```

router rip

Enables Routing Information Protocol (RIP) globally on the device. Does not enable RIP at the interface level.

Syntax

router rip

no router rip

Command Default

By default, RIP is not enabled on the device.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command disables RIP on the device.

Once you have enabled RIP on the device, you must also configure RIP on each RIP interface. Refer to the **ip rip** command for more information.

Examples

The following example enables RIP on a Brocade router.

```
device# configure terminal
device(config)# router rip
device(config-rip-router)#
```

router vrrp

Globally enables Virtual Router Redundancy Protocol (VRRP).

Syntax

router vrrp

no router vrrp

Command Default

VRRP is not globally enabled.

Modes

Global configuration mode

Usage Guidelines

After globally enabling VRRP, the command prompt does not change. Nearly all subsequent VRRP configuration is performed at the interface level, but VRRP must be enabled globally before configuring VRRP instances.

The **no router vrrp** command disables VRRP globally.

Examples

The following example globally enables VRRP and enters interface configuration mode.

```
device# configure terminal
device(config)# router vrrp
device(config)# interface ethernet 1/1/5
```

router vrrp-extended

Globally enables Virtual Router Redundancy Protocol Extended (VRRP-E) and enters VRRP-E router configuration mode.

Syntax

```
router vrrp-extended
no router vrrp-extended
```

Command Default

VRRP-E is not globally enabled.

Modes

Global configuration mode

Usage Guidelines

After globally enabling VRRP-E, nearly all subsequent VRRP-E configuration is performed at the interface level. VRRP-E must be enabled globally before configuring VRRP-E instances.

The **no router vrrp-extended** command globally disables VRRP-E.

Examples

The following example globally enables VRRP-E and enters interface configuration mode.

```
device# configure terminal
device(config)# router vrrp-extended
device(config-vrrpe-router)# interface ethernet 1/1/5
device(config-if-e1000-1/1/5)# ip address 10.53.5.3/24
device(config-if-e1000-1/1/5)# ip vrrp-extended vrid 1
device(config-if-e1000-1/1/5-vrid-1)# backup priority 110
device(config-if-e1000-1/1/5-vrid-1)# version 2
device(config-if-e1000-1/1/5-vrid-1)# ip-address 10.53.5.254
device(config-if-e1000-1/1/5-vrid-1)# activate
VRRP-E router 1 for this interface is activating
```

router vsrp

Enables the Virtual Switch Redundancy Protocol (VSRP) on Layer 2 or Layer 3 switches.

Syntax

router vsrp

no router vsrp

Command Default

By default, VSRP is enabled on Layer 2 and Layer 3 switches.

Modes

Global configuration mode

Usage Guidelines

On a Layer 3 switch, if you want to use VRRP or VRRP-E for Layer 3 redundancy instead of VSRP, you must disable VSRP first. Because VRRP and VRRP-E do not apply to Layer 2 switches, there is no need to disable VSRP and there is no command to do so. VSRP is always enabled on Layer 2 switches.

The **no** form of the command disables VSRP.

Examples

The following example shows how to disable VSRP and then enable it.

```
device(config)# no router vsrp  
device(config)# router vsrp
```

rpf-mode

Enables strict or loose unicast Reverse Path Forwarding (uRPF) mode on FastIron ICX devices.

Syntax

```
rpf-mode [ strict [ urpf-exclude-default ] | loose [urpf-exclude-default ] ]  
no rpf-mode [ strict [ urpf-exclude-default ] | loose [urpf-exclude-default ] ]
```

Command Default

uRPF mode is not enabled.

Parameters

strict

Specifies uRPF strict mode.

loose

Specifies uRPF loose mode. This mode allows all packets to pass the uRPF check.

urpf-exclude-default

Excludes the default route for uRPF source IP lookup.

Modes

Interface configuration mode

Usage Guidelines

You must enable uRPF at the global level before enabling the mode (strict or loose). This command is applicable only to the Layer 3 physical interface and Layer 3 VE interfaces.

The **loose** option allows all packets to pass through. Choose the **loose** option along with the **urp-exclude-default** option to subject the packets to uRPF check.

The **no** form of the command disables uRPF mode.

Examples

The following example sets the Reverse Path Forwarding mode to strict mode.

```
device(config)# interface ethernet 1/1/3  
device(config-if-e1/1/3)# rpf-mode strict
```

History

Release version	Command history
08.0.30	This command was introduced.

rp-address

Configures a device interface as a rendezvous point (RP).

Syntax

```
rp-address { ip-address | ipv6-address } acl_name_or_id  
no rp-address { ip-address | ipv6-address }
```

Command Default

The RP is selected by the PIM Sparse protocol's RP election process.

Parameters

ip-address

Specifies the IP address of the RP.

ipv6-address

Specifies the IPv6 address of the RP.

acl_name_or_id

Specifies the name or ID of the ACL that specifies which multicast groups use the RP.

Modes

Router PIM configuration mode

VRF configuration mode

Usage Guidelines

The **no** form of this command restores the default and the RP is selected by the RP election process.

Devices in the PIM Sparse domain use the specified RP and ignore group-to-RP mappings received from the bootstrap router (BSR).

The RP is the meeting point for PIM Sparse sources and receivers. A PIM Sparse domain can have multiple RPs, but each PIM Sparse multicast group address can have only one active RP. PIM Sparse routers learn the addresses of RPs and the groups for which they are responsible from messages that the BSR sends to each of the PIM Sparse routers.

NOTE

Specify the same IP or IPv6 address as the RP on all PIM Sparse devices within the PIM Sparse domain. Make sure the device is on the backbone or is otherwise well connected to the rest of the network.

Examples

This example configures the device interface at IP address 207.95.7.1 as the RP for the PIM Sparse domain.

```
device(config)# router pim
device(config-pim-router)# rp-address 207.95.7.1
```

This example configures an ACL named acl1 to specify which multicast groups use the RP.

```
device(config)# router pim
device(config-pim-router)# rp-address 130.1.1.1 acl1
```

This example configures an RP for a VRF named blue.

```
device(config)# ipv6 router pim vrf blue
device(config-ipv6-pim-router-vrf-blue)# rp-address 31::207
```

rp-adv-interval

Configures the interval at which the candidate rendezvous point (RP) configured on the device sends candidate-RP advertisement messages to the bootstrap router (BSR).

Syntax

rp-adv-interval *seconds*

no rp-adv-interval *seconds*

Command Default

The device sends candidate-RP advertisement messages every 60 seconds.

Parameters

seconds

Specifies the interval, in seconds, between advertisement messages. The range is 10 through 65535 seconds. The default is 60 seconds.

Modes

PIM router configuration mode

PIM router VRF configuration mode

Usage Guidelines

The **no** form of this command restores the candidate-RP advertisement-message interval to 60 seconds.

Examples

The following example configures the candidate-RP advertisement-message interval to 90 seconds.

```
device(config)# router pim
device(config-pim-router)# rp-adv-interval 90
```

The following example configures, on a VRF named blue, the candidate-RP advertisement-message interval to 90 seconds.

```
device(config)# ipv6 router pim vrf blue
device(config-ipv6-pim-router-vrf-blue)# rp-adv-interval 90
```

rp-candidate

Configures a device as a candidate rendezvous point (RP) for all multicast groups with the prefix 224.0.0.0/4, by default, and explicitly adds or deletes groups with other prefixes.

Syntax

rp-candidate { **ethernet** *stackid / slot / portnum* | **loopback** *num* | **ve** *num* | **tunnel** *num* }

rp-candidate {**add** | **delete** } *group-addr mask-bits*

no rp-candidate { **ethernet** *stackid / slot / portnum* | **loopback** *num* | **ve** *num* | **tunnel** *num* }

no rp-candidate {**add** | **delete** } *group-addr mask-bits*

Command Default

The PIM router is not available for selection as an RP.

Parameters

ethernet *stackid/slot/portnum*

Specifies a physical interface for the candidate RP. On standalone devices specify the interface ID in the format slot/port-id; on stacked devices you must also specify the stack ID, in the format stack-id/slot/port-id.

loopback *num*

Specifies a loopback interface for the candidate RP.

ve *num*

Specifies a virtual interface for the candidate RP.

tunnel *num*

Specifies a GRE tunnel interface for the candidate RP.

add

Specifies adding a group address or range of group addresses to the default group configured by the those the device is the candidate RP for by default, that is, groups with the prefix 224.0.0.0/4.

delete

Specifies deleting a group address or range of group addresses, that were added using the **add** keyword.

group-addr mask-bits

Specifies the group address and the number of significant bits in the subnet mask.

Modes

Router PIM configuration mode

Usage Guidelines

The **no rp-candidate** command makes the PIM router cease to act as a candidate RP.

The **no rp-candidate add** command deletes a group address or range of group addresses that were added using the **add** keyword.

Configuring the **rp-candidate** command on an Ethernet, loopback, virtual, or tunnel interface, configures the device as a candidate RP for all multicast groups with the prefix 224.0.0.0/4, by default. You can configure the **rp-candidate add** command to add to those a group address or range of group addresses. You can configure the **rp-candidate delete** command to delete a group address or range of group addresses that were added to the default addresses.

NOTE

You cannot delete the default group prefix.

The RP is the meeting point for PIM Sparse sources and receivers. A PIM Sparse domain can have multiple RPs, but each PIM Sparse multicast group address can have only one active RP. PIM Sparse routers learn the addresses of RPs and the groups for which they are responsible from messages that the bootstrap router (BSR) sends to each of the PIM Sparse routers.

Although you can configure the device as only a candidate BSR or an RP, it is recommended that you configure the same interface on the same device as both a BSR and an RP.

NOTE

Specify the same IPv6 address as the RP on all IPv6 PIM Sparse routers within the IPv6 PIM Sparse domain. Make sure the device is on the backbone or is otherwise well connected to the rest of the network. You can configure the **rp-address** command to specify the RP address.

Examples

This example configures a physical device as a candidate RP.

```
device(config)# router pim
device(config-pim-router)# rp-candidate ethernet 1/2/2
```

This example uses a loopback interface to configure a device as a candidate RP.

```
device(config)# router pim
device(config-pim-router)# rp-candidate loopback 1
```

This example uses a virtual interface to configure a device as a candidate RP.

```
device(config)# router pim
device(config-pim-router)# rp-candidate ve 120
```

This example configures an address group to the devices for which it is a candidate RP.

```
device(config)# router pim
device(config-pim-router)# rp-candidate add 224.126.0.0 16
```

This example deletes an address group from the devices for which it is a candidate RP.

```
device(config)# router pim
device(config-pim-router)# rp-candidate delete 224.126.22.0 24
```

History

Release version	Command history
8.0.20	This command was modified to add the tunnel keyword.

rp-embedded

Configures embedded-rendezvous point (RP) support on PIM devices.

Syntax

rp-embedded

no rp-embedded

Command Default

Embedded RP support is enabled.

Modes

PIM router configuration mode

PIM router VRF configuration mode

Usage Guidelines

The **no** form of this command disables embedded RP support.

Examples

This example disables embedded RP support.

```
Device(config)# ipv6 router pim
Device(config-ipv6-pim-router)#no rp-embedded
```

This example disables embedded RP support on a VRF named blue.

```
Device(config)#ipv6 router pim vrf blue
Device(config-ipv6-pim-router-vrf-blue)#no rp-embedded
```

sa-filter

Configures filters for incoming and outgoing Source-Active (SA) messages from and to multicast source discovery protocol (MSDP) neighbors.

Syntax

```
sa-filter { in | out } ip-addr [ route-map map-tag [ rp-route-map rp-map-tag ] ]  
no sa-filter { in | out } ip-addr [ route-map map-tag [ rp-route-map rp-map-tag ] ]  
sa-filter originate [ route-map map-tag ]  
no sa-filter originate [ route-map map-tag ]
```

Command Default

Source-Active filters are not configured.

Parameters

in

Specifies filtering incoming SA messages.

out

Specifies filtering self-originated and forwarded outbound SA messages.

ip-addr

specifies the IP address of the MSDP neighbor that the filtered SA messages are sent to of received from.

originate

Specifies filtering self-originated outbound SA messages.

route-map *map-tag*

Specifies a route map. The device applies the filter to source-group pairs that match the route map.

rp-route-map *rp-map-tag*

Specifies a route map to use for filtering based on Rendezvous Point (RP) address. Use this parameter if you want to filter SA messages based on their originating RP.

Modes

MSDP VRF configuration mode

Router MSDP configuration mode

Usage Guidelines

The default filter action is deny. If you want to permit some source-group pairs, use a route map. A permit action in the route map allows the device to advertise the matching source-group pairs. A deny action in the route map drops the source-group pairs from advertisements.

The **no** form of this command removes the SA filters.

Examples

The following example configures extended access-control lists (ACLs) to be used in the route map definition and use them to configure a route map that denies source-group with source address 10.x.x.x and any group address, while permitting everything else.

```
device(config)# access-list 123 permit ip 10.0.0.0 0.255.255.255 any
device(config)# access-list 125 permit ip any any
device(config)# route-map msdp_map deny 1
device(config-routemap msdp_map)# match ip address 123
device(config-routemap msdp_map)# exit
device(config)# route-map msdp_map permit 2
device(config-routemap msdp_map)# match ip address 125
device(config-routemap msdp_map)# exit
```

The following example configures a filter that filters self-originated outbound SA messages on a route map.

```
device(config)# router msdp
device(config-msdp-router)# sa-filter originate route-map msdp_map
```

The following example configures an SA filter on a VRF.

```
device(config)# router msdp vrf blue
device(config-msdp-router-vrf blue)# sa-filter in 2.2.2.99
device(config-msdp-router-vrf blue)# sa-filter in 2.2.2.97 route-map msdp_map
device(config-msdp-router-vrf blue)# sa-filter in 2.2.2.96 route-map msdp2_map rproute-map msdp2_rp_map
```

save-current-values

Configures a backup to save the VSRP timer values received from the master instead of the timer values configured on the backup.

Syntax

save-current-values

no save-current-values

Command Default

By default, the backups always use the value of the timers received from the master.

Modes

VSRP VRID configuration mode

Usage Guidelines

Saving the current timer values instead of the configured ones helps ensure consistent timer usage for all the VRID devices.

The **no** form of the command disables saving the timer values from the master.

Examples

The following example shows how to configure a backup to save the VSRP timer values received from the master instead of the timer values configured on the backup.

```
device(config)# vlan 200
device(config-vlan-200)# vsrp vrid 1
device(config-vlan-200-vrid-1)# save-current-values
```

scp

Copies a license file from an SCP-enabled client to the license database of the device.

Syntax

```
scp license_file_on_hostuser@IP_address: license:unit_id
```

Command Default

By default, the command is not enabled.

Parameters

license_file_on_hostuser@IP_address:

Specifies the filename of the license file at the specified IP address.

license

Specifies the keyword license to be used.

unit_id

Indicates the specific unit you want to copy the software license file to. The *unit-id* can be from 1 through 12.

Usage Guidelines

The *unit_id* parameter is used on Ruckus ICX devices when copying a license file from an SCP-enabled client to a specific unit id.

Examples

The following example copies the license file from an SCP-enabled client to the license database of a specific unit on the Ruckus ICX devices. In the example the license is copied to unit 3.

```
device# scp license.xml terry@10.20.91.39:license:3
```

History

Release version	Command history
07.2.00	This command was introduced.
05.0.00	This command was introduced.

secure-login

Configures Web Authentication to use secure (HTTPS) or non-secure (HTTP) login and logout pages.

Syntax

secure-login

no secure-login

Command Default

Web Authentication uses secure (HTTPS) login and logout pages.

Modes

Web Authentication configuration mode

Usage Guidelines

The **no** form of the command changes the setting to non-secure (HTTP) mode.

Examples

The following example configures Web Authentication to use non-secure (HTTP) login.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# no secure-login
```

secure-mac-address

Configures secure MAC addresses on tagged and untagged interfaces.

Syntax

secure-mac-address *mac-address* [*vlan-id*]

no secure-mac-address *mac-address* [*vlan-id*]

Command Default

Secure MAC addresses are not configured.

Parameters

mac-address

Specifies the MAC address.

vlan-id

Specifies the VLAN ID.

Modes

Port security interface configuration mode

Usage Guidelines

When specifying a secure MAC address on a tagged interface, you must also specify the VLAN ID.

NOTE

If MAC port security is enabled on a port and you change the VLAN membership of the port, make sure that you also change the VLAN ID specified in the **secure-mac-address** configuration statement for the port.

When a secure MAC address is applied to a tagged port, the VLAN ID is generated for both tagged and untagged ports. When you display the configuration, you see an entry for the secure MAC addresses.

The **no** form of the command removes the configured secure MAC address.

Examples

The following example shows how to specify a secure MAC address on an untagged interface.

```
device(config)# interface ethernet 1/7/11
device(config-if-e1000-1/7/11)# port security
device(config-port-security-e1000-1/7/11)# secure-mac-address 0000.0018.747C
```

The following example shows how to specify a secure MAC address on a tagged interface.

```
device(config)# interface ethernet 1/7/11
device(config-if-e1000-1/7/11)# port security
device(config-port-security-e1000-1/7/11)# secure-mac-address 0000.0018.747C 2
```

server (NTP)

Configures the device in client mode and specifies the NTP servers to synchronize the system clock.

Syntax

```
server { ipv4-address | ipv6-address } [ maxpoll interval ] [ minpoll interval ] [ version version-number ] [ key key-id ]  
    [ burst ]  
no server { ipv4-address | ipv6-address } [ maxpoll interval ] [ minpoll interval ] [ version version-number ] [ key key-id ]  
    [ burst ]
```

Parameters

ipv4-address

Specifies the IPv4 address of the server that provides the clock synchronization.

ipv6-address

Specifies the IPv6 address of the server that provides the clock synchronization.

version *version-number*

Specifies the Network Time Protocol (NTP) version number. Valid values are 3 and 4. The default value is 4.

key *key-id*

Specifies the authentication key range. The value can range from 1 to 65535.

minpoll *interval*

Specifies the shortest polling interval. The range is from 4 through 17. The default is 6. The interval argument is a power of 2 (4=16, 5=32, 6=64, 7=128, 8=256, 9=512, and so on).

maxpoll *interval*

Specifies the longest polling interval. The range is from 4 through 17. The default is 10. The interval argument is a power of 2 (4=16, 5=32, 6=64, 7=128, 8=256, 9=512, and so on).

burst

Sends a burst of packets to the server at each polling interval.

Modes

NTP configuration mode

Usage Guidelines

A maximum of eight NTP servers can be configured.

The **no** form of the command removes the NTP server configuration.

Examples

The following example configures the NTP server.

```
device(config)# ntp  
device(config-ntp)# server 10.1.1.1 key 23 maxpoll 15 minpoll 8 version 3 burst
```

service local-user-protection

Prevents unauthorized deletion or modification of a user account.

Syntax

service local-user-protection

no service local-user-protection

Command Default

The user account can be deleted or modified without any authentication; that is, user account security is disabled.

Modes

Global configuration mode

Usage Guidelines

This command allows for the deletion of user accounts or changing the password or privilege level of the user (using the **username** command) only upon successful validation of the existing user password.

If the command is enabled and you try to delete or modify a user account using the **username**, you will be prompted for confirmation to proceed. Upon confirmation, you will be prompted to provide the existing password. The attempt to modify or delete a user account is successful only if the correct password is entered.

The **no** form of the command disables user account security; the deletion or modification of the user account without any authentication is allowed.

Examples

The following example permits the modification of the user account password only after providing the existing password.

```
device(config)# username user1 password xpassx
device(config)# service local-user-protection
device(config)# username user1 password ypasswordy
User already exists. Do you want to modify: (enter 'y' or 'n'): y
To modify or remove user, enter current password: *****
```

The following example prevents unauthorized modification of the user account password.

```
device(config)# username user1 password ypasswordy
device(config)# service local-user-protection
device(config)# username user1 password zpassz
User already exists. Do you want to modify: (enter 'y' or 'n'): y
To modify or remove user, enter current password: ****
Error: Current password doesn't match. Access denied
```

History

Release version	Command history
8.0.40	This command was introduced.

service password-encryption

Configures the password encryption service to encrypt the passwords using different encryption methods.

Syntax

```
service password-encryption { sha1 | sha256 }
```

```
no service password-encryption { sha1 | sha256 }
```

Command Default

The user account password is encrypted using the MD5 encryption type.

Parameters

sha1

Encrypts system passwords using the SHA 1 encryption type.

sha256

Encrypts system passwords using the SHA 256 encryption type.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command reverts the password encryption service type to MD5.

Examples

The following example specifies the user account password to be encrypted using SHA 1.

```
device(config)# service password-encryption sha1  
Warning: Moving to higher password-encryption type, Do you want to continue(y/n)? (enter 'y' or 'n'): y
```

The following example specifies the user account password to be encrypted using SHA 256.

```
device(config)# service password-encryption sha256  
Warning: Moving to higher password-encryption type, Do you want to continue(y/n)? (enter 'y' or 'n'): y
```

The following example reverts the password encryption service type to MD5.

```
device(config)# no service password-encryption sha1  
Warning: Moving to lower password-encryption type, Do you want to continue(y/n)? (enter 'y' or 'n'): y
```

History

Release version	Command history
8.0.40	This command was introduced.

set interface null0

Drops traffic when the null0 statement becomes the active setting as determined by the route-hop selection process.

Syntax

set interface null0

no set interface null0

Command Default

The configuration to direct the traffic to the null0 interface is not configured.

Modes

Route map configuration mode

Usage Guidelines

This command sends the traffic to the null0 interface, which is the same as dropping the traffic.

The **no** form of this command deletes the matching filter from the ACL.

Examples

The following example configures the PBR policy to send all traffic from 192.168.1.204/32 to the null interface, thus dropping the traffic instead of forwarding it.

```
device(config)# access-list 56 permit 192.168.1.204 0.0.0.0  
  
device(config)# route-map file-13 permit 56  
device(config-routemap file-13)# match ip address 56  
device(config-routemap file-13)# set interface null0  
device(config-routemap file-13)# exit
```

set next-hop-ip-tunnel

Configures an IPsec or GRE tunnel interface as the next hop of a PBR route map.

Syntax

set next-hop-ip-tunnel *tunnel-id*

no set next-hop-ip-tunnel *tunnel-id*

Command Default

The next hop is not set to a tunnel interface.

Parameters

tunnel-id

Specifies the ID of the tunnel interface.

Modes

Route map configuration mode

Usage Guidelines

When PBR is used to map IP traffic into a GRE tunnel or IPsec tunnel, the VRF of the tunnel interface is considered as the egress VRF interface.

The **no** form of the command removes the tunnel interface as the PBR next hop.

Examples

The following example configures tunnel interface 1 as the PBR next hop.

```
device# interface tunnel 1
device(config-tnif-1)# vrf forwarding blue
device(config-tnif-1)# tunnel source ethernet 1/1/1
device(config-tnif-1)# tunnel destination 10.2.2.1
device(config-tnif-1)# tunnel mode ipsec ipv4
device(config-tnif-1)# tunnel protection ipsec profile prof-blue
device(config-tnif-1)# ip address 10.4.4.4/24
device(config-tnif-1)# exit
device(config)# access-list 99 permit 10.157.23.0 0.0.0.255
device(config)# route-map test-route permit 99
device(config-routemap test-route)# match ip address 99
device(config-routemap test-route)# set next-hop-ip-tunnel 1
device(config-routemap test-route)# end
device(config)# interface ethernet 1/1/3
device(config-if-e1000-1/1/3)# vrf forwarding blue
device(config-if-e1000-1/1/3)# ip policy route-map test-route
device(config-if-e1000-1/1/3)# end
```

History

Release version	Command history
08.0.50	This command was introduced.

scale-timer

Configures a scale time factor that increases the timing sensitivity across all configured and default Virtual Router Redundancy Protocol Extended (VRRP-E) timers.

Syntax

scale-timer vrrp-extended *scale-factor*

no scale-timer vrrp-extended *scale-factor*

Command Default

VRRP timers are not scaled.

Parameters

vrrp-extended

A scale time factor can be configured for VRRP-E timers.

scale-factor

A number representing the scale of the division of a VRRP-E configured interval timer or the default interval timer. Valid values are in a range from 1 through 10. The default value is 1.

Modes

VRRP-E router configuration mode

Usage Guidelines

Configuring the VRRP-E scale timer is supported only in VRRP-E sessions. When a scaling value is configured, the existing timer values are divided by the scaling value. For example: a value of 10 divides the timers by a factor of 10, allowing the default dead interval to be set to 300 ms. Using timer scaling, VRRP-E subsecond convergence is possible if a master VRRP device fails.

NOTE

Increased timing sensitivity as a result of this configuration could cause protocol flapping during periods of network congestion.

Examples

The following example scales all VRRP-E timers by a factor of 10.

```
device# configure terminal
device(config)# router vrrp-extended
device(config-vrrpe-router)# scale-timer vrrp-extended 10
```

scale-timer

Changes the timer scale, the value used by the software to calculate all VSRP timers.

Syntax

scale-timer *number*

no scale-timer *number*

Command Default

By default, the timer scale is set to 1.

Parameters

number

Specifies the multiplier factor for the timer. The range for the timer is from 1 through 10.

Modes

Global configuration mode

Usage Guidelines

Increasing the timer scale value decreases the length of all the VSRP timers equally, without changing the ratio of one timer to another.

To achieve sub-second failover times, you can shorten the duration of all scale timers for VSRP, VRRP, and VRRP-E by adjusting the timer scale. The timer scale is a value used by the software to calculate the timers. If you increase the timer scale, each timer value is divided by the scale value. Using the timer scale to adjust timer values enables you to easily change all the timers while preserving the ratios among their values. For example, if you set the timer scale to 2, all VSRP, VRRP, and VRRP-E timer values will be divided by 2. Here is an example:

Timer	Timer scale	Timer value
Hello interval	1	1 second
	2	0.5 seconds
Dead interval	1	3 seconds
	2	1.5 seconds
Backup Hello interval	1	60 seconds
	2	30 seconds
Hold-down interval	1	3 seconds
	2	1.5 seconds

The **no** form of the command sets the multiplier to 1.

Examples

The following example shows how to set the scale timer to 2.

```
device(config)# scale-timer 2
```

scheduler-profile

Attaches a scheduler profile to one or more ports.

Syntax

scheduler-profile *profile-name*

no scheduler-profile *profile-name*

Command Default

A scheduler profile is not attached to a port.

Parameters

profile-name

Specifies the name of the scheduler profile to be attached to the port.

Modes

Interface mode

Multiple-interface mode

Usage Guidelines

The **no** form of this command removes the scheduler profile from the port or ports.

You must configure a user scheduler profile before you can attach it to a port.

Only one scheduler profile at a time can be attached to any port. You can attach a scheduler profile to more than one port.

Examples

The following example attaches a scheduler profile named user1 to a port.

```
Device(config-if-e10000-1/1/1)# scheduler-profile user1
```

The following example attaches a scheduler profile named user2 to multiple ports.

```
Device(config-mif-1/1/2-1/1/16)# scheduler-profile user2
```

The following example removes a scheduler profile named user2 from multiple ports.

```
Device(config-mif-1/1/2-1/1/16)# no scheduler-profile user2
```

History

Release version	Command history
8.0.10	This command was introduced.

sequence (permit|deny in extended ACLs)

Inserts filtering rules in IPv4 extended named or numbered ACLs. Extended ACLs permit or deny traffic according to source and destination addresses, port protocol, and other IPv4 frame content.

Syntax

Use the following syntax to define a TCP or UDP rule:

```
[ sequence seq-num ] { deny | permit } { tcp | udp } { S_IPAddress [ mask ] | host S_IPAddress | any } [ source-comparison-operators ] { D_IPAddress [ mask ] | host D_IPAddress | any } [ established ] [ destination-comparison-operators ] [ precedence { precedence-name | precedence-value } ] [ tos { tos-name | tos-value } ] [ dscp-matching dscp-value ] [ dscp-marking dscp-value ] [ 802.1p-priority-matching 802.1p-value ] [ 802.1p-priority-marking 802.1p-value ] [ internal-priority-marking queuing-priority ] [ 802.1p-and-internal-marking priority-value ] [ traffic-policy name ] [ log ] [ mirror ]
```

Use the following syntax to define an ICMP rule:

```
[ sequence seq-num ] { deny | permit } icmp { S_IPAddress [ mask ] | host S_IPAddress | any } { D_IPAddress [ mask ] | host D_IPAddress | any } [ icmp-num | icmp-type ] [ precedence { precedence-name | precedence-value } ] [ tos { tos-name | tos-value } ] [ dscp-matching dscp-value ] [ dscp-marking dscp-value ] [ 802.1p-priority-matching 802.1p-value ] [ 802.1p-priority-marking 802.1p-value ] [ internal-priority-marking queuing-priority ] [ 802.1p-and-internal-marking priority-value ] [ traffic-policy name ] [ log ] [ mirror ]
```

Use the following syntax to define a rule for protocols other than TCP, UDP, or ICMP:

```
[ sequence seq-num ] { deny | permit } ip-protocol { S_IPAddress [ mask ] | host S_IPAddress | any } { D_IPAddress [ mask ] | host D_IPAddress | any } [ precedence { precedence-name | precedence-value } ] [ tos { tos-name | tos-value } ] [ dscp-matching dscp-value ] [ dscp-marking dscp-value ] [ 802.1p-priority-matching 802.1p-value ] [ 802.1p-priority-marking 802.1p-value ] [ internal-priority-marking queuing-priority ] [ 802.1p-and-internal-marking priority-value ] [ traffic-policy name ] [ log ] [ mirror ]
```

no **sequence** *seq-num*

NOTE

To delete an ACL rule, you can also type **no** and then enter the full syntax without **sequence** *seq-value*.

Parameters

sequence

(Optional) Enables you to assign a sequence number to the rule.

seq-num

Valid values range from 1 through 65000.

permit

Specifies rules to permit traffic.

deny

Specifies rules to deny traffic.

ip-protocol

Specifies the type of IPv4 packet to filter. You can either specify a protocol number (from 0 through 255) or a supported protocol name. For a complete list, type ? after **permit** or **deny**. Some of the supported protocols:

- ICMP—Internet Control Message Protocol

Commands K - S

sequence (permit|deny in extended ACLs)

- IGMP—Internet Group Management Protocol
- IGRP—Internet Gateway Routing Protocol
- IP—any IPv4 protocol
- OSPF—Open Shortest Path First
- TCP—Transmission Control Protocol
- UDP—User Datagram Protocol

S_IPAddress

Specifies a source address for which you want to filter the subnet.

mask

Defines a mask, whose effect is to specify a subnet that includes the source address that you specified. For options to specify the mask, see the Usage Guidelines.

host

Specifies a source address.

S_IPAddress

The source address.

any

Specifies all source addresses.

source-comparison-operators and *destination-comparison-operators*

If you specified **tcp** or **udp** protocol, the following optional operators are available:

eq

Specifies the port name or number you enter after **eq**.

gt

Specifies port numbers equal to or greater than the port number or the numeric equivalent of the port name you enter after **gt**.

lt

Specifies port numbers that are equal to or less than the port number or the numeric equivalent of the port name you enter after **lt**.

neq

Specifies all port numbers except the port number or port name you enter after **neq**.

range

Specifies all port numbers that are between the first port name or number and the second one you enter following the **range** keyword. The range includes the port names or numbers you enter. For example, to apply the policy to all ports between and including 23 (Telnet) and 53 (DNS), enter the following: **range 23 53** (two values separated by a space). The first port number in the range must be lower than the last number in the range.

D_IPAddress

Specifies a destination address for which you want to filter the subnet.

mask

Defines a mask, whose effect is to specify a subnet that includes the destination address that you specified. For options to specify the mask, see the Usage Guidelines.

host

Specifies a destination address.

D_IPAddress

The destination address.

any

Specifies all destination addresses.

established

(For TCP rules only) Filter packets that have the ACK (Acknowledgment) or RST (Reset) flag set. This policy applies only to established TCP sessions, not to new sessions.

icmp-num | icmp-type

(For ICMP protocol only) Specifies a named or numbered message type.

icmp-num

Specifies a numbered message type. Use this format if the rule also needs to include **precedence**, **tos**, one of the DSCP options, one of the 802.1p options, **internal-priority-marking**, or **traffic-policy**.

any-icmp-type

Specifies any ICMP type.

echo

Specifies an echo request (ping).

echo-reply

Specifies an echo reply.

information-request

Specifies an information request.

mask-reply

Specifies an address mask reply.

mask-request

Specifies an address mask request.

parameter-problem

Specifies a parameter problem.

redirect

Specifies a redirect.

source-quench

Specifies relieve congestion.

time-exceeded

Specifies a time exceed.

timestamp-reply

Specifies a timestamp reply.

timestamp-request

Specifies a timestamp request.

unreachable

Specifies an unreachable.

precedence

Specifies a *precedence-name* or corresponding *precedence-value*, as follows:

0 or routine

Specifies routine precedence.

1 or priority

Specifies priority precedence.

2 or immediate

Specifies immediate precedence.

3 or flash

Specifies flash precedence.

4 or flash-override

Specifies flash-override precedence.

5 or critical

Specifies critical precedence.

6 or internet

Specifies internetwork control precedence.

7 or network

Specifies network control precedence.

tos

Specifies a type of service (ToS). Enter either a supported *tos-name* or *tos-value*.

0 or normal

Specifies normal ToS.

1 or min-monetary-cost

Specifies min monetary cost ToS.

2 or max-reliability

Specifies max reliability ToS.

4 or max-throughput

Specifies max throughput ToS.

8 or min-delay

Specifies min-delay ToS.

tos-value

As mentioned above, you can specify the corresponding *tos-value* instead of *tos-name*. To specify multiple options, enter the sum of the needed ToS options. For example, to specify both **max-reliability** and **min-delay**, enter **10**. To specify all options, enter **15**. Values range from **0** through **15**.

dscp-matching *dscp-value*

Filters by DSCP value. Values range from 0 through 63.

dscp-marking *dscp-value*

Assigns the DSCP value that you specify to the packet. Values range from 0 through 63.

802.1p-priority-matching *802.1p-value*

Filters by 802.1p priority, for rate limiting. Values range from 0 through 7. For details, refer to "Inspecting the 802.1p bit in the ACL for adaptive rate limiting" section in the *Ruckus FastIron Traffic Management Configuration Guide*.

802.1p-priority-marking *802.1p-value*

Assigns the 802.1p value that you specify to the packet. Values range from 0 through 7.

internal-priority-marking *queuing-priority*

Assigns the internal queuing priority (traffic class) that you specify to the packet. Values range from 0 through 7.

802.1p-and-internal-marking *priority-value*

Assigns the identical 802.1p value and internal queuing priority (traffic class) that you specify to the packet. Values range from 0 through 7.

traffic-policy *name*

Enables the device to limit the rate of inbound traffic and to count the packets and bytes per packet to which ACL permit or deny clauses are applied. For configuration procedures and examples, refer to the chapter "Traffic Policies" in the *Ruckus FastIron Traffic Management Configuration Guide*.

log

Enables SNMP traps and Syslog messages for the rule. In addition, logging must be enabled using the **acl-logging** command.

mirror

Mirrors packets matching the rule.

Modes

ACL configuration mode

Usage Guidelines

This command inserts filtering rules in IPv4 extended named or numbered ACLs. Extended ACLs permit or deny traffic according to source and destination addresses, port protocol, and other IPv4 frame content. You can also enable logging and mirroring.

Although the **access-list** *acl-num* [**sequence** *seq-num*] { **deny** | **permit** } command is still supported, Ruckus recommends that you use the **ip access-list** command instead, following which you insert rules into the ACL using the [**sequence** *seq-num*] { **deny** | **permit** } command described in the current topic.

The order of the rules in an ACL is critical, as the first matching rule stops further processing. When creating rules, specifying sequence values determines the order of rule processing. If you do not specify a sequence value, the rule is added to the end of the list. Such a rule is automatically assigned the next multiple of 10 as sequence number.

You can specify a mask in either of the following ways:

- Wildcard mask format—for example, 0.0.0.255. The advantage of this format is that it enables you mask any bit, for example by specifying 0.255.0.255.
- Classless Interdomain Routing (CIDR) format—in which you specify the number of bits of the prefix. For example, appending /24 to an IPv4 address is equivalent to specifying 0.0.0.255 as wildcard mask format.

On the ICX 7750, ACL logging is not supported for egress ACLs.

In a rule that includes one or more of the following parameters, the **log** keyword is ignored:

- **dscp-matching**
- **dscp-marking**
- **802.1p-priority-matching**

Commands K - S

sequence (permit|deny in extended ACLs)

- **802.1p-priority-marking**
- **802.1p-and-internal-marking**

To delete a rule from an ACL, do either of the following:

- Enter **no sequence** *seq-value*.
- Type **no** and then enter the full syntax without **sequence** *seq-value*.

Examples

The following ACL, applied to an Ethernet interface, blocks and logs IPv4 TCP packets transmitted via Telnet from a specified host to any destination.

```
device# configure terminal
device(config)# ip access-list extended "block Telnet"
device(config-ext-nacl)# deny tcp host 10.157.22.26 any eq telnet log
device(config-ext-nacl)# permit ip any any
device(config-ext-nacl)# exit
device(config)# interface ethernet 1/1/1
device(config-if-1/1/1)# ip access-group "block Telnet" in
```

History

Release version	Command history
8.0.50	This command was modified to support the sequence keyword and to support logging in permit rules.

sequence (permit|deny in IPv6 ACLs)

Inserts filtering rules in IPv6 ACLs. Such rules permit or deny traffic according to source and destination addresses, port protocol, and other IPv6 frame content.

Syntax

Use the following syntax to define a TCP or UDP rule:

```
[ sequence seq-num ] { deny | permit } { tcp | udp } { ipv6-source-prefix/prefix-length | host source-ipv6_address | any }
[ source-comparison-operators ] { ipv6-destination-prefix/prefix-length | host ipv6-destination-address | any }
[ established ] [ destination-comparison-operators ] [ dscp-matching dscp-value ] [ dscp-marking dscp-value ]
[ 802.1p-priority-matching 802.1p-value ] [ 802.1p-priority-marking 802.1p-value ] [ internal-priority-marking
queuing-priority ] [ traffic-policy name ] [ log ] [ mirror ]
```

Use the following syntax to define an ICMP rule:

```
[ sequence seq-num ] { deny | permit } icmp { ipv6-source-prefix/prefix-length | host source-ipv6_address | any } { ipv6-destination-prefix/prefix-length | host ipv6-destination-address | any } [ icmp-num | icmp-type ] [ dscp-matching dscp-value ] [ dscp-marking dscp-value ] [ traffic-policy name ] [ log ] [ mirror ]
```

Use the following syntax to define a rule an IPv6 rule:

```
[ sequence seq-num ] { deny | permit } IPv6 { ipv6-source-prefix/prefix-length | host source-ipv6_address | any } { ipv6-destination-prefix/prefix-length | host ipv6-destination-address | any } [ fragments | routing ] [ dscp-matching dscp-value ] [ dscp-marking dscp-value ] [ 802.1p-priority-matching 802.1p-value ] [ 802.1p-priority-marking 802.1p-value ] [ internal-priority-marking queuing-priority ] [ traffic-policy name ] [ log ] [ mirror ]
```

Use the following syntax to define an AHP, ESP, or SCTP or *protocol-number* rule:

```
[ sequence seq-num ] { deny | permit } { AHP | ESP | SCTP | protocol-number } { ipv6-source-prefix/prefix-length | host source-ipv6_address | any } { ipv6-destination-prefix/prefix-length | host ipv6-destination-address | any } [ dscp-matching dscp-value ] [ dscp-marking dscp-value ] [ 802.1p-priority-matching 802.1p-value ] [ 802.1p-priority-marking 802.1p-value ] [ internal-priority-marking queuing-priority ] [ traffic-policy name ] [ log ] [ mirror ]
```

no **sequence** *seq-num*

NOTE

To delete an ACL rule, you can also type **no** and then enter the full syntax without **sequence** *seq-value*.

Parameters

sequence

(Optional) Enables you to assign a sequence number to the rule.

seq-num

Valid values range from 1 through 65000.

permit

Specifies rules to permit traffic.

deny

Specifies rules to deny traffic.

protocol

Specifies the type of IPv6 packet you are filtering. You can either specify a *protocol-number* (from 0 through 255) or one of the following protocol names:

- **ahp**—Authentication Header
- **esp**—Encapsulating Security Payload
- **icmp**—Internet Control Message Protocol
- **ipv6**—Internet Protocol, version 6
- **sctp**—Stream Control Transmission Protocol
- **tcp**—Transmission Control Protocol
- **udp**—User Datagram Protocol

ipv6-source-prefix / prefix-length

Specifies a source prefix and prefix length that a packet must match for the specified action (deny or permit) to occur. You must specify the *ipv6-source-prefix* parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373. Specify the *prefix-length* parameter as a decimal value, preceded by a slash mark (/).

host *source-ipv6_address*

Enables you specify a host IPv6 address. When you use this parameter, you do not need to specify the prefix length. A prefix length of all 128 is implied.

any

Specifies all source addresses.

source-comparison-operators and *destination-comparison-operators*

If you specified **tcp** or **udp** protocol, the following optional operators are available:

eq

Specifies the port name or number you enter after **eq**.

gt

Specifies port numbers equal to or greater than the port number or the numeric equivalent of the port name you enter after **gt**.

lt

Specifies port numbers that are equal to or less than the port number or the numeric equivalent of the port name you enter after **lt**.

neq

Specifies all port numbers except the port number or port name you enter after **neq**.

range

Specifies all port numbers that are between the first port name or number and the second one you enter following the **range** keyword. The range includes the port names or numbers you enter. For example, to apply the policy to all ports between and including 23 (Telnet) and 53 (DNS), enter the following: **range 23 53** (two values separated by a space). The first port number in the range must be lower than the last number in the range.

ipv6-destination-prefix / prefix-length

Specifies a destination prefix and prefix length that a packet must match for the specified action (deny or permit) to occur. You must specify the *ipv6-destination-prefix* parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373. Specify the *prefix-length* parameter as a decimal value, preceded by a slash mark (/).

host *destination-ipv6_address*

Enables you specify a host IPv6 address. When you use this parameter, you do not need to specify the prefix length. A prefix length of all 128 is implied.

any

Specifies all destination addresses.

established

(For TCP protocol only) Filter packets that have the ACK (Acknowledgment) or RST (Reset) flag set. This policy applies only to established TCP sessions, not to new sessions.

icmp-num | *icmp-type*

(For ICMP protocol only) Specifies a named or numbered message type.

icmp-num

Specifies a numbered message type.

beyond-scope

Specifies a beyond scope message.

destination-unreachable

Specifies a destination unreachable message.

echo-reply

Specifies an echo reply.

echo-request

Specifies an echo request (ping).

header

Specifies a parameter problem header error message.

hop-limit

Specifies an in-transit, time exceeded message.

mld-query

Specifies an MLD query message.

mld-reduction

Specifies an MLD reduction message.

mld-report

Specifies an MLD report message.

nd-na

Specifies a neighbor discovery (ND) neighbor advertisement message.

nd-ns

Specifies an ND neighbor solicitation message.

next-header

Specifies a parameter problem next-header error message.

no-admin

Specifies a destination unreachable administratively prohibited message.

no-route

Specifies a destination unreachable no route message.

packet-too-big

Specifies a packet too big message.

parameter-option

Specifies a parameter-option problem message.

parameter-problem

Specifies a parameter problem message.

port-unreachable

Specifies a destination-port unreachable message.

reassemble-timeout

Specifies a reassembly timeout message.

renum-command

Specifies a renumber command message.

renum-result

Specifies a renumber result message.

renum-seq-number

Specifies a renumber sequence number message.

router-advertisement

Specifies a router advertisement message.

router-renumbering

Specifies a router renumbering message.

router-solicitation

Specifies a router solicitation message.

time-exceeded

Specifies a time exceeded message.

unreachable

Specifies a destination-unreachable message.

fragments

(For IPv6 protocol only) Specifies fragmented packets that contain a non-zero offset.

routing

(For IPv6 protocol only) Specifies source-routed packets.

dscp-matching *dscp-value*

Filters by DSCP value. Values range from 0 through 63.

dscp-marking *dscp-value*

Assigns the DSCP value that you specify to the packet. Values range from 0 through 63.

802.1p-priority-matching *802.1p-value*

Filters by 802.1p priority, for rate limiting. Values range from 0 through 7. For details, refer to "Inspecting the 802.1p bit in the ACL for adaptive rate limiting" section in the *Ruckus FastIron Traffic Management Configuration Guide*.

802.1p-priority-marking *802.1p-value*

Assigns the 802.1p value that you specify to the packet. Values range from 0 through 7.

internal-priority-marking *queuing-priority*

Assigns the internal queuing priority (traffic class) that you specify to the packet. Values range from 0 through 7.

traffic-policy *name*

Enables the device to limit the rate of inbound traffic and to count the packets and bytes per packet to which ACL permit or deny clauses are applied. For configuration procedures and examples, refer to the chapter "Traffic Policies" in the *Ruckus FastIron Traffic Management Configuration Guide*.

log

Enables SNMP traps and Syslog messages for the rule. In addition, logging must be enabled using the **logging-enable** command.

mirror

Mirrors packets matching the rule.

Modes

ACL configuration mode

Usage Guidelines

The order of the rules in an ACL is critical, as the first matching rule stops further processing. When creating rules, specifying sequence values determines the order of rule processing. If you do not specify a sequence value, the rule is added to the end of the list. Such a rule is automatically assigned the next multiple of 10 as sequence number.

On the ICX 7750, ACL logging is not supported for egress ACLs.

In a rule that includes one or more of the following parameters, the **log** keyword is ignored:

- **dscp-matching**
- **dscp-marking**
- **802.1p-priority-matching**
- **802.1p-priority-marking**

To delete a rule from an ACL, do either of the following:

- Enter **no sequence** *seq-value*.
- Type **no** and then enter the full syntax without **sequence** *seq-value*.

Examples

The following example creates an IPv6 named "netw", with remarks preceding each rule.

```
device# configure terminal
device(config)# ipv6 access-list netw

remark Permits ICMP traffic from 2001:DB8:e0bb::x to 2001:DB8::x.
device(config-ipv6-access-list netw)# permit icmp 2001:DB8:e0bb::/64 2001:DB8::/64

remark Denies traffic from 2001:DB8:e0ac::2 to 2001:DB8:e0aa:0::24.
device(config-ipv6-access-list netw)# deny ipv6 host 2001:DB8:e0ac::2 host 2001:DB8:e0aa:0::24

remark Denies all UDP traffic.
device(config-ipv6-access-list netw)# deny udp any any

remark Permits traffic not explicitly denied by the previous rules.
device(config-ipv6-access-list netw)# permit ipv6 any any
```

Commands K - S

sequence (permit|deny in IPv6 ACLs)

The following example applies "netw" to incoming traffic on 1/1/2 and 1/4/3.

```
device# configure terminal
device(config)# interface ethernet 1/1/2
device(config-if-e1000-1/1/2)# ipv6 enable
device(config-if-e1000-1/1/2)# ipv6 traffic-filter netw in
device(config-if-e1000-1/1/2)# exit
device(config)# interface ethernet 1/4/3
device(config-if-e1000-1/4/3)# ipv6 enable
device(config-if-e1000-1/4/3)# ipv6 traffic-filter netw in
```

The following example creates an IPv6 named "rtr", with remarks preceding each rule.

```
device# configure terminal
device(config)# ipv6 access-list rtr

device(config-ipv6-access-list rtr)# remark Denies TCP traffic from 2001:DB8:21::x to 2001:DB8:22::x.
device(config-ipv6-access-list rtr)# deny tcp 2001:DB8:21::/24 2001:DB8:22::/24

device(config-ipv6-access-list rtr)# remark Denies UDP traffic from UDP ports 5 through 6 to
2001:DB8:22::/24.
device(config-ipv6-access-list rtr)# deny udp any range 5 6 2001:DB8:22::/24

device(config-ipv6-access-list rtr)# remark Permits traffic not explicitly denied by the previous rules.
device(config-ipv6-access-list rtr)# permit ipv6 any any
```

The following example applies "rtr" to incoming traffic on ports 1/2/1 and 1/2/2.

```
device# configure terminal
device(config)# interface ethernet 1/2/1
device(config-if-e1000-1/2/1)# ipv6 enable
device(config-if-e1000-1/2/1)# ipv6 traffic-filter rtr in
device(config-if-e1000-1/2/1)# exit
device(config)# int eth 1/2/2
device(config-if-e1000-1/2/2)# ipv6 enable
device(config-if-e1000-1/2/2)# ipv6 traffic-filter rtr in
```

The following examples are show commands for ACL "rtr".

```
device# show running-config
ipv6 access-list rtr
deny tcp 2001:DB8:21::/24 2001:DB8:22::/24
deny udp any range rje 6 2001:DB8:22::/24
permit ipv6 any anyy

ddevice# show ipv6 access-list rtr
ipv6 access-list rtr: 3 entries
10: deny tcp 2001:DB8:21::/24 2001:DB8:22::/24
20: deny udp any range rje 6 2001:DB8:22::/24
30: permit ipv6 any any
```

History

Release version	Command history
8.0.50	This command was modified to support the sequence keyword and to support logging in permit rules.

sequence (permit|deny in standard ACLs)

Inserts filtering rules in IPv4 standard named or numbered ACLs. Standard ACLs permit or deny traffic according to source address only.

Syntax

```
sequence seq-num { deny | permit } { S_IPAddress [ mask ] | host S_IPAddress | any } [ log ] [ mirror ]  
{ deny | permit } { S_IPAddress [ mask ] | host S_IPAddress | any } [ log ] [ mirror ]  
no sequence seq-num  
no { deny | permit } { S_IPAddress [ mask ] | host S_IPAddress | any } [ log ] [ mirror ]
```

Parameters

sequence

(Optional) Enables you to assign a sequence number to the rule.

seq-num

Valid values range from 1 through 65000.

permit

Specifies rules to permit traffic.

deny

Specifies rules to deny traffic.

S_IPAddress

Specifies a source address for which you want to filter the subnet.

mask

Defines a mask, whose effect is to specify a subnet that includes the source address that you specified. For options to specify the mask, see the Usage Guidelines.

host

Specifies a source address.

S_IPAddress

The source address.

any

Specifies all source addresses.

log

Enables logging for the rule. In addition, logging must be enabled using the **acl-logging** command.

mirror

Mirrors packets matching the rule.

Modes

ACL configuration mode

Usage Guidelines

This command configures rules to permit or drop traffic based on source addresses. You can also enable logging and mirroring.

Although the **access-list** *acl-num* [**sequence** *seq-num*] { **deny** | **permit** } command is still supported, Ruckus recommends that you use the **ip access-list** command instead, following which you insert rules into the ACL using the [**sequence** *seq-num*] { **deny** | **permit** } command described in the current topic.

The order of the rules in an ACL is critical, as the first matching rule stops further processing. When creating rules, specifying sequence values determines the order of rule processing. If you do not specify a sequence value, the rule is added to the end of the list. Such a rule is automatically assigned the next multiple of 10 as sequence number.

You can specify a mask in either of the following ways:

- Wildcard mask format—for example, 0.0.0.255. The advantage of this format is that it enables you mask any bit, for example by specifying 0.255.0.255.
- Classless Interdomain Routing (CIDR) format—in which you specify the number of bits of the prefix. For example, appending /24 to an IPv4 address is equivalent to specifying 0.0.0.255 as wildcard mask format.

On the ICX 7750, ACL logging is not supported for egress ACLs.

To delete a rule from an ACL, do either of the following:

- Enter **no sequence** *seq-value*.
- Type **no** and then enter the full syntax without **sequence** *seq-value*.

Examples

The following example shows how to configure a standard numbered ACL and apply it to incoming traffic on port 1/1/1.

```
device# configure terminal
device(config)# ip access-list standard 1
device(config-std-nacl)# deny host 10.157.22.26 log
device(config-std-nacl)# deny 10.157.29.12 log
device(config-std-nacl)# deny host IPHost1 log
device(config-std-nacl)# permit any
device(config-std-nacl)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# ip access-group 1 in
```

History

Release version	Command history
8.0.50	This command was modified to support the sequence keyword and to support logging in permit rules.

set ip next-hop

Configures the next-hop IP address for the traffic that matches a match statement in the route map.

Syntax

```
set ip next-hop { peer-address | ip-address [ no-ttl-decrement | vrf vrf-name ] }
```

```
no set ip next-hop { peer-address | ip-address [ no-ttl-decrement | vrf vrf-name ] }
```

Command Default

The next-hop IP address is not configured by default.

Parameters

peer-address

Specifies the BGP peer IP address.

ip-address

Specifies the IP address of the next hop.

no-ttl-decrement

Disables the TTL value decrement and ensures that the packets are forwarded to the neighbor router without decrementing Time-to-Live (TTL) for the matched traffic.

vrf vrf-name

Specifies the VRF of the interface.

Modes

Route map configuration mode

Usage Guidelines

no-ttl-decrement

Policy-based routing (PBR) does not support the **peer-address** option while configuring the next-hop IP address using the **set ip next-hop** command.

For PBR on an interface in a VRF, if the VRF is not specified in the next hop (that is, only the IP address is specified as the next hop), the default VRF of the interface is considered. The next hop in a route map will take effect only if the interface on which the route map is applied and the next hop in the route map are in the same VRF

The **no-ttl-decrement** option is supported only on the Brocade ICX 7750 and Brocade ICX 7450 devices.

The **no** form of the command removes the next-hop IP address configured for the traffic.

Examples

The following example configures a route map without decrementing the Time-to-Live (TTL) value.

```
device(config)# route-map test-route permit 99
device(config-route-map test-route)# match ip address 100
device(config-route-map test-route)# set ip next-hop 192.168.3.1 no-ttl-decrement
device(config-route-map test-route)# exit
```

The following example configures a route map with the default VRF of the interface as the next hop.

```
device(config)# route-map test-route permit 99
device(config-route-map test-route)# match ip address 100
device(config-route-map test-route)# set ip next-hop 192.168.3.1
device(config-route-map test-route)# exit
```

The following example configures a route map which specifies the next hop is a VRF named as vrf_c.

```
device(config)# route-map test-route permit 99
device(config-route-map test-route)# match ip address 100
device(config-route-map test-route)# set ip next-hop 192.168.3.1 vrf vrf_c
device(config-route-map test-route)# exit
```

History

Release version	Command history
08.0.10d	The no-ttl-decrement option was introduced.
08.0.30	The support for the no-ttl-decrement option was added in 08.0.30 and later releases.
08.0.50	The vrf option was introduced.

sflow agent-ip

Configures an arbitrary IPv4 or IPv6 address as the sFlow agent IP address.

Syntax

sflow agent-ip { *ipv4-addr* | *ipv6-addr* }

no sflow agent-ip { *ipv4-addr* | *ipv6-addr* }

Command Default

By default, the device automatically selects the sFlow agent IP address based on the configuration.

Parameters

ipv4-addr

Specifies an IPv4 address as the sFlow agent IP address.

ipv6-addr

Specifies an IPv6 address as the sFlow agent IPv6 address.

Modes

Global configuration mode

Usage Guidelines

The sampled sFlow data that is sent to the collectors includes an `agent_address` field. This field identifies the device (the sFlow agent) that sent the data. By default, the device automatically selects the sFlow agent IP address based on the configuration. Alternatively, you can configure the device to use an arbitrary IPv4 or IPv6 address as the sFlow agent IP address instead.

The **no** form of the command removes the configured IPv4 or IPv6 address as the sFlow agent IP address.

Examples

The following example configures an IPv4 address as the sFlow agent IP address.

```
device(config)# sflow agent-ip 10.10.10.1
```

The following example configures an IPv6 address as the sFlow agent IP address.

```
device(config)# sflow agent-ip FE80::240:D0FF:FE48:4672
```

sflow destination

Configures an sFlow collector for the destination address.

Syntax

sflow destination [*ip-address* | **ipv6** *ipv6-address*] [*udp-port-number*] [**vrf** *vrf-name*]

no sflow destination [*ip-address* | **ipv6** *ipv6-address*] [*udp-port-number*] [**vrf** *vrf-name*]

Command Default

An sFlow collector is not configured.

Parameters

ip-address

Specifies the IPv4 destination address.

ipv6 *ipv6-address*

Specifies the IPv6 destination address.

udp-port-number

Specifies the User Datagram Protocol (UDP) port number. The default value is 6343.

vrf *vrf-name*

Specifies the Virtual Routing and Forwarding (VRF) name.

Modes

Global configuration mode

Usage Guidelines

sFlow exports traffic statistics to an external collector. You can specify up to four collectors. You can specify more than one collector with the same IP address if the UDP port numbers are unique. You can have up to four unique combinations of IP addresses and UDP port numbers.

By default sFlow uses the management VRF to send the samples to the collector. If no management VRF is configured, sFlow uses the default VRF, and this default VRF ID will be assigned to any configured collector that does not have a user-included VRF.

sFlow-forwarding ports can come from ports that belong to any VRF. The port does not have to be in the same VRF as the collector. sFlow collects packets from all sFlow-forwarding ports, even if they do not belong to a VRF, compiles the packets into the sFlow samples, and sends the samples to the particular collector with no filtering for VRF membership.

The **no** form of the command configures the management VRF to send the samples to the collector.

Examples

The following example configures an sFlow collector and specifies a VRF.

```
device(config)# sflow destination 10.10.10.10 vrf customer1
```

sflow enable

Enables sFlow forwarding globally.

Syntax

sflow enable

no sflow enable

Command Default

sFlow is not enabled.

Modes

Global configuration mode

Usage Guidelines

To enable sFlow forwarding, you must first enable it on a global basis and then use the **sflow forwarding** command to enable it on individual interfaces or LAG ports, or both.

The **no** form of the command disables sFlow forwarding globally.

Examples

The following example enables sFlow forwarding globally.

```
device(config)# sflow enable
```

sflow export

Configures exporting, to the sFlow collector, the CPU usage and memory usage information or exporting CPU-directed data.

Syntax

```
sflow export { cpu-traffic [ traffic-seconds ] | system-info [ info-seconds ] }
no sflow export { cpu-traffic [ traffic-seconds ] | system-info [ info-seconds ] }
```

Command Default

By default, CPU and memory usage information and CPU-directed data are not exported.

Parameters

cpu-traffic

Specifies the CPU usage.

traffic-seconds

Specifies the average sampling rate of incoming packets on an sFlow-enabled port to the number of flow samples taken from those packets.

system-info

Specifies the system information and the memory usage.

info-seconds

Specifies the polling interval, in seconds. The default polling interval for exporting CPU and memory usage information to the sFlow collector is 20 seconds and the interval for exporting CPU-directed data to the sFlow collector is 16.

Modes

Global configuration mode

Usage Guidelines

The polling interval defines how often sFlow data for a port is sent to the sFlow collector.

The **no** form of the command removes the configured value and sets the sampling rate or the polling interval to its default value.

Examples

The following example sets the sampling rate to 2048.

```
device(config)# sflow export cpu-traffic 2048
```

Commands K - S

sflow export

The following example enables the export of CPU usage and memory usage information.

```
device(config)# sflow export system-info
```

The following example sets the polling interval for exporting CPU and memory usage information to 30 seconds.

```
device(config)# sflow export system-info 30
```

sflow forwarding

Enables sFlow forwarding on individual interfaces.

Syntax

sflow forwarding

no sflow forwarding

Command Default

sFlow forwarding is not enabled on individual interfaces.

Modes

Interface configuration mode

Usage Guidelines

You must use both the **sflow enable** command and the **sflow forwarding** command to enable the feature.

The **no** form of the command disables sFlow forwarding on individual interfaces.

Examples

The following example enables sFlow forwarding on a range of Ethernet interfaces.

```
device(config)# sflow enable
device(config)# interface ethernet 1/1/1 to 1/1/8
device(config-mif-1/1/1-1/1/8)# sflow forwarding
```

sflow forwarding (LAG)

Enables sFlow forwarding on an individual port in a deployed LAG.

Syntax

sflow forwarding { **ethernet** *stackid/slot/port* | **port-name** *name* }

no sflow forwarding { **ethernet** *stackid/slot/port* | **port-name** *name* }

Command Default

sFlow is not configured.

Parameters

ethernet *stackid/slot/port*

Specifies the Ethernet port within the LAG on which you want to enable sFlow forwarding.

port-name *name*

Specifies a named port within the LAG on which you want to enable sFlow forwarding.

Modes

LAG configuration mode

Usage Guidelines

For a keep-alive LAG, sFlow can be enabled only in interface configuration mode and not in LAG configuration mode.

The **no** form of the command disables sFlow forwarding.

Examples

The following example shows how to enable sFlow forwarding on an individual port.

```
device(config)# lag blue static
device(config-lag-blue)# deploy
device(config-lag-blue)# sflow forwarding ethernet 1/3/1
```

The following example shows how to enable sFlow forwarding on a named port.

```
device(config)# lag test2 static
device (config-lag-test2)# deploy
device(config-lag-test2)# sflow forwarding port-name port1
```

sflow management-vrf-disable

Disables the management Virtual Routing and Forwarding (VRF) in sFlow.

Syntax

sflow management-vrf-disable

no sflow management-vrf-disable

Command Default

sFlow uses the management VRF to send samples to the collector.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command enables the management VRF in sFlow.

Examples

The following example disables management VRF in sFlow.

```
device(config)# sflow management-vrf-disable
```

sflow max-packet-size

Configures the maximum flow sample size sent to the sFlow collector.

Syntax

sflow max-packet-size *size*
no sflow max-packet-size

Command Default

The default maximum flow sample size is 128 bytes.

Parameters

size
Specifies the maximum sFlow packet size, in bytes. For sFlow version 5, the maximum flow sample size is 1300 bytes.

Modes

Global configuration mode

Usage Guidelines

With sFlow version 5, you can specify the maximum size of the flow samples sent to the sFlow collector. If a packet is larger than the specified maximum size, only the contents of the packet up to the specified maximum number of bytes are exported. If the size of the packet is smaller than the specified maximum, the entire packet is exported.

The **no** form of the command removes the configured value and reverts to the default value.

Examples

The following example sets the maximum flow sample size to 1024.

```
device(config)# sflow max-packet-size 1024
```

sflow polling-interval

Configures the sflow polling interval.

Syntax

sflow polling-interval *secs*
no sflow polling-interval

Command Default

The default polling interval is 20 seconds.

Parameters

secs

Specifies the polling interval, in seconds. The value can range from 0 through 429496729. If you specify 0, counter data sampling is disabled. The default polling interval is 20 seconds.

Modes

Global configuration mode

Usage Guidelines

The polling interval defines how often sFlow byte and packet counter data for a port is sent to the sFlow collectors. If multiple ports are enabled for sFlow, the device staggers transmission of the counter data to smooth performance. For example, if sFlow is enabled on two ports and the polling interval is 20 seconds, the device sends counter data every 10 seconds. The counter data for one of the ports is sent after 10 seconds, and the counter data for the other port is sent after an additional 10 seconds. 10 seconds later, new counter data for the first port is sent.

The interval value applies to all interfaces on which sFlow is enabled.

The **no** form of the command returns the polling interval to the default value.

Examples

The following example sets the polling interval to 30 seconds.

```
device(config)# sflow polling-interval 30
```

sflow sample

Changes the default sampling rate.

Syntax

sflow sample *num*

no sflow sample *num*

Command Default

The default sampling rate is 4096 packets.

Parameters

num

Specifies the average number of packets from which each sample is taken. The software rounds the value that you enter to the next higher odd power of 2. Refer to the Usage Guidelines section for information on the range of supported values.

Modes

Global configuration mode

Interface configuration mode

LAG configuration mode

Usage Guidelines

The value range for the sampling rate on Brocade ICX 7250, ICX 7450, and ICX 7750 is from 256 through 1073741823.

You cannot change a module's sampling rate directly. You can change a module's sampling rate only by changing the sampling rate of a port on that module.

You can configure an individual port to use a different sampling rate than the global default sampling rate. This is useful when ports have different bandwidths.

You can configure individual LAG ports to use a different sampling rate than the global default sampling rate.

Configuring a sampling rate on a port that is the primary port of a LAG applies that same sampling rate to all ports in the LAG. For a keep-alive LAG, sFlow can be enabled only at the interface level and not at the LAG level.

When configuring the sample rate, if you configure the value as 1000, the software rounds the value to the next higher odd power of 2; so the actual rate is 2^{11} (2048), and 1 in 2048 packets are sampled by the hardware.

The **no** form of the command resets the sampling rate to the default value.

Examples

The following example changes the default (global) sampling rate.

```
device(config)# sflow sample 2048
```

The following example changes the sampling rate on an individual port.

```
device(config)# interface ethernet 1/1/1  
device(config-if-e1000-1/1/1)# sflow sample 8192
```

The following example enables an sFlow sample rate in a LAG configuration.

```
device(config)# lag blue static  
device(config-lag-blue)# deploy  
device(config-lag-blue)# sflow sample 512
```

sflow source

Configures the sFlow source interface (IPv4 or IPv6) from which the IP source address is selected for the sFlow datagram.

Syntax

sflow source [**ipv6**] { **ethernet** *stackid/slot/port* | **ve** *ve-number* | **loopback** *number* }

no sflow source [**ipv6**] { **ethernet** *stackid/slot/port* | **ve** *ve-number* | **loopback** *number* }

Command Default

The sFlow source is not configured. The IP address of the outgoing interface is used in the sFlow datagram.

Parameters

ipv6

Configures the IPv6 interface as the sFlow source. If **ipv6** is not specified, the IPv4 interface is automatically configured as the sFlow source.

ethernet *stackid/slot/port*

Configures an Ethernet interface as the sFlow source interface.

ve *ve-number*

Configures a virtual interface (VE) as the sFlow source interface.

loopback *number*

Configures a loopback interface as the sFlow source interface.

Modes

Global configuration mode

Usage Guidelines

At any time, only one source of the Ethernet, VE, or loopback interface can be specified as the source interface.

The first IP address in the interface IP address list is considered the source IP address. Upon configuring another source for an IPv4 or IPv6 address, any previously configured source for the IPv4 or IPv6 address will be deleted. You can configure IPv4 and IPv6 source interfaces independently.

If the sFlow destination is IPv6, and the sFlow source is configured for an IPv6 address, then an IPv6 address will be selected from the configured interface. If the sFlow destination is IPv4, and the sFlow source is configured for an IPv4 address, then an IPv4 address will be selected from the configured interface.

The **no** form of the command removes the sFlow source configuration from the interface and restores the default behavior of using IP address of the outgoing interface as the source IP address of the sFlow datagram.

Examples

The following example configures an Ethernet interface to be used as the sFlow source IPv6 interface.

```
device(config)# sflow source ipv6 ethernet 1/1/2
```

The following example configures an Ethernet interface to be used as the sFlow source IPv4 interface.

```
device(config)# sflow source ethernet 1/1/3
```

History

Release version	Command history
08.0.30	This command was introduced.

sflow source-port

Configures the source sFlow UDP port.

Syntax

sflow source-port *num*

no sflow source-port

Command Default

sFlow sends data to the collector using UDP source port 8888.

Parameters

num

Specifies the sFlow source port. The value can range from 1025 through 65535.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command reverts the sFlow source port to its default port of 8888.

Examples

The following example changes the source UDP port to 8000.

```
device(config)# sflow source-port 8000
```

sflow version

Configures the version used for exporting sFlow data.

Syntax

sflow version *version-num*

no sflow version [*version-num*]

Command Default

When sFlow is enabled globally on the device, the sFlow agent exports sFlow data in version 5 format.

Parameters

version-num

Specifies the version number. The version can be 2 or 5.

Modes

Global configuration mode

Usage Guidelines

You can switch between versions without rebooting the device or disabling sFlow.

NOTE

When the sFlow version number is changed, the system resets sFlow counters and flow sample sequence numbers.

The **no** form of the command resets the sFlow version to its default.

Examples

The following example sets the sFlow version to 2.

```
device(config)# sflow version 2
```

short-path-forwarding

Enables short-path forwarding on a Virtual Router Redundancy Protocol (VRRP) router.

Syntax

short-path-forwarding [**revert-priority** *number*]
no short-path-forwarding [**revert-priority** *number*]

Command Default

Short-path forwarding is disabled.

Parameters

revert-priority *number*

Allows additional control over short-path forwarding on a backup router. If you configure this option, the revert-priority number acts as a threshold for the current priority of the session, and only if the current priority is higher than the revert-priority will the backup router be able to route frames. The range of revert-priority is 1 to 254.

Modes

VRRP-E router configuration mode

Usage Guidelines

Short-path forwarding means that a backup physical router in a virtual router attempts to bypass the VRRP-E master router and directly forward packets through interfaces on the backup router.

This command can be used for VRRP-E, but not for VRRP. You can perform this configuration on a virtual Ethernet (VE) interface only.

Enter the **no short-path-forwarding** command to remove this configuration.

Examples

To enable short-path forwarding for a VRRP-E instance:

```
device# configure terminal
device(config)# router vrrp-extended
device(config-vrrpe-router)# slow-start 40
device(config-vrrpe-router)# short-path-forwarding
```

source-guard enable

Enables IP source guard on a port, per-port-per-vlan, virtual interface or on a range of ports.

Syntax

source-guard enable

no source-guard enable

Command Default

IP source guard is disabled.

Modes

Interface configuration mode.

Usage Guidelines

You can enable IP source guard on a range of ports within a given slot only. Enabling IP source guard across multiple slots is not supported.

The following considerations apply:

- In a specific port range if a port is added as tagged to a VLAN with or without a VE defined for that VLAN, the port will be excluded from IP Source Guard programming.
- If a port is added as an untagged port in a VLAN with a VE defined for the VLAN, the port will be excluded from IP Source Guard programming.
- If a port is added as untagged without a VE defined for the VLAN, IP Source Guard programming is allowed on the port.

The **no** form of the command disables IP source guard on the specified interface.

Examples

The following example enables IP source guard on an interface.

```
device# configure terminal
device(config)# interface ethernet 1/1/4
device(config-if-e10000-1/1/4)# source-guard enable
```

The following example enables IP source guard on a virtual interface.

```
device(config)# vlan 2
device(config-vlan-2)# tag ethernet 1
Added tagged port(s) ethernet 1 to port-vlan 2
device(config-vlan-2)# router-interface ve 2
device(config-vlan-2)# interface ve 2
device(config-vif-2)# source-guard enable ethernet 1
```

Commands K - S

source-guard enable

The following command enables IP source guard on a range of ports in the same slot.

```
device# configure terminal
device(config)# interface ethernet 1/1/1
device(config-if-e10000-1/1/1)# interface ethernet 1/1/21 to 1/1/25
decice(config-mif-1/1/21-1/1/25)# source-guard enable
```

The following error displays if you try to configure ports across multiple slots.

```
device(config)# interface ethernet 1/1/18 to 2/1/18
Error - cannot configure multi-ports on different slot
```

History

Release version	Command history
8.0.40a	This command was modified to support enabling IP source guard on a range of ports.

Show Commands

show 802-1w

Displays the Rapid Spanning Tree Protocol (RSTP) information of the specified port-based VLAN.

Syntax

```
show 802-1w [ detail ] [ number | vlan vlan-id ]
```

Parameters

detail

Displays detailed output.

number

Specifies the number of spanning tree entries to skip before the display begins.

vlan *vlan-id*

Displays the RSTP details for a specific VLAN.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Cluster configuration mode

VLAN configuration mode

Examples

The following example shows the output of the **show 802-1w** command.

```

device# show 802-1w

```

show aaa

Displays information about all TACACS+ and RADIUS servers identified on the device.

Syntax

show aaa

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Command Output

The **show aaa** command displays the following information:

Output field	Description
Tacacs+ key	The setting configured with the tacacs-server key command. At the Super User privilege level, the actual text of the key is displayed. At the other privilege levels, a string of periods (...) is displayed instead of the text.
Tacacs+ retries	The setting configured with the tacacs-server retransmit command.
Tacacs+ timeout	The setting configured with the tacacs-server timeout command.
Tacacs+ dead-time	The setting configured with the tacacs-server dead-time command.
Tacacs+ Server	For each TACACS/TACACS+ server, the IP address, port, and the following statistics are displayed: <ul style="list-style-type: none"> • opens - Number of times the port was opened for communication with the server • closes - Number of times the port was closed normally • timeouts - Number of times the port was closed due to a timeout • errors - Number of times an error occurred while opening the port • packets in - Number of packets received from the server • packets out - Number of packets sent to the server
connection	The current connection status. This can be "no connection" or "connection active".
Radius key	The setting configured with the radius-server key command. At the Super User privilege level, the actual text of the key is displayed. At the other privilege levels, a string of periods (...) is displayed instead of the text.
Radius retries	The setting configured with the radius-server retransmit command.
Radius timeout	The setting configured with the radius-server timeout command.

Show Commands

show aaa

Output field	Description
Radius Server	For each RADIUS server, the IP address, and the following statistics are displayed: <ul style="list-style-type: none">• Auth Port - RADIUS authentication port number (default 1645)• Acct Port - RADIUS accounting port number (default 1646)• opens - Number of times the port was opened for communication with the server• closes - Number of times the port was closed normally• timeouts - Number of times the port was closed due to a timeout• errors - Number of times an error occurred while opening the port• packets in - Number of packets received from the server• packets out - Number of packets sent to the server
connection	The current connection status. This can be "no connection" or "connection active".

Examples

The following example displays information about all TACACS/TACACS+ and RADIUS servers identified on the device.

```
device(config)# show aaa
Tacacs+ key: foundry
Tacacs+ retries: 1
Tacacs+ timeout: 15 seconds
Tacacs+ Server: 10.95.6.90 Port:49:
    opens=6 closes=3 timeouts=3 errors=0
    packets in=4 packets out=4
no connection
Radius key: networks
Radius retries: 3
Radius timeout: 3 seconds
Radius Server: 10.95.6.90 Auth Port=1645 Acct Port=1646:
    opens=2 closes=1 timeouts=1 errors=0
    packets in=1 packets out=4
no connection
```

show access-list

Displays access-list (ACL) status-information for a specified numbered ACL or for all named and numbered ACLs. You can also toggle enablement and display of ACL-related hardware data for this command.

Syntax

```
show access-list { std-acl-num | extd-acl-num | all | hw-usage { on | off } }
```

Parameters

std-acl-num

Displays information about the specified standard ACL. Valid values are from 1 through 99.

extd-acl-num

Displays information about the specified extended ACL. Valid values are from 100 through 199.

all

Displays information about all ACLs.

hw-usage

Displays the hardware usage statistics.

on

Enables display of ACL rule numbers needed by hardware.

off

Disables display of ACL rule numbers needed by hardware.

Modes

User EXEC mode

Usage Guidelines

The number of configured ACL rules can affect the rate at which hardware resources are used. You can use the **show access-list hw-usage on** command to enable hardware usage statistics, followed by the **show access-list std-acl-num** command to determine the hardware usage for an ACL. To gain more hardware resources, you can modify the ACL rule so that it uses less hardware resources.

From FastIron 8.0.50, sequence numbers are automatically added to existing ACL rules, as follows:

- The first rule within each ACL is numbered 10.
- The sequence number for each succeeding rule is incremented by 10.

Command Output

The **show access-list all** command displays the following information:

Show Commands

show access-list

Output field	Description
Rule cam	Lists the number of CAM entries used by the ACL or entry. The number of CAM entries listed for the ACL itself is the total of the CAM entries used by the ACL entries.
Flows	Lists the number of Layer 4 session table flows in use for the ACL.
Packets	Lists the number of packets and is applicable only to flow-based ACLs.

Examples

The following example shows sample output from the **show access-list all** command.

```
device# show access-list all
Extended IP access list 100 (Total flows: N/A, Total packets: N/A, Total rule cam use: 3)
10: permit udp host 192.168.2.169 any (Flows: N/A, Packets: N/A, Rule cam use: 1)
20: permit icmp any any (Flows: N/A, Packets: N/A, Rule cam use: 1)
30: deny ip any any (Flows: N/A, Packets: N/A, Rule cam use: 1)
```

The following example shows sample output from the **show access-list all** command.

```
device# show access-list all
Standard IP access list 1 (hw usage (if applied on 24GC modules) : 2) (hw usage (if applied on 48GC
modules) : 2)
10: permit any (hw usage (if applied on 24GC modules) : 1) (hw usage (if applied on 48GC modules) : 1)

Extended IP access list 100 (hw usage (if applied on 24GC modules) : 7) (hw usage (if applied on 48GC
modules) : 7)
10: deny tcp any range newacct src any (hw usage (if applied on 24GC modules) : 6) (hw usage (if
applied on 48GC modules) : 6)
```

The following example enables the hardware usage statistics. Once enabled, output of the show access-list command displays the hardware usage statistics.

```
device# show access-list hw-usage on
device# show access-list 100
Extended IP access list 100 (hw usage : 2)
10: deny ip any any (hw usage : 1)
```

History

Release version	Command history
8.0.40	This command was modified. In order to display ACL information for a specified named ACL, you now need to include the named-acl keyword. For details, refer to show access-list named-acl on page 1477.
8.0.50	Sequence numbers are automatically added to existing rules.

show access-list accounting

Displays the Access Control List (ACL) accounting statistics for IPv4 ACLs, IPv6 ACLs, and Layer 2 MAC filters.

Syntax

```
show access-list accounting interface-type interface-name in
show access-list accounting traffic-policy [ all | name ]
```

Parameters

interface-type interface-name

Specifies the ID of an **ethernet** or **ve** interface.

in

Displays the statistics of the inbound ACLs.

traffic-policy

Displays traffic policy statistics.

all

Displays the statistics of all traffic policies.

name

Displays the statistics of a specific traffic policy.

Modes

Privileged EXEC mode

Command Output

The **show access-list accounting** command displays the following information. The output displayed gives information about IPv4 ACLs or IPv6 ACLs, or MAC filters based on the configuration of the port or interface. If both IPv4 and IPv6 ACLs are configured on the same port, it gives both IPv4 and IPv6 ACL accounting information appears in a single output.

Output field	Description
IPv4 ACL Accounting Information or IPv6 ACL Accounting Information	Denotes the ACL for which the accounting information was collected.
devNum [#] => ACL: Num	Specifies the device number and the ID of the ACL used.
#	Shows the index of the ACL entry, starting with 0, followed by the permit or deny condition defined for that ACL entry. (The first entry created for an ACL is assigned the index 0. The next one created is indexed as 1, and so on.)
Hit count	Shows the number of hits for each counter.

Show Commands

show access-list accounting

Examples

The following output shows a virtual interface that has both IPv4 and IPv6 ACLs applied to the same port and has ACL accounting enabled.

```
device# show access-list accounting ve 16 in
IPV4 ACL Accounting Information
devNum[0] => ACL: 10
  0: permit any
    Hit Count:   (1Min)           0   (5Sec)           0
                 (PktCnt)         0 (ByteCnt)         0
-----
65535: Implicit Rule deny any any
    Hit Count:   (1Min)           0   (5Sec)           0
                 (PktCnt)         0 (ByteCnt)         0
-----

IPV6 ACL Accounting Information
devNum[0] => ACL: v6
  0: permit ipv6 any any
    Hit Count:   (1Min)           0   (5Sec)           0
                 (PktCnt)         0 (ByteCnt)         0
-----
65533: Implicit ND_NA Rule: permit any any
    Hit Count:   (1Min)           0   (5Sec)           0
                 (PktCnt)         0 (ByteCnt)         0
-----
65534: Implicit ND_NS Rule: permit any any

```

History

Release version	Command history
8.0.10	This command was introduced.

show access-list named-acl

Displays access-list (ACL) status-information for a specified named ACL.

Syntax

show access-list named-acl *acl-name*

Parameters

acl-name

Specifies the named ACL.

Modes

User EXEC mode

Usage Guidelines

From FastIron 8.0.50, sequence numbers are automatically added to existing ACL rules, as follows:

- The first rule within each ACL is numbered 10.
- The sequence number for each succeeding rule is incremented by 10.

Examples

The following example displays information about "acl_01".

```
device# show access-list named-acl acl_01

Standard IP access list  acl_01 : 4 entries
10: deny host 10.157.22.26
20: deny 10.157.29.12
30: deny host IPHost1
40: permit any
```

History

Release version	Command history
8.0.40	This command was introduced. Previously, in order to display ACL information for a specified named ACL, you did not need to precede the <i>acl-name</i> value with the named-acl keyword.
8.0.50	Sequence numbers are automatically added to existing rules.

show acl-on-arp

Displays the list of ACLs that are configured to filter ARP requests.

Syntax

```
show acl-on-arp [ ethernet stack/slot/port [ to stack/slot/port | [ ethernet stack/slot/port to stack/slot/port | ethernet stack/slot/port ] ... ] | loopback num | tunnel num | ve num ]
```

Parameters

ethernet *stack/slot/port*

Displays the list of ACLs that are configured to filter ARP requests on a specific Ethernet interface.

to *stack/slot/port*

Displays the list of ACLs that are configured to filter ARP requests on a range of Ethernet interfaces.

loopback *num*

Displays the list of ACLs that are configured to filter ARP requests on a specific loopback interface.

tunnel *num*

Displays the list of ACLs that are configured to filter ARP requests on a specific tunnel interface.

ve *num*

Displays the list of ACLs that are configured to filter ARP requests on a specific VE interface.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Access list configuration mode

Usage Guidelines

The Filter Count column shows how many ARP packets have been dropped on the interface since the last time the count was cleared.

Examples

The following example displays a sample output of the **show acl-on-arp** command.

```
device(config)# show acl-on-arp
Port      ACL ID      Filter Count
2         103         10
3         102         23
4         101         12
```

show arp

Displays the ARP table.

Syntax

show arp

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Usage Guidelines

Use this command to view the total number of ARP entries and the maximum capacity for the ARP table along with the details of the ARP entries.

Command Output

The **show arp** command displays the following information:

Output field	Description
Total number of ARP entries	The total number of ARP entries in the table.
Maximum capacity	The maximum capacity of the ARP table.

Examples

The following example displays the ARP table.

```
device# show arp
Total number of ARP entries: 2, maximum capacity: 6000
No IP Address    MAC Address      Type    Age  Port  Status
1  10.43.1.1      0000.00a0.4000  Dynamic  0   mgmt1  Valid
2  10.43.1.78    0000.0060.6ab1  Dynamic  2   mgmt1  Valid
```

show batch schedule

Displays the schedule and status of batch execution.

Syntax

show batch schedule

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Examples

The following example displays the status and schedule of batch buffer execution.

```
device# show batch schedule
Printing the details of Timer
Batch buffer 1 timer is off
Batch buffer 2 timer is off
Batch buffer 3 timer is off
Batch buffer 4 timer is off
Printing Details of Start Timer
Batch buffer 1 start timer will be executed 0 days 0 hours 4 minutes 20 seconds from now
Batch buffer 2 start timer is off
Batch buffer 3 start timer is off
Batch buffer 4 start timer is off
Printing Details of Stop Timer
Batch buffer 1 stop timer will be executed 9 days 20 hours 44 minutes 19 seconds from now
Batch buffer 2 stop timer is off
Batch buffer 3 stop timer is off
Batch buffer 4 stop timer is off
```

show boot-preference

Displays the boot sequence in the startup configuration and running configuration files.

Syntax

show boot-preference

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

All configuration modes

Usage Guidelines

The displayed boot sequence is also identified as user-configured or the default.

Examples

The following example shows the default boot sequence preference.

```
device# show boot-preference

Boot system preference (Configured):
    Use Default
Boot system preference(Default):
    Boot system flash primary
    Boot system flash secondary
```

The following example shows a user-configured boot sequence preference.

```
device# show boot-preference

Boot system preference(Configured):
    Boot system flash primary
Boot system preference(Default):
    Boot system flash primary
    Boot system flash secondary
```

show breakout

Displays information on 10 Gbps sub-ports broken out from 40 Gbps ports on certain FastIron devices.

Syntax

show breakout

Modes

Privileged EXEC mode.

Usage Guidelines

The **show breakout** command is available only on ICX 7750 devices.

Command Output

The **show breakout** command displays the following information:

Output field	Description
Port	Specifies the port for which breakout information is displayed to the right.
Module Exist	Indicates whether the module on which the specified port resides is present in the unit.
Module Conf	Indicates whether the module on which the specified port resides is configured.
Breakout-config	Indicates whether breakout is configured on the specified port.
Breakout-oper	Indicates whether sub-ports on the specified breakout port are operational.

Examples

The following example shows that port 1/2/1 has been configured for breakout into four 10 Gbps sub-ports and is operational (has active sub-ports). Ports 1/2/2 and 1/2/4 are configured for breakout, pending reload.

```
Device# show breakout
Unit-Id: 1
Port      Module Exist  Module Conf  Breakout-config  Breakout-oper
1/2/1     yes           no           yes              yes
1/2/2     yes           no           yes              no
1/2/3     yes           no           no               no
1/2/4     yes           no           yes              no
1/2/5     yes           no           no               no
1/2/6     yes           no           no               no
1/3/1     yes           no           no               no
1/3/2     yes           no           no               no
1/3/3     yes           no           no               no
1/3/4     yes           no           no               no
1/3/5     yes           no           no               no
1/3/6     yes           no           no               no
```

History

Release version	Command history
FastIron Release 08.0.30	This command was introduced.

show cable-diagnostics tdr

Displays the results of Virtual Cable Test (VCT) TDR cable diagnostic testing.

Syntax

show cable-diagnostics tdr *stackid/slot/ port*

Parameters

stackid/slot/port Identifies the specific interface (port), by device, slot, and port number in the format shown.

Modes

- User EXEC mode
- Privileged EXEC mode

Usage Guidelines

Most Brocade devices support VCT technology. VCT technology enables the diagnosis of a conductor (wire or cable) by sending a pulsed signal into the conductor, then examining the reflection of that pulse. This method of cable analysis is referred to as Time Domain Reflectometry (TDR). By examining the reflection, the Brocade device can detect and report cable statistics such as local and remote link pair, cable length, and link status.

Examples

The following example displays TDR test results for port 1, slot 2 on device 3 in the stack. The results indicate that the port is down or the cable is not connected.

```
device>show cable-diagnostics tdr 3/2/1
```

Port	Speed	Local pair	Pair Length	Remote pair	Pair status
01	UNKWN	Pair A	>=3 M		Open
		Pair B	>=3 M		Open
		Pair C	>=3 M		Open
		Pair D	>=3 M		Open

The following example displays the TDR test results for the same port show details for an active port.

```
device>show cable-diagnostics tdr 3/2/1
```

Port	Speed	Local pair	Pair Length	Remote pair	Pair status
01	1000M	Pair A	50M	Pair B	Terminated
		Pair B	50M	Pair A	Terminated
		Pair C	50M	Pair D	Terminated
		Pair D	50M	Pair C	Terminated

History

Release version	Command history
08.0.20	This command was introduced.

show captive-portal

Displays the details of the Captive Portal profile configured on the device.

Syntax

show captive-portal *profile-name*

Parameters

profile-name

Specifies a specific Captive Portal profile configured on the device.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Web Authentication configuration mode

Command Output

The **show captive-portal** command displays the following information:

Output field	Description
cp-name	The local account username.
virtual-ip	The IP address of the Aruba ClearPass server.
virtual-port	The port number to facilitate HTTP services for the client. The port can be secure HTTPS port 443 or unsecure HTTP port 80.
user-role	The role of the user defined on the NAS and Aruba ClearPass server.
login-page	The login-page hosted on the Aruba ClearPass server.

Examples

The following example displays the details for the cp-brocade Captive Portal profile.

```
device(config)# show captive-portal cp-brocade
Configured Captive Portal Profile Details :
  cp-name           :cp-brocade
  virtual-ip        :10.21.240.42
  virtual-port      :80
  user-role         :guest
  login-page        :brocadeguestlogin.php
```

History

Release version	Command history
8.0.40	This command was introduced.

show chassis

Displays chassis information for each stack unit.

Syntax

show chassis

Command Output

The **show chassis** command output displays the following information.

Output field	Description
Power supply #	The presence, status, output type, model number, serial number, and firmware version number of the power supply units, if present.
Power supply # Fan Air Flow Direction	The air flow direction of the power supply unit.
Fan #	The presence, status, speed mode, and air flow direction of the fan. The fan controlled temperature and temperature thresholds.
MAC # Temperature Readings	The current temperature reading of the MAC device.
CPU Temperature Readings	The current temperature reading of the CPU.
sensor # Temperature Readings	The current temperature reading of the sensor.
Boot Prom MAC	The MAC address of the boot prom.
Management MAC	The management MAC address, for the active controller only.

Modes

Privileged EXEC mode

Examples

The following is sample output from the **show chassis** command executed on an ICX 7450 device.

```
device# show chassis
The stack unit 1 chassis info:

Power supply 1 not present
Power supply 2 (AC - Regular) present, status ok
    Model Number: 23-0000144-02
    Serial Number: 07W
    Firmware Ver: A
Power supply 2 Fan Air Flow Direction: Front to Back

Fan 1 not present
Fan 2 ok, speed (auto): [[1]]<->2

Fan controlled temperature: 40.5 deg-C

Fan speed switching temperature thresholds:
    Speed 1: NM<----->66 deg-C
    Speed 2: 56<-----> 85 deg-C (shutdown)

Fan 2 Air Flow Direction: Front to Back
Slot 1 Current Temperature: 31.0 deg-C (Sensor 1), 41.0 deg-C (Sensor 2), 38.5 d
eg-C (Sensor 3), 29.5 deg-C (Sensor 4)
Slot 2 Current Temperature: 31.0 deg-C (Sensor 1)
Slot 3 Current Temperature: 31.0 deg-C (Sensor 1)
Slot 4 Current Temperature: 31.5 deg-C (Sensor 1)
    Warning level.....: 70.0 deg-C
    Shutdown level.....: 85.0 deg-C
Boot Prom MAC : cc4e.248b.b050
Management MAC: cc4e.248b.b050
```

History

Release	Command History
08.0.00a	This command was enhanced to display model number, serial number, and firmware version number for power supply units.

show cli-command-history

Displays the history list of CLI commands executed on the device from any console, Telnet, or SSH session.

Syntax

show cli-command-history [wide]

Parameters

wide

Displays the complete form of the command names that are truncated in the output.

Modes

User EXEC mode

Global configuration

Command Output

The **show cli-command-history** command displays the following information:

Output field	Description
Session	The session type from which the command was executed.
User-name	The local account username.
Ip-address	The IP address of the device.
Executed-time	The time at which the command was executed.
Command	The command that was executed.

Examples

The following example shows the history list of commands executed on the device.

```
device# show cli-command-history
```

```
Slno Session User-name Ip-address Executed-time Command
  1 console Un-authenticated user Jun 2 10:15:54 no crypto-ssl certificate zero*
  2 console Un-authenticated user Jun 2 10:15:42 show files

```

History

Release version	Command history
8.0.40	This command was introduced.

show clock

Displays the local time, date, and time zone.

Syntax

show clock [**detail**]

Parameters

detail

Displays detailed information for the system clock including the summer-time settings.

Modes

Privileged EXEC mode

Usage Guidelines

To set the local system clock you can configure the date and time using the **clock set** command. Use the **clock timezone** command to set the timezone. If the daylight savings time is different from the default timezone setting, use the optional **clock summer-time** command to set the time and date for the start and end of the daylight savings period.

Examples

In the following example, the local system clock time, timezone, date, and time source are displayed.

```
device# show clock
03:35:53.658 Mountain Wed Aug 03 2016
Time source is Set Clock
```

In the following example, the local system clock time, timezone, date, time source, and summer time start and end dates and times are displayed.

```
device# show clock detail
03:35:53.658 Mountain Wed Aug 03 2016
Time source is Set Clock
Summer time starts 02:00:00 Mountain Sun Feb 28 2016 offset 30 mins
Summer time ends 02:00:00 Mountain Sun Oct 30 2016 offset 30 mins
```

History

Release version	Command history
8.0.50	This command was modified to display additional subsets of time zones specific to Australia and Europe and to display the optional offset value.

show configuration

Displays the configuration data in the startup configuration file.

Syntax

show configuration

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

All configuration modes

Examples

The following example is sample output from the **show configuration** command.

```
device# show configuration
!
Startup-config data location is flash memory
!
Startup configuration:
!
ver 08.0.20

ip default-gateway 10.25.224.1
!
!
!
!
!
!
!
!
!
end
```

show configuration (SPX)

Shows the startup configuration in regular switch or router mode, or the PE startup configuration in Provisional-PE or PE mode.

Syntax

show configuration

Modes

Device mode

PE mode

Provisional-PE mode

Usage Guidelines

In regular switch or router mode, the **show configuration** command shows the saved startup configuration.

In PE or Provisional-PE mode, the **show configuration** command shows the configuration in the PE startup file for this unit. To view the configuration that the unit would have in regular mode (as a switch or router), use the **show startup-config** command.

Command Output

The **show configuration** command displays the following information in Provisional-PE and PE mode:

Output field	Description
ver	Software version loaded to this unit.
spx-enable	The unit has been enabled to act as an SPX PE unit.
spx unit x	SPX unit number. Locally, the SPX number will always be 1 for the unit.
module x	Module number and type installed for this SPX unit.
spx-lag	SPX LAG configuration for this unit (if any).
spx-port	SPX port configuration for this unit (if any).

Examples

The following example shows the saved startup configuration for a provisional PE that has been enabled with the **spx pe-enable** command.

```
[Provisional-PE]device# show configuration
Configuration in PE startup file:
!
ver 08.0.40b1T213
!
spx pe-enable
spx unit 1
  module 1 icx7450-48f-sf-port-management-module
  module 2 icx7400-xgf-4port-40g-module
  module 4 icx7400-qsfp-lport-40g-module
  spx-lag 1/2/1 to 1/2/2
  spx-port 1/2/4
```

The following example shows the startup configuration for the active PE unit. Jumbo mode has been enabled on the CB.

```
[PE]local-id@device# show configuration
Configuration in PE startup file:
!
ver 08.0.40b728T213
!
spx pe-enable
spx unit 1
  module 1 icx7450-48p-poe-management-module
  module 2 icx7400-xgf-4port-40g-module
  module 3 icx7400-qsfp-lport-40g-module
  module 4 icx7400-qsfp-lport-40g-module
  spx-lag 1/1/1 to 1/1/3
  spx-port 1/2/4
!
jumbo
!
[PE]local-id@device#
```

The following example shows command output when the PE configuration has not been saved with the **write memory** command.

```
[Provisional-PE]device(config-spx-unit-1)# show configuration
PE startup file does not exist.
[Provisional-PE]device(config-spx-unit-1)# end
```

History

Release version	Command history
8.0.40	This command was introduced.

show cpu-utilization

Displays the CPU histogram for the device, and optionally, the CPU utilization for each task running on the device.

Syntax

show cpu [tasks]

Parameters

tasks

Specifies the display of CPU utilization information for each task running on the device.

Modes

User EXEC mode

Usage Guidelines

This command may be entered in all configuration modes.

Examples

The following example displays the CPU histogram for the device.

```
device# show cpu-utilization
cpu0:
1 percent busy, from 8213 sec ago
1 sec avg: 1 percent busy
5 sec avg: 1 percent busy
60 sec avg: 1 percent busy
300 sec avg: 1 percent busy
cpul:
0 percent busy, from 7402 sec ago
1 sec avg: 0 percent busy
5 sec avg: 0 percent busy
60 sec avg: 0 percent busy
300 sec avg: 0 percent busy
```

The following example displays the CPU utilization for each task on the device.

```
device# show cpu tasks
... Usage average for all tasks in the last 1 second ...

History

Release version	Command history
8.0.30	This command was introduced.
8.0.50	The command output was modified to show information for cpu0 and cpu1.

show cpu histogram

Displays the CPU usage histogram for the device, and optionally, clears the hold time and wait time.

Syntax

```
show cpu histogram [ clear | holdtime | waittime ]
```

Parameters

clear

Displays the CPU usage histogram and clears the hold time and wait time.

holdtime

Displays the CPU hold time usage histogram.

waittime

Displays the CPU wait time usage histogram.

Modes

Global configuration mode

User EXEC

Usage Guidelines

Command Output

The **show cpu histogram** command displays the following information:

Output field	Description
No. of buckets	The CPU usage histogram is presented in the form of buckets. Usage is divided into different intervals called buckets.
Bucket granularity	The time interval at which the CPU usage information is collected for each bucket.
Last clear	The datestamp when the task was cleared last.

Examples

The following command displays the CPU hold time usage histogram.

```
device# show cpu histogram holdtime
```

```
CPU Histogram Info
```

```
-----
No. of Buckets      : 11
Bucket Granularity : 50 msec
No. of Tasks       : 14
Last clear         : Jan  1 18:11:39.414
```

```

CPU Histogram data cleared

History

Release version	Command history
08.0.30	This command was introduced.

show errdisable

Displays information about errdisabled ports.

Syntax

```
show errdisable { recovery | summary }
```

Parameters

recovery

Displays all the default error disable recovery states for all possible conditions.

summary

Displays the port number along with the reason why the port is in an errdisable state and the method used to recover the port.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

VLAN configuration mode

show default

Displays the system default settings of the device.

Syntax

show default [values]

Parameters

values

Displays default, maximum, current, and configured values for system parameters.

Modes

Privileged EXEC mode

Examples

The following output displays the system default settings.

```
device# show default
spanning tree disabled      fast port span disabled
auto sense port speed      port untagged              port flow control on
no username assigned        no password assigned       boot sys flash primary
system traps enabled       ntp disabled               radius disabled
rip disabled                ospf disabled              bgp disabled

when ip routing enabled :
ip irdp disabled           ip load-sharing enabled    ip proxy arp disabled
ip rarp enabled            ip bcast forward disabled
dvmrp disabled             pim/dm disabled
vrrp disabled              fsrp disabled

when rip enabled :
rip type:v2 only           rip poison rev enabled

ipx disabled                appletalk disabled
```

Show Commands

show default

The following output displays the system default parameter values.

```
device# show default values
sys log buffers:50          mac age time:300 sec      telnet sessions:5

ip arp age:10 min          bootp relay max hops:4    ip ttl:64 hops
ip addr per intf:24

when multicast enabled :
igmp group memb.:260 sec   igmp query:125 sec       hardware drop: enabled

when ospf enabled :
ospf dead:40 sec           ospf hello:10 sec        ospf retrans:5 sec
ospf transit delay:1 sec

when bgp enabled :
bgp local pref.:100        bgp keep alive:60 sec     bgp hold:180 sec
bgp metric:10             bgp local as:1           bgp cluster id:0
bgp ext. distance:20      bgp int. distance:200    bgp local distance:200
```

show default values

Displays default, maximum, current, and configured values for system maximum parameters.

Syntax

show default values

Modes

Privileged EXEC mode

Examples

This example does not show complete output; it shows only PIM hardware mcache values.

```
Device(config)#show default values
System Parameters      Default      Maximum      Current      Configured
pim-hw-mcache          1024         6144         1500         1500
```

This example does not show complete output; it shows only PIM6 hardware mcache values.

```
Device(config)#show default values
System Parameters      Default      Maximum      Current      Configured
pim6-hw-mcache         512          1024         1024         1024
```

This example does not show complete output; it shows only MLD mcache values.

```
Device(config)#show default values
System Parameters      Default      Maximum      Current      Configured
mld-snoop-mcache       512          8192         512          512
```

This example does not show complete output; it shows only IGMP group values.

```
Device(config)#show default values
System Parameters      Default      Maximum      Current      Configured
igmp-snoop-group-add   4096         8192         5000         5000
```

This example does not show complete output; it shows only MLD group values.

```
Device(config)#show default values
System Parameters      Default      Maximum      Current      Configured
MLD-snoop-group-addr   4096         8192         5000         5000
```

show dlb-internal-trunk-hash

Displays the dynamic load balancing (DLB) hashing method for inter-packet-processor (inter-pp) links that connect master and slave units in ICX 7450-48 devices.

Syntax

show dlb-internal-trunk-hash

Modes

Global configuration mode

Examples

The following example displays the hashing method in effect for inter-pp links on an ICX 7450-48 device.

```
ICX7450-48P Router(config)#show dlb-internal-trunk-hash  
Internal trunk mode: spray-mode
```

History

Release version	Command history
08.0.20	This command was introduced.

show dot1x

Displays information about the 802.1X configuration.

Syntax

show dot1x

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

dot1x configuration mode

Command Output

The **show dot1x** command displays the following information:

Output field	Description
PAE Capability	The Port Access Entity (PAE) role for the Brocade device. This is always "Authenticator Only".
system-auth-control	Whether system authentication control is enabled on the device. The dot1x-enable command enables system authentication control on the device.
re-authentication	Whether periodic re-authentication is enabled on the device. When periodic re-authentication is enabled, the device automatically re-authenticates clients every 3,600 seconds by default.
global-filter-strict-security	Whether strict security mode is enabled or disabled globally.
quiet-period	When the Brocade device is unable to authenticate a client, the amount of time the Brocade device waits before trying again (default 60 seconds).
tx-period	When a client does not send back an EAP-response/identity frame, the amount of time the Brocade device waits before retransmitting the EAP-request/identity frame to a client (default 30 seconds).
supptimeout	When a client does not respond to an EAP-request frame, the amount of time before the Brocade device retransmits the frame.
servertimeout	When the Authentication Server does not respond to a message sent from the client, the amount of time before the Brocade device retransmits the message.
maxreq	The number of times the Brocade device retransmits an EAP-request/identity frame if it does not receive an EAP-response/identity frame from a client (default 2 times).
reAuthMax	The maximum number of re-authentication attempts.
re-authperiod	How often the device automatically re-authenticates clients when periodic re-authentication is enabled (default 3,600 seconds).
Protocol Version	The version of the 802.1X protocol in use on the device.

Show Commands
show dot1x

Examples

The following example displays information about the 802.1X configuration.

```
device# show dot1x
PAE Capability           : Authenticator Only
system-auth-control     : Enable
re-authentication       : Disable
global-filter-strict-security : Enable
quiet-period            : 60 Seconds
tx-period                : 30 Seconds
supptimeout             : 30 Seconds
servertimeout           : 30 Seconds
maxreq                  : 2
reAuthMax               : 2
re-authperiod           : 3600 Seconds
Protocol Version        : 1
```

show dot1x configuration

Displays detailed information about the 802.1X configuration.

Syntax

show dot1x configuration[all | ethernet *slot/port*]

Parameters

all

Displays information about the 802.1X configuration on all ports.

ethernet *slot/port*

Displays information about the 802.1X configuration on a specific port.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

dot1x configuration mode

Command Output

The **show dot1x configuration** command displays the following information:

Output field	Description
PAE Capability	The Port Access Entity (PAE) role for the Brocade device. This is always "Authenticator Only".
system-auth-control	Whether system authentication control is enabled on the device. The dot1x-enable command enables system authentication control on the device.
Number of Ports enabled	The number of ports on which 802.1X authentication is enabled.
Re-authentication	Whether periodic re-authentication is enabled on the device. When periodic re-authentication is enabled, the device automatically re-authenticates clients every 3,600 seconds by default.
Authentication-fail-action	The configured authentication-failure action. This can be Restricted VLAN or Block Traffic.
Mac Session Aging	Whether aging for dot1x-MAC-sessions has been enabled or disabled for permitted or denied dot1x-MAC-sessions.
Mac Session max-age	The configured software aging time for dot1x-MAC-sessions.
Protocol Version	The version of the 802.1X protocol in use on the device.
quiet-period	When the Brocade device is unable to authenticate a client, the amount of time the Brocade device waits before trying again (default 60 seconds).
tx-period	When a client does not send back an EAP-response/identity frame, the amount of time the Brocade device waits before retransmitting the EAP-request/identity frame to a client (default 30 seconds).

Show Commands

show dot1x configuration

Output field	Description
supptimeout	When a client does not respond to an EAP-request frame, the amount of time before the Brocade device retransmits the frame.
servertimeout	When the Authentication Server does not respond to a message sent from the client, the amount of time before the Brocade device retransmits the message.
maxreq	The number of times the Brocade device retransmits an EAP-request/identity frame if it does not receive an EAP-response/identity frame from a client (default 2 times).
reAuthmax	The maximum number of re-authentication attempts.
re-authperiod	How often the device automatically re-authenticates clients when periodic re-authentication is enabled (default 3,600 seconds).
global strict security	Whether strict security mode is enabled or disabled globally.

The **show dot1x configuration ethernet slot/port** command displays the following information:

Output field	Description
Port-Control	The configured port control type for the interface. This can be one of the following types: <ul style="list-style-type: none">force-authorized: The controlled port is placed unconditionally in the authorized state, allowing all traffic. This is the default state for ports on the Brocade device.force-unauthorized: The controlled port is placed unconditionally in the unauthorized state. No authentication takes place for any connected 802.1X clients.auto - The authentication status for each 802.1X client depends on the authentication status returned from the RADIUS server.
filter strict security	Whether strict security mode is enabled or disabled on the interface.
Action on RADIUS timeout	The action taken for the client MAC session on this port upon a RADIUS timeout.
Authentication-fail-action	The configured authentication-failure action. This can be Restricted VLAN or Block Traffic.
PVID State	The port default VLAN ID (PVID) and the state of the port PVID. The PVID state can be one of the following: <ul style="list-style-type: none">Normal - The port PVID is not set by a RADIUS server, nor is it the restricted VLAN.RADIUS - The port PVID was dynamically assigned by a RADIUS server.RESTRICTED - The port PVID is the restricted VLAN.
Original PVID	The originally configured (not dynamically assigned) PVID for the port.
Authorized PVID ref count	The number of authenticated MAC sessions on this port's current PVID (port default VLAN ID).
Restricted PVID ref count	The number of MAC sessions on the port that failed authentication and are now in the restricted VLAN (which should be the port's current PVID).
Radius assign PVID ref count	The number of times the port has changed PVIDs due to RADIUS VLAN assignment.
num mac sessions	The number of dot1x-MAC-sessions on the port.
num mac authorized	The number of authorized dot1x-MAC-sessions on the port.
num Dynamic Tagged Vlan	The number of dynamically tagged VLANs on the port.
Number of Auth filter	The number of dynamic MAC filters applied to the port.

Examples

The following example displays information about the 802.1X configuration.

```
device# show dot1x configuration
PAE Capability           : Authenticator Only
system-auth-control     : Enable
Number of Ports enabled : 3
Re-Authentication       : Disabled
Authentication-fail-action : Per Port
Mac Session Aging       : Enabled
Mac Session max-age     : 120 seconds
Protocol Version        : 1
quiet-period            : 60 Seconds
tx-period                : 30 Seconds
supptimeout             : 30 Seconds
servvertimeout          : 30 Seconds
maxreq                  : 2
reAuthmax               : 2
re-authperiod           : 3600 Seconds
global strict security  : Enable
```

The following example displays information about the 802.1X configuration on an individual port.

```
device# show dot1x configuration ethernet 4/1/12
Port-Control           : control-auto
filter strict security : Enable
Action on RADIUS timeout : Restart authentication
Authentication-fail-action : Restricted VLAN(299)
PVID State              : Normal (1)
Original PVID          : 1
Authorized PVID ref count : 2
Restricted PVID ref count : 0
Radius assign PVID ref count : 0
num mac sessions       : 2
num mac authorized     : 2
num Dynamic Tagged Vlan : 0
Number of Auth filter  : 0
```

show dot1x ip-acl

Displays the Layer 3 ACLs for 802.1X authentication.

Syntax

```
show dot1x ip-acl { all | ethernet unit/slot/port }
```

Parameters

all

Specifies the ACLs at the global level.

ethernet unit/slot/port

Specifies the ACLs at the interface level.

Modes

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Command Output

The **show dot1x ip-acl** command displays the following information.

Output field	Description
Port	The port number.
MAC Addr	The MAC address of the client.
Inbound IPv4 ACL	The IPv4 ACL applied to the authenticated port in the inbound direction.
Outbound IPv4 ACL	The IPv4 ACL applied to the authenticated port in the outbound direction.
Inbound IPv6 ACL	The IPv6 ACL applied to the authenticated port in the inbound direction.
Outbound IPv6 ACL	The IPv6 ACL applied to the authenticated port in the inbound direction.

Examples

The following example displays 802.1X IP ACL authentication information for Ethernet interface 1/1/15.

```
device# show dot1x ip-acl ethernet 1/1/15
-----
Port      MAC          Inbound   Outbound   Inbound   Outbound
  Addr    IPv4 ACL   IPv4 ACL  IPv6 ACL  IPv6 ACL
-----
1/1/15    0180.c200.0003  10        11         20        21
1/1/15    0180.c300.0005  100       101        120       121
```

History

Release version	Command history
08.0.20	This command was introduced.
08.0.50	The command output was updated.

show dot1x mac-address-filter

Displays the MAC address filters active on the device.

Syntax

```
show dot1x mac-address-filter [ all | ethernet slot/port | user-defined ]
```

Parameters

all

Displays dynamically applied MAC address filters active on the device.

ethernet *slot/port*

Displays dynamically applied MAC address filters active on an interface.

user-defined

Displays user-defined MAC address filters active on the device.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

dot1x configuration mode

Examples

The following example displays dynamically applied MAC address filters active on an interface.

```
device# show dot1x mac-address-filter ethernet 1/3
Port 1/3 MAC Address Filter information:
802.1X Dynamic MAC Address Filter :
mac filter-group 2
Port default MAC Address Filter:
No mac address filter is set
```

show dot1x mac-filter

Shows the layer 2 ACLs for 802.1X authentication.

Syntax

```
show dot1x mac-filter { all | ethernet device/slot/port }
```

Parameters

all

Specifies the ACLs at the global level.

ethernet device/slot/port

Specifies the ACLs at the interface level.

Modes

Global configuration

Interface configuration

Usage Guidelines

Command Output

The **show mac-filter** command displays the following information:

Output field	Description
Dynamic MAC filter-list	The MAC filter defined on the device.

Examples

The **show dot1x mac-filter** command displays the following information

```
device# show dot1x mac-filter all
802.1x MAC Address Filter information:
Port 1/1/48:
Dynamic MAC filter-list: 1
```

History

Release version	Command history
08.0.20	This command was introduced.

show dot1x mac-session

Displays information about the dot1x-MAC-session on each port on the device.

Syntax

show dot1x mac-sessions [**brief** | **ip-addr**]

Parameters

brief

Displays information about the dot1x-MAC-sessions in brief.

ip-addr

Displays dot1x-mac-session information with an IP address instead of a MAC address.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

dot1x configuration mode

Command Output

The **show dot1x mac-sessions** command displays the following information:

Output field	Description
Port	The port on which the dot1x-MAC-session exists.
MAC/IP (username)	The MAC address of the client and the username used for RADIUS authentication.
Vlan	The VLAN to which the port is currently assigned.
Auth-State	The authentication state of the dot1x-MAC-session. This can be one of the following states: <ul style="list-style-type: none">• permit - The client has been successfully authenticated, and traffic from the client is being forwarded normally.• blocked - Authentication failed for the client, and traffic from the client is being dropped in hardware.• restricted - Authentication failed for the client, but traffic from the client is allowed in the restricted VLAN only.• init - The client is in in the process of 802.1X authentication, or has not started the authentication process.
Age	The software age of the dot1x-MAC-session.

Output field	Description
PAE State	<p>The current status of the Authenticator PAE state machine. This state can be INITIALIZE, DISCONNECTED, CONNECTING, AUTHENTICATING, AUTHENTICATED, ABORTING, HELD, FORCE_AUTH, or FORCE_UNAUTH.</p> <p>NOTE When the Authenticator PAE state machine is in the AUTHENTICATING state, if the reAuthenticate, eapStart, eapLogoff, or authTimeout parameters are set to TRUE, it may place the Authenticator PAE state machine indefinitely in the ABORTING state. If this should happen, use the dot1x initialize command to initialize 802.1X authentication on the port, or unplug the client or hub connected to the port, then reconnect it.</p>

The **show dot1x mac-session brief** command displays the following information:

Output field	Description
Port	Information about the users connected to each port.
Number of users	The number of users connected to the port.
Number of Authorized users	The number of users connected to the port that have been successfully authenticated.
Dynamic VLAN	Whether the port is a member of a RADIUS-specified VLAN.
Dynamic ACL	Whether RADIUS-specified IP ACLs are applied to the port.
Dynamic MAC-Filter	Whether RADIUS-specified MAC address filters are applied to the port.

Examples

The following example displays information about the dot1x-MAC-session on each port on the device.

```
device# show dot1x mac-session
Port MAC/IP(username)      Vlan      Auth      ACL      Age      PAE
State State
-----
4/1/12 0044.0002.0002 :user1    10        permit   none     Ena      AUTHENTICATED
4/1/12 0044.0002.0003 :user2    10        permit   none     Ena      AUTHENTICATED
```

The following example displays information about the dot1x-MAC-session in brief.

```
device# show dot1x mac-session brief
Port      Number of   Number of   Dynamic   Dynamic   Dynamic
         users     Authorized users  VLAN     ACL       MAC-Filt
-----
4/1/12      2           2           no       no        no
```

show dot1x sessions

Displays 802.1X authentication sessions at the global and interface level.

Syntax

```
show dot1x sessions { all | brief | ethernet unit/slot/port }
```

Parameters

all

Specifies the 802.1X authentication sessions for all ports.

brief

Specifies details of 802.1X authentication sessions in brief.

ethernet *unit/slot/port*

Specifies the 802.1X authentication sessions of an interface.

Modes

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Authentication configuration mode

Command Output

The **show dot1x sessions** command displays the following information.

Output field	Description
Port	The port number.
MAC Addr	The MAC address of the client.
IP Addr	The IP address of the client. The IP address of the authenticated host is displayed only if an IP ACL is applied to the interface based on the RADIUS server response.
User Name	The specified user name.
Vlan	The VLAN.
Auth State	The authentication state.
ACL	The specific ACL applied.
Age	The age of the session.
PAE State	The Port Access Entity state.

Examples

The following example displays 802.1X sessions for all interfaces.

```
device(config)# show dot1x sessions all
```

Port	MAC Addr	IP Addr	User Name	Vlan	Auth State	ACL	Age	PAE State
2/1/1	0010.9400.1303	192.85.1.2	User1	200	permit	Yes		Ena AUTHENTICATED
2/1/1	0010.9400.1304	1.1.1.4	User2	2009	permit	Yes		Ena AUTHENTICATED
2/1/1	0010.9400.1305	1.1.1.2	User3	2009	permit	Yes		Ena AUTHENTICATED
2/1/1	0010.9400.1306	1.1.1.6	User4	2009	permit	Yes		Ena AUTHENTICATED

The following example displays 802.1X authentication sessions for a specified interface.

```
device(config)# show dot1x sessions ethernet 2/1/1
```

Port	MAC Addr	IP Addr	User	Vlan	Auth State	ACL	Age	PAE State
2/1/1	0010.9400.1303	192.85.1.2	User1	200	permit	Yes		Ena AUTHENTICATED

The following example displays 802.1X authentication sessions in brief.

```
device# show dot1x sessions brief
```

Port	Number of Attempted Users	Number of Authorized Users	Number of Denied Users	Untagged VLAN Type	Dynamic Port ACL	Dynamic MAC-Filt
1/1/2	1	1	0	Radius-VLAN	No	No
1/1/3	0	0	0	Auth-Default-VLAN	No	No
1/1/4	0	0	0	Auth-Default-VLAN	No	No
1/1/5	0	0	0	Auth-Default-VLAN	No	No
2/1/1	0	0	0	Auth-Default-VLAN	No	No
2/1/2	0	0	0	Auth-Default-VLAN	No	No
2/1/4	0	0	0	Auth-Default-VLAN	No	No

History

Release version	Command history
08.0.20	This command was introduced.
08.0.50	The command output was updated.

show dot1x statistics

Displays the 802.1X authentication statistics.

Syntax

```
show dot1x statistics { all | ethernet device/slot/port }
```

Parameters

all

Displays the 802.1X authentication statistics for all interfaces.

ethernet *device/slot/port*

Displays the 802.1X authentication statistics for the specified interface.

Modes

Privileged EXEC mode

Global configuration

Interface configuration

Authentication configuration mode

Usage Guidelines

Command Output

The **show dot1x statistics** command displays the following information:

Output field	Description
RX EAPOL Start	The number of EAPOL-Start frames received on the port.
RX EAPOL Logoff	The number of EAPOL-Logoff frames received on the port.
RX EAPOL Invalid	The number of invalid EAPOL frames received on the port.
RX EAPOL Total	The total number of EAPOL frames received on the port.
RX EAP Resp/Id	The number of EAP-Response/Identity frames received on the port
RX EAP Resp other than Resp/Id	The total number of EAP-Response frames received on the port that were not EAP-Response/Identity frames.
RX EAP Length Error	The number of EAP frames received on the port that have an invalid packet body length.
Last EAPOL Version	The version number of the last EAPOL frame received on the port.
Last EAPOL Source	The source MAC address in the last EAPOL frame received on the port.
TX EAPOL Total	The total number of EAPOL frames transmitted on the port.
TX EAP Req/Id	The number of EAP-Request/Identity frames transmitted on the port.
TX EAP Req other than Req/Id	The number of EAP-Request frames transmitted on the port that were not EAP-Request/Identity frames.

Examples

The following example displays 802.1X authentication statistics for port 10/2/1.

```
device# show dot1x statistics ethernet 10/2/1
```

```
Port 10/2/1 Statistics:  
RX EAPOL Start : 2  
RX EAPOL Logoff : 2  
RX EAPOL Invalid : 0  
RX EAPOL Total : 12  
RX EAP Resp/Id : 4  
RX EAP Resp other than Resp/Id : 4  
RX EAP Length Error : 0  
Last EAPOL Version : 1  
Last EAPOL Source : 0022.0002.0002  
TX EAPOL Total : 0  
TX EAP Req/Id : 10417  
TX EAP Req other than Req/Id : 2
```

History

Release version	Command history
08.0.20	This command was introduced.

show dot1x-mka config

Shows the MACsec Key Agreement (MKA) configuration for the device.

Syntax

show dot1x-mka config

Modes

EXEC, Privileged EXEC, global configuration, or dot1x-mka interface mode.

Command Output

The **show dot1x-mka config** command displays the following information:

Output field	Description
dot1x-mka-enable	MACsec is enabled on the device.
enable-mka ethernet <i>device/slot/port</i>	The ethernet interfaces specified are enabled for MACsec.
mka-cfg-group <i>group-name</i>	The configuration details that follow are for the named MACsec MKA group.
key-server-priority <i>value</i>	The key server priority for MACsec transmissions on the named group is set at this value.
macsec cipher-suite gcm-aes-128 or macsec cipher-suite gcm-aes-128 integrity-only	MACsec encryptions between members of the group are encrypted. or ICV checking only is performed, but no encryption is performed.
macsec confidentiality-offset <i>value</i>	The byte offset used for encrypted data is set to the value shown. Allowable values are 0, 30 (the first 30 bytes of data are not encrypted), and 50 (the first 50 bytes of data are not encrypted).
macsec frame-validation { check discard }	For transmissions between MKA group members, indicates whether the MACsec frame header is checked and what action is taken for invalid frames (counted or discarded).
macsec-replay protection { strict out-of-order window-size <i>value</i> }	Replay protection is enabled. The type of protection is shown as strict (discard any frame received out of sequence) or as allowing receipt of out-of-sequence frames within the specified window.
key <i>value</i> name <i>value</i>	The pre-shared key is set to this value and name for the MKA configuration group. Both key and name are hexadecimal strings.
enable ethernet <i>device/slot/port</i> mka-cfg-group <i>name</i> key <i>hexadecimal value</i> name <i>hexadecimal value</i>	The specified interface is enabled for MACsec. The interface belongs to the named MKA group, and the interface uses the pre-shared key shown to confirm peers with which it can communicate.

Examples

The following example displays MACsec configuration information for a device with MACsec enabled. Two MKA groups, test1 and group1, are configured. Interfaces with either group of parameters applied could form secure channels because the groups have the same pre-shared key.

```
device(config-dot1x-mka-1/3/2)# show dot1x-mka config

dot1x-mka-enable
mka-cfg-group test1
  key-server-priority 5
  macsec cipher-suite gcm-aes-128 integrity-only
  macsec confidentiality-offset 30
  macsec frame-validation strict
mka-cfg-group group1
  key-server-priority 20
  macsec cipher-suite gcm-aes-128
  macsec confidentiality-offset 30
enable-mka ethernet 1/3/2
  mka-group test1
  pre-shared-key 135bd758 b0ee5c11 c55ff6ab 19fdb199 key-name 96437a93 ccf10d9d fe347846 cce52c7d
enable-mka ethernet 1/3/3
  mka-group group1
  pre-shared-key 135bd758 b0ee5c11 c55ff6ab 19fdb199 key-name 96437a93 ccf10d9d fe347846 cce52c7d
enable-mka ethernet 1/3/4
  mka-group group1
  pre-shared-key 135bd758 b0ee5c11 c55ff6ab 19fdb199 key-name 96437a93 ccf10d9d fe347846 cce52c7d
```

History

Release version	Command history
08.0.20	This command was introduced.
08.0.30	Support for this command was added on the ICX 7450.

show dot1x-mka config-group

Shows details for the specified MACsec Key Agreement (MKA) groups configured on this device, or for a designated MKA group.

Syntax

show dot1x-mka config-group *group-name*

Parameters

group-name Limits the group configuration displayed to the named MKA group.

Modes

EXEC, Privileged EXEC, global configuration, or dot1x-mka interface mode.

Command Output

The **show dot1x-mka config-group** command displays the following information:

Output field	Description
mka-cfg-group	The configuration details that follow are for the specified MACsec MKA group.
key-server-priority	The key-server priority for MACsec transmissions on the named group is set at the specified value.
macsec cipher-suite gcm-aes-128 or macsec cipher-suite gcm-aes-128 integrity-only	MACsec transmissions are encrypted. or ICV checking only is performed.
macsec confidentiality-offset	The byte offset used for encrypted data is set to the value shown. Allowable values are 0, 30 (the first 30 bytes of data are not encrypted), and 50 (the first 50 bytes of data are not encrypted).
macsec frame-validation {check discard}	Indicates whether the MACsec frame header is checked and what action is taken for invalid frames (counted or discarded).
macsec replay-protection {strict out-of-order window-size size}	Replay protection is enabled. The type of protection is shown as strict (discard any frame received out of sequence) or as allowing receipt of out-of-sequence frames within the specified window.

Examples

The following example lists the configuration details for MKA group test1.

```
device(config-dot1x-mka-1/3/2)# show dot1x-mka config-group test1  
  
mka-cfg-group test1  
  key-server-priority 5  
  macsec cipher-suite gcm-aes-128 integrity-only  
  macsec confidentiality-offset 30  
  macsec frame-validation check  
  macsec replay-protection strict
```

History

Release version	Command history
08.0.20	This command was introduced.
08.0.30	Support for this command was added on the ICX 7450.

show dot1x-mka sessions

Displays a summary of all MACsec Key Agreement (MKA) sessions on the device.

Syntax

show dot1x-mka sessions brief

show dot1x-mka sessions ethernet *device/slot/port*

Parameters

brief Displays a brief status of all MKA sessions.

ethernet device/ slot/port Displays MKA sessions that are active on a specified Ethernet interface. The Ethernet interface is specified by device position in stack, slot on the device, and interface on the slot.

Modes

EXEC, Privileged EXEC, global configuration, or dot1x-mka interface mode.

Command Output

The **show dot1x-mka sessions** command with the **brief** option displays the following information:

Output field	Description
Port	Designates the interface for which MACsec information is listed (by device, slot, and port).
Link-Status	Indicates whether the link is up or down.
MKA-Status	Indicates whether a secure channel has been established.
Key-Server	Indicates whether the interface is operating as a key-server.
Negotiated Capability	Indicates MACsec parameters configured on the designated interface.

The **show dot1x-mka sessions** command with the **ethernet** interface options displays the following information:

Output field	Description
Interface	The information that follows applies to the designated interface.
MKA cfg group Name	The designated MKA configuration group has been applied to the designated interface.
DOT1X-MKA Enabled (Yes, No)	Indicates whether MACsec is enabled for the designated interface.
DOT1X-MKA Active (Yes, No)	Indicates whether MACsec is active on the interface.
Key Server (Yes, No)	Indicates whether the MACsec key-server is active over the interface.
Configuration Status:	The following fields describe the MKA configuration applied to the interface.
Enabled (Yes, No)	Indicates whether MACsec is currently enabled.
Capability (Integrity and or confidentiality)	Indicates whether ICV checks are being performed on MACsec frames and whether encryption is being applied.
Desired (Yes, No)	Indicates whether port is interested in becoming the key-server.
Protection (Yes, No)	Indicates whether replay protection is applied to the interface.
Frame Validation (Yes, No)	Indicates whether frames received are being checked for valid MACsec headers.

Output field	Description
Replay Protection (Strict, Out of Order)	Indicates that replay protection is configured and whether frames must be received in exact order or within an allowable window.
Replay Protection Size	Indicates the allowable window size within which frames may be received.
Cipher Suite (GCM-AES-128)	Specifies the cipher suite used for ICV checking, encryption, and decryption.
Key Server Priority (1 to 127)	Specifies the key-server priority configured on the interface.
Secure Channel Information	The following fields describe a secure channel established on this interface.
Local SCI	Provides the hexadecimal value of the Secure Channel Identifier for this channel.
Member Identifier	Provides the MACsec number assigned to the MKA peer.
Message Number	Provides the Message Number contained in Hello packets from this MKA peer. Hello packets are exchanged to determine peer status, MACsec capabilities, and SAK Key Identifier.
Latest SAK Status (RX and or TX)	Indicates the Secure Association Key (SAK) state.
Latest SAK AN	Provides the Association Number for the most recently active Secure Association Key.
Latest SAK KI	Provides the Key Identifier for the most recently active Secure Association Key.
Negotiated Capability (Integrity and or Confidentiality with offset)	Indicates whether ICV checking, encryption, and a confidentiality offset have been applied on the secure channel. (The negotiated capability may differ from parameters configured on the interface when it does not have key-server status.)
Peer Information:	The output fields that follow provide information on actual and potential MACsec peer interfaces.
State (Live or Potential)	Indicates whether the peer is considered a live peer or a potential peer for MKA protocol.
Member Identifier	Designates the peer by its Member Identifier, a hexadecimal value.
Message Number	Provides the Message Number that appears in Hello packets from the designated peer interface as a hexadecimal value.
SCI	Provides the peer's Secure Channel Identifier.
Priority	Provides the key-server priority configured on the peer interface.

Examples

In the following example, all enabled MKA interfaces on the device are listed, along with configured parameters and current status.

```
device(config-dot1x-mka-1/3/2)# show dot1x-mka sessions brief
```

Port	Link-Status	MKA-Status	Key-Server	Negotiated Capability
1/3/2	Down	Pending	---	---
1/3/3	Up	Secured	No	Integrity, Confidentiality with Off. 30
1/3/4	Up	Secured	No	Integrity, Confidentiality with Off. 30

Show Commands

show dot1x-mka sessions

The following example lists MKA sessions that are active on Ethernet interface 1/3/3 (device 1, slot 3, port 3), with configuration details for each active interface.

```
device(config-dot1x-mka-1/3/3)# show dot1x-mka sessions ethernet 1/3/3
```

```
Interface                : 1/3/3
MACsec Status           : Secured
DOT1X-MKA Enabled       : Yes
DOT1X-MKA Active        : Yes
Key Server              : No

Configuration Status:
Enabled                 : Yes
Capability               : Integrity, Confidentiality
Desired                 : Yes

History

Release version	Command history
08.0.20	This command was introduced.
08.0.30	Support for this command was added on the ICX 7450 device.

show dot1x-mka statistics

Displays current MACsec Key Agreement (MKA) statistics on the interface.

Syntax

show dot1x-mka statistics ethernet *device/slot/port*

Parameters

ethernet *device/slot/port*

Ethernet interface for which MKA statistics are to be displayed. The interface is designated by a device number in stack/slot on the device/interface on the slot.

Modes

EXEC, Privileged EXEC, global configuration, or dot1x-mka interface mode.

Usage Guidelines

It is recommended that you use the **clear dot1x-mka statistics** command to clear results of the previous **show dot1x-mka statistics** command before re-executing it.

Command Output

The **show dot1x-mka statistics** command displays the following information:

Output field	Description
Interface (device/slot/port)	The output fields describe MACsec activity for the designated interface.
MKA in Pkts	MKA protocol packets received
MKA in SAK Pkts	MKA protocol packets received containing a SAK
MKA in Bad Pkts	MKA protocol packets received that are bad
MKA in Bad ICV Pkts	MKA protocol packets received with a bad ICV
MKA in Mismatch Pkts	MKA protocol packets received with mismatched CAK
MKA out Pkts	MKA protocol packets transmitted
MKA out SAK Pkts	MKA protocol packets transmitted containing a SAK
Number of SAK	Total number of SAKs received

Show Commands

show dot1x-mka statistics

Examples

The following example shows MKA statistics for Ethernet interface 1/3/3 (device 1, slot 3, port 3), which is transmitting and receiving MACsec frames.

```
device(config-dot1x-mka-1/3/3)# clear dot1x-mka statistics ethernet 1/3/3
device(config-dot1x-mka-1/3/3)# show dot1x-mka statistics ethernet 1/3/3
```

```
Interface                : 1/3/3
MKA in Pkts              : 8585
MKA in SAK Pkts          : 1
MKA in Bad Pkts          : 0
MKA in Bad ICV Pkts      : 0
MKA in Mismatch Pkts     : 0
MKA out Pkts             : 8687
MKA out SAK Pkts         : 0
Number of SAK             : 1
```

History

Release version	Command history
08.0.20	This command was introduced.
08.0.30	Support for this command was added on the ICX 7450 device.

show eee-statistics

Displays the global energy efficient statistics.

Syntax

```
show eee-statistics
```

Modes

Global configuration mode

Usage Guidelines

Command Output

The **show eee-statistics** command displays the following information:

Output field	Description
Port	The port number.
EEE-State	Displays if Energy Efficient Ethernet is enabled or disabled. If disabled then all the counters will be 0. If EEE is enabled, then these counters will be updated.
TXEventCount	TX EEE Low Power Idle (LPI) event counter. This counter specifies the number of times the LPI mode has been enforced by EEE on Transmit side.
TXDuration	TX EEE LPI duration counter. This is an LPI event duration counter on the transmit path which gets updated if the port is in LPI mode.
RXEventCount	RX EEE LPI event counter. This counter specifies the number of times the LPI mode has been enforced by EEE on the receive side.
RXDuration	RX EEE LPI duration counter. This is an LPI event duration counter on the receive path which gets updated if the port is in LPI mode.

Show Commands
show eee-statistics

Examples

The following example displays Energy Efficient Ethernet globally.

```
device# show eee-statistics
Port      EEE-State  TXEventCount  TXDuration  RXEventCount  RXDuration
1/1/1     Enable    0              0            0              0
1/1/2     Enable    0              0            0              0
1/1/3     Enable    17             2551234     16             2561886
1/1/4     Enable    17             2545628     16             50953524
1/1/5     Enable    2              2550749     2              50952549
1/1/6     Enable    1              2543935     1              2551760
1/1/7     Enable    17             2549030     17             2550750
1/1/8     Enable    2              419455      16             50952710
1/1/9     Enable    1              424565      1              50950470
1/1/10    Enable    17             2549030     1              2549101
1/1/11    Enable    2              419455      2              424563
1/1/12    Enable    1              424565      10             50945833
1/1/13    Enable    2              1526709     10             1532337
1/1/14    Enable    10             1531808     2              2561886
1/1/15    Enable    10             1531391     2              1531834
1/1/16    Enable    2              1526292     10             50945548
1/1/17    Enable    2              1542560     10             50957135
1/1/18    Enable    10             1537443     2              1542565
1/1/19    Enable    10             1528600     2              1533722
1/1/20    Enable    2              1533717     10             50948350
1/1/21    Enable    2              1533203     10             50947920
1/1/22    Enable    10             1528087     2              1533230
1/1/23    Enable    10             1527677     2              1532799
1/1/24    Enable    2              1532794     10             50947596
```

History

Release version	Command history
08.0.30	This command was introduced.

show eee-statistics ethernet

Displays the Energy Efficient Ethernet statistics on a specific interface.

Syntax

show eee-statistics ethernet *stackid/slot/port*

Modes

Global configuration mode

Usage Guidelines

Command Output

The **show eee-statistics ethernet** command displays the following information:

Output field	Description
Port	The port number.
EEE-State	Displays if Energy Efficient Ethernet is enabled or disabled. If disabled then all the counters will be 0. If EEE is enabled, then these counters will be updated.
TXEventCount	TX EEE Low Power Idle (LPI) event counter. This counter specifies the number of times the LPI mode has been enforced by EEE on Transmit side.
TXDuration	The total time from the first LPI (Low Power Idle) signal transmission. This is an LPI event duration counter on the transmit path which gets updated if the port is in LPI mode.
RXEventCount	The LPI signal reception count. This counter specifies the number of times the LPI mode has been enforced by EEE on the receive side.
RXDuration	Total time from the first LPI signal reception. This is an LPI event duration counter on the receive path which gets updated if the port is in LPI mode.

Examples

The following example displays energy efficient statistics on a specific interface.

```
device(config)# show eee-statistics ethernet 1/1/4
```

```
Port      EEE-State      TXEventCount    TXDuration      RXEventCount      RXDuration
1/1/4     Enable         17              2545628         16                50953524
```

History

Release version	Command history
08.0.30	This command was introduced.

show erspan

Displays the ERSPAN profiles.

Syntax

show erspan [**profile** *profile-number*]

Parameters

profile

Specifies the profile number to display.

profile-number

Specifies the profile number. Valid values are from 1 through 4.

Modes

Global configuration mode

Command Output

The **show erspan** command displays the following information:

Output field	Description
Profile	The profile number.
Type	The type of profile (ERSPAN).
Mirror destination	Indicates whether the mirror destination is reachable or unreachable.
Destination IP	The IP address of the destination host.
Destination MAC	The MAC address of the destination host.
Source IP	The IP address of the source router.
Source MAC	The MAC address of the source router.
Ports monitored	The ports that are being monitored.
HW destination id for each device	The hardware destination ID for each device being monitored. The ID is in the form <code>stack_id/device:dest_id</code> .

Examples

The following example displays all of the ERSPAN profiles. In this example, ERSPAN mirroring has been enabled for profile 1, but has not yet been enabled for profile 2.

```
device(config)# show erspan

Profile 1
Type          ERSPAN
Mirror destination Not reachable.
Destination IP 1.1.1.1
Destination MAC 0000.5e00.5300
Source IP      2.2.2.2
Source MAC     0000.5300.5312
Outgoing port  INVALID
Ports monitored:
  Input monitoring      : (U1/M1) 1
  Output monitoring    : (U1/M1) 1
HW destination id for each device:
stack_id/device:dest_id

Profile 2
Type          ERSPAN
Mirror destination Not reachable.
Destination IP 3.3.3.3
Destination MAC 0000.5e00.5300
Source IP      2.2.2.2
Source MAC     0000.5300.5312
Ports monitored:
HW destination id for each device:
stack_id/device:dest_id
```

History

Release version	Command history
8.0.40	This command was introduced.

show ethernet loopback interfaces

Displays the status and details of each Ethernet loopback-enabled port and the associated VLANs.

Syntax

```
show ethernet loopback interfaces [ brief | port stackid/slot/port | vlan vlan-id ]
```

Parameters

brief

Displays the Ethernet loopback information in brief mode.

port

Displays the status and details of each port.

stackid/slot/port

Specifies the port number.

vlan

Displays the status and details of a VLAN.

vlan-id

Specifies the VLAN ID.

Modes

Privileged EXEC mode

Global configuration mode

VLAN configuration mode

Command Output

The **show ethernet loopback interfaces** command displays the following information:

Output field	Description
Interface Type	Type of interface (VLAN-aware or VLAN-unaware)
Interface Port	Interface ID (Port number)
Interface Mode	Flow classification mode (Flow-aware or Flow-unaware)
Flow Mode DA/SA	Destination and Source MAC address of the flow

Examples

The following example shows the output of the **show ethernet loopback interfaces** command.

```
device(config-vlan-10)# show ethernet loopback interfaces

ETHERNET LOOPBACK INTERFACE [1/1/11] (In Service)
Interface Type : PORT
Interface Port : 1/1/11
Interface Mode : FLOW-UNAWARE
Flow Mode DA/SA : ANY/ANY
```

The following example shows the output of the **show ethernet loopback interfaces brief** command.

```
device(config-vlan-10)# show ethernet loopback interfaces brief
PORT          TYPE  VLANS  STATUS  OP-MODE  D-MAC          S-MAC
=====|=====|=====|=====|=====|=====|=====
1/1/11      | PORT|    0|   ACTV|FLOW-U |           ANY|           ANY
1/1/12      | VLAN|    1|   ACTV|FLOW-A |1111.2222.3333|4444.5555.5555
```

The following example shows the output of the **show ethernet loopback interfaces port** command.

```
device(config-vlan-10)# show ethernet loopback interfaces port 1/1/1
ETHERNET LOOPBACK INTERFACE [1/1/1] (In Service)
Interface Type : PORT
Interface Port : 1/1/1
Interface Mode : FLOW-UNAWARE
Flow Mode DA/SA : ANY/ANY
```

History

Release version	Command history
08.0.30	This command was introduced.

show ethernet loopback resources

Displays the available resources and the resources that are used by loopback testing.

Syntax

show ethernet loopback resources

Modes

- Privileged EXEC mode
- Global configuration mode
- VLAN configuration mode

Command Output

The **show ethernet loopback resources** command displays the following information:

Output field	Description
Interface Resource	Maximum number of ports that can be enabled with Ethernet loopback.
H/W Pool Resource	Maximum hardware resource for loopback.

Examples

The following example shows the output of the **show ethernet loopback resources** command.

```
device(config)# show ethernet loopback resources
Ethernet Loopback Resource:
  RESOURCE NAME      MAX      USED      AVAILABLE
=====|=====|=====|=====
  Interface Resource|      20|      0|      20
  H/W Pool Resource |      40|      0|      40
```

History

Release version	Command history
08.0.30	This command was introduced.

show fdp entry

Displays detailed Foundry Discovery Protocol (FDP) and Cisco Discovery Protocol (CDP) information for all neighbor devices or for a specific device.

Syntax

```
show fdp entry { * | device-id }
```

Parameters

*

Displays detailed FDP updates for all neighbor devices.

device-id

Specifies the device ID of the FDP neighbor entry for which the update information is to be displayed. The value is an ASCII string.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Command Output

The **show fdp entry** command displays the following information.

Output field	Description
Device ID	The host name of the neighbor. In addition, this field lists the VLAN memberships and other VLAN information for the neighbor port that sent the update to this device.
Entry address(es)	The Layer 3 protocol addresses configured on the neighbor port that sent the update to this device. If the neighbor is a Layer 2 switch, this field lists the management IP address.
Platform	The product platform of the neighbor.
Interface	The interface on which this device received the FDP or CDP update from the neighbor.
Port ID	The interface through which the neighbor sent the update.
Holdtime	The maximum number of seconds that this device can keep the information received in the update before discarding it.
Version	The software version running on the neighbor.

Show Commands
show fdp entry

Examples

The following is sample output from the **show fdp entry** command.

```
device# show fdp entry FastIronB

Device ID: FastIronB configured as default VLAN1, tag-type8100
Entry address(es):
Platform: FastIron Router, Capabilities: Router
Interface: Eth 1/2/9
Port ID (outgoing port): Eth 1/2/9 is TAGGED in following VLAN(s):
9 10 11
Holdtime : 176 seconds
```

show fdp interface

Displays Foundry Discovery Protocol (FDP) information for an interface.

Syntax

show fdp interface [**ethernet** *stack-id/slot/port*]

Parameters

ethernet *stack-id/slot/port*

Displays the FDP information for the specified Ethernet port ID.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Command Output

The **show fdp interface** command displays the following information.

Output field	Description
Holdtime	The maximum number of seconds that this device keeps the information received in the update before discarding it.

Examples

The following example shows FDP information for Ethernet port 1/2/3.

```
device# show fdp interface ethernet 1/2/3

FastEthernet1/2/3 is up, line protocol is up
Encapsulation ethernet
Sending FDP packets every 5 seconds
Holdtime is 180 seconds
```

Show Commands
show fdp neighbors

show fdp neighbors

Displays the Cisco neighbors about which the Brocade device has learned from Cisco Discovery Protocol (CDP) packets.

Syntax

```
show fdp neighbors [ detail | ethernet stack-id/slot/port ]
```

Parameters

detail

Displays detailed information for the Cisco neighbors.

ethernet *stack-id/slot/port*

Specifies the Ethernet port ID for which the information is to be displayed.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Examples

The following is sample output from the **show fdp neighbors** command.

```
device# show fdp neighbors detail

Capability Codes: R - Router, T - Trans Bridge, B - Source Route Bridge
S - Switch, H - Host, I - IGMP, r - Repeater
(*) indicates a Cisco device
Device ID      Local Int    Holdtm      Capability   Platform     Port ID
-----
(*)Router      Eth 1/1/1    124         R            cisco RSP4   FastEthernet5/0/0
```

The following is sample output from the **show fdp neighbors detail** command.

```
device# show fdp neighbors detail

Device ID: Router
Entry address(es):
    IP address: 10.95.6.143
Platform: cisco RSP4, Capabilities: Router

```

show fdp traffic

Displays packet statistics for Foundry Discovery Protocol (FDP) and Cisco Discovery Protocol (CDP).

Syntax

show fdp traffic

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Examples

The following is sample output from the **show fdp traffic** command.

```
device# show fdp traffic

CDP/FDP counters:
Total packets output: 6, Input: 3
Hdr syntax: 0, Chksum error: 0, Encaps failed: 0
No memory: 0, Invalid packet: 0, Fragmented: 0
Internal errors: 0
```

show files

Displays the list of files stored in flash memory.

Syntax

```
show files [ dir-name ]
```

Parameters

dir-name

Specifies the name of a directory.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Examples

The following is sample output from the **show files** command.

```
device# show files
Type      Size      Name
-----
F         28203908  primary
F         27949956  secondary
F          641  startup-config.txt
F          391  stacking.boot
F         76942  debug.boot
F          638  startup-config.backup
F           0  startup-config.no

56232476 bytes 7 File(s) in FI root

1771020288 bytes free in FI root
1771020288 bytes free in /
```

show files disk0

Displays the contents of the USB flash drive.

Syntax

show files disk0

Parameters

Modes

Enable mode

Usage Guidelines

show files disk0

Examples

The following example displays the contents of the USB flash drive.

```
device# show files disk0
F          681 20140611132829945ICX7450-PREM-LIC-SW.XML
F      28483780 SPS08030q066.bin
F          391 stacking.boot
F           0 sil_logs
F      28483780 pri.bin
F          391 stacking.boot1111
F          2160 running-configsp2
F          2162 startup-config.sp2
F          2160 run1
F          5344 core-file
```

History

Release version	Command history
08.0.30	This command was introduced.

show flash

Displays flash memory contents on the device.

Syntax

```
show flash [ unit unit-num ]
```

Parameters

unit *unit-num*

Displays flash memory contents for the specified stack unit.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Usage Guidelines

Use this command to view the flash and boot images installed on the device.

The device does not have separate primary and secondary flash areas for the boot image. The flash memory module contains only one boot image.

Command Output

The **show flash** command displays the following information.

Output field	Description
Compressed Pri Code size	The flash code size installed in the primary flash area.
Compressed Sec Code size	The flash code size installed in the secondary flash area.
Compressed Boot-Monitor Image size	The boot code size installed in flash memory.

Examples

The following is sample output from the **show flash** command.

```
device# show flash
Stack unit 1:
  Compressed Pri Code size = 28893380, Version:08.0.40T211 (SPS08040b074.bin)
  Compressed Sec Code size = 28893380, Version:08.0.40T211 (SPS08040b074.bin)
  Compressed Boot-Monitor Image size = 786944, Version:10.1.05T215
  Code Flash Free Space = 1779965952
```

show gvrp

Displays the GVRP information.

Syntax

show gvrp

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

GVRP configuration mode

Command Output

The **show gvrp** command displays the following information:

Output field	Description
Protocol state	The state of GVRP. The display shows one of the following: <ul style="list-style-type: none">GVRP is disabled on the systemGVRP is enabled on the system
GVRP BASE VLAN ID	The ID of the base VLAN used by GVRP.
GVRP MAX Leaveall Timer	The maximum number of milliseconds to which you can set the Leaveall timer.
GVRP Join Timer	The value of the Join timer.
GVRP Leave Timer	The value of the Leave timer.
GVRP Leave-all Timer	The value of the Leaveall timer.
Configuration that is being used	The configuration commands used to enable GVRP on individual ports. If GVRP learning or advertising is disabled on a port, this information also is displayed.
Spanning Tree	The type of STP enabled on the device. NOTE GVRP is only supported with Single STP.
Dropped Packets Count	The number of GVRP packets that the device has dropped. A GVRP packet can be dropped for either of the following reasons: <ul style="list-style-type: none">GVRP packets are received on a port on which GVRP is not enabled. NOTE If GVRP support is not globally enabled, the device does not drop the GVRP packets but instead forwards them at Layer 2.GVRP packets are received with an invalid GARP protocol ID. The protocol ID must always be 0x0001.

Output field	Description
Number of VLANs in the GVRP Database	The number of VLANs in the GVRP database. NOTE This number includes the default VLAN (1), the GVRP base VLAN (4093), and the Single STP VLAN (4094). These VLANs are not advertised by GVRP but are maintained as "Registration Forbidden".
Maximum Number of VLANs that can be present	The maximum number of VLANs that can be configured on the device. This number includes statically configured VLANs, VLANs learned through GVRP, and VLANs 1, 4093, and 4094.

Examples

The following example displays sample output of the **show gvrp** command.

```
device# show gvrp
GVRP is enabled on the system
GVRP BASE VLAN ID : 4093
GVRP MAX Leaveall Timer : 300000 ms
GVRP Join Timer : 200 ms
GVRP Leave Timer : 600 ms
GVRP Leave-all Timer : 10000 ms
=====
Configuration that is being used:
block-learning ethe 1/1/3
block-applicant ethe 1/2/7 ethe 1/2/11
enable ethe 1/1/1 to 1/1/7 ethe 1/2/1 ethe 1/2/7 ethe 1/2/11
=====
Spanning Tree: SINGLE SPANNING TREE
Dropped Packets Count: 0
=====
Number of VLANs in the GVRP Database: 15
Maximum Number of VLANs that can be present: 4095
=====
```

show gvrp ethernet

Displays the GVRP information per individual port.

Syntax

show gvrp ethernet *stackid/slot/port*

Parameters

stackid/slot/port

Specifies the GVRP enabled ports.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

GVRP configuration mode

Command Output

The **show gvrp ethernet** command displays the following information:

Output field	Description
Port number	The port for which information is being displayed.
GVRP Enabled	Whether GVRP is enabled on the port.
GVRP Learning	Whether the port can learn VLAN information from GVRP.
GVRP Applicant	Whether the port can advertise VLAN information into GVRP.
Port State	The port link state, which can be UP or DOWN.
Forwarding	Whether the port is in the GVRP Forwarding state: <ul style="list-style-type: none">• NO - The port is in the Blocking state.• YES - The port is in the Forwarding state.
VLAN Membership	The VLANs of which the port is a member. For each VLAN, the following information is shown: <ul style="list-style-type: none">• VLAN ID - The VLAN ID.• Mode - The type of VLAN, which can be one of the following:<ul style="list-style-type: none">• FIXED - The port will always be a member of this VLAN and the VLAN will always be advertised on this port by GVRP. A port becomes FIXED when you configure the port as a tagged member of a statically configured VLAN.• FORBIDDEN - The VLAN is one of the special VLANs that is not advertised or learned by GVRP. The following VLANs are forbidden: the default VLAN (1), the GVRP base VLAN (4093), or the Single STP VLAN (4094).• NORMAL - The port became a member of this VLAN after learning about the VLAN through GVRP. The port membership in the VLAN depends on GVRP. If the VLAN is removed from the ports that send GVRP advertisements to this device, then the port will stop being a member of the VLAN.

Examples

The following example shows GVRP information for an individual port.

```
device# show gvrp ethernet 1/2/1
Port 1/2/1 -
  GVRP Enabled      : YES
  GVRP Learning     : ALLOWED
  GVRP Applicant    : ALLOWED
  Port State        : UP
  Forwarding        : YES

VLAN Membership:      [VLAN-ID]          [MODE]
                     1                  FORBIDDEN
                     2                  FIXED
                     1001               NORMAL
                     1003               NORMAL
                     1004               NORMAL
                     1007               NORMAL
                     1009               NORMAL
                     1501               NORMAL
                     2507               NORMAL
                     4001               NORMAL
                     4093               FORBIDDEN
                     4094               FORBIDDEN
```

show gvrp statistics

Displays the GVRP statistics.

Syntax

```
show gvrp statistics { all | ethernet stackid/slot/port }
```

Parameters

all

Displays the GVRP statistics for all ports.

ethernet stackid/slot/port

Displays the GVRP statistics for a specific Ethernet port.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

GVRP configuration mode

Command Output

The **show gvrp statistics ethernet** command displays the following information:

Output field	Description
Leave All Received	The number of Leaveall messages received.
Join Empty Received	The number of Join Empty messages received.
Join In Received	The number of Join In messages received.
Leave Empty Received	The number of Leave Empty messages received.
Leave In Received	The number of Leave In messages received.
Empty Received	The number of Empty messages received.
Leave All Transmitted	The number of Leaveall messages sent.
Join Empty Transmitted	The number of Join Empty messages sent.
Join In Transmitted	The number of Join In messages sent.
Leave Empty Transmitted	The number of Leave Empty messages sent.
Leave In Transmitted	The number of Leave In messages sent.
Empty Transmitted	The number of Empty messages sent.

Output field	Description
Invalid Messages/Attributes Skipped	<p>The number of invalid messages or attributes received or skipped. This can occur in the following cases:</p> <ul style="list-style-type: none"> • The incoming GVRP PDU has an incorrect length. • "End of PDU" was reached before the complete attribute could be parsed. • The Attribute Type of the attribute that was being parsed was not the GVRP VID Attribute Type (0x01). • The attribute that was being parsed had an invalid attribute length. • The attribute that was being parsed had an invalid GARP event. • The attribute that was being parsed had an invalid VLAN ID. The valid range is from 1 through 4095.
Failed Registrations	<p>The number of failed registrations that have occurred. A failed registration can occur for the following reasons:</p> <ul style="list-style-type: none"> • Join requests were received on a port that was blocked from learning dynamic VLANs (GVRP Blocking state). • An entry for a new GVRP VLAN could not be created in the GVRP database.

Examples

The following example shows the GVRP statistics for an individual port.

```
device# show gvrp statistics ethernet 1/2/1
PORT 1/2/1 Statistics:
Leave All Received           : 147
Join Empty Received        : 4193
Join In Received           : 599
Leave Empty Received        : 0
Leave In Received           : 0
Empty Received             : 588
Leave All Transmitted       : 157
Join Empty Transmitted     : 1794
Join In Transmitted        : 598
Leave Empty Transmitted     : 0
Leave In Transmitted        : 0
Empty Transmitted          : 1248
Invalid Messages/Attributes Skipped : 0
Failed Registrations       : 0
```

show gvrp vlan

Displays the GVRP VLAN information.

Syntax

```
show gvrp vlan { all | brief | vlan-id }
```

Parameters

all

Displays the information for all GVRP VLANs.

brief

Displays the GVRP VLAN information summary.

vlan-id

Displays the information for a specific VLAN ID.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

GVRP configuration mode

Command Output

The **show gvrp vlan brief** command displays the following information:

Output field	Description
Number of VLANs in the GVRP Database	The number of VLANs in the GVRP database. NOTE This number includes the default VLAN (1), the GVRP base VLAN (4093), and the Single STP VLAN (4094). These VLANs are not advertised by GVRP but are included in the total count.
Maximum Number of VLANs that can be present	The maximum number of VLANs that can be configured on the device. This number includes statically configured VLANs, VLANs learned through GVRP, and VLANs 1, 4093, and 4094.
VLAN-ID	The VLAN ID.
MODE	The type of VLAN, which can be one of the following: <ul style="list-style-type: none">• STATIC - The VLAN is statically configured and cannot be removed by GVRP. This includes VLANs you have configured as well as the default VLAN (1), base GVRP VLAN (4093), and Single STP VLAN (4094).• DYNAMIC - The VLAN was learned through GVRP.
VLAN-INDEX	A number used as an index into the internal database.

The **show gvrp vlan** command displays the following information:

Output field	Description
VLAN-ID	The VLAN ID.
VLAN-INDEX	A number used as an index into the internal database.
STATIC	Whether the VLAN is a statically configured VLAN.
DEFAULT	Whether this is the default VLAN.
BASE-VLAN	Whether this is the base VLAN for GVRP.
Timer to Delete Entry Running	Whether all ports have left the VLAN and the timer to delete the VLAN itself is running.
Legend	The meanings of the letter codes used in other parts of the display.
Forbidden Members	The ports that cannot become members of a VLAN advertised or learned by GVRP.
Fixed Members	The ports that are statically configured members of the VLAN. GVRP cannot remove these ports.
Normal (Dynamic) Members	The ports that were added by GVRP. These ports also can be removed by GVRP.
MODE	The type of VLAN, which can be one of the following: <ul style="list-style-type: none"> STATIC - The VLAN is statically configured and cannot be removed by GVRP. This includes VLANs you have configured as well as the default VLAN (1), base GVRP VLAN (4093), and Single STP VLAN (4094). DYNAMIC - The VLAN was learned through GVRP.

Examples

The following example shows the output of the **show gvrp vlan brief** command.

```
device# show gvrp vlan brief
Number of VLANs in the GVRP Database: 7
Maximum Number of VLANs that can be present: 4095
```

[VLAN-ID]	[MODE]	[VLAN-INDEX]
1	STATIC-DEFAULT	0
7	STATIC	2
11	STATIC	4
1001	DYNAMIC	7
1003	DYNAMIC	8
4093	STATIC-GVRP-BASE-VLAN	6
4094	STATIC-SINGLE-SPAN-VLAN	5

The following example shows the output of the **show gvrp vlan** command.

```
device# show gvrp vlan 1001
VLAN-ID: 1001, VLAN-INDEX: 7, STATIC: NO, DEFAULT: NO, BASE-VLAN: NO
Timer to Delete Entry Running: NO
Legend: [S=Slot]
Forbidden Members: None
Fixed Members: None
Normal(Dynamic) Members: (S2) 1
```

show ikev2

Displays global Internet Key Exchange version 2 (IKEv2) configuration information.

Syntax

show ikev2

Modes

User EXEC mode

Usage Guidelines

This command may be entered in all configuration modes.

Command Output

The **show ikev2** command displays the following information:

Output field	Description
Retry Count	The maximum number of attempts that are permitted to retransmit a message. The range is from 1 through 25. The default value is 5.
Max Exchange Time	The maximum setup time (in seconds) for an exchange. The range is from 0 through 300. The default value is 30 seconds.
Retransmit Interval	The length of time (in seconds) that an IKEv2 task waits before attempting to resend a packet. The range is from 1 through 60. The default value is 5 seconds. The interval between each resend attempt is increased by the value of the retransmit interval; that is, the retransmit interval increases exponentially.
Max SA	The maximum number of IKEv2 SAs that may be on a node. The range is from 1 through 256. The default value is 256.
Max SA In Nego	The maximum number of IKEv2 security associations (SAs) that may be "in negotiation" on a node. The range is from 1 through 256. The default value is 256.
Total IPSEC Intf	The total number of IPsec tunnel interfaces.
Total Peers	The total number of peers.
Total IPSEC SA	The total number of IPsec SAs (for the total number of IKEv2 SAs).
Total IKE SA	The total number of IKEv2 SAs including SAs in active, constructing, and dying states.

Examples

The following example displays global IKEv2 configuration information.

```
device# show ikev2

IKEv2 Global data:
Retry Count           : 5           Max Exchange Time      : 10
Retransmit Interval  : 5           Max SA                  : 256
Max SA In Nego       : 50          Total IPSEC Intf       : 1
Total Peers          : 1           Total IPSEC SA         : 0
Total IKE SA         : 1
```

History

Release version	Command history
8.0.50	This command was introduced.

show ikev2 auth-proposal

Displays configuration information about Internet Key Exchange version 2 (IKEv2) authentication proposals.

Syntax

show ikev2 auth-proposal [*name*]

Parameters

name

Specifies the name of an IKEv2 authentication proposal.

Modes

User EXEC mode

Usage Guidelines

This command may be entered in all configuration modes.

When an IKEv2 authentication proposal is not specified, this command displays information about all configured authentication proposals.

Command Output

The **show ikev2 auth-proposal** command displays the following information:

Output field	Description
Ikev2 Auth-Proposal	The name of an IKEv2 authentication proposal.
Local Auth Method	Local authentication method.
Remote Auth Method	Remote authentication method.
pre-share-key	Pre-shared key (the encrypted format is displayed).

Examples

The following example displays information about the IKEv2 authentication proposal configuration.

```
device# show ikev2 auth-proposal
=====
Ikev2 Auth-Proposal : def-ike-auth-prop
Local Auth Method  : pre_shared
Remote Auth Method : pre_shared
pre-share-key      : $QG5HTT1Ebk1TVW5NLWIhVW5ATVMhLS0rc1VA
```

History

Release version	Command history
8.0.50	This command was introduced.

show ikev2 policy

Displays configuration information about Internet Key Exchange version 2 (IKEv2) policies.

Syntax

```
show ikev2 policy [ policy-name ]
```

Parameters

policy-name
Specifies the name of an IKEv2 policy.

Modes

User EXEC mode

Usage Guidelines

This command may be entered in all configuration modes.

When a policy is not specified, this command displays information about all IKEv2 policies.

Command Output

The **show ikev2 policy** command displays the following information:

Output field	Description
Name	The name of an IKEv2 policy.
vrf	The front-door VRF (fvrf) to match for the policy.
Local address/Mask	The local IP address to match for the policy.
Proposal	The IKEv2 proposal that is configured for the policy.
Ref Count	The number of IPsec profiles that refer to this IKEv2 policy.

Examples

The following example displays information about all configured IKEv2 policies.

```
device# show ikev2 policy

Name           : ike_policy_red
vrf            : any
Local address/Mask : 0.0.0.0/0.0.0.0
Proposal       : ike_proposal_red
Ref Count      : 0

Name           : def-ike-policy
vrf            : any
Proposal       : def-ike-prop
Ref Count      : 0
```

History

Release version	Command history
8.0.50	This command was introduced.

show ikev2 profile

Displays configuration information about Internet Key Exchange version 2 (IKEv2) profiles.

Syntax

```
show ikev2 profile [ profile-name ]
```

Parameters

profile-name

Specifies the name of an IKEv2 profile.

Modes

User EXEC mode

Usage Guidelines

This command may be entered in all configuration modes.

When a profile is not specified, this command displays information about all IKEv2 profiles.

Command Output

The **show ikev2 profile** command displays the following information:

Output field	Description
IKEv2 Profile	The IKEv2 profile name.
Auth Profile	The authentication profile for this IKEv2 profile.
Match Criteria	
Inside VRF	The VRF name.
Local	The local system ID that is compared with the received payload during negotiation. Permitted ID formats are: <ul style="list-style-type: none">• address—An IPv4 address• fqdn—A fully qualified domain name, for example, router1.example.com• email—An email address, for example, test@test.com• key-id—A key ID
Remote	Remote system ID that is compared with the received payload during negotiation. Permitted ID formats are: <ul style="list-style-type: none">• address—An IPv4 address• fqdn—A fully qualified domain name, for example, router1.example.com• email—An email address, for example, test@test.com• key-id—A key ID

Output field	Description
Local Identifier	Local system ID that is sent with the payload during negotiation. Permitted ID formats are: <ul style="list-style-type: none"> address—An IPv4 address. fqdn—A fully qualified domain name, for example, router1.example.com. email—An email address, for example, test@test.com. key-id—A key ID.
Remote Identifier	Remote system ID. Permitted ID formats are: <ul style="list-style-type: none"> address—An IPv4 address. fqdn—A fully qualified domain name, for example, router1.example.com. email—An email address, for example, test@test.com. key-id—A key ID.
Lifetime	The IKEv2 SA lifetime (in minutes). This is also known as the rekey time.
Keepalive Check	The interval, in seconds, between the IKEv2 messages sent to detect a dead peer.
Initial contact	The initial contact configuration status. When a device reboots, peer devices may have security associations (SAs) that are no longer valid. When initial contact is enabled, an initial contact message is sent to ensure that old security associations (SAs) on the peer are deleted.
Ref Count	Number of IPsec profiles that refer to this IKEv2 profile.

Examples

The following example displays configuration information for an IKEv2 profile named prof_mktg.

```
device# show ikev2 profile ipsec_tunnel_1

IKEv2 Profile       : ipsec_tunnel_1
Auth Profile        : ipsec_tunnel_1
Match Criteria      :
Inside VRF          : vrf1
  Local:
    email ipsec_tunnel_1@example.com
  Remote:
    email ipsec_tunnel_1@example.com
Local Identifier    : email ipsec_tunnel_1@example.com
Remote Identifier   : email ipsec_tunnel_1@example.com
Lifetime            : 2592000 sec
Keepalive Check     : 10 sec
Initial contact     : yes
Ref Count           : 1
```

History

Release version	Command history
8.0.50	This command was introduced.

show ikev2 proposal

Displays configuration information about Internet Key Exchange version 2 (IKEv2) proposals.

Syntax

```
show ikev2 proposal [ name ]
```

Parameters

name

Specifies the name of an IKEv2 proposal.

Modes

User EXEC mode

Usage Guidelines

This command may be entered in all configuration modes.

When an IKEv2 proposal is not specified, this command displays configuration information for all IKEv2 proposals.

Command Output

The **show ikev2 proposal** command displays the following information:

Output field	Description
Name	The name of an IKEv2 proposal.
Encryption	The encryption algorithms that are configured for the proposal.
Integrity	The integrity algorithms that are configured for the proposal.
PRF	The pseudorandom function algorithms that are configured for the proposal.
DH Group	The Diffie-Hellman groups that are configured for the proposal.
Ref Count	The number of IPsec profiles that refer to this IKEv2 proposal

Examples

The following example shows how to display information about the IKEv2 proposal configuration.

```
device# show ikev2 proposal

Name       : def-ike-prop
Encryption : aes256
Integrity  : sha384
PRF        : sha384
DH Group   : 384_ECP/Group 20
Ref Count  : 2
```

History

Release version	Command history
8.0.50	This command was introduced.

show ikev2 sa

Displays configuration information about current Internet Key Exchange version 2 (IKEv2) security associations (SAs).

Syntax

```
show ikev2 sa [ [ interface tunnel-port | local ip-address | remote ip-address ] [ detail ] | fvrfrf vrf-name | ipv4 ]
```

Parameters

interface *tunnel-port*

Specifies a tunnel port number.

local *ip-address*

Specifies the IPv4 address of a local interface.

remote *ip-address*

Specifies the IPv4 address of a remote interface.

detail

Specifies the display of detailed information.

fvrfrf *vrf-name*

Specifies the name of a forwarding VRF.

ipv4

Specifies the display of information about IPv4 connections.

Modes

User EXEC mode

Usage Guidelines

This command may be entered in all configuration modes.

When the **detail** option is omitted, only the basic SA information is displayed.

Command Output

The **show ikev2 sa** command displays the following information:

Output field	Description
Total SA	The total number of IKEv2 SAs, that is; SAs that are in active, constructing, and dying states.
Active SA	The number of IKEv2 SAs in an active state.
Constructing SA	The number of IKEv2 SAs in a constructing state.
Dying SA	The number of IKEv2 SAs in an dying state.
tnl-id	The tunnel interface ID for the IKEv2 SA.
local	The local address of the tunnel.

Output field	Description
remote	The remote address of the tunnel.
status	The IKEv2 SA state.
vrf(i)	The base or internal VRF for the IKEv2 tunnel.
vrf(f)	The front-end (customer end) VRF for the IKEv2 tunnel.
Role	The role of the device (initiator, responder).
Local SPI	The local security parameter index (SPI) for the IKEv2 SA.
Remote SPI	The remote SPI for the IKEv2 SA.
Profile	The IKEv2 profile for the session.
Policy	The IKEv2 policy for the session.
Auth Proposal	The IKEv2 authentication proposal for the session.

Examples

The following example displays information about the current SA configuration, in which there are four active SAs.

```
device# show ikev2 sa

Total SA : 4
Active SA: 4      : Constructing SA:0      : Dying SA:0
-----
tnl-id  local          remote          status  vrf(i)         vrf(f)
-----
tnl 18  10.18.3.4/500   10.18.3.5/500   active  default-vrf    default-vrf
tnl 22  10.22.3.4/500   10.22.3.5/500   active  default-vrf    default-vrf
tnl 19  10.19.3.4/500   10.19.3.5/500   active  default-vrf    default-vrf
tnl 20  10.20.3.4/500   10.20.3.5/500   active  default-vrf    default-vrf
```

The following example displays detailed IKEv2 SA information.

```
device# show ikev2 sa detail

Total SA : 1
Active SA: 1      : Constructing SA:0      : Dying SA:0
-----
tnl-id  Local          Remote          Status        Vrf(i)         Vrf(f)
-----
tnl 1   10.1.41.1      10.4.41.1       Active        vrf1           vrf2
-----
Role           : Initiator
Local SPI      : 0x6fb19219160c7d71      Remote SPI: 0xde1b24e5764f311e
Profile        : p1
Policy         : ipsec_tunnel_1
Auth Proposal  : p1
```

History

Release version	Command history
8.0.50	This command was introduced.

show ikev2 session

Displays Internet Key Exchange version 2 (IKEv2) session information that includes rekeys and other negotiated information.

Syntax

```
show ikev2 session [ local-spi-id | detail ]
```

Parameters

local-spi-id

Specifies the security parameter index (SPI) for the IKEv2 session.

detail

Specifies the display of detailed information about IKEv2 sessions.

Modes

User EXEC mode

Usage Guidelines

This command may be entered in all configuration modes.

Command Output

The **show ikev2 session** command displays the following information:

Output field	Description
IKE count	The total number of IKEv2 security associations (SAs).
Child Sa Count	The total number of IPsec security associations (SAs).
tnl-id	The tunnel interface ID for the IKEv2 SA.
local	The local address of the tunnel.
remote	The remote address of the tunnel.
status	The IKEv2 SA state.
vrf(i)	The base or internal VRF for the IKEv2 tunnel.
vrf(f)	The front-end (customer end) VRF for the IKEv2 tunnel.
Encr	The encryption algorithm used by this session after IKEv2 negotiations.
Hash	The hashing algorithm used by this session after IKEv2 negotiations.
DH Grp	The Diffie-Hellman (DH) group used by this session after IKEv2 negotiations.
Auth	The authentication method used by this session after IKEv2 negotiations.
PRF	The pseudorandom function (PRF) used by this session after IKEv2 negotiations.
Local spi	The local security parameter index (SPI) for the session.
Remote spi	The remote SPI for the session.

Output field	Description
Life/Active Time	The configured IKEv2 rekey time and the time left until the next rekey.
Rekey count Local	The total number of session key changes for the IKEv2 SA that were initiated by the local device.
Rekey count Remote	The total number of session key changes for the IKEv2 SA that were initiated by the remote device.
Status Description	The IKEv2 SA state.
Initiator id	The initiator identity for the IKEv2 SA.
Responder id	The responder identity for the IKEv2 SA.
no Exchange in progress	Indicates that this session is not in an exchange state.
next request message id	The next message ID for the session.
Keepalive timer	The interval between IKEv2 messages that are sent to detect if a peer is still alive.
Total keepalive sent	The total number of "keepalive" messages sent for the session.
Total keepalive received	The total number of "keepalive" messages received for the session.
Total Bytes sent	The total number of bytes sent in the session.
Total Bytes Received	The total number of bytes received in the session.
Time past since last msg	The elapsed time since the last message.
NAT-T	Network Address Translation (NAT) configuration status.
Child Sa	IPsec SA details.
id	The numeric identifier for an IPsec SA.
Local selector	The local traffic selector.
Remote selector	The remote traffic selector.
ESP SPI IN/OUT	The IPsec SPI for ingress and the SPI for egress.
Encryption	The encryption algorithm used by the session.
ICV Size	The size of the integrity check value (ICV) for the encryption algorithm.
Esp_hmac	The hashed message authentication code (HMAC) algorithm used by the session.
Authentication	The authentication algorithm used by the session.
DH Group	The Diffie-Hellman (DH) group used by the authentication algorithm.
Mode	The Encapsulating Security Protocol (ESP) mode for the session.
Rekey count Local	The total number of changes to the IPsec SA session key initiated by the local device.
Rekey count Remote	The total number of changes to the IPsec SA session key initiated by the remote device.

Examples

The following example displays IKEv2 session information.

```
device# show ikev2 session

IKE count:1, Child Sa Count:2
tnl-id      local      remote      status      vrf(i)      vrf(f)
-----
tnl 18      10.18.3.4    10.18.3.5    active      default-vrf default-vrf
-----
Encr: aes-cbc-256, Hash: sha384, DH Grp:384_ECP/Group 20, Auth: pre_shared
PRF: sha384
Is Initiator: Yes
Local spi   : 0xe115847e85ad667b      Remote spi: 0x7bb5ee3b6074a4b4
Life/Active Time: 2592000/534 sec
Rekey count Local: 0      Rekey count Remote: 2
Child Sa:
id 1
  Local selector 0.0.0.0/0 - 255.255.255.255
  Remote selector 0.0.0.0/0 - 255.255.255.255
  ESP SPI IN/OUT: 0xb278/0x7935
  Encryption: aes-gcm-256, ICV Size: 16 octects, Esp_hmac: Null
  Authentication: null DH Group:none , Mode: tunnel
  Rekey count Local: 0      Rekey count Remote: 2
```

The following example displays detailed IKEv2 session information.

```
device# show ikev2 session detail

IKE count:4, Child Sa Count:8
tnl-id      local      remote      status      vrf(i)      vrf(f)
-----
tnl 18      10.18.3.4    10.18.3.5    active      default-vrf default-vrf
-----
Encr: aes-cbc-256, Hash: sha384, DH Grp:384_ECP/Group 20, Auth: pre_shared
PRF: sha384
Local spi   : 0xe115847e85ad667b      Remote spi: 0x7bb5ee3b6074a4b4
Life/Active Time: 2592000/614 sec
Rekey count Local: 0      Rekey count Remote: 2
Status Description: active
Initiator id: address 18.3.3.4      Responder id: address 18.3.3.5
no Exchange in progress
next request message id=4
Keepalive timer: 300 seconds, retry 0
  Total keepalive sent: 2
  Total keepalive received: 0
  Total Bytes sent      : 524      Total Bytes Received   : 672
Time past since last msg: 14
NAT-T is not detected
Child Sa:
id 1
  Local selector 0.0.0.0/0 - 255.255.255.255
  Remote selector 0.0.0.0/0 - 255.255.255.255
  ESP SPI IN/OUT: 0xb278/0x7935
  Encryption: aes-gcm-256, ICV Size: 16 octects, Esp_hmac: Null
  Authentication: null DH Group:none , Mode: tunnel
  Rekey count Local: 0      Rekey count Remote: 2
```

History

Release version	Command history
8.0.50	This command was introduced.

show ikev2 statistics

Displays statistical information about Internet Key Exchange version 2 (IKEv2).

Syntax

show ikev2 statistics

Modes

User EXEC mode

Usage Guidelines

This command may be entered in all configuration modes.

Command Output

The **show ikev2 statistics** command displays the following information:

Output field	Description
Total IKEv2 SA Count active	The total number of IKEv2 security associations (SAs) in an active state.
Incoming IKEv2 Requests	The number of IKEv2 SAs (accepted and rejected) initiated by the peer device.
Outgoing IKEv2 Requests	The number of IKEv2 SAs initiated by the local device.
Accepted	The total number of outgoing IKEv2 SAs that were accepted.
Rejected	The total number of outgoing IKEv2 SAs that were rejected.
Rejected due to no cookie	The total number of outgoing IKEv2 SAs that were rejected due to no cookie.
IKEv2 Packet Statistics	
Total Packets Received	The total number of packets received.
Total Packets Transmitted	The total number of packets transmitted.
Total Packets Retransmitted	The total number of packets retransmitted.
Total Failed Transmission	The total number of packets where transmission failed.
Total Pending Packets	The total number of packets to be transmitted.
Total Buffer Failed	The total number of packets where transmission failed due to a buffer issue.
Total Keepalive Received	The total number of IKEv2 keepalive messages received.
Total Keepalive Transmitted	The total number of IKEv2 keepalive messages transmitted.
IKEv2 Error Statistics	
Unsupported Payload	The total number of IKEv2 packets received with an unsupported payload.
Invalid IKE SPI	The total number of IKEv2 packets received with an invalid security parameter index (SPI).
Invalid Version	The total number of IKEv2 packets received with an invalid version.
Invalid Syntax	The total number of IKEv2 packets received with invalid syntax.
Negotiation Timeout	The total number of IKEv2 sessions deleted due to dead peer detection (DPD) or negotiation timeouts.
No Policy	The total number of IKEv2 sessions deleted or rejected due to a policy issue.

Show Commands
show ikev2 statistics

Output field	Description
No Protection Suite	The total number of IKEv2 sessions deleted or rejected due to a protection suite issue.
Policy Error	The total number of IKEv2 sessions deleted or rejected due to policy error.
IKE Packet Error	The total number of IKEv2 or IPsec packets received with a packet error.
Discard Policy	The total number of IKEv2 or IPsec sessions deleted or rejected due to a policy error or mismatch.
Proposal Mismatch	The total number of IKEv2 or IPsec packets sent or received with a proposal mismatch.
Invalid Selectors	The total number of IKEv2 or IPsec packets sent or received with invalid selectors.
Internal Error	The total number of IKEv2 or IPsec packets sent or received with an internal error.
SA Overflow	The total number of times the maximum SA count was reached.
IKE SA Overflow	The number of times the maximum IKEv2 SA count was reached.
IPSEC SA Overflow	The number of times the maximum IPsec SA count was reached.
Authentication Failed	The total number of IKEv2 or IPsec packets sent or received when authentication failed.
Others	The total number of IKEv2 or IPsec packets sent or received with other error types.
Number of HW-SPI Add write	The number of times the creation of an IPsec SPI was written to the hardware.
Number of HW-SPI Delete	The number of times the deletion of an IPsec SPI was written to the hardware.

Examples

The following example displays IKEv2 statistics.

```
device# show ikev2 statistics

Total IKEv2 SA Count active: 0
Incoming IKEv2 Requests: Accepted: 0 Rejected: 0
Outgoing IKEv2 Requests: 0
  Accepted: 0 Rejected: 0 Rejected due to no cookie: 0
IKEv2 Packet Statistics:
  Total Packets Received      : 0
  Total Packets Transmitted   : 2
  Total Packets Retransmitted : 0
  Total Failed Transmission   : 0
  Total Pending Packets      : 0
  Total Buffer Failed         : 0
  Total Keepalive Received   : 0
  Total Keepalive Transmitted: 0
IKEv2 Error Statistics:
  Unsupported Payload      : 0      Invalid IKE SPI : 0
  Invalid Version         : 0      Invalid Syntax  : 0
  Negotiation Timeout    : 0      No Policy       : 0
  No Protection Suite     : 0      Policy Error    : 0
  IKE Packet Error       : 1      Discard Policy  : 0
  Proposal Mismatch      : 0      Invalid Selectors: 0
  Internal Error         : 0      SA Overflow     : 0
  IKE SA Overflow        : 0      IPSEC SA Overflow: 0
  Authentication Failed  : 0      Others          : 0
  Number of HW-SPI Add write : 0    Number of HW-SPI Delete write: 0
```

History

Release version	Command history
8.0.50	This command was introduced.

show inline power

Displays the inline power capacity, power allocation, power consumption, and power priority details for Power over Ethernet (PoE) ports.

Syntax

```
show inline power [ stack-unit | stack/slot/port [ debug-info ] ]
```

Parameters

stack-unit

Displays inline power information for the specified stack unit.

stack/slot/port

Displays inline power information for a specific interface.

debug-info

Displays inline power debugging information for the specified interface.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Usage Guidelines

Use this command to view details about PoE power usage.

You can view the PoE operational status for the entire device, for a specific PoE module, or for a specific interface.

Command Output

The **show inline power** command displays the following information.

Output field	Description
Power Capacity	The total PoE power supply capacity and the amount of available power (current free) for PoE-power-consuming devices. Both values are shown in milliwatts.
Power Allocations	The number of times the device fulfilled PoE requests for power.
Port	The slot number and port number.
Admin State	Specifies whether Power over Ethernet has been enabled on the port: <ul style="list-style-type: none">On: The inline power command was issued on the port.Off: The inline power command has not been issued on the port.

Show Commands
show inline power

Output field	Description
Oper State	<p>Shows the status of inline power on the port:</p> <ul style="list-style-type: none"> • On: The PoE power supply is delivering inline power to the powered device (PD). • Off: The PoE power supply is not delivering inline power to the PD. • Non-PD: Identifies the ports connected to nonpowered devices. • Denied: The port is in standby mode (waiting for power) because the device does not currently have enough available power for the port. <p>NOTE When you enable a port using the CLI, it may take 12 or more seconds before the operational state of that port is displayed correctly in the show inline power output.</p>
Power Consumed	The number of current, actual milliwatts that the PD is consuming.
Power Allocated	The number of milliwatts allocated to the port. This value is either the default or configured maximum power level or the power class that was automatically detected by the device.
PD Type	<p>The type of PD connected to the port:</p> <ul style="list-style-type: none"> • 802.3at: The PD connected to this port is 802.3at-compliant. • 802.3af: The PD connected to this port is 802.3af-compliant. • Legacy: The PD connected to this port is a legacy product (not 802.3af-compliant). • N/A: Power over Ethernet is configured on this port, and one of the following is true: <ul style="list-style-type: none"> - The device connected to this port is a nonpowered device. - No device is connected to this port. - The port is in standby or denied mode (waiting for power). <p>NOTE Although not 802.3af-compliant, some legacy products may show the PD type as 802.3af.</p>
PD Class	<p>Determines the maximum amount of power that a PD receives. This field can also be "n/a" meaning that the device attached to the port cannot advertise its power class.</p> <p>NOTE If an 802.3at PD with a class 4 value is connected to a Brocade FastIron switch, the switch must be running FastIron release 08.0.20 or later to be able to perform the necessary power negotiations.</p>
Pri	<p>The port inline power priority, which determines the order in which the port receives power while in standby mode (waiting for power). Ports with a higher priority receive power before ports with a lower priority. This value can be one of the following:</p> <ul style="list-style-type: none"> • 3: Low priority • 2: High priority • 1: Critical priority

Output field	Description
Fault/Error	<p>If applicable, the fault or error that occurred on the port:</p> <ul style="list-style-type: none"> • critical temperature — The PoE chip temperature limit rose above the safe operating level, thereby powering down the port. • detection failed: discharged capacitor — The port failed capacitor detection (legacy PD detection) because of a discharged capacitor. This can occur when connecting a non-PD on the port. • detection failed: out of range capacitor — The port failed capacitor detection (legacy PD detection) because of an out-of-range capacitor value. This can occur when connecting a non-PD on the port. • internal h/w fault — A hardware problem hindered port operation. • lack of power: The port shut down due to lack of power. • main supply voltage high — The voltage was higher than the maximum voltage limit, thereby tripping the port. • main supply voltage low — The voltage was lower than the minimum voltage limit, thereby tripping the port. • overload state — The PD consumed more power than the maximum limit configured on the port, based on the default configuration, user configuration, or CDP configuration. • over temperature — The port temperature rose above the temperature limit, thereby powering down the port. • PD DC fault — A succession of underload and overload states, or a PD DC/DC fault, caused the port to shut down. • short circuit — A short circuit was detected on the port delivering power. • underload state — The PD consumed less power than the minimum limit specified in the 802.3af standard. • voltage applied from ext src — The port failed capacitor detection (legacy PD detection) because the voltage applied to the port was from an external source.
Total	The total power in milliwatts being consumed by all PDs connected to the interface module and the total power in milliwatts allocated to all PDs connected to the interface module.
Grand Total	The total number of current, actual milliwatts being consumed by all PDs connected to the PoE device and the total number of milliwatts allocated to all PDs connected to the PoE device.

Examples

The following is sample output from the **show inline power** command.

```
device# show inline power

Power Capacity:      Total is 2160000 mWatts. Current Free is 18800 mWatts.
Power Allocations:  Requests Honored 769 times

History

Release version	Command history
8.0.10	This command was introduced.
8.0.50	A new operating state was added (Non-PD).

show inline power debug-info

Displays inline power debug information.

Syntax

show inline power debug-info [stack_unit | stack/slot/port]

Parameters

stack_unit

Displays inline power debug information for the specified stack unit or SPX unit ID.

stack/slot/port

Displays inline power debug information for the specified interface.

Modes

Privileged exec mode

Usage Guidelines

The command prints the complete output of **show inline power** port-id plus the last five hardware port states, and the last five software port states.

Examples

Use the following command to display inline power information that is of use in debugging the configuration.

```
device# show inline power debug-info
```

History

Release version	Command history
8.0.50	This command was introduced.

show inline power detail

Displays detailed information about the PoE power supplies installed in a PoE device.

Syntax

show inline power detail [*stack-unit* | **debug-info** *stack-unit*]

Parameters

stack-unit

Displays detailed inline power information for the specified stack unit.

debug-info

Displays detailed debug information.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Usage Guidelines

You can view the PoE operational status for the entire device, for a specific PoE module, or for a specific interface.

Command Output

The **show inline power detail** command displays the following information.

Output field	Description
Max Curr:	The number of milliwatts available for the unit in the stack, not the entire stack. This value is either the default or configured maximum power level, or the power class that was automatically detected by the device.
Voltage	The number of Volts allocated to the stack.
Capacity	The total PoE power supply capacity and the amount of available power (current free) for PoE-power-consuming devices. Both values are shown in milliwatts.
Firmware Version	Returns firmware version information.
Power Allocations	The number of times the device fulfilled PoE requests for power.
Cumulative Port State Data	Shows the number of ports with a particular status/configuration.
Cumulative Port Power Data	Shows the port power consumption and allocation.

Examples

The following is sample output from the **show inline power detail** command.

```
device# show inline power detail

show inline power emesg

Displays a history of Power over Ethernet (PoE) events.

Syntax

show inline power emesg { *count* | on [*count*] | off }

Parameters

count

Number of logged PoE events to print. By default, 2000 PoE events are printed if a count is not specified.

on

Turns on event trace logging.

off

Turns off event trace logging.

Modes

Privileged exec mode

Usage Guidelines

By default the logging is off.

The command prints the last 2000 PoE events from each unit of the system.

Examples

The following is sample output from the **show inline power emesg** command.

```
device# show inline power emesg

Log Size: 2000 entries.           Number of entries in use: 1.
Logging is active.
Log printing is requested for first (oldest) 3 entries.
-----+-----+-----+-----+-----+

8.0.50	This command was introduced.

Show Commands
show interfaces ethernet

show interfaces ethernet

Displays Ethernet interface information.

Syntax

show interfaces ethernet *stackid/slot/port*

Parameters

stackid / slot / port

Stack ID number, slot number, and port number for an existing Ethernet interface.

Modes

Privileged EXEC mode

Examples

This example shows detailed interface information. Note that the priority flow control (PFC) is shown as enabled and information for the unicast and multicast egress queues is shown separately.

```
device# show interfaces ethernet 1/1/22

10GigabitEthernet1/1/22 is up, line protocol is up
  Port up for 16 minutes 1 seconds
  Hardware is 10GigabitEthernet, address is aabb.ccdd.ef14 (bia aabb.ccdd.ef14)
  Configured speed 10Gbit, actual 10Gbit, configured duplex fdx, actual fdx
  Member of 1 L2 VLANs, port is tagged, port state is FORWARDING
  BPDU guard is Disabled, ROOT protect is Disabled, Designated protect is Disabled
  Link Error Dampening is Disabled
  STP configured to ON, priority is level0, mac-learning is enabled
  ...
  ....
  MTU 1500 bytes
  Priority-Flow-Control is Enabled
  300 second input rate: 37014512 bits/sec, 9036 packets/sec, 0.38% utilization
  300 second output rate: 731174584 bits/sec, 178509 packets/sec, 7.58% utilization
  0 packets input, 0 bytes, 0 no buffer
  Received 0 broadcasts, 0 multicasts, 0 unicasts
  0 input errors, 0 CRC, 0 frame, 0 ignored
  0 runts, 0 giants
  26055807 packets output, 13340529672 bytes, 0 underruns
  Transmitted 0 broadcasts, 98 multicasts, 26055709 unicasts
  0 output errors, 0 collisions
  Relay Agent Information option: Disabled

UC Egress queues:
Queue counters      Queued packets      Dropped Packets
   0                   0                    2074860
   1                2349160              2074861

   5                2349165              2074860
   6                5461694              518651
   7                6498353              0

MC Egress queues:
Queue counters      Queued packets      Dropped Packets
   0                   0                    0
   1                   0                    0
   2                   0                    0
   3                   0                    0
   4                   0                    0
```

Show Commands

show interfaces ethernet

This example shows information for an interface that has an ingress profile and an egress profile attached to a port.

```
device(config-if-e40000-1/1/1)# show interfaces ethernet 1/1/1

40GigabitEthernet1/1/1 is up, line protocol is up
  Port up for 5 days 12 hours 45 minutes 48 seconds
  Hardware is 40GigabitEthernet, address is 748e.f8f9.3d80 (bia 748e.f8f9.3d80)
  Configured speed 40Gbit, actual 40Gbit, configured duplex fdx, actual fdx
  Configured mdi mode AUTO, actual none
  Member of 1 L2 VLANs, port is tagged, port state is FORWARDING
  BPDU guard is Disabled, ROOT protect is Disabled, Designated protect is Disabled
  Link Error Dampening is Disabled
  STP configured to ON, priority is level0, mac-learning is enabled
  Flow Control is enabled
  Mirror disabled, Monitor disabled
  Mac-notification is disabled
  Not member of any active trunks
  Not member of any configured trunks
  No port name
  IPG MII 96 bits-time, IPG GMII 96 bits-time
  MTU 1500 bytes, encapsulation ethernet
  Ingress Profile is il
  Egress Profile is e1
  300 second input rate: 0 bits/sec, 0 packets/sec, 0.00% utilization
  300 second output rate: 0 bits/sec, 0 packets/sec, 0.00% utilization
  8060797794 packets input, 1031782117647 bytes, 0 no buffer
  Received 0 broadcasts, 0 multicasts, 8060797794 unicasts
  4 input errors, 0 CRC, 0 frame, 0 ignored
  0 runts, 0 giants
  8078157201 packets output, 1034004121728 bytes, 0 underruns
  Transmitted 0 broadcasts, 0 multicasts, 8078157201 unicasts
  0 output errors, 0 collisions
  Relay Agent Information option: Disabled
```

This example shows information for the configured bandwidth on a specific interface. In this example the configured interface bandwidth value is 2000 kilobits.

```
device# show interfaces ethernet 1/1/1

GigabitEthernet1/1/1 is disabled, line protocol is down
  STP Root Guard is disabled, STP BPDU Guard is disabled
  Hardware is GigabitEthernet, address is 748e.f82a.6a00 (bia 748e.f82a.6a00)
  Configured speed auto, actual unknown, configured duplex fdx, actual unknown
Interface bandwidth is 2000 kbps
```

History

Release version	Command history
8.0.20	This command was modified to include PFC status and separate unicast and multicast egress queues.
8.0.30	This command was modified to include configured bandwidth status.

show interfaces lag

Displays information about the LAG interface including counters.

Syntax

```
show interfaces lag [ lag-id | lag-name ]
```

Parameters

lag-id

Displays LAG information of a LAG specified by the LAG ID. If the specified LAG ID is not available, a warning message is displayed.

lag-name

Displays LAG information of a LAG specified by the LAG name. If the specified LAG name is not available, a warning message is displayed.

Modes

Privileged EXEC mode

Global configuration mode

Examples

The following command shows that the LAG specified by LAG ID 2 is not available in the system.

```
device(config)# show interfaces lag id2  
Warning: can't find LAG id2
```

Show Commands
show interfaces lag

The following command shows LAG information of a lag1.

```
device(config)# show interfaces lag lag1
Total number of LAGs: 1
Total number of deployed LAGs: 1
Total number of trunks created:1 (127 available)

show interfaces management

Displays the status of a management interface.

Syntax

show interfaces management [*mgmt_interface*]

Parameters

mgmt_interface

Specifies a management interface.

Modes

Global configuration mode

Examples

To display the status of a management interface:

```
device(config-vlan-20)# show interfaces management 1
GigEthernetmgmt1 is disabled, line protocol is down
Port down for 2 minute(s) 26 second(s)
Hardware is GigEthernet, address is cc4e.24b4.6e64 (bia cc4e.24b4.6e7c)
Configured speed auto, actual unknown, configured duplex fdx, actual unknown
Configured mdi mode AUTO, actual unknown
Member of VLAN 20, port is untagged, port state is NONE
No port name
MTU 1500 bytes
300 second input rate: 0 bits/sec, 0 packets/sec, 0.00% utilization
300 second output rate: 0 bits/sec, 0 packets/sec, 0.00% utilization
0 packets input, 0 bytes, 0 no buffer
Received 0 broadcasts, 0 multicasts, 0 unicasts
0 input errors, 0 CRC, 0 frame, 0 ignored
0 runts, 0 giants
0 packets output, 0 bytes, 0 underruns
Transmitted 0 broadcasts, 0 multicasts, 0 unicasts
0 output errors, 0 collisions
```

History

Release version	Command history
8.0.50	This command was introduced.

show interfaces stack-ports

Use the **show interfaces stack-ports** command to display information about the stacking ports for all members in a stack.

Syntax

show interfaces stack-ports

Modes

Privileged EXEC mode

Usage Guidelines

Use the **clear stack ipc** command before issuing the **show stack ipc** command. This helps to ensure that the data are the most recent traffic statistics for the stack.

This command must be executed from active stack controller.

Command Output

The **show interfaces stack-ports** command displays the following information:

Output field	Description
Port	Specifies the stack identification number for this unit
Link	Identifies the configuration for modules on this unit
State	Indicates that a priority has been assigned to this stack unit
Dupl	Indicates whether the port is configured as half- or full-duplex
Speed	Indicates the port speed
Trunk	Indicates whether the port is part of a trunk
Tag	Indicates whether the port is tagged or untagged
P	Specifies port priority
MAC	Provides the MAC address of the port. NOTE If a unit is provisional (it is reserved and does not have a physical unit associated with the unit ID), the interface MAC address displayed for the unit is 0000.0000.0000.
Name	Displays the optional name assigned to the port if present

Show Commands

show interfaces stack-ports

Examples

The following example displays information about the stack-port interfaces.

```
device# show interfaces stack-ports
Port  Link  State  Dupl  Speed  Trunk  Tag  Pvid  Pri  MAC  Name
1/2/1  Up    Forward Full  40G   None  No   N/A   0   748e.f8f9.6315
1/2/2  Down  None   None  None  None  No   N/A   0   748e.f8f9.6319
1/2/4  Up    Forward Full  40G   None  No   N/A   0   748e.f8f9.6321
1/2/5  Down  None   None  None  None  No   N/A   0   748e.f8f9.6325
1/2/6  Down  None   None  None  None  No   N/A   0   748e.f8f9.6329
2/2/1  Up    Forward Full  40G   None  No   N/A   0   cc4e.2438.7295
2/2/4  Up    Forward Full  40G   None  No   N/A   0   cc4e.2438.72a1
2/2/5  Down  None   None  None  None  No   N/A   0   cc4e.2438.72a5
3/2/1  Up    Forward Full  40G   None  No   N/A   0   cc4e.2438.7515
3/2/2  Down  None   None  None  None  No   N/A   0   cc4e.2438.7519
3/2/3  Down  None   None  None  None  No   N/A   0   cc4e.2438.751d
3/2/4  Up    Forward Full  40G   None  No   N/A   0   cc4e.2438.7521
```

show interfaces tunnel

Displays tunnel interface information.

Syntax

show interfaces tunnel *tunnel-number*

Parameters

tunnel-number

Specifies the tunnel number. Valid values range from 1 through 72,

Modes

Privileged EXEC mode

Command Output

The **show interfaces tunnel** command displays the following information:

Field	Definition
Hardware is Tunnel	The interface is a tunnel interface.
Tunnel source	The source address for the tunnel.
Tunnel destination	The destination address for the tunnel.
Tunnel mode	The tunnel mode. The gre specifies that the tunnel will use GRE encapsulation (IP protocol 47).
Interface bandwidth	The configured bandwidth on a tunnel interface for routing metric purposes only.
Port name	The port name (if applicable).
Internet address	The internet address.
MTU	The configured path maximum transmission unit.
encapsulation GRE	GRE encapsulation is enabled on the port.
Keepalive	Indicates whether or not GRE link keepalive is enabled.
Path MTU Discovery	Indicates whether or not PMTUD is enabled. If PMTUD is enabled, the MTU value is also displayed.
Path MTU	The PMTU that is dynamically learned.
Age-timer	Indicates the pmtud aging timer configuration in minutes. The default is 10. The range is from 10 - 30.
Path MTU will expire	Indicates the time after which the learned PMTU expires. This line is displayed only when a PMTU is dynamically learned.

Show Commands

show interfaces tunnel

Examples

This example displays the GRE tunnel configuration and the pmttd aging timer information..

```
show interfaces tunnel 10
Tunnel10 is up, line protocol is up
  Hardware is Tunnel
  Tunnel source 10.1.41.10
  Tunnel destination is 10.1.14.10
  Tunnel mode gre ip
  Port name is GRE_10_to_VR1_on_ICX_STACK
  Internet address is 10.11.1.1/31, MTU 1476 bytes, encapsulation GRE
  Keepalive is not Enabled
  Path MTU Discovery: Enabled, MTU is 1428 bytes, age-timer: 10 minutes
  Path MTU will expire in 0 minutes 50 secs
```

This example shows information for the configured interface bandwidth value on a tunnel interface.

```
device# show interfaces tunnel 2

Tunnel2 is up, line protocol is up
  Hardware is Tunnel
  Tunnel source 10.70.15.1
  Tunnel destination is 10.70.15.2
  Tunnel mode gre ip
  Interface bandwidth is 2000 kbps
  No port name
  Internet address is: 10.0.0.1/24
  Tunnel TOS 0, Tunnel TTL 255, Tunnel MTU 1476 bytes
  Keepalive is not Enabled

Tunnel Packet Statistics:

```

In-Port(s)	Unicast Packets		Multicast Packets	
	[Rcv-from-tnnl	Xmit-to-tnnl]	[Rcv-from-tnnl	Xmit-to-tnnl]
e1/1 - e1/24	2224	0	0	0

History

Release version	Command history
8.0.30	This command was modified to include configured bandwidth status.

show interfaces ve

Displays Virtual Ethernet (VE) interface information.

Syntax

show interfaces ve *vlan_id*

Parameters

vlan_id

Specifies the configured corresponding VLAN interface.

Modes

Privileged EXEC mode

Examples

This example shows information for the configured bandwidth on a VE interface. In this example the configured interface bandwidth value is 2000 kilobits.

```
device#show interfaces ve 100
Ve100 is up, line protocol is up
  Type is Vlan (Vlan Id: 100)
  Hardware is Virtual Ethernet, address is 748e.f82a.cf00 (bia 748e.f82a.cf00)
  No port name
  Vlan id: 100
  Interface bandwidth is 2000 kbps
  ipv6 address 190::1/64
```

History

Release version	Command history
8.0.30	This command was modified to include configured bandwidth status.

show ip

Displays global IP configuration information.

Syntax

show ip

Modes

User EXEC mode

Usage Guidelines

This command has additional options, which are explained in separate command pages.

Examples

The following is sample output from the **show ip** command.

```
device(config)# show ip
Global Settings
  ttl: 64, arp-age: 10, bootp-relay-max-hops: 4
  router-id : 0.0.0.0
  enabled : BGP4  UDP-Broadcast-Forwarding  Source-Route  Load-Sharing  RARP  VRRP-Extended  VSRP
  disabled: Route-Only  Directed-Broadcast-Forwarding  IRDP  Proxy-ARP  RIP  OSPF  VRRP  ICMP-Redirect
```

show ip access-lists

Displays IPv4 access list information.

Syntax

show ip access-list [*acl-num* | *acl-name*]

show ip access-lists [*acl-num* | *acl-name*]

Parameters

acl-num

Displays the information for the ACL with the specified ACL number.

acl-name

Displays information for the ACL with the specified name.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Access list configuration mode

Usage Guidelines

From FastIron 8.0.50, sequence numbers are automatically added to existing ACL rules, as follows:

- The first rule within each ACL is numbered 10.
- The sequence number for each succeeding rule is incremented by 10.

Examples

The following example displays sample output of the **show ip access-lists** command.

```
device(config-ext-nacl)# show ip access-lists 111
Extended IP access list 111: 4 entries
10: permit ip host 1.1.1.111 host 2.2.2.111
20: permit ospf any any
30: permit pim any any
40: deny ip 20.20.20.96 0.0.0.15 any
```

History

Release version	Command history
8.0.50	Sequence numbers are automatically added to existing rules.

show ip bgp

Displays entries in the IPv4 Border Gateway Protocol (BGP4) routing table.

Syntax

show ip bgp

show ip bgp *ip-addr* [/*prefix*]

show ip bgp *ip-addr* [/*prefix*] **longer-prefixes**

Parameters

ip-addr/prefix

Specifies the IPv4 address and optional prefix.

longer-prefixes

Filters on prefixes equal to or greater than that specified by *prefix*.

Modes

User EXEC mode

Examples

The following example displays sample output from the **show ip bgp** command.

```
device> show ip bgp
Total number of BGP Routes: 1
Status codes: s suppressed, d damped, h history, * valid, > best, i internal, S stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network      Next Hop      Metric  LocPrf  Weight  Path
*> 10.1.1.0/24   192.168.1.5    1       100     0       90000 100 200 65535
65536 65537 65538 65539 75000
```

The following example displays sample output from the **show ip bgp** command when an IP address is specified.

```
device> show ip bgp 10.3.4.0

Number of BGP Routes matching display condition : 1
Status codes: s suppressed, d damped, h history, * valid, > best, i internal
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network      Next Hop      Metric  LocPrf  Weight  Path
*> 10.3.4.0/24   192.168.4.106  100     0       65001 4355 1 1221 ?
   Last update to IP routing table: 0h11m38s, 1 path(s) installed:
     Gateway      Port
     192.168.2.1   1/2/1
   Route is advertised to 1 peers:
     10.20.20.2 (65300)
```

show ip bgp attribute-entries

Displays BGP4 route-attribute entries that are stored in device memory.

Syntax

show ip bgp attribute-entries

Modes

User EXEC mode

Usage Guidelines

The route-attribute entries table lists the sets of BGP4 attributes that are stored in device memory. Each set of attributes is unique and can be associated with one or more routes. In fact, the device typically has fewer attribute entries than routes. Use this command to view BGP4 route-attribute entries that are stored in device memory.

Command Output

The **show ip bgp attribute-entries** command displays the following information:

Output field	Description
Total number of BGP4 Attribute Entries	The number of routes contained in this BGP4 route table.
Next Hop	The IP address of the next-hop device for routes that have this set of attributes.
Metric	The cost of the routes that have this set of attributes.
Origin	<p>The source of the route information. The origin can be one of the following:</p> <ul style="list-style-type: none"> EGP - The routes with these attributes came to BGP4 through EGP. IGP - The routes with these attributes came to BGP4 through IGP. INCOMPLETE - The routes came from an origin other than one of the above. For example, they may have been redistributed from OSPF or RIP. <p>When BGP4 compares multiple routes to a destination to select the best route, IGP is preferred over EGP and both are preferred over INCOMPLETE.</p>
Originator	The originator of the route in a route reflector environment.
Cluster List	The route-reflector clusters through which this set of attributes has passed.
Aggregator	<p>Aggregator information:</p> <ul style="list-style-type: none"> AS Number shows the AS in which the network information in the attribute set was aggregated. This value applies only to aggregated routes and is otherwise 0. Router-ID shows the device that originated this aggregator.

Show Commands

show ip bgp attribute-entries

Output field	Description
Atomic	Whether the network information in this set of attributes has been aggregated <i>and</i> this aggregation has resulted in information loss. <ul style="list-style-type: none">• TRUE - Indicates information loss has occurred• FALSE - Indicates no information loss has occurred NOTE Information loss under these circumstances is a normal part of BGP4 and does not indicate an error.
Local Pref	The degree of preference for routes that use these attributes relative to other routes in the local AS.
Communities	The communities to which routes with these attributes belong.
AS Path	The autonomous systems through which routes with these attributes have passed. The local AS is shown in parentheses.

Examples

The following example show sample output for the **show ip bgp attribute-entries** command.

```
device> show ip bgp attribute-entries

```

show ip bgp config

Displays active BGP4 configuration information.

Syntax

show ip bgp config

Modes

User EXEC mode

Examples

The following example displays sample output from the **show ip bgp config** command.

```
device> show ip bgp config

router bgp
  local-as 200
  neighbor 10.102.1.1 remote-as 200
  neighbor 10.102.1.1 ebgp-multihop
  neighbor 10.102.1.1 update-source loopback 1
  neighbor 192.168.2.1 remote-as 100
  neighbor 10.200.2.2 remote-as 400
  neighbor 2001:db8::1:1 remote-as 200
  neighbor 2001:db8::1:2 remote-as 400
  neighbor 2001:db8::1 remote-as 300

  address-family ipv4 unicast

    no neighbor 2001:db8::1:2 activate
    no neighbor 2001:db8::1 activate
  exit-address-family

  address-family ipv6 unicast
    redistribute static
    neighbor 2001:db8::1:1 activate
    neighbor 2001:db8::1:2 activate
    neighbor 2001:db8::1 activate
  exit-address-family
end of BGP configuration
```

Show Commands

show ip bgp dampened-paths

show ip bgp dampened-paths

Displays all BGP4 dampened routes.

Syntax

show ip bgp dampened-paths

Modes

User EXEC mode

show ip bgp filtered-routes

Displays BGP4 filtered routes that are received from a neighbor or peer group.

Syntax

```
show ip bgp filtered-routes [ detail ] [ ip-addr { / mask } [ longer-prefixes ] | as-path-access-list name | prefix-list name ]
```

Parameters

detail

Displays detailed route information.

ip-addr

Specifies the IPv4 address of the destination network in dotted-decimal notation.

mask

Specifies the IPv4 mask of the destination network in CIDR notation.

longer-prefixes

Specifies all statistics for routes that match the specified route, or that have a longer prefix than the specified route.

as-path-access-list name

Specifies an AS-path ACL. The name must be between 1 and 32 ASCII characters in length.

prefix-list name

Specifies an IP prefix list. The name must be between 1 and 32 ASCII characters in length.

name

Specifies the name of an AS-path ACL or prefix list.

Modes

User EXEC mode

Examples

The following example displays BGP4 filtered routes.

```
device> show ip bgp filtered-routes
Searching for matching routes, use ^C to quit...
Status A:AGGREGATE B:BEST b:NOT-INSTALLED-BEST C:CONFED_EBGP D:DAMPED

  AS_PATH: 65001 4355 701 80
2 10.4.0.0/8       192.168.4.106           100           0           EF
  AS_PATH: 65001 4355 1
3 10.60.212.0/22   192.168.4.106           100           0           EF
  AS_PATH: 65001 4355 701 1 189
```

show ip bgp flap-statistics

Displays BGP4 route-dampening statistics for all dampened routes with a variety of options.

Syntax

```
show ip bgp flap-statistics
show ip bgp flap-statistics ip-addr { / mask } [ longer-prefix ]
show ip bgp flap-statistics as-path-filter name
show ip bgp flap-statistics neighbor ip-addr
show ip bgp flap-statistics regular-expression name
```

Parameters

ip-addr
IPv4 address of a specified route in dotted-decimal notation.

mask
IPv4 mask of a specified route in CIDR notation.

longer-prefixes
Displays statistics for routes that match the specified route or have a longer prefix than the specified route.

as-path-filter *name*
Specifies an AS-path filter.

neighbor
Displays flap statistics only for routes learned from the specified neighbor.

ip-addr
IPv4 address of the neighbor.

regular-expression
Specifies a regular expression in the display output on which to filter.

name
Name of an AS-path filter or regular expression.

Modes

User EXEC mode

Command Output

The **show ip bgp flap-statistics** command displays the following information:

Output field	Description
Total number of flapping routes	The total number of routes in the BGP4 route table that have changed state and have been marked as flapping routes.

Output field	Description
Status code	Indicates the dampening status of the route, which can be one of the following: <ul style="list-style-type: none"> > - This is the best route among those in the BGP4 route table to the route destination. d - This route is currently dampened, and unusable. h - The route has a history of flapping and is unreachable now. * - The route has a history of flapping but is currently usable.
Network	The destination network of the route.
From	The neighbor that sent the route to the device.
Flaps	The number of flaps the route has experienced.
Since	The amount of time since the first flap of this route.
Reuse	The amount of time remaining until this route will be un-suppressed and can be used again.
Path	Shows the AS-path information for the route.

Examples

The following example displays route dampening statistics.

```
device> show ip bgp flap-statistics
Total number of flapping routes: 414
  Status Code  >:best d:damped h:history *:valid
  Network      From      Flaps  Since  Reuse  Path
h> 10.50.206.0/23 10.90.213.77 1    0 :0 :13 0 :0 :0 65001 4355 1 701
h> 10.255.192.0/20 10.90.213.77 1    0 :0 :13 0 :0 :0 65001 4355 1 7018
h> 10.252.165.0/24 10.90.213.77 1    0 :0 :13 0 :0 :0 65001 4355 1 7018
h> 10.50.208.0/23 10.90.213.77 1    0 :0 :13 0 :0 :0 65001 4355 1 701
h> 10.33.0.0/16 10.90.213.77 1    0 :0 :13 0 :0 :0 65001 4355 1 701
*> 10.17.220.0/24 10.90.213.77 1    0 :1 :4 0 :0 :0 65001 4355 701 62
```

show ip bgp ipv6

Displays IPv6 unicast information.

Syntax

```
show ip bgp ipv6 neighbors
show ip bgp ipv6 neighbors ip-addr advertised-routes [ detail ] [ ipv6 address /mask ]
show ip bgp ipv6 neighbors ip-addr flap-statistics
show ip bgp ipv6 neighbors ip-addr last-packet-with-error [ decode ]
show ip bgp ipv6 neighbors ip-addr received [ prefix-filter ]
show ip bgp ipv6 neighbors ip-addr received-routes [ detail ]
show ip bgp ipv6 neighbors ip-addr rib-out-routes [ detail ] [ ipv6 address /mask ]
show ip bgp ipv6 neighbors ip-addr routes
show ip bgp ipv6 neighbors ip-addr routes { best | not-installed-best | unreachable }
show ip bgp ipv6 neighbors ip-addr routes detail { best | not-installed-best | unreachable }
show ip bgp ipv6 neighbors ip-addr routes-summary
show ip bgp ipv6 neighbors last-packet-with-error
show ip bgp ipv6 neighbors routes-summary
show ip bgp ipv6 summary
```

Parameters

neighbors

Specifies a neighbor.

ip-addr

IPv4 address of a neighbor in dotted-decimal notation.

advertised-routes

Specifies the routes that the device has advertised to the neighbor during the current BGP4 session.

detail

Specifies detailed information.

ipv6 address /mask

Specifies an IPv6 address and mask.

flap-statistics

Specifies the route flap statistics for routes received from or sent to a BGP4 neighbor.

last-packet-with-error

Specifies the last packet with an error.

decode

Decodes the last packet that contained an error from any of a device's neighbors.

received

Specifies Outbound Route Filters (ORFs) received from BGP4 neighbors of the device.

prefix-filter

Displays the results for ORFs that are prefix-based.

received-routes

Specifies all route information received in route updates from BGP4 neighbors of the device since the soft-reconfiguration feature was enabled.

rib-out-routes

Displays information about the current BGP4 Routing Information Base (Adj-RIB-Out) for specific neighbors and specific destination networks.

routes

Displays a variety of route information received in UPDATE messages from BGP4 neighbors.

best

Displays routes received from the neighbor that are the best BGP4 routes to their destination.

not-installed-best

Displays routes received from the neighbor that are the best BGP4 routes to their destination but were not installed in the route table because the device received better routes from other sources.

unreachable

Displays routes that are unreachable because the device does not have a valid RIP, OSPF, or static route to the next hop.

routes-summary

Displays all route information received in UPDATE messages from BGP4 neighbors.

summary

Displays summarized IPv6 unicast information.

Modes

User EXEC mode

Examples

The following example displays summarized IPv6 unicast information.

```
device> show ip bgp ipv6 summary
BGP4 Summary
Router ID: 10.1.1.1 Local AS Number: 1
Confederation Identifier: not configured
Confederation Peers:
Maximum Number of IP ECMP Paths Supported for Load Sharing: 1
Number of Neighbors Configured: 1, UP: 1
Number of Routes Installed: 1, Uses 86 bytes
Number of Routes Advertising to All Neighbors: 0 (0 entries)
Number of Attribute Entries Installed: 1, Uses 90 bytes
Neighbor Address AS# State Time Rt:Accepted Filtered Sent ToSend
192.168.1.2 2 ESTAB 0h 1m51s 1 0 0 0
```

Show Commands

show ip bgp ipv6

The following example displays IPv6 unicast device information with respect to IPv4 neighbors.

```
device(config-bgp)# show ip bgp ipv6 neighbors
Total number of BGP Neighbors: 1
1 IP Address: 192.168.1.2, AS: 2 (EBGP), RouterID: 10.1.1.2, VRF: default-vrf
State: ESTABLISHED, Time: 0h8m33s, KeepAliveTime: 60, HoldTime: 180
KeepAliveTimer Expire in 17 seconds, HoldTimer Expire in 135 seconds
UpdateSource: Loopback 1
RefreshCapability: Received
.....
Neighbor NLRI Negotiation:
Peer Negotiated IPV6 unicast capability
Peer configured for IPV6 unicast Routes
Neighbor AS4 Capability Negotiation:
TCP Connection state: ESTABLISHED, flags:00000033 (0,0)
```

show ip bgp neighbors

Displays configuration information and statistics for BGP4 neighbors of the device.

Syntax

```
show ip bgp neighbors [ ip-addr ]
show ip bgp neighbors last-packet-with-error
show ip bgp neighbors routes-summary
```

Parameters

ip-addr

Specifies the IPv4 address of a neighbor in dotted-decimal notation.

last-packet-with-error

Displays the last packet with an error.

routes-summary

Displays routes received, routes accepted, number of routes advertised by peer, and so on.

Modes

User EXEC mode

Usage Guidelines

Output shows all configured parameters for the neighbors. Only the parameters whose values differ from defaults are shown.

Command Output

The **show ip bgp neighbors** command displays the following information:

Output field	Description
Total Number of BGP4 Neighbors	The number of BGP4 neighbors configured.
IP Address	The IP address of the neighbor.
AS	The AS the neighbor is in.
EBGP or IBGP	Whether the neighbor session is an IBGP session, an EBGP session, or a confederation EBGP session: <ul style="list-style-type: none"> EBGP - The neighbor is in another AS. EBGP_Confed - The neighbor is a member of another sub-AS in the same confederation. IBGP - The neighbor is in the same AS.
RouterID	The neighbor device ID.
Description	The description you gave the neighbor when you configured it on the device.

Show Commands

show ip bgp neighbors

Output field	Description
Local AS	The value (if any) of the Local AS configured.
State	<p>The state of the session with the neighbor. The states are from the device perspective, not the neighbor perspective. The state values are based on the BGP4 state machine values described in RFC 1771 and can be one of the following for each device:</p> <ul style="list-style-type: none"> • IDLE - The BGP4 process is waiting to be started. Usually, enabling BGP4 or establishing a neighbor session starts the BGP4 process. A minus sign (-) indicates that the session has gone down and the software is clearing or removing routes. • ADMND - The neighbor has been administratively shut down. A minus sign (-) indicates that the session has gone down and the software is clearing or removing routes. • CONNECT - BGP4 is waiting for the connection process for the TCP neighbor session to be completed. • ACTIVE - BGP4 is waiting for a TCP connection from the neighbor. <p>NOTE If the state frequently changes between CONNECT and ACTIVE, there may be a problem with the TCP connection.</p> <ul style="list-style-type: none"> • OPEN SENT - BGP4 is waiting for an Open message from the neighbor. • OPEN CONFIRM - BGP4 has received an OPEN message from the neighbor and is now waiting for either a KEEPALIVE or NOTIFICATION message. If the device receives a KEEPALIVE message from the neighbor, the state changes to Established. If the message is a NOTIFICATION, the state changes to Idle. • ESTABLISHED - BGP4 is ready to exchange UPDATE messages with the neighbor. <p>If there is more BGP4 data in the TCP receiver queue, a plus sign (+) is also displayed.</p> <p>NOTE If you display information for the neighbor using the show ip bgp neighbor ip-addr command, the TCP receiver queue value will be greater than 0.</p>
Time	The amount of time this session has been in the current state.
KeepAliveTime	The keep alive time, which specifies how often this device sends keepalive messages to the neighbor.
HoldTime	The hold time, which specifies how many seconds the device will wait for a keepalive or update message from a BGP4 neighbor before deciding that the neighbor is not operational.
PeerGroup	The name of the peer group the neighbor is in, if applicable.
Multihop-EBGP	Whether this option is enabled for the neighbor.
RouteReflectorClient	Whether this option is enabled for the neighbor.
SendCommunity	Whether this option is enabled for the neighbor.
NextHopSelf	Whether this option is enabled for the neighbor.
DefaultOriginate	Whether this option is enabled for the neighbor.

Output field	Description
MaximumPrefixLimit	Maximum number of prefixes the device will accept from this neighbor.
RemovePrivateAs	Whether this option is enabled for the neighbor.
RefreshCapability	Whether this device has received confirmation from the neighbor that the neighbor supports the dynamic refresh capability.
CooperativeFilteringCapability	Whether the neighbor is enabled for cooperative route filtering.
Distribute-list	Lists the distribute list parameters, if configured.
Filter-list	Lists the filter list parameters, if configured.
Prefix-list	Lists the prefix list parameters, if configured.
Route-map	Lists the route map parameters, if configured.
Messages Sent	The number of messages this device has sent to the neighbor. The display shows statistics for the following message types: <ul style="list-style-type: none"> • Open • Update • KeepAlive • Notification • Refresh-Req
Messages Received	The number of messages this device has received from the neighbor. The message types are the same as for the Message Sent field.
Last Update Time	Lists the last time updates were sent and received for the following: <ul style="list-style-type: none"> • NLRIs • Withdraws

Show Commands

show ip bgp neighbors

Output field	Description
Last Connection Reset Reason	<p>The reason the previous session with this neighbor ended. The reason can be one of the following:</p> <p>Reasons described in the BGP4 specifications:</p> <ul style="list-style-type: none">• Message Header Error• Connection Not Synchronized• Bad Message Length• Bad Message Type• OPEN Message Error• Unsupported Version Number• Bad Peer AS Number• Bad BGP4 Identifier• Unsupported Optional Parameter• Authentication Failure• Unacceptable Hold Time• Unsupported Capability• UPDATE Message Error• Malformed Attribute List• Unrecognized Well-known Attribute• Missing Well-known Attribute• Attribute Flags Error• Attribute Length Error• Invalid ORIGIN Attribute• Invalid NEXT_HOP Attribute• Optional Attribute Error• Invalid Network Field• Malformed AS_PATH• Hold Timer Expired• Finite State Machine Error• Rcv Notification
Last Connection Reset Reason (cont.)	<p>Reasons specific to the Ruckus implementation:</p> <ul style="list-style-type: none">• Reset All Peer Sessions• User Reset Peer Session• Port State Down• Peer Removed• Peer Shutdown• Peer AS Number Change• Peer AS Confederation Change• TCP Connection KeepAlive Timeout• TCP Connection Closed by Remote• TCP Data Stream Error Detected

Output field	Description
Notification Sent	<p>If the device receives a NOTIFICATION message from the neighbor, the message contains an error code corresponding to one of the following errors. Some errors have subcodes that clarify the reason for the error. Where applicable, the subcode messages are listed underneath the error code messages.</p> <ul style="list-style-type: none"> • Message Header Error: <ul style="list-style-type: none"> - Connection Not Synchronized - Bad Message Length - Bad Message Type - Unspecified • Open Message Error: <ul style="list-style-type: none"> - Unsupported Version - Bad Peer As - Bad BGP4 Identifier - Unsupported Optional Parameter - Authentication Failure - Unacceptable Hold Time - Unspecified • Update Message Error: <ul style="list-style-type: none"> - Malformed Attribute List - Unrecognized Attribute - Missing Attribute - Attribute Flag Error - Attribute Length Error - Invalid Origin Attribute - Invalid NextHop Attribute - Optional Attribute Error - Invalid Network Field - Malformed AS Path - Unspecified • Hold Timer Expired • Finite State Machine Error • Cease • Unspecified
Notification Received	Refer to details for the field Notification Sent.

Show Commands

show ip bgp neighbors

Output field	Description
TCP Connection state	<p>The state of the connection with the neighbor. The connection can have one of the following states:</p> <ul style="list-style-type: none">• LISTEN - Waiting for a connection request.• SYN-SENT - Waiting for a matching connection request after having sent a connection request.• SYN-RECEIVED - Waiting for a confirming connection request acknowledgment after having both received and sent a connection request.• ESTABLISHED - Data can be sent and received over the connection. This is the normal operational state of the connection.• FIN-WAIT-1 - Waiting for a connection termination request from the remote TCP, or an acknowledgment of the connection termination request previously sent.• FIN-WAIT-2 - Waiting for a connection termination request from the remote TCP.• CLOSE-WAIT - Waiting for a connection termination request from the local user.• CLOSING - Waiting for a connection termination request acknowledgment from the remote TCP.• LAST-ACK - Waiting for an acknowledgment of the connection termination request previously sent to the remote TCP (which includes an acknowledgment of its connection termination request).• TIME-WAIT - Waiting for enough time to pass to be sure the remote TCP received the acknowledgment of its connection termination request.• CLOSED - There is no connection state.
Byte Sent	The number of bytes sent.
Byte Received	The number of bytes received.
Local host	The IP address of the device.
Local port	The TCP port the device is using for the BGP4 TCP session with the neighbor.
Remote host	The IP address of the neighbor.
Remote port	The TCP port the neighbor is using for the BGP4 TCP session with the device.
ISentSeq	The initial send sequence number for the session.
SendNext	The next sequence number to be sent.
TotUnAck	The number of sequence numbers sent by the device that have not been acknowledged by the neighbor.
TotSent	The number of sequence numbers sent to the neighbor.
ReTrans	The number of sequence numbers that the device retransmitted because they were not acknowledged.
UnAckSeq	The current acknowledged sequence number.
IRcvSeq	The initial receive sequence number for the session.
RcvNext	The next sequence number expected from the neighbor.
SendWnd	The size of the send window.
TotalRcv	The number of sequence numbers received from the neighbor.
DupliRcv	The number of duplicate sequence numbers received from the neighbor.

Output field	Description
RcvWnd	The size of the receive window.
SendQue	The number of sequence numbers in the send queue.
RcvQue	The number of sequence numbers in the receive queue.
CngstWnd	The number of times the window has changed.

Examples

The following example shows sample output from the show ip bgp neighbors command.

```
device> show ip bgp neighbors

```

show ip bgp neighbors advertised-routes

Displays the routes that the device has advertised to the neighbor during the current BGP4 session.

Syntax

```
show ip bgp neighbors ip-addr advertised-routes [ detail | / mask-bits ]
```

Parameters

ip-addr

Specifies the IPv4 address of a neighbor in dotted-decimal notation.

detail

Specifies detailed information.

mask-bits

Specifies the number of mask bits in CIDR notation.

Modes

User EXEC mode

Examples

The following example displays the routes the device has advertised to a specified neighbor.

```
device> show ip bgp neighbors 192.168.4.211 advertised-routes

      There are 2 routes advertised to neighbor 192.168.4.211
Status A:AGGREGATE B:BEST b:NOT-INSTALLED-BEST C:CONFED EBGP D:DAMPED
      E:EBGP H:HISTORY I:IBGP L:LOCAL M:MULTIPATH m:NOT-INSTALLED-MULTIPATH
      S:SUPPRESSED F:FILTERED s:STALE
      Network      Next Hop      Metric    LocPrf    Weight    Status
  1      10.102.0.0/24  192.168.2.102  12
  2      10.200.1.0/24  192.168.2.102   0          32768    BL
```

show ip bgp neighbors flap-statistics

Displays the route flap statistics for routes received from or sent to a BGP4 neighbor.

Syntax

```
show ip bgp neighbors ip-addr flap-statistics
```

Parameters

ip-addr

IPv4 address of a neighbor in dotted-decimal notation.

Modes

User EXEC mode

Show Commands

show ip bgp neighbors last-packet-with-error

show ip bgp neighbors last-packet-with-error

Displays the last packets with an error from BGP4 neighbors of the device.

Syntax

```
show ip bgp neighbors ip-addr last-packet-with-error [ decode ]
```

Parameters

ip-addr

IPv4 address of a neighbor in dotted-decimal notation.

decode

Decodes the last packet that contained an error from any of a device's neighbors.

Modes

User EXEC mode

show ip bgp neighbors received

Displays Outbound Route Filters (ORFs) received from BGP4 neighbors of the device.

Syntax

```
show ip bgp neighbors ip-addr received { extended-community | prefix-filter }
```

Parameters

ip-addr

Specifies the IPv4 address of a neighbor in dotted-decimal notation.

extended-community

Displays the results for ORFs that use the BGP Extended Community Attribute.

prefix-filter

Displays the results for ORFs that are prefix-based.

Modes

User EXEC mode

Examples

The following example displays sample output for the **show ip bgp neighbors received** command when the **prefix-filter** keyword is used.

```
device> show ip bgp neighbor 10.10.10.1 received prefix-filter

ip prefix-list 10.10.10.1: 4 entries
  seq 5 permit 10.10.0.0/16 ge 18 le 28
  seq 10 permit 10.20.10.0/24
  seq 15 permit 10.0.0.0/8 le 32
  seq 20 permit 10.10.0.0/16 ge 18
```

Show Commands

show ip bgp neighbors received-routes

show ip bgp neighbors received-routes

Lists all route information received in route updates from BGP4 neighbors of the device since the soft-reconfiguration feature was enabled.

Syntax

```
show ip bgp neighbors ip-addr received-routes [ detail ]
```

Parameters

ip-addr

Specifies the IPv4 address of a neighbor in dotted-decimal notation.

detail

Displays detailed route information.

Modes

User EXEC mode

Examples

The following example displays the details of route updates.

```
device> show ip bgp neighbor 10.168.4.106 received-routes

      There are 97345 received routes from neighbor 10.168.4.106
Searching for matching routes, use ^C to quit...

```

show ip bgp neighbors rib-out-routes

Displays information about the current BGP4 Routing Information Base (Adj-RIB-Out) for specific neighbors and specific destination networks.

Syntax

```
show ip bgp neighbors ip-addr rib-out-routes [ detail ] [ip-addr [ / mask ]]
```

Parameters

ip-addr

Specifies the IPv4 address of a neighbor in dotted-decimal notation.

last-packet-with-error

Displays the last packet with an error.

routes-summary

Displays routes received, routes accepted, number of routes advertised by peer, and so on.

Modes

User EXEC mode

Examples

The following example shows information about the routes that the device either has most recently sent, or is about to send, to a specified neighbor and a specified destination network

```
device> show ip bgp neighbor 192.168.4.211 rib-out-routes 192.168.1.0/24

Status A:AGGREGATE B:BEST b:NOT-INSTALLED-BEST C:CONFED_EBGP D:DAMPED

```

show ip bgp neighbors routes

Lists a variety of route information received in UPDATE messages from BGP4 neighbors.

Syntax

show ip bgp neighbors *ip-addr* routes

show ip bgp neighbors *ip-addr* routes { **best** | **not-installed-best** | **unreachable** }

show ip bgp neighbors *ip-addr* routes detail { **best** | **not-installed-best** | **unreachable** }

Parameters

ip-addr

IPv4 address of a neighbor in dotted-decimal notation.

best

Displays routes received from the neighbor that are the best BGP4 routes to their destination.

not-installed-best

Displays routes received from the neighbor that are the best BGP4 routes to their destination but were not installed in the route table because the device received better routes from other sources.

unreachable

Displays routes that are unreachable because the device does not have a valid RIP, OSPF, or static route to the next hop.

Modes

User EXEC mode

Examples

The following example shows sample output for the **show ip bgp neighbors routes** command.

```
device> show ip bgp neighbors 192.168.4.106 routes

      There are 97345 received routes from neighbor 192.168.4.106

...

```

show ip bgp neighbors routes-summary

Lists all route information received in UPDATE messages from BGP4 neighbors.

Syntax

show ip bgp neighbors *ip-addr* routes-summary

Parameters

ip-addr

IPv4 address of a neighbor in dotted-decimal notation.

Modes

User EXEC mode

Command Output

The **show ip bgp neighbors routes-summary** command displays the following information:

Output field	Description
IP Address	The IP address of the neighbor.
Routes Received	How many routes the device has received from the neighbor during the current BGP4 session: <ul style="list-style-type: none"> Accepted or Installed - Number of received routes the device accepted and installed in the BGP4 route table. Filtered or Kept - Number of routes that were filtered out, but were retained in memory for use by the soft reconfiguration feature. Filtered - Number of received routes filtered out.
Routes Selected as BEST Routes	The number of routes that the device selected as the best routes to their destinations.
BEST Routes not Installed in IP Forwarding Table	The number of routes received from the neighbor that are the best BGP4 routes to their destinations, but were not installed in the IP route table because the device received better routes from other sources (such as OSPF, RIP, or static IP routes).
Unreachable Routes	The number of routes received from the neighbor that are unreachable because the device does not have a valid RIP, OSPF, or static route to the next-hop.
History Routes	The number of routes that are down but are being retained for route flap dampening purposes.
NLRIs Received in Update Message	The number of routes received in Network Layer Reachability (NLRI) format in UPDATE messages: <ul style="list-style-type: none"> Withdraws - Number of withdrawn routes the device has received. Replacements - Number of replacement routes the device has received.

Show Commands

show ip bgp neighbors routes-summary

Output field	Description
NLRIs Discarded due to	<p>Indicates the number of times the device discarded an NLRI for the neighbor due to the following reasons:</p> <ul style="list-style-type: none">• Maximum Prefix Limit - The configured maximum prefix amount had been reached.• AS Loop - An AS loop occurred. An AS loop occurs when the BGP4 AS-path attribute contains the local AS number.• maxas-limit aspath - The number of route entries discarded because the AS path exceeded the configured maximum length or exceeded the internal memory limits.• Invalid Nexthop - The next-hop value was not acceptable.• Duplicated Originator_ID - The originator ID was the same as the local device ID.• Cluster_ID - The cluster list contained the local cluster ID, or the local device ID if the cluster ID is not configured.
Routes Advertised	<p>The number of routes the device has advertised to this neighbor:</p> <ul style="list-style-type: none">• To be Sent - The number of routes queued to send to this neighbor.• To be Withdrawn - The number of NLRIs for withdrawing routes the device has queued to send to this neighbor in UPDATE messages.
NLRIs Sent in Update Message	<p>The number of NLRIs for new routes the device has sent to this neighbor in UPDATE messages:</p> <ul style="list-style-type: none">• Withdraws - Number of routes the device has sent to the neighbor to withdraw.• Replacements - Number of routes the device has sent to the neighbor to replace routes the neighbor already has.
Peer Out of Memory Count for	<p>Statistics for the times the device has run out of BGP4 memory for the neighbor during the current BGP4 session:</p> <ul style="list-style-type: none">• Receiving Update Messages - The number of times UPDATE messages were discarded because there was no memory for attribute entries.• Accepting Routes (NLRI) - The number of NLRIs discarded because there was no memory for NLRI entries. This count is not included in the Receiving Update Messages count.• Attributes - The number of times there was no memory for BGP4 attribute entries.• Outbound Routes (RIB-out) - The number of times there was no memory to place a "best" route into the neighbor route information base (Adj-RIB-Out) for routes to be advertised.

Examples

The following example displays route summary information received in UPDATE messages.

```
device> show ip bgp neighbor 10.168.4.211 routes-summary

1  IP Address: 10.168.4.211
Routes Accepted/Installed:1, Filtered/Kept:11, Filtered:11
  Routes Selected as BEST Routes:1
    BEST Routes not Installed in IP Forwarding Table:0
  Unreachable Routes (no IGP Route for NEXTHOP):0
  History Routes:0

NLRIs Received in Update Message:24, Withdraws:0 (0), Replacements:1
  NLRIs Discarded due to
    Maximum Prefix Limit:0, AS Loop:0
    Invalid Nexthop:0, Invalid Nexthop Address:0.0.0.0
    Duplicated Originator_ID:0, Cluster_ID:0

Routes Advertised:0, To be Sent:0, To be Withdrawn:0
NLRIs Sent in Update Message:0, Withdraws:0, Replacements:0

Peer Out of Memory Count for:
  Receiving Update Messages:0, Accepting Routes (NLRI):0
  Attributes:0, Outbound Routes (RIB-out):0
```

Show Commands
show ip bgp peer-group

show ip bgp peer-group

Displays peer-group information.

Syntax

show ip bgp peer-group *peer-group-name*

Parameters

peer-group-name
Specifies a peer group name.

Modes

User EXEC mode

Usage Guidelines

Only the parameters that have values different from their defaults are listed.

Examples

The following example shows sample output from the **show ip bgp peer-group** command.

```
device> show ip bgp peer-group pg1
1  BGP peer-group is pg
   Description: peer group abc
   SendCommunity: yes
   NextHopSelf: yes
   DefaultOriginate: yes
Members:
  IP Address: 10.168.10.10, AS: 65111
```

show ip bgp routes

Displays statistics for the routes in the BGP4 route table of a device.

Syntax

```
show ip bgp routes [ detail ] [ num | ip-address/prefix | age num | as-path-access-list name | as-path-filter number |
best | cidr-only | community-access-list name | community-filter number | community-reg-expression
expression | local | neighbor ip-addr | nexthop ip-addr | no-best | not-installed-best | prefix-list string |
regular-expression name | route-map name | summary | unreachable ]
```

Parameters

detail

Displays detailed information.

num

Table entry at which the display starts. For example, if you want to list entries beginning with table entry 100, specify 100.

ip-address/prefix

Specifies an IP address and prefix.

age num

Displays BGP4 route information that is filtered by age.

as-path-access-list name

Displays BGP4 route information that is filtered by autonomous system (AS)-path access control list (ACL).

as-path-filter number

Displays BGP4 route information that is filtered using the specified AS-path filter.

best

Displays BGP4 route information that the device selected as best routes.

cidr-only

Displays BGP4 routes whose network masks do not match their class network length.

community-access-list name

Displays BGP4 route information for an AS-path community access list.

community-filter number

Displays BGP4 route information that matches a specific community filter.

community-reg-expression expression

Displays BGP4 route information for an ordered community list regular expression.

local

Displays BGP4 route information about selected local routes.

neighbor ip-addr

Displays BGP4 route information about selected BGP neighbors.

nexthop ip-addr

Displays BGP4 route information about routes that are received from the specified next hop.

no-best

Displays BGP4 route information that the device selected as not best routes.

not-installed-best

Displays BGP4 route information about best routes that are not installed.

prefix-list *string*

Displays BGP4 route information that is filtered by a prefix list.

regular-expression *name*

Displays BGP4 route information about routes that are associated with the specified regular expression.

route-map *name*

Displays BGP4 route information about routes that use the specified route map.

summary

Displays BGP4 summary route information.

unreachable

Displays BGP4 route information about routes whose destinations are unreachable through any of the BGP4 paths in the BGP4 route table.

Modes

User EXEC mode

Command Output

The **show ip bgp routes** command displays the following information:

Output field	Description
Total number of BGP4 routes (NLRIs) installed	Number of BGP4 routes the device has installed in the BGP4 route table.
Distinct BGP4 destination networks	Number of destination networks the installed routes represent. The BGP4 route table can have multiple routes to the same network.
Filtered BGP4 routes for soft reconfig	Number of route updates received from soft-reconfigured neighbors or peer groups that have been filtered out but retained.
Routes originated by this device	Number of routes in the BGP4 route table that this device originated.
Routes selected as BEST routes	Number of routes in the BGP4 route table that this device has selected as the best routes to the destinations.
BEST routes not installed in IP forwarding table	Number of BGP4 routes that are the best BGP4 routes to their destinations but were not installed in the IP route table because the device received better routes from other sources (such as OSPF, RIP, or static IP routes).
Unreachable routes (no IGP route for NEXTHOP)	Number of routes in the BGP4 route table whose destinations are unreachable because the next-hop is unreachable.
IBGP routes selected as best routes	Number of "best" routes in the BGP4 route table that are IBGP routes.
EBGP routes selected as best routes	Number of "best" routes in the BGP4 route table that are EBGP routes.

Examples

The following example shows sample output from the **show ip bgp routes** command.

```
device> show ip bgp routes
Total number of BGP Routes: 97371
Status A:AGGREGATE B:BEST b:NOT-INSTALLED-BEST C:CONFED_EBGP D:DAMPED

```

show ip bgp routes community

Displays BGP4 route information that is filtered by community and other options.

Syntax

```
show ip bgp routes community { num | aa:nn | internet | local-as | no-advertise | no-export }
```

Parameters

community

Displays routes filtered by a variety of communities.

num

Specifies a community number in the range from 1 to 4294967200.

aa:nn

Specifies an autonomous system-community number.

internet

Displays routes for the Internet community.

local-as

Displays routes for a local sub-AS within the confederation.

no-advertise

Displays routes with this community that cannot be advertised to any other BGP4 devices at all.

no-export

Displays routes for the community of sub-ASs within a confederation.

Modes

User EXEC mode

show ip bgp summary

Displays summarized information about the status of all BGP connections.

Syntax

show ip bgp summary

Modes

User EXEC mode

Usage Guidelines

If a BGP4 peer is not configured for an address-family, the peer information is not displayed. If a BGP4 peer is configured for an address-family but not negotiated for an address-family after the BGP4 peer is in the established state, the **show ip bgp summary** command output shows (**NoNeg**) at the end of the line for this peer.

Command Output

The **show ip bgp summary** command displays the following information:

This field	Displays
Router ID	The device ID.
Local AS Number	The BGP4 AS number for the device.
Confederation Identifier	The AS number of the confederation in which the device resides.
Confederation Peers	The numbers of the local autonomous systems contained in the confederation. This list matches the confederation peer list you configure on the device.
Maximum Number of Paths Supported for Load Sharing	The maximum number of route paths across which the device can balance traffic to the same destination. The feature is enabled by default but the default number of paths is 1. You can increase the number from 2 through 8 paths.
Number of Neighbors Configured	The number of BGP4 neighbors configured on this device, and currently in established state.
Number of Routes Installed	The number of BGP4 routes in the device BGP4 route table and the route or path memory usage.
Number of Routes Advertising to All Neighbors	The total of the RtSent and RtToSend columns for all neighbors, the total number of unique ribout group entries, and the amount of memory used by these groups.
Number of Attribute Entries Installed	The number of BGP4 route-attribute entries in the device route-attributes table and the amount of memory used by these entries.
Neighbor Address	The IP addresses of the BGP4 neighbors for this device.
AS#	The AS number.

This field	Displays
State	<p>The state of device sessions with each neighbor. The states are from this perspective of the device, not the neighbor. State values are based on the BGP4 state machine values described in RFC 1771 and can be one of the following for each device:</p> <ul style="list-style-type: none"> • IDLE - The BGP4 process is waiting to be started. Usually, enabling BGP4 or establishing a neighbor session starts the BGP4 process. A minus sign (-) indicates that the session has gone down and the software is clearing or removing routes. • ADMND - The neighbor has been administratively shut down. • CONNECT - BGP4 is waiting for the connection process for the TCP neighbor session to be completed. • ACTIVE - BGP4 is waiting for a TCP connection from the neighbor. Note : If the state frequently changes between CONNECT and ACTIVE, there may be a problem with the TCP connection. • OPEN SENT - BGP4 is waiting for an Open message from the neighbor. • OPEN CONFIRM - BGP4 has received an Open message from the neighbor and is now waiting for either a KEEPALIVE or NOTIFICATION message. If the device receives a KEEPALIVE message from the neighbor, the state changes to Established. If the message is a NOTIFICATION, the state changes to Idle. • ESTABLISHED - BGP4 is ready to exchange UPDATE packets with the neighbor. <p>Operational States:</p> <p>Additional information regarding the operational states of BGP described above may be added as described in the following:</p> <ul style="list-style-type: none"> • (+) - is displayed if there is more BGP data in the TCP receiver queue. Note : If you display information for the neighbor using the show ip bgp neighbor ip-addr command, the TCP receiver queue value will be greater than 0. • (>) - indicates that there is more BGP data in the outgoing queue. • (-) - indicates that the session has gone down and the software is clearing or removing routes. • (*) - indicates that the inbound or outbound policy is being updated for the peer. • (c) - indicates that the table entry is clearing. • (p) - indicates that the neighbor ribout group membership change is pending or in progress • (s) - indicates that the peer has negotiated restart, and the session is in a stale state. • (r) - indicates that the peer is restarting the BGP4 connection, through restart. • (^) - on the standby MP indicates that the peer is in the ESTABLISHED state and has received restart capability (in the primary MP). • (<) - indicates that the device is waiting to receive the "End of RIB" message the peer.
Time	The time that has passed since the state last changed.

Show Commands

show ip bgp summary

This field	Displays
Accepted	The number of routes received from the neighbor that this device installed in the BGP4 route table. Usually, this number is lower than the RoutesRcvd number. The difference indicates that this device filtered out some of the routes received in the UPDATE messages.
Filtered	The routes or prefixes that have been filtered out: <ul style="list-style-type: none">• If soft reconfiguration is enabled, this field shows how many routes were filtered out (not placed in the BGP4 route table) but retained in memory.• If soft reconfiguration is not enabled, this field shows the number of BGP4 routes that have been filtered out.
Sent	The number of BGP4 routes the device has sent to the neighbor.
ToSend	The number of routes the device has queued to advertise and withdraw to a neighbor.

Examples

The following example displays sample output from the **show ip bgp summary** command.

```
device> show ip bgp summary
  BGP4 Summary
Router ID: 7.7.7.7   Local AS Number: 100
Confederation Identifier: not configured
Confederation Peers:
Maximum Number of IP ECMP Paths Supported for Load Sharing: 1
Number of Neighbors Configured: 1, UP: 1
Number of Routes Installed: 0
Number of Routes Advertising to All Neighbors: 0 (0 entries)
Number of Attribute Entries Installed: 0
'+': Data in InQueue '>': Data in OutQueue '-': Clearing
'*': Update Policy 'c': Group change 'p': Group change Pending
'r': Restarting 's': Stale '^': Up before Restart '<': EOR waiting
Neighbor Address  AS#      State   Time           Rt:Accepted  Filtered  Sent    ToSend
10.1.1.8         100     ESTAB   0h 9m16s      0             0         0       0
```

show ip bgp vrf

Displays entries in the IPv4 Border Gateway Protocol (BGP4) routing table for a virtual routing and forwarding (VRF) instance.

Syntax

```
show ip bgp vrf vrf-name
```

```
show ip bgp vrf vrf-name ipv6 address /mask [ longer-prefixes ]
```

```
show ip bgp vrf vrf-name ip address /mask [ longer-prefixes ]
```

```
show ip bgp vrf vrf-name attribute-entries
```

```
show ip bgp vrf vrf-name dampened-paths
```

```
show ip bgp vrf vrf-name filtered-routes [ detail ] [ ip-addr { / mask } [ longer-prefixes ] ] | as-path-access-list name ]  
| prefix-list name ]
```

```
show ip bgp vrf vrf-name flap-statistics
```

```
show ip bgp vrf vrf-name flap-statistics ip-addr { / mask } [ longer-prefix ]
```

```
show ip bgp vrf vrf-name flap-statistics as-path-filter name
```

```
show ip bgp vrf vrf-name flap-statistics neighbor ip-addr
```

```
show ip bgp vrf vrf-name flap-statistics regular-expression name
```

```
show ip bgp vrf vrf-name nexthop [ ip-addr | reachable | unreachable ]
```

```
show ip bgp vrf vrf-name peer-group peer-group-name
```

```
show ip bgp vrf vrf-name summary
```

Parameters

vrf-name

Specifies the name of a VRF instance.

ipv6 address /mask

Specifies an IPv6 address and mask.

longer-prefixes

Specifies all statistics for routes that match the specified route, or that have a longer prefix than the specified route.

ip address /mask

Specifies an IP address and mask.

attribute-entries

Specifies BGP4 route-attribute entries that are stored in device memory.

dampened-paths

Specifies multiprotocol BGP (MBGP) paths that have been dampened by route-flap dampening.

filtered-routes

Specifies BGP4 filtered routes that are received from a neighbor or peer group.

detail

Optionally displays detailed route information.

as-path-access-list *name*

Specifies an AS-path ACL. The name must be between 1 and 32 ASCII characters in length.

prefix-list *name*

Specifies an IP prefix list. The name must be between 1 and 32 ASCII characters in length.

flap-statistics

Specifies the route flap statistics for routes received from or sent to a BGP4 neighbor.

as-path-filter *name*

Specifies an AS-path filter.

neighbor

Displays flap statistics only for routes learned from the specified neighbor.

ip-addr

IPv4 address of the neighbor.

regular-expression

Specifies a regular expression in the display output on which to filter.

name

Name of an AS-path filter or regular expression.

nexthop

Specifies the configured next hop.

reachable

Specifies reachable next hops.

unreachable

Specifies unreachable next hops.

peer-group *peer-group-name*

Specifies a peer group.

summary

Displays summarized information.

Modes

User EXEC mode

show ip bgp vrf neighbors

Displays configuration information and statistics for BGP4 neighbors of the device for a virtual routing and forwarding (VRF) instance.

Syntax

```
show ip bgp vrf vrf-name neighbors [ ip-addr ]
show ip bgp vrf vrf-name neighbors last-packet-with-error
show ip bgp vrf vrf-name neighbors routes-summary
show ip bgp vrf vrf-name neighbors ip-addr advertised-routes [ detail ] [ ip address /mask ]
show ip bgp vrf vrf-name neighbors ip-addr flap-statistics
show ip bgp vrf vrf-name neighbors ip-addr last-packet-with-error [ decode ]
show ip bgp vrf vrf-name neighbors ip-addr received [ prefix-filter ]
show ip bgp vrf vrf-name neighbors ip-addr received-routes [ detail ]
show ip bgp vrf vrf-name neighbors ip-addr rib-out-routes [ detail ] [ ipv6 address /mask ]
show ip bgp vrf vrf-name neighbors ip-addr routes
show ip bgp vrf vrf-name neighbors ip-addr routes { best | not-installed-best | unreachable }
show ip bgp vrf vrf-name neighbors ip-addr routes detail { best | not-installed-best | unreachable }
show ip bgp vrf vrf-name neighbors ip-addr routes-summary
```

Parameters

vrf-name

Specifies the name of a VRF instance.

neighbors

Specifies a neighbor.

ip-addr

IPv4 address of a neighbor in dotted-decimal notation.

last-packet-with-error

Displays the last packet with an error.

routes-summary

Displays routes received, routes accepted, number of routes advertised by peer, and so on.

advertised-routes

Specifies the routes that the device has advertised to the neighbor during the current BGP4 session.

detail

Specifies detailed information.

ip address /mask

Specifies an IP address and mask.

Show Commands

show ip bgp vrf neighbors

flap-statistics

Specifies the route flap statistics for routes received from or sent to a BGP4 neighbor.

last-packet-with-error

Specifies the last packet with an error.

decode

Decodes the last packet that contained an error from any of a device's neighbors.

received

Specifies Outbound Route Filters (ORFs) received from BGP4 neighbors of the device.

prefix-filter

Displays the results for ORFs that are prefix-based.

received-routes

Specifies all route information received in route updates from BGP4 neighbors of the device since the soft-reconfiguration feature was enabled.

rib-out-routes

Displays information about the current BGP4 Routing Information Base (Adj-RIB-Out) for specific neighbors and specific destination networks.

routes

Displays a variety of route information received in UPDATE messages from BGP4 neighbors.

best

Displays routes received from the neighbor that are the best BGP4 routes to their destination.

not-installed-best

Displays routes received from the neighbor that are the best BGP4 routes to their destination but were not installed in the route table because the device received better routes from other sources.

unreachable

Displays routes that are unreachable because the device does not have a valid RIP, OSPF, or static route to the next hop.

routes-summary

Displays all route information received in UPDATE messages from BGP4 neighbors.

Modes

User EXEC mode

show ip bgp vrf routes

Displays statistics for the routes in the BGP4 route table of a device for a virtual routing and forwarding (VRF) instance.

Syntax

```
show ip bgp vrf vrf-name routes [ detail ] [ num | ip-address/prefix | age num | as-path-access-list name | as-path-filter number | best | cidr-only | community-access-list name | community-filter number | community-reg-expression expression | local | neighbor ip-addr | nexthop ip-addr | no-best | not-installed-best | prefix-list string | regular-expression name | route-map name | summary | unreachable ]
```

Parameters

vrf-name

Specifies the name of a VRF instance.

detail

Displays detailed information.

num

Table entry at which the display starts. For example, if you want to list entries beginning with table entry 100, specify 100.

ip-address/prefix

Specifies an IP address and prefix.

age *num*

Displays BGP4 route information that is filtered by age.

as-path-access-list *name*

Displays BGP4 route information that is filtered by autonomous system (AS)-path access control list (ACL).

as-path-filter *number*

Displays BGP4 route information that is filtered using the specified AS-path filter.

best

Displays BGP4 route information that the device selected as best routes.

cidr-only

Displays BGP4 routes whose network masks do not match their class network length.

community-access-list *name*

Displays BGP4 route information for an AS-path community access list.

community-filter *number*

Displays BGP4 route information that matches a specific community filter.

community-reg-expression *expression*

Displays BGP4 route information for an ordered community list regular expression.

local

Displays BGP4 route information about selected local routes.

neighbor *ip-addr*

Displays BGP4 route information about selected BGP neighbors.

Show Commands

show ip bgp vrf routes

nexthop *ip-addr*

Displays BGP4 route information about routes that are received from the specified next hop.

no-best

Displays BGP4 route information that the device selected as not best routes.

not-installed-best

Displays BGP4 route information about best routes that are not installed.

prefix-list *string*

Displays BGP4 route information that is filtered by a prefix list.

regular-expression *name*

Displays BGP4 route information about routes that are associated with the specified regular expression.

route-map *name*

Displays BGP4 route information about routes that use the specified route map.

summary

Displays BGP4 summary route information.

unreachable

Displays BGP4 route information about routes whose destinations are unreachable through any of the BGP4 paths in the BGP4 route table.

Modes

User EXEC mode

show ip bgp vrf routes community

Displays BGP4 route information that is filtered by community and other options for a virtual routing and forwarding (VRF) instance.

Syntax

```
show ip bgp vrf routes community vrf-name { num | aa:nn | internet | local-as | no-advertise | no-export }
```

Parameters

community

Displays routes filtered by a variety of communities.

num

Specifies a community number in the range from 1 to 4294967200.

aa:nn

Specifies an autonomous system-community number.

internet

Displays routes for the Internet community.

local-as

Displays routes for a local sub-AS within the confederation.

no-advertise

Displays routes with this community that cannot be advertised to any other BGP4 devices at all.

no-export

Displays routes for the community of sub-ASs within a confederation.

Modes

User EXEC mode

show ip cache

Displays IP forwarding cache.

Syntax

show ip cache [**vrf** *vrf-name*] [*ip-address* | *index*]

show ip cache resource

Parameters

vrf *vrf-name*

Displays cache details for a specific VPN Routing/Forwarding instance.

ip-address

Displays cache details for a specific IP address.

index

Displays cache details for cache beginning with the row following the number you enter.

resource

Displays the number of entries in the cache.

Modes

User EXEC mode

Command Output

The **show ip cache** command displays the following information:

Output field	Description
IP Address	The IP address of the destination.
Next Hop	The IP address of the next-hop router to the destination. This field contains either an IP address or the value DIRECT. DIRECT means the destination is either directly attached or the destination is an address on this Brocade device. For example, the next hop for loopback addresses and broadcast addresses is shown as DIRECT.
MAC	The MAC address of the destination. If the entry is type U (indicating that the destination is this Brocade device), the address consists of zeroes.

Output field	Description
Type	The type of host entry, which can be one or more of the following: <ul style="list-style-type: none"> • D - Dynamic • P - Permanent • F - Forward • U - Us • C - Complex Filter • W - Wait ARP • I - ICMP Deny • K - Drop • R - Fragment • S - Snap Encap
Port	The port through which this device reaches the destination. For destinations that are located on this device, the port number is shown as "n/a".
VLAN	Indicates the VLANs the listed port is in.
Pri	The QoS priority of the port or VLAN.

Examples

The following example is sample output from the **show ip cache** command.

```
device# show ip cache
Entries in default routing instance:
Total number of cache entries: 1
D:Dynamic P:Permanent F:Forward U:Us C:Complex Filter
W:Wait ARP I:ICMP Deny K:Drop R:Fragment S:Snap Encap
  IP Address      Next Hop      MAC              Type   Port   Vlan   Pri
1   192.168.1.11   DIRECT       0000.0000.0000  PU    n/a    0
1   192.168.1.125  DIRECT       0000.0000.0000  PU    n/a    0
1   10.168.1.11    DIRECT       0000.0000.0000  PU    n/a    0
```

The following example is sample output from the **show ip cache resource** command.

```
device# show ip cache resource
9 entries in ip-cache, maximum #: 10000
```

show ip client-pub-key

Displays the currently loaded public keys.

Syntax

show ip client-pub-key

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Examples

The following example displays sample output of the **show ip client-pub-key** command.

```
device(config)# show ip client-pub-key
---- BEGIN SSH2 PUBLIC KEY ----
Comment: DSA Public Key

```

show ipc_stats

Displays reliable Inter-process Communications (IPC) and dynamic queue statistics.

Syntax

```
show ipc_stats
```

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

NTP configuration mode

Examples

The following is sample output from the **show ipc_stats** command.

```
device# show ipc_stats

Total available Hsync channel space = 1048580
Total available Appl channel space = 524292
Total number of application msgs in dyn queue = 0
Total number of hsync msgs in dyn queue = 0
Total number of rel sync msgs in dyn queue = 0
Total number of rx pkt msgs in standby dynamic queue = 0
Total number of rx pkt msgs in active dyn queue = 0
Total number of rx pkts relayed = 0
Total number of rx pkts received = 5686578
Total number of dyn-sync messages received so far = 3
Total number of rel-sync pending complete = 0
Total number of L3 baseline-sync packets = 655
Total number of packet drops in sync = 0
Is image_sync_in_progress? = 0
Total num of rx dyn queue drops = 0
Total num of jumbo corrupts = 0
Total number of messages in IP send queue = 0
```

show ip dhcp-client options

Displays the list of options the DHCP client has received from the DHCP server.

Syntax

show ip dhcp-client options

Modes

User EXEC mode

Global configuration mode

Usage Guidelines

Command Output

The **show ip dhcp-client options** command displays the following information:

Output field	Description
DHCP client received option (s)	Specifies the options the client has received, such as the dynamic IP address, subnet mask, lease time, server IP address, default-router address, TFTP server address, boot filename, DNS-server address and host name.

Examples

The following example displays the DHCP client options.

```
device(config)# show ip dhcp-client options
DHCP Client Received Option(s):
Client Received Options on port: 1/1/8*2/1/20
Dynamic IP address: 45.5.5.2
Subnet mask: 255.255.255.0
Lease Time: 300
Server IP Address: 45.5.5.1
default-router address: 52.1.1.1
TFTP server address: 52.1.1.2
TFTP Server Name: None
Boot filename: ICXR08040.bin
dns-server address: None
DNS Server Name: None
```

History

Release version	Command history
8.0.40	This command was introduced.

show ip dhcp relay information

Displays the configured DHCP relay information options.

Syntax

show ip dhcp relay information

Modes

Global configuration mode

Privileged EXEC mode

Interface configuration mode

Usage Guidelines

The outputs of the show commands vary depending on the relay information options you configure. See the examples below for the various outputs.

Examples

The following example displays the default output if option 82 is not enabled.

```
device(config)# show ip dhcp relay information
Relay Agent Information: format: Circuit-ID: vlan-mod-port
                        Remote-ID : mac
                        Policy    : replace
```

The following output displays if only the subscriber ID is configured. The circuit ID and remote ID display the defaults.

```
device(config)# show ip dhcp relay information
Relay Agent Information: policy: replace
port : 1/2/3:1
  circuit-id      : 000a01020301
  remote-id       : 001094000002
  subscriber-id   : Brcd01
```

The following output displays if all the sub-options are configured. This output is displayed only to the relay connected to the client. The output displays all 63 configured characters for the CID and RID, and 50 characters for the SID.

```
device(config-if-e10000-1/2/3)# show ip dhcp relay information
Relay Agent Information: policy: replace
port : 1/2/3
  circuit-id      : Brcd01
  remote-id       : remote01
  subscriber-id   : Brcd02
```

History

Release version	Command history
8.0.50	This command was introduced.

show ip dhcp relay information brief

Displays the configured DHCP relay information options in brief.

Syntax

show ip dhcp relay information brief

Modes

Global configuration mode

Privileged EXEC mode

Interface configuration mode

Usage Guidelines

The **show ip dhcp relay information brief** command output shows a maximum of 20 characters. The **show ip dhcp relay information** command displays all the characters.

Examples

The following output displays when Option 82 is not enabled.

```
device(config)# show ip dhcp relay information brief
Relay Agent Information: policy: replace
```

The following output displays if only the subscriber-id is configured.

```
device(config)# show ip dhcp relay info brief
Relay Agent Information: policy: replace
Port      Circuit-ID      Remote-ID      Subscriber-ID
1/2/3     000a01020301   001094000002   Brcd01
```

The following output displays if the circuit ID or remote ID is configured.

```
device(config-if-e10000-1/2/3)# show ip dhcp relay info brief
Relay Agent Information: policy: replace
Port      Circuit-ID      Remote-ID      Subscriber-ID
1/2/3     Brcd01         001094000002   none
```

The following example displays if all the sub-options are configured.

```
device(config-if-e10000-1/2/3)# show ip dhcp relay info brief
Relay Agent Information: policy: replace
Port      Circuit-ID      Remote-ID      Subscriber-ID
1/2/3     Brcd01         remote01      Brcd02
```

History

Release version	Command history
8.0.50	This command was introduced.

show ip dhcp-server address-pool

Displays a specific DHCP address pool or all DHCP address pools.

Syntax

show ip dhcp-server address-pool [**pools**] [*name*]

Parameters

pools

Displays all the DHCP address pools.

name

Displays information about a specific address pool.

Modes

Global configuration mode

Command Output

The **show ip dhcp-server address-pool** command displays the following information:

Output field	Description
Pool name	The name of the address pool
Time elapsed since last save	The amount of time that has elapsed since the last save
Total number of active leases	The number of leases that are currently active
Address Pool State	The state of the address pool (active or inactive)
IP Address Exclusions	IP addresses that are not included in the address pool
bootfile	The name of the bootfile
dhcp-default-router	The address of the DHCP default router
dhcp-server-router	The address of the DHCP server router
dns-server	The address of the DNS server
domain-name	The name of the domain
lease	The identifier for the lease
ip-telephony-voice-server	The IP address of the voice server
ip-telephony-data-server	The IP address of the data server
wpad	The network location of the PAC file
xwindow manager	The IP addresses of systems that are running the X Window System Display Manager and are available to the client.
netbios-name-server	The address of the netBIOS name server
network	The address of the network
tftp-server	The IP address of the TFTP server
next-bootstrap-server	The IP address of the next-bootstrap server

Show Commands

show ip dhcp-server address-pool

Examples

The following example displays the IP DHCP server address pools.

```
device# show ip dhcp-server address-pools
Showing all address pool(s):
Pool Name: one
Time elapsed since last save: 0d:0h:6m:52s
Total number of active leases: 2
Address Pool State: active
IP Address Exclusions: 192.168.1.45
IP Address Exclusions: 192.168.1.99 192.168.1.103
Pool Configured Options:
bootfile: FI08030b_Manifest.txt
dhcp-default-router: 192.168.1.1
dns-server: 192.168.1.100
domain-name: example.com
lease: 0 0 30
ip-telephony-voice-server: MCIPADD=192.168.42.1,MCPOR=1719,TFTPSRVR=192.168.42.1
ip-telephony-data-server: MCIPADD=192.168.42.1,MCPOR=1719,TFTPSRVR=192.168.42.1
wpad: http://172.26.67.243:8080/wpad.dat
xwindow manager: 10.38.12.1 10.38.12.3 10.38.12.5
netbios-name-server: 192.168.1.101
network: 192.168.1.0 255.255.255.0
hostname: brocade_router
tftp-server:172.26.51.66
next-bootstrap-server: 192.168.1.102
```

History

Release version	Command history
08.0.30b	This command was modified to include X Window System Display Manager updates in the output.
8.0.40	This command was modified to include updates in the output for WPAD, IP-telephony-voice, and data server.

show ip dhcp-server binding

Displays the IP DHCP server lease entry.

Syntax

show ip dhcp-server binding

Modes

Global configuration mode.

Usage Guidelines

The **show ip dhcp-server binding** command displays a specific DHCP active lease, or all active leases.

Command Output

The **show ip dhcp-server binding** command displays the following information:

Output field	Description
IP Address	The IP addresses currently in the binding database.
Client ID/Hardware address	The hardware address of the client.
Lease expiration	The time when this lease will expire.
Type	The type of lease.

Examples

The following example displays the IP DHCP server bindings.

```
device# show ip dhcp-server binding
Bindings from all pools:
IP Address Client-ID/ Lease expiration Type
Hardware address
192.168.1.2 0000.005d.a440 0d:0h:29m:31s Automatic
192.168.1.3 0000.00e1.26c0 0d:0h:29m:38s Automatic
```

show ip dhcp-server flash

Displays the lease-binding database stored in the flash memory.

Syntax

show ip dhcp-server flash

Modes

Global configuration mode

User EXEC mode

Command Output

The **show ip dhcp-server flash** command displays the following information:

Output field	Description
IP Address	The IP address of the flash memory lease-binding database.
Client-ID/Hardware address	The address of the client.
Lease expiration	The time when the lease will expire.
Type	The type of lease.

Examples

The following example displays details of the lease-binding database stored in the flash memory.

```
device# show ip dhcp-server flash
Address Pool Binding:
IP Address Client-ID/ Lease expiration Type
Hardware address
192.168.1.2 0000.005d.a440 0d:0h:18m:59s Automatic
192.168.1.3 0000.00e1.26c0 0d:0h:19m:8s Automatic
```

show ip dhcp-server summary

Displays the IP DHCP server summary.

Syntax

```
show ip dhcp-server summary
```

Modes

Global configuration mode.

User EXEC mode.

Usage Guidelines

The **show ip dhcp-server summary** command displays information about active leases, deployed address pools, undeployed address pools, and server uptime.

Command Output

The **show ip dhcp-server summary** command displays the following information:

Output field	Description
Total number of active leases	Indicates the number of leases that are currently active.
Total number of deployed address-pools	The number of address pools currently in use.
Total number of undeployed address-pools	The number of address pools being held in reserve.
Server uptime	The amount of time that the server has been active.

Examples

The following example displays the IP DHCP server summary.

```
device# show ip dhcp-server summary
DHCP Server Summary:
Total number of active leases: 2
Total number of deployed address-pools: 1
Total number of undeployed address-pools: 0
Server uptime: 0d:0h:8m:27s
```

show ip dhcp snooping flash

Displays the DHCP snooping learned entries from the flash file.

Syntax

show ip dhcp snooping flash

Modes

- User EXEC mode
- Privileged EXEC mode
- Global configuration mode

Command Output

The **show ip dhcp snooping flash** command displays the following information:

Output field	Description
DHCP snooping Info	Displays information about the saved DHCP entries in the flash file. This includes details about the total number of learned entries along with the IP address, MAC address, port number, VLAN, lease, and VRF name of each entry.

Examples

The following example displays the IP DHCP snooping flash information.

```
device# show ip dhcp snooping flash
Dhcp snooping Info
Total learnt entries 10
SAVED DHCP ENTRIES IN FLASH
  IP Address  Mac Address  Port          Virtual Port  vlan  lease  VRF
1  10.1.1.20   0000.0000.0001 1/1/1*2/1/25 v100   100   170  default-vrf
2  10.1.1.21   0000.0000.0002 1/1/1*2/1/25 v100   100   170  default-vrf
3  10.1.1.22   0000.0000.0003 1/1/1*2/1/25 v100   100   170  default-vrf
4  10.1.1.23   0000.0000.0004 1/1/1*2/1/25 v100   100   170  default-vrf
5  10.1.1.24   0000.0000.0005 1/1/1*2/1/25 v100   100   170  default-vrf
6  10.1.1.25   0000.0000.0006 1/1/1*2/1/25 v100   100   170  default-vrf
7  10.1.1.26   0000.0000.0007 1/1/1*2/1/25 v100   100   170  default-vrf
8  10.1.1.27   0000.0000.0008 1/1/1*2/1/25 v100   100   170  default-vrf
9  10.1.1.28   0000.0000.0009 1/1/1*2/1/25 v100   100   170  default-vrf
10 10.1.1.29   0000.0000.000a 1/1/1*2/1/25 v100   100   170  default-vrf
```

History

Release version	Command history
08.0.30b	This command was introduced.

show ip dhcp snooping info

Displays the DHCP snooping binding database.

Syntax

show ip dhcp snooping info

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Usage Guidelines

Beginning with FastIron release 08.0.30b, this command reads data from the DHCP binding database, and not from the flash file, as in releases prior to 08.0.30b.

Examples

The following example displays the DHCP snooping information.

```
device# show ip dhcp snooping info
Dhcp snooping Info
Total learnt entries 10
Learnt DHCP Snoop Entries
IP Address      Mac Address      Port              Virtual Port      vlan      lease  VRF
10.1.1.20       0000.0000.0001  1/1/1*2/1/25     v100              100      200   default-vrf
10.1.1.21       0000.0000.0002  1/1/1*2/1/25     v100              100      200   default-vrf
10.1.1.22       0000.0000.0003  1/1/1*2/1/25     v100              100      200   default-vrf
10.1.1.23       0000.0000.0004  1/1/1*2/1/25     v100              100      200   default-vrf
10.1.1.24       0000.0000.0005  1/1/1*2/1/25     v100              100      200   default-vrf
10.1.1.25       0000.0000.0006  1/1/1*2/1/25     v100              100      200   default-vrf
10.1.1.26       0000.0000.0007  1/1/1*2/1/25     v100              100      200   default-vrf
10.1.1.27       0000.0000.0008  1/1/1*2/1/25     v100              100      200   default-vrf
10.1.1.28       0000.0000.0009  1/1/1*2/1/25     v100              100      200   default-vrf
10.1.1.29       0000.0000.000a  1/1/1*2/1/25     v100              100      200   default-vrf
```

The following example displays the DHCP snooping information on a switch image.

```
device(config-if-e1000-1/1/1)# show ip dhcp snoop info
Dhcp snooping Info
Total learnt entries 10
Learnt DHCP Snoop Entries
IP Address      Mac Address      Port              Virtual Port      vlan      lease  VRF
10.1.1.20       0000.0000.0001  1/1/1*2/1/25     1/1/1*2/1/25     100      145   -
10.1.1.21       0000.0000.0002  1/1/1*2/1/25     1/1/1*2/1/25     100      145   -
10.1.1.22       0000.0000.0003  1/1/1*2/1/25     1/1/1*2/1/25     100      145   -
10.1.1.23       0000.0000.0004  1/1/1*2/1/25     1/1/1*2/1/25     100      145   -
10.1.1.24       0000.0000.0005  1/1/1*2/1/25     1/1/1*2/1/25     100      145   -
10.1.1.25       0000.0000.0006  1/1/1*2/1/25     1/1/1*2/1/25     100      145   -
10.1.1.26       0000.0000.0007  1/1/1*2/1/25     1/1/1*2/1/25     100      145   -
```

Show Commands

show ip dhcp snooping info

History

Release version	Command history
08.0.30b	This command was modified to include the output on a switch image.

show ip dhcp snooping vlan

Displays the DHCP snooping status for a VLAN and the trusted or untrusted ports.

Syntax

```
show ip dhcp snooping vlan vlan-id
```

Parameters

vlan-id

Specifies the VLAN ID.

Modes

Privileged EXEC mode

Command Output

The **show ip dhcp snooping vlan** command displays the following information:

Output field	Description
IP DHCP snooping VLAN #	Displays whether the IP DHCP snooping is enabled or disabled.

Examples

The following example displays the IP DHCP snooping status on VLAN 2.

```
device# show ip dhcp snooping vlan 2  
IP DHCP snooping VLAN 2: Enabled
```

show ip igmp group

Displays the status of IGMP multicast groups on a device.

Syntax

```
show ip igmp [vrf vrf-name ] group [ group-address [ detail | tracking ] ]
```

Parameters

vrf *vrf-name*

Specifies information for a VRF instance.

group-address

Specifies the address of the specific multicast group. If you do not specify a group address, information for all multicast groups is displayed.

detail

Displays information for the source list of the multicast group.

tracking

Displays information about interfaces that have tracking enabled.

Modes

Privileged EXEC mode

Command Output

The **show ip igmp group** command displays the following information:

Output Field	Description
Group	The address of the multicast group
Port	The physical port on which the multicast group was received.
Intf	The virtual interface on which the multicast group was received.
Timer	Shows the number of seconds the interface can remain in exclude mode. An exclude mode changes to include mode if it does not receive an "IS_EX" or "TO_EX" message during a certain period of time. The default is 140 seconds.
Mode	Indicates current mode of the interface: include or exclude. If the interface is in Include mode, it admits traffic only from the source list. If an interface is in exclude mode, it denies traffic from the source list and accepts the rest.
Srcs	Identifies the source list that will be included or excluded on the interface. If IGMP V2 group is in exclude mode with a #_src of 0, the group excludes traffic from 0 (zero) source list, which means that all traffic sources are included.

Examples

The example displays information for all IGMP multicast groups.

```
device# show ip igmp group
Total 2 entries
```

Idx	Group	Address	Port	Intf	Mode	Timer	Srcs
1	232.0.0.1		e1/1/1	v30	include	0	7
2	226.0.0.1		e1/1/2	v30	exclude	240	2
			e1/1/3	e1/1/3	include	0	3

Total number of groups 2

The following example displays information for the IGMP multicast group, 239.0.0.1.

```
device# show ip igmp group 239.0.0.1 detail
Total 2 entries
```

Idx	Group	Address	Port	Intf	Mode	Timer	Srcs
1	226.0.0.1		e1/1/2	v30	exclude	218	2
		S: 40.40.40.12					
		S: 40.40.40.11					
		S: 40.40.40.10					
		S: 40.40.40.2		(Age: 218)			
		S: 40.40.40.3		(Age: 218)			
	226.0.0.1		e1/1/3	e1/1/3	include	0	3
		S: 30.30.30.3		(Age: 165)			
		S: 30.30.30.2		(Age: 165)			
		S: 30.30.30.1		(Age: 165)			

The following example displays the list of clients that belong to a particular IGMP multicast group.

```
device# show ip igmp group 224.1.10.1 tracking
Total 2 entries
```

Idx	Group	Address	Port	Intf	Mode	Timer	Srcs
1	226.0.0.1		e1/1/1	v30	exclude	253	3
		S: 40.40.40.12					
		S: 40.40.40.11					
		S: 40.40.40.10					
		S: 40.40.40.2		(Age: 253)			
		S: 40.40.40.3		(Age: 253)			
		C: 10.10.10.1		(Age: 253)			
		C: 10.10.10.1		(Age: 253)			
	226.0.0.1		e1/1/3	e1/1/3	include	0	3
		S: 30.30.30.3		(Age: 196)			
		C: 10.2.0.1		(Age: 196)			
		S: 30.30.30.2		(Age: 196)			
		C: 10.2.0.1		(Age: 196)			
		S: 30.30.30.1		(Age: 196)			
		C: 10.2.0.1		(Age: 196)			

show ip igmp interface

Displays the status of a multicast enabled port.

Syntax

```
show ip igmp [vrf vrf-name] interface [ ve ve-num [ group A.B.C.D] | ethernet stack/slot/port | tunnel tunnel-id ]
```

Parameters

vrf *vrf-name*

Specifies information for a VRF instance.

ve *ve-num*

Specifies displaying information for a specific virtual routing interface.

group *A.B.C.D*

Specifies displaying information for a specific group address.

ethernet *stack/slot/port*

Specifies displaying information for an Ethernet interface.

tunnel *tunnel-id*

Specifies displaying information about a GRE tunnel interface that is being configured. The GRE tunnel interface is enabled under the router PIM configuration.

Modes

Privileged EXEC mode

Command Output

The **show ip igmp interface** command displays the following information:

Output Field	Description
Intf	The virtual interface on which IGMP is enabled.
Port	The physical port on which IGMP is enabled.
Groups	The number of groups that this interface or port has membership.
Version	
Oper	The IGMP version that is operating on the interface.
Cfg	The IGMP version that is configured for this interface.
Querier	Where the Querier resides: The IP address of the router where the querier is located or Self - if the querier is on the same router as the intf or port.
Max response	
oQrr	Other Querier present timer.

show ip igmp proxy

Displays information about the proxy groups and interfaces on the default VRF or, when the **vrf** keyword is specified, other VRFs.

Syntax

```
show ip igmp [ vrf vrf-name ] proxy [ group group-addr ]  
show ip igmp [ vrf vrf-name ] proxy [ interface { ethernet stack/slot/port | tunnel tunnel-id | ve ve-num } [ detail |  
group-resp ip-addr | stats ] ]  
show ip igmp [ vrf vrf-name ] proxy [ resource ]  
show ip igmp [ vrf vrf-name ] proxy [ stats ]  
show ip igmp [ vrf vrf-name ] proxy [ summary ]
```

Parameters

vrf *vrf-name*
Displays information for a VRF instance.

proxy
Displays information about the proxy groups and interfaces.

group *group-addr*
Displays information for the specified IGMP group.

interface
Displays information for the specified interface.

ethernet *stack/slot/port*
Displays information for the specified Ethernet interface.

tunnel *tunnel-id*
Displays information for the specified tunnel interface.

ve *ve-num*
Displays information for the specified VE interface.

detail
Displays detailed information.

group-resp *ip-addr*
Displays information for the group response tree.

stats
Displays information on the interface status.

resource
Displays memory status of various pools.

summary
Displays summary information.

stats

Displays information about queries and reports on a specific interface.

Modes

Privileged EXEC mode

Command Output

The **show ip igmp proxy** command displays the following information:

Output Field	Description
Address	Group address.
Mode	Multicast group mode. Can be "exclude" or "include."
Source count	Number sources in the given mode. A group in IGMP v2 has exclude mode with zero sources.
ref count	Number of proxy interfaces where the responses (query, state, change, etc) are scheduled.
flags	Can be "0" or "1". "1" indicates that the group state has changed and it needs to be reevaluated before a response is generated. "0" indicates that no change in state response is scheduled.
Name	Interface name.
Oper version	Current querier version or configured version.
Cfg Robust	Configured robustness value.
Unsoli Interval	Unsolicited report interval in seconds.
Filter Acl Id	Number of the access list.
Filter Name	Name of the access list.

The **show ip igmp proxy summary** command displays the following information:

Output Field	Description
Inst-Name	Number of the proxy instance.
Total Grps	Number of proxy groups.

The **show ip igmp proxy stats** command displays the following information:

Output Field	Description
Intf	Interface
genQv1 RX	IGMP v1 general query received on proxy interface.
genQv2 RX	IGMP v2 general query received on proxy interface.
genQv3 RX	IGMP v3 general query received on proxy interface.
GrpQ RX	Group query received.
SrcQ RX	Source query received.
Rprt1 TX	IGMP v1 report generated.
Rprt2 TX	IGMP 2 report generated.
Rprt3 TX	IGMP v3 report generated.

Show Commands

show ip igmp proxy

Output Field	Description
leave TX	IGMP v2 leave generated.

Examples

The following example shows information about the proxy groups and interfaces on the default VRF.

```
device# show ip igmp proxy
Proxy instance name: default-vrf
Total proxy groups: 4
Address          Mode      Source   ref      flags
                  count    count
-----
225.1.1.1        exclude  0         0         0
225.1.1.2        exclude  0         0         0
225.1.1.3        exclude  0         0         0
225.1.1.4        exclude  0         0         0
Proxy interfaces
-----
Name      Oper   Cfg    Unsoli  Filter  Filter
          Version Robust Interval Acl Id  Name
-----
e1/1/3    2      2      1       0
```

The following example shows summary information about the proxy groups and interfaces on the default VRF.

```
device# show ip igmp proxy summary
Proxy instances:
-----
Inst-Name    Total Grps
-----
default-vrf  4
```

This example shows information about queries and reports on interface v300.

```
device# show ip igmp proxy stats
Intf      genQv1  genQv2  genQv3  GrpQ   SrcQ   Rprt1  Rprt2  Rprt3  leave
          RX      RX      RX      RX     RX     TX     TX     TX     TX
-----
v3000     0       0       0       0      0      0      0      0      0
```

show ip igmp settings

Displays global IGMP settings or IGMP settings for a specified VRF.

Syntax

```
show ip igmp [vrf vrf-name ] settings
```

Parameters

vrf *vrf-name*
Specifies information for a VRF instance.

Modes

Privileged EXEC mode

Command Output

The **show ip igmp settings** command displays the following information:

Output Field	Description
Query Interval	How often the router will query an interface for group membership.
Configured Query Interval	The query interval that has been configured for the router.
Max Response Time	The length of time in seconds that the router will wait for an IGMP (V1 or V2) response from an interface before concluding that the group member on that interface is down and removing it from the group.
Group Membership Time	The length of time in seconds that a group will remain active on an interface in the absence of a group report.
Configured Version	The IGMP version configured on the router.
Operating Version	The IGMP version operating on the router.
Robustness Variable	The Robustness Variable allows tuning for the expected packet loss on a network. If a network is expected to be lossy, the Robustness Variable may be increased. IGMP is robust to (Robustness Variable -1) packet losses. The Robustness Variable must not be zero, and should not be one. Default: 2
Router Alert Check	IGMP (v2/v3) messages have a router-alert option in the IP header. By default this is validated by the router and it drops the packets without the router-alert option. If this check is disabled, IGMP messages without the router-alert option are accepted.
Last Member Query Interval	The Last Member Query Interval is the Max Response Time used to calculate the Max Resp Code inserted into Group-Specific Queries sent in response to Leave Group messages. It is also the Max Response Time used in calculating the Max Resp Code for Group-and-Source-Specific Query messages. Default: 10 (1 second)

Show Commands

show ip igmp settings

Output Field	Description
Last Member Query Count	The Last Member Query Count is the number of Group-Specific Queries sent before the router assumes there are no local members. The Last Member Query Count is also the number of Group-and-Source-Specific Queries sent before the router assumes there are no listeners for a particular source. Default: the Robustness Variable.
Older Host Present Timer	The Older Host Present Interval is the time-out for transitioning a group back to IGMPv3 mode when an older version report is sent for that group. When an older version report is received, routers set their Older Host Present Timer to Older Host Present Interval. This value must be ((the Robustness Variable) times (the Query Interval)) plus (one Query Response Interval).
Maximum Group Address	This value indicates the maximum number of group address that can be accepted by the router.

Examples

The following example shows global IGMP settings.

```
device# show ip igmp settings
IGMP Global Configuration
  Query Interval      : 125s   Configured Interval    : 125
  Max Response Time   : 10s
  Group Membership Time : 260s
  Operating Version    : 2       Configured Version     : 0
  Robustness Variable  : 2
  Router Alert Check   : Enabled
  Last Member Query Interval: 1   Last Member Query Count: 2
  Older Host Present Timer : 260
  Maximum Group Address : 4096
```

show ip igmp ssm-map

Displays the association between a configured access control list (ACL) and source address mapped to it.

Syntax

```
show ip igmp [vrf vrf-name ] ssm-map [ group-address ]
```

Parameters

vrf *vrf-name*

Specifies information for a VRF instance.

group-address

Specifies displaying the ACL ID that has the specified multicast group address in its permit list and listing the source addresses mapped to the specified multicast group address.

Modes

Privileged EXEC mode

Examples

The following example shows the association between a configured ACL and source address mapped to it.

```
device# show ip igmp ssm-map
+-----+-----+
| Acl id | Source Address |
+-----+-----+
| 20     | 1.1.1.1       |
| 100    | 1.1.1.1       |
| 20     | 2.2.2.2       |
| 20     | 2.2.2.3       |
| 20     | 2.2.2.4       |
| 20     | 2.2.2.5       |
| 20     | 2.2.2.6       |
```

The following example shows the ACL IDs that have the specified multicast group address in their permit lists and lists the source addresses mapped to them.

```
device# show ip igmp ssm-map
+-----+-----+
| Acl id | Source Address |
+-----+-----+
| 20     | 1.1.1.1       |
| 100    | 1.1.1.1       |
| 20     | 2.2.2.2       |
| 20     | 2.2.2.3       |
| 20     | 2.2.2.4       |
| 20     | 2.2.2.5       |
| 20     | 2.2.2.6       |
```

Show Commands

show ip igmp ssm-map

The following example shows the ACL IDs that have the specified multicast group address in their permit lists and lists the source addresses mapped to it.

```
device# show ip igmp ssm-map 232.1.1.1
+-----+-----+
| Acl id | Source Address |
+-----+-----+
      20      1.1.1.1
     100      1.1.1.1
      20      2.2.2.2
      20      2.2.2.3
      20      2.2.2.4
      20      2.2.2.5
      20      2.2.2.6
```

show ip igmp static

Displays information about static IGMP groups.

Syntax

show ip igmp [**vrf** *vrf-name*] **static**

Parameters

vrf *vrf-name*
Specifies information for a VRF instance.

Modes

Privileged EXEC mode

Command Output

The **show ip igmp static** command displays the following information:

Output Field	Description
Group Address	The address of the multicast group.
Interface Port List	The physical ports on which the multicast groups are received.

Examples

The following example shows information about static IGMP groups for the VRF named my_vrf.

```
device#show ip igmp vrf my_vrf static
Group Address      Interface Port List
-----+-----+-----
229.1.0.12        1/1/1 ethe 1/1/1
229.1.0.13        1/1/1 ethe 1/1/1
229.1.0.14        1/1/1 ethe 1/1/1
229.1.0.92        1/1/1 ethe 1/1/1
```

show ip igmp traffic

Displays the traffic status on each virtual routing interface.

Syntax

```
show ip igmp [vrf vrf-name] traffic
```

Parameters

vrf *vrf-name*
Specifies information for a VRF instance.

Modes

Privileged EXEC mode

Command Output

The **show ip igmp traffic** command displays the following information:

Output Field	Description
QryV2	Number of general IGMP V2 query received or sent by the virtual routing interface.
QryV3	Number of general IGMP V3 query received or sent by the virtual routing interface.
G-Qry	Number of group specific query received or sent by the virtual routing interface.
GSQry	Number of source specific query received or sent by the virtual routing interface.
MbrV2	The IGMP V2 membership report.
MbrV3	The IGMP V3 membership report.
Leave	Number of IGMP V2 "leave" messages on the interface. (See ToEx for IGMP V3.)
IsIN	Number of source addresses that were included in the traffic.
IsEX	Number of source addresses that were excluded in the traffic.
ToIN	Number of times the interface mode changed from exclude to include.
ToEX	Number of times the interface mode changed from include to exclude.
ALLOW	Number of times that additional source addresses were allowed or denied on the interface:
BLK	Number of times that sources were removed from an interface.

Examples

The following example shows the traffic status on each virtual routing interface.

```
device# show ip igmp traffic
Recv  QryV2 QryV3 G-Qry GSQry MbrV2 MbrV3 Leave  IsIN  IsEX ToIN ToEX ALLOW BLK
v5    29    0    0    0    0    0    0    0    0    0    0    0    0
v18   15    0    0    0    0    30   0    60   0    0    0    0    0
v110  0     0    0    0    0    97   0    142  37   2    2    3    2
Send  QryV1 QryV2 QryV3 G-Qry GSQry
v5    0     2    0    0    0    0
v18   0     0    30   30   0    0
v110  0     0    30   44   11   0
```

show ip interface

Displays useful information about the configuration and status of the IP protocol and its services, on all interfaces.

Syntax

```
show ip interface [ ethernet slot/port | loopback num | tunnel num | ve num ]
```

Parameters

ethernet *slot port*

Displays the specified Ethernet interface port.

loopback *num*

Displays the loopback interface number.

tunnel *num*

Displays the tunnel interface number.

ve *num*

Displays the Virtual Ethernet interface number.

Modes

User EXEC mode

Command Output

The **show ip interface** command displays the following information:

Output field	Description
Interface	The type and the slot and port number of the interface.
IP-Address	The IP address of the interface.
OK?	Whether the IP address is configured on the interface.
Method	Whether the IP address is saved in NVRAM. If you have set the IP address for the interface in the CLI, the Method field is "manual".
Status	The link status of the interface. If the user has disabled the interface with the disable command, the entry in the 'Status' field is "administratively DOWN". Otherwise, the entry in the 'Status' field is either UP or DOWN.
Protocol	Whether the interface can provide two-way communication. If the IP address is configured and the link status of the interface is up, the entry in the 'Protocol' field is UP. Otherwise, the entry in the 'Protocol' field is DOWN.
VRF	Whether the VRF is configured or set to default.

Examples

The following example displays information about all IP interfaces.

```
device# show ip interface

Interface      IP-Address      OK?  Method  Status  Protocol  VRF
Eth 1/1/6     10.53.5.1       YES  manual  down    down      default-vrf
Eth mgmt1     10.25.224.194   YES  manual  up      up        default-vrf
```

The following example displays the **show ip interface** command specifically for tunnel interface 64.

```
device# show ip interface tunnel 64

Interface Tunnel 64
port enabled
port state: UP
ip address: 10.224.64.0/31
Port belongs to VRF: default-vrf
encapsulation: GRE, mtu: 1476, metric: 1
directed-broadcast-forwarding: disabled
proxy-arp: disabled
ip arp-age: 10 minutes
No Helper Addresses are configured.
No inbound ip access-list is set
No outgoing ip access-list is set
```

The following example displays the IP interface VE configurations.

```
device(config)# show ip interface ve 10

Interface Ve 10
members: ethe 1/1/47 to 1/1/48 ethe 3/1/47
active: ethe 1/1/47 to 1/1/48 ethe 3/1/47
port enabled
port state: UP
ip address: 100.1.1.1          subnet mask: 255.255.255.0
Port belongs to VRF: default-vrf
encapsulation: ETHERNET, mtu: 1500, metric: 1
directed-broadcast-forwarding: disabled
ICMP redirect: enabled
proxy-arp: disabled
ip arp-age: 10 minutes
delay notification timer: 20 seconds
No Helper Addresses are configured.
No inbound ip access-list is set
No outgoing ip access-list is set
```

The following example displays the **show ip interface** command to verify a user-configured MAC address. The "ip-mac:" text is followed by the configured MAC address.

```
device# show ip interface ethernet 1/1/6

Interface Ethernet 1/1/6
port enabled
port state: DOWN
ip address: 10.53.5.1          subnet mask: 255.255.255.0
Port belongs to VRF: default-vrf
encapsulation: ETHERNET, mtu: 1500, metric: 1
directed-broadcast-forwarding: disabled
ICMP redirect: disabled
proxy-arp: disabled
ip arp-age: 10 minutes
No Helper Addresses are configured.
No inbound ip access-list is set
No outgoing ip access-list is set
ip-mac: aaaa.bbbb.cccc
```

Show Commands
show ip interface

History

Release version	Command history
8.0.40	The command output was modified to display a user-configured MAC address for an IP interface.

show ip mroute

Displays information on multicast routes. You can specify whether you want to display information from static or connected mroutes or from a particular mroute.

Syntax

```
show ip mroute [vrf vrf-name ] { static | connected | nexthop | ip-subnet [ mask]}
```

Parameters

vrf vrf-name

Specifies a VRF route.

static

Specifies a static multicast route.

connected

Specifies a directly attached (connected) multicast route.

nexthop

Specifies an IPv4 next hop table.

ip-subnet [mask]

Specifies an IP address.

Modes

Privileged EXEC mode

Global configuration mode

Examples

The following example displays information for IP multicast routes:

```
Device(config)# show ip mroute

Total number of IP routes: 5
Type Codes - B:BGP D:Connected S:Static; Cost - Dist/Metric
  Destination          Gateway          Port          Cost      Type      Uptime
1  20.20.20.0/24        220.220.220.1   ve 220        1/1       S         8m54s
2  50.50.50.0/24        DIRECT          ve 50          0/0       D         8h26m
3  77.1.1.1/32          DIRECT          loopback 1     0/0       D         8h26m
4  129.129.129.0/24     DIRECT          ve 129         0/0       D         8h26m
5  220.220.220.0/24     DIRECT          ve 220         0/0       D         2h49m
```

The following example displays information for static multicast routes:

```
Device(config)# show ip mroute static

Type Codes - B:BGP D:Connected S:Static; Cost - Dist/Metric
  Destination          Gateway          Port          Cost      Type      Uptime
1  20.20.20.0/24        220.220.220.1   ve 220        1/1       S         8m54s
```

Show Commands

show ip mroute

The following example displays information for directly attached multicast routes:

```
Device(config)# show ip mroute connected
```

```
  Type Codes - B:BGP  D:Connected  S:Static;  Cost - Dist/Metric
      Destination      Gateway      Port      Cost  Type  Uptime
1      50.50.50.0/24    DIRECT      ve 50     0/0   D     8h26m
2      77.1.1.1/32     DIRECT      loopback 1 0/0   D     8h26m
3      129.129.129.0/24 DIRECT      ve 129    0/0   D     8h26m
4      220.220.220.0/24 DIRECT      ve 220    0/0   D     2h49m
```

The following example displays information for IP multicast route 50.50.50.100:

```
Device(config)# show ip mroute 50.50.50.100
```

```
  Type Codes - B:BGP  D:Connected  S:Static;  Cost - Dist/Metric
      Destination      Gateway      Port      Cost  Type  Uptime
1      50.50.50.0/24    DIRECT      ve 50     0/0   D     8h26m
```

History

Release version	Command history
8.0.10a	This command was introduced.

show ip msdp mesh-group

Displays the details of a specific mesh-group.

Syntax

```
show ip msdp [ vrf vrf-name ] mesh-group group-name
```

Parameters

vrf

Displays the mesh-group details for the VRF instance specified by the *vrf-name* variable.

vrf-name

Specifies the VRF instance.

mesh-group

Specifies the MSDP group.

group-name

Specifies the mesh group.

Modes

Privileged EXEC mode

Global configuration mode

MSDP router configuration mode

Usage Guidelines

If used without specifying a VRF, this command shows data from the default VRF.

Command Output

The **show ip msdp [vrf *vrf-name*] mesh-group *group-name*** command displays the following information:

Output field	Description
Peer Address	The IP address of the MSDP peer that is placed in the mesh group.
State	The state of the MSDP device connection with the mesh group. The state can be one of the following: <ul style="list-style-type: none"> CONNECT - The session is in the active open state. ESTABLISH - The MSDP session is fully up. IDLE - The session is idle. LISTEN - The session is in the passive open state.
KA (Keep Alive) In	The number of MSDP keepalive messages received by the mesh group.
KA (Keep Alive) Out	The number of MSDP keepalive messages sent by the mesh group.
SA (Source-Active) In	The number of SA messages received by the mesh group.

Show Commands

show ip msdp mesh-group

Output field	Description
SA (Source-Active) Out	The number of SA messages sent by the mesh group.
NOT (Notification) In	The number of notification messages received by the mesh group.
NOT (Notification) out	The number of notification messages sent by the mesh group.
Age	The number of seconds the messages has been in the cache.

Examples

The following example shows the mesh-group configuration details.

```
device#show ip msdp mesh-group
Mesh-Group-Name      Peer-IP-Address
group1                40.0.0.40
group2                21.0.0.23
```

The following example shows the details of mesh-group group1.

```
device#show ip msdp mesh-group group1
MSDP MESH-GROUP:group1
KA: Keepalive SA:Source-Active NOT: Notification
Peer Address      State      KA          SA          NOT          Age
                   In      Out      In      Out      In      Out
40.0.0.40         ESTABLISH  1407     1406     0         0         0         0         6
```

The following example shows the mesh-group configuration details for the VRF 10 instance.

```
device#show ip msdp vrf 10 mesh-group
Mesh-Group-Name      Peer-IP-Address
group1                22.0.0.22
group2                21.0.0.23
```

The following example shows the mesh-group group2 details for the VRF 10 instance.

```
device#show ip msdp vrf 10 mesh-group group2
MSDP MESH-GROUP:group2
KA: Keepalive SA:Source-Active NOT: Notification
Peer Address      State      KA          SA          NOT          Age
                   In      Out      In      Out      In      Out      In      Out
21.0.0.23         IDLE       0          0          0          0          0          0          0
```

History

Release version	Command history
08.0.20	This command was introduced.

show ip msdp peer

Displays Multicast Source Discovery Protocol (MSDP) peer information.

Syntax

```
show ip msdp peer [ vrf vrf-name ] peer peer-address
```

Parameters

vrf *vrf-name*

Displays information for a specific VRF instance.

peer-address

Displays information for the specified peer address.

Modes

Privileged EXEC mode

Examples

The following example shows MSDP information about the specified peer.

```
device# show ip msdp peer 10.40.40.3
MSDP Peer Status Summary
KA: Keepalive SA:Source-Active NOT: Notification
Peer Address Peer As State KA SA NOT Age
In Out In Out In Out
10.40.40.3 1001 ESTABLISH 62 62 0 0 0 0 7
```

Show Commands
show ip msdp rpf-peer

show ip msdp rpf-peer

Displays Multicast Source Discovery Protocol (MSDP) peer information for a reverse-path forwarding (RPF) peer.

Syntax

```
show ip msdp [ vrf vrf-name ] rpf-peer peer-address
```

Parameters

vrf *vrf-name*

Specifies information for a VRF instance.

peer-address

Specifies the source address for reverse-path forwarding (RPF) check.

Modes

Privileged EXEC mode

Examples

The following example shows MSDP peer information for the VRF named my_vrf.

```
device#show ip msdp vrf my_vrf rpf-peer 10.40.40.2
MSDP Peer Status Summary
KA: Keepalive SA:Source-Active NOT: Notification
Peer Address Peer As State KA SA NOT Age
In Out In Out In Out
10.40.40.2 1001 ESTABLISH 5569 5568 0 0 0 0 57
```

show ip msdp sa-cache

Displays the source actives (SA) in the Multicast Source Discovery Protocol (MSDP) cache.

Syntax

```
show ip msdp [ vrf vrf-name ] sa-cache [ counts ] [ source-address group-address | peer peer-address { in | out } | peer-  
as as-number | orig-rp rp-address | rejected [ rpf | rp-filter | sg-filter ] | self-originated ]
```

Parameters

vrf *vrf-name*

Displays information for a specific VRF instance.

counts

Displays only the count of entries.

source-address

Specifies the source address of the SA entry.

group-address

Specifies the group address of the SA entry.

peer-as *as-number*

Specifies the BGP any-source (AS) number of the forwarding peer.

orig-rp *rp-address*

Displays information for the originating reverse-path (RP) address.

peer *peer-address*

Displays information for the peer address.

in

Displays SA entries received from this peer.

out

Displays SA entries advertised to this peer.

rejected

Displays the rejected SAs.

rpf

Displays the RPF failure information.

rp-filter

Displays the RP filter failure information.

sg-filter

Displays the SG failure information.

self-originated

Displays the self-originated SAs.

Modes

User EXEC mode

Command Output

The **show ip msdp sa-cache** command displays the following information:

Output Field	Description
Total	The number of entries the cache currently contains.
Index	The cache entry number.
RP	The RP through which receivers can access the group traffic from the source
SourceAddr	The IP address of the multicast source.
GroupAddr	The IP multicast group to which the source is sending information.
Orig Peer	The peer from which this source-active entry was received.
Age	The number of seconds the entry has been in the cache

Examples

This example shows the source actives in the MSDP cache:

```
device> show ip msdp vrf my_vrf sa-cache
Total of 10 SA cache entries
Index  RP address (Source, Group)      Orig Peer  Age
1      2.2.2.2   (192.6.1.10, 227.1.1.1)        192.1.1.2  0
2      2.2.2.2   (192.6.1.10, 227.1.1.2)        192.1.1.2  0
3      2.2.2.2   (192.6.1.10, 227.1.1.3)        192.1.1.2  0
4      2.2.2.2   (192.6.1.10, 227.1.1.4)        192.1.1.2  0
5      2.2.2.2   (192.6.1.10, 227.1.1.5)        192.1.1.2  0
6      2.2.2.2   (192.6.1.10, 227.1.1.6)        192.1.1.2  0
7      2.2.2.2   (192.6.1.10, 227.1.1.7)        192.1.1.2  0
8      2.2.2.2   (192.6.1.10, 227.1.1.8)        192.1.1.2  0
9      2.2.2.2   (192.6.1.10, 227.1.1.9)        192.1.1.2  0
10     2.2.2.2   (192.6.1.10, 227.1.1.10)       192.1.1.2  0
```

The following example configures to display only the entries matching a specific source.

```
device> show ip msdp sa-cache 1.1.1.1
```

The following example configures to display only the entries matching a specific group.

```
device> show ip msdp sa-cache 239.1.1.1
```

The following example configures to display only the SA cache entries that are received from peers in the BGP AS Number 100.

```
device> show ip msdp sa-cache 100
```

The following example configures to display only the SA cache entries that are originated by the RP 10.1.1.1.

```
device> show ip msdp sa-cache orig-rp 10.1.1.1
```

The following example configures to display only the rejected SAs. You can further narrow down by quoting the reason for rejection.

```
device> show ip msdp sa-cache rejected
```

The following example configures to display the self-originated SA.

```
device> show ip msdp sa-cache self-originated
```

show ip msdp summary

Displays the IP addresses of the Multicast Source Discovery Protocol (MSDP) peers, the state of the device MSDP session with each peer, and statistics for keepalive, source active, and notification messages sent to and received from each of the peers.

Syntax

```
show ip msdp [ vrf vrf-name ] summary
```

Parameters

vrf vrf-name
Specifies information for a VRF instance.

Modes

Privileged EXEC mode

Command Output

The **show ip msdp summary** command displays the following information:

Output Field	Description
Peer address	The IP address of the peer interface with the device
State	The state of the MSDP device connection with the peer. The state can be one of the following: <ul style="list-style-type: none">CONNECTING - The session is in the active open state.ESTABLISHED - The MSDP session is fully up.INACTIVE - The session is idle.LISTENING - The session is in the passive open state.
KA In	The number of MSDP keepalive messages the MSDP device has received from the peer
KA Out	The number of MSDP keepalive messages the MSDP device has sent to the peer
SA In	The number of source active messages the MSDP device has received from the peer
SA Out	The number of source active messages the MSDP device has sent to the peer
NOT In	The number of notification messages the MSDP router has received from the peer
NOT Out	The number of notification messages the MSDP router has sent to the peer

Examples

The following example shows summary MSDP information for the VRF named my_vrf.

```
device# show ip msdp my_vrf summary
MSDP Peer Status Summary
KA: Keepalive SA:Source-Active NOT: Notification
Peer Address      Peer As   State      In      Out      In      Out      In      Out      Age
                  Peer As   State      KA      SA      NOT
40.40.40.1        1001     ESTABLISH  59      59      0       0       0       0       6
40.40.40.3        1001     ESTABLISH  59      59      0       0       0       0       47
47.1.1.2          N/A      ESTABLISH  59      59      0       0       0       0       47
```

show ip multicast

Displays IPv4 IGMP snooping information.

Syntax

show ip multicast

Modes

User EXEC mode

Usage Guidelines

You can use the **show ip multicast** command to display information for VLANs.

Examples

The following example shows IGMP snooping information.

```
device# show ip multicast
Summary of all vlans. Please use "sh ip mu vlan <vlan-id>" for details
Version=2, Intervals: Query=125, Group Age=260, Max Resp=10, Other Qr=255,
                Leave Wait=2, Robustness=2

Replication resource sharing: Enabled.
VL20: dft V2, vlan cfg active, 0 grp, 0 (*G) cache, rtr ports,
      router ports: e1/1/5(220) 1.1.1.20,
My Query address: None
Vlan Querier address not configured. Ve/Loopback address also not available.
VL30: dft V2, vlan cfg active, 0 grp, 0 (*G) cache, no rtr port,
Vlan Querier address configured: 30.1.1.1
VL40: dft V2, vlan cfg passive, 0 grp, 0 (*G) cache, no rtr port,
Vlan Querier address not configured. Ve/Loopback address also not available.
VL120 no snoop: no global or local config
VL200 no snoop: no global or local config
```

History

Release version	Command history
8.0.50	The output of this command was modified to display the robustness variable, leave-wait timer, and the My Query address field.
8.0.30	This command was modified to display information for unregistered flooding.

show ip multicast error

Displays information about possible IGMP errors.

Syntax

show ip multicast error

Modes

User EXEC mode

Command Output

The **show ip multicast error** command displays the following information:

Output Field	Description
SW processed pkt	The number of multicast packets processed by IGMP snooping.
up-time	The time since the IGMP snooping is enabled.

Examples

The following example shows information about possible IGMP errors.

```
device> show ip multicast error  
snoop SW processed pkt: 173, up-time 160 sec
```

show ip multicast group

Displays information about IGMP groups.

Syntax

```
show ip multicast [ cluster ] group [group-address [detail] [tracking] ]
```

Parameters

cluster

Specifies a multi-chassis trunking (MCT) cluster.

group-address

Specifies information for a particular group.

detail

Specifies detailed IGMP group information for a specific group.

tracking

Specifies tracking information on interfaces that have tracking enabled.

Modes

Privileged EXEC mode

Command Output

The **show ip multicast group** command displays the following information:

Output Field	Description
group	The address of the group (destination address in this case, 224.1.1.1)
p-port	The physical port on which the group membership was received.
ST	Yes indicates that the IGMP group was configured as a static group; No means the address was learned from reports.
QR	Yes means the port is a querier port; No means it is not. A port becomes a non-querier port when it receives a query from a source with a lower source IP address than the device.
life	The number of seconds the group can remain in EXCLUDE mode. An EXCLUDE mode changes to INCLUDE mode if it does not receive an "IS_EX" or "TO_EX" message during a certain period of time. The default is 260 seconds. There is no life displayed in INCLUDE mode.
mode	Indicates current mode of the interface: INCLUDE or EXCLUDE. If the interface is in INCLUDE mode, it admits traffic only from the source list. If an interface is in EXCLUDE mode, it denies traffic from the source list and accepts the rest.

Output Field	Description
source	Identifies the source list that will be included or excluded on the interface. For example, if an IGMP V2 group is in EXCLUDE mode with a source of 0, the group excludes traffic from the 0 (zero) source list, which actually means that all traffic sources are included.

Examples

The following example shows that an IGMP V2 group is in EXCLUDE mode with a source of 0. The group excludes only traffic from the 0 (zero) source list, which means that all traffic sources are included.

```
Device#show ip multicast group
p-:physical, ST:static, QR:querier, EX:exclude, IN:include, Y:yes, N:no
VL70 : 3 groups, 4 group-port, tracking_enabled
  group      p-port  ST    QR    life mode  source
1    224.1.1.2  1/33  no   yes   120  EX    0
2    224.1.1.1  1/33  no   yes   120  EX    0
3    226.1.1.1  1/35  yes  yes   100  EX    0
4    226.1.1.1  1/33  yes  yes   100  EX    0
```

The following example displays detailed IGMP group information for multicast group 226.1.1.1:

```
Device#show ip multicast group 226.1.1.1 detail
Display group 226.1.1.1 in all interfaces in details.
p-:physical, ST:static, QR:querier, EX:exclude, IN:include, Y:yes, N:no
VL70 : 1 groups, 2 group-port, tracking_enabled
  group      p-port  ST    QR    life mode  source
1    226.1.1.1  1/35  yes  yes   120  EX    0
  group: 226.1.1.1, EX, permit 0 (source, life):
  life=120, deny 0:
  group      p-port  ST    QR    life mode  source
2    226.1.1.1  1/33  yes  yes   120  EX    0
  group: 226.1.1.1, EX, permit 0 (source, life):
  life=120, deny 0:
```

The following example displays the list of clients that belong to multicast group 224.1.1.1 when tracking and fast leave are enabled:

```
Device#show ip multicast group 224.1.1.1 tracking
Display group 224.1.1.1 in all interfaces with tracking enabled.
p-:physical, ST:static, QR:querier, EX:exclude, IN:include, Y:yes, N:no
VL70 : 1 groups, 1 group-port, tracking_enabled
  group      p-port  ST    QR    life mode  source
*** Note: has 1 static groups to the entire vlan, not displayed here
1    224.1.1.1  1/33  no   yes   100  EX    0
  receive reports from 1 clients: (age)
  (10.2.100.2 60)
```

The following example displays information for a device in an MCT cluster. In the "local" column, YES indicates that report/leave were received on local ports [cluster-edge ports (CEP) or cluster-client-edge ports (CCEP)]; NO indicates that report/leave were received on a port that is an inter-chassis link (ICL) between the MCT cluster switches, via an MCT peer.

```
Device#show ip multicast cluster group
p-:physical, ST:static, QR:querier, EX:exclude, IN:include, Y:yes, N:no
VL70 : 1 groups, 1 group-port
  group      p-port  ST    QR    life mode  source  local
1    225.1.1.1  e3/10  no   no    260  EX    0      YES
2    230.1.1.2  e3/12  no   yes   40   EX    0      NO
```

Show Commands
show ip multicast group

History

Release version	Command history
8.0.20	This command was modified to display MCT cluster information.

show ip multicast mcache

Displays information in the multicast forwarding mcache.

Syntax

show ip multicast [**cluster**] **mcache**

Parameters

cluster

Specifies a multi-chassis trunking (MCT) cluster.

Modes

Privileged EXEC mode

Usage Guidelines

Configuring the **show default values** command does not show complete output; it shows only IGMP mcache values. The IGMP snooping mcache contains multicast forwarding information for VLANs and you must configure the **show ip multicast mcache** command to display those.

Command Output

The **show ip multicast mcache** command displays the following information:

Field	Description
(source group)	Source and group addresses of this data stream. (* group) means match group only; (source group) means match both.
cnt	The number of packets processed in software. Packets are switched in hardware, which increases this number slowly.
OIF	The output interfaces. If <code>entire vlan</code> is displayed, this indicates that static groups apply to the entire VLAN.
age	The mcache age. The mcache will be reset to 0 if traffic continues to arrive, otherwise the mcache will be aged out when it reaches the time defined by the ip multicast mcache-age command.
uptime	The up time of this mcache in seconds.
vidx	Vidx specifies output port list index. Range is from 4096 through 8191.
ref-cnt	The vidx is shared among mcaches having the same output interfaces. Ref-cnt indicates the number of mcaches using this vidx.
ICL	Inter-chassis link between MCT cluster switches.
CCEP	Cluster-client-edge ports (ports on cluster switch connecting it with a cluster client).

Show Commands

show ip multicast mcache

Examples

The following example shows information in the multicast forwarding mcache:

```
Device#show ip multicast mcache
Example: (S G) cnt=: cnt is number of SW processed packets
        OIF: e1/22 TR(1/32,1/33), TR is trunk, e1/32 primary, e1/33 output
vlan 10, 1 caches. use 1 VIDX
1      (10.10.10.2 239.0.0.3) cnt=0
        OIF: tag e2
        age=2s up-time=2s change=2s vidx=8191 (ref-cnt=1)
```

The following example shows information in the multicast forwarding mcache when data arrives locally:

```
Device#show ip multicast cluster mcache
Example: (S G) cnt=: (S G) are the lowest 32 bits, cnt is number of SW processed packets
        OIF: e1/22 TR(e1/32,e1/33), TR is trunk, e1/32 primary, e1/33 output
        [1,10]: [1 - has local oif, 10 - ICL due to CCEP count]

vlan 10, 1 caches. use 1 VIDX
1      (* 225.1.1.3) cnt=52244
        OIF: tag TR(e4/23) [1,0]
        age=167s up-time=11548s, change=58639s vidx=8184 (ref-cnt=1)
```

The following example shows information in the multicast forwarding mcache when data arrives on an MCT peer:

```
Device#show ip multicast cluster mcache
Example: (S G) cnt=: (S G) are the lowest 32 bits, cnt is number of SW processed packets
        OIF: e1/22 TR(e1/32,e1/33), TR is trunk, e1/32 primary, e1/33 output
        [1,10]: [1 - has local oif, 10 - ICL due to CCEP count]

vlan 10, 1 caches. use 1 VIDX
1      (30.0.0.10 225.1.1.3) cnt=30084
        OIF: tag TR(e3/13) [1,0]
        age=152s up-time=13728s, change=9990s vidx=8184 (ref-cnt=1)
```

History

Release version	Command history
8.0.20	This command was modified to display MCT cluster information.

show ip multicast optimization

Displays Internet Group Management Protocol (IGMP) snooping hardware resource-sharing information.

Syntax

show ip multicast optimization [*ipmc-num*]

Parameters

ipmc-num

Specifies the IP multicast (IPMC) group index number.

Modes

Privileged EXEC mode

VLAN configuration mode

Usage Guidelines

The **show ip multicast optimization** command is available only on the ICX 7250, ICX 7450, and ICX 7750 devices.

Use this command to display the availability of IPMC group indexes in the hardware and how they are used and shared.

The IPMC group index range varies depending on the platform; values out of range are not displayed.

Examples

The following example displays resource information showing that IPMC group index 4 is shared by two users and the ports included in the set are 1/1/6 and 1/1/1:

```
Device(config)#vlan 150
Device(config-vlan-150)#show ip multicast optimization
Total IPMCs Allocated: 0; Available: 8192; Failed: 0
Index  IPMC      SetId      Users      Set
  1.    4          0x161fcbd8    2  {<1/1/6>,<1/1/1>,<1/1/1>,<1/1/1>}
  2.    1          0x161d0930   10  {<1/1/6>,<1/1/4>,<1/1/3>,<1/1/2>,<1/1/1>,<1/1/1>,<1/1/1>,<1/1/1>,<1/1/1>,<1/1/1>}
Sharability Coefficient: 76%
```

History

Release version	Command history
8.0.10	This command was introduced.

show ip multicast pimsm-snooping

Displays information related to PIM sparse mode (SM) snooping on the mcache.

Syntax

```
show ip multicast pimsm-snooping [ vlan vlan-id ] [ cache ip-address ] [ resources ]
```

Parameters

- cache** *ip-address*
Specifies the PIM SM Snooping cache.
- vlan** *vlan-id*
Specifies snooping for a VLAN.
- resources**
Specifies PIM SM snooping resources.

Modes

Privileged EXEC mode

Usage Guidelines

Use the **show ip multicast pimsm-snooping** command to display information related to the PIM SM snooping on the outgoing interface (OIF) in the mcache.

Examples

The following example shows PIM SM information for the mcache:

```
Device#show ip multicast pimsm-snooping
Example: Port: 7/3 (ref_count=1)
         ref_count: no of entries in pimsm snoop cache added this oif)

vlan 503, has 1 caches.
1      (* 225.1.1.1) has 3 pim join ports out of 4 OIF
      4/23 (ref_count=2), 4/13 (ref_count=1), 4/5 (ref_count=3),
```

show ip multicast resource

Displays information about the software resources used.

Syntax

show ip multicast resource

Modes

User EXEC mode

Command Output

The **show ip multicast resource** command displays the following information:

Output Field	Description
alloc	The allocated number of units.
in-use	The number of units currently being used.
avail	The number of available units.
get-fail	This number of resource failures. NOTE It is important to pay attention to this field.
limit	The upper limit of this expandable field. The limit of <code>multicast group</code> is configured by the system-max igmp-snoop-group-addr command. The limit of <code>snoop mcache entry</code> is configured by the system-max igmp-snoop-mcache command.
get-mem	The number of memory allocation. This number must continue to increase.
size	The size of a unit (in bytes).
init	The initial allocated amount of memory. More memory may be allocated if resources run out.
Available vidx	The output interface (OIF) port mask used by mcache. The entire device has a maximum of 4096 vidx. Different mcaches with the same OIF share the same vidx. If vidx is not available, the stream cannot be hardware-switched.

Examples

The following example shows information about the software resources.

```
Device#show ip multicast resource
          alloc in-use  avail get-fail   limit  get-mem  size  init
igmp group      256     1    255     0    32000     1    16   256
igmp phy port  1024     1   1023     0   200000     1    22  1024
... entries deleted ...
snoop mcache entry 128     2    126     0     8192     3    56   128
total pool memory 109056 bytes
has total 2 forwarding hash
VIDX sharing hash : size=2      anchor=997  2nd-hash=no  fast-trav=no
Available vidx: 4060. IGMP/MLD use 2
```

show ip multicast vlan

Displays IGMP snooping information for a specific VLAN.

Syntax

```
show ip multicast vlan [ cluster ] vlan-id
```

Parameters

cluster

Specifies a Multi-Chassis Trunking (MCT) cluster.

vlan-id

Specifies the VLAN for which you want information. If you do not specify a *vlan-id*, information for all VLANs is displayed.

Modes

Privileged EXEC mode

Usage Guidelines

You can use the **show ip multicast vlan** command to display the querier information for a VLAN. This command displays the VLAN interface status and whether there is any other querier present with the lowest IP address. The following list provides the combinations of querier possibilities:

- Active Interface with no other querier present
- Passive Interface with no other querier present
- Active Interface with other querier present
- Passive Interface with other querier present

Command Output

The **show ip multicast vlan** command displays the following information:

Output Field	Description
Version	The global IGMP version.
Query	How often a querier sends a general query on the interface.
Group Age	The number of seconds membership groups can be members of this group before aging out.
Max Resp	The maximum number of seconds a client waits before replying to a query.
Other Qr	How long it took a switch with a lower IP address to become a new querier. This value is 2 x Query + Max Resp.
Unregistered IPv4 Multicast Packets Flooding	Indicates whether flooding is enabled.
cfg	The IGMP version for the specified VLAN.
vlan cfg	The IGMP configuration mode, which is either passive or active.

Output Field	Description
pimsm	Indicates that PIM SM is enabled on the VLAN.
rtr port	The router ports, which are the ports receiving queries.
local	Entries learned on local interfaces of the cluster switch, for example, the local client edge port (CCEP) or cluster edge port (CEP).
mct peer	Entries learned by way of the MCT peer cluster switch. Control messages synchronize by way of the inter-chassis link (ICL) from the MCT peer cluster switch.

Examples

The following example shows IGMP snooping information for VLAN 10:

```
device# show ip multicast vlan 10
Version=3, Intervals: Query=10, Group Age=260, Max Resp=10, Other Qr=30
VL10: cfg V3, vlan cfg passive, , pimsm (vlan cfg), 3 grp, 1 (SG) cache, no rtr port,
My Query address: None
e2 has 3 groups, non-QR (passive), default V3
**** Warning! has V2 client (life=240),
group: 239.0.0.3, life = 240
group: 224.1.1.2, life = 240
group: 224.1.1.1, life = 240
e4 has 0 groups, non-QR (passive), default V3
```

The following example shows IGMP snooping information when the VLAN interface is active and no other querier is present with the lowest IP address:

```
device# show ip multicast vlan 10
Version=2, Intervals: Query=125, Group Age=260, Max Resp=10, Other Qr=260

  group: 236.6.6.6, life = 260
```

The following example shows IGMP snooping information when the device is connected to an MCT cluster:

```
device# show ip multicast cluster vlan 10
Version=2, Intervals: Query=125, Group Age=260, Max Resp=10, Other Qr=255
VL10: dft V2, vlan cfg passive, 0 grp, 0 (*G) cache, rtr ports,
  My Query address: None
  router ports: e4/14(65) 50.0.0.1 (local:1, mct peer:0)

(local:1, mct peer:0)    <- Indicates if entry is local or\and mct-peer entry
```

The following example shows IGMP snooping information when flooding of unregistered IPv4 multicast frames is disabled:

```
device#show ip multicast vlan
Summary of all vlans. Please use "sh ip mu vlan <vlan-id>" for details
Version=2, Intervals: Query=125, Group Age=260, Max Resp=10, Other Qr=255

Unregistered IPv4 Multicast Packets Flooding: Disabled.

VL500: dft V2, vlan cfg active, 0 grp, 0 (*G) cache, no rtr port,
VL600 no snoop: no global or local config
```

History

Release version	Command history
8.0.20	This command was modified to display MCT cluster information.
8.0.30	This command was modified to display flooding information.
8.0.50	The output of this command was updated to include the My Query address field.

show ip ospf interface

Displays information about all or specific OSPF-enabled interfaces.

Syntax

```
show ip ospf interface [ ip address ] [ brief ] [ ethernet unit/slot/port ] [ loopback number ] [ tunnel number ] [ ve vlan_id ]
```

Parameters

ip address

Specifies interface IP address in dotted decimal format.

brief

Displays brief summary information about the specified interface.

ethernet *unit/slot/port*

Specifies an Ethernet interface. Specify the interface ID in the format unit/slot/port-id.

loopback *number*

Specifies a loopback port number in the range of 1 to 255.

tunnel *number*

Specifies a tunnel interface.

ve *vlan_id*

Specifies the VLAN number.

Modes

Privileged EXEC mode

Usage Guidelines

Use the **brief** keyword to limit the display to the following fields:

- Interface
- Area
- IP address
- Cost
- State
- Nbrs(F/C)

Command Output

The **show ip ospf interface** command displays the following information:

This field	Displays
Interface	The type of interface type and the port number or number of the interface.
IP Address	The IP address of the interface.
Area	The OSPF area configured on the interface
Database Filter	The router's configuration for blocking outbound LSAs on an OSPF interface. If Not Configured is displayed, there is no outbound LSA filter configured. This is the default condition.
State	The state of the interface. Possible states include the following: <ul style="list-style-type: none"> • DR - The interface is functioning as the Designated Router for OSPFv2. • BDR - The interface is functioning as the Backup Designated Router for OSPFv2. • Loopback - The interface is functioning as a loopback interface. • P2P - The interface is functioning as a point-to-point interface. • Passive - The interface is up but it does not take part in forming an adjacency. • Waiting - The interface is trying to determine the identity of the BDR for the network. • None - The interface does not take part in the OSPF interface state machine. • Down - The interface is unusable. No protocol traffic can be sent or received on such a interface. • DR other - The interface is a broadcast or NBMA network on which another router is selected to be the DR. • Active - The interface sends or receives all the OSPFv2 control packets and forms the adjacency.
default	Shows whether or not the default passive state is set.
Pri	The interface priority.
Cost	The configured output cost for the interface.
Interface bandwidth	The configured bandwidth on a tunnel interface for routing metric purposes only.
Options	OSPF Options (Bit7 - Bit0): <ul style="list-style-type: none"> • unused:1 • opaque:1 • summary:1 • dont_propagate:1 • nssa:1 • multicast:1 • external route capable:1 • tos:1
Type	The area type, which can be one of the following: <ul style="list-style-type: none"> • Broadcast • Point to Point • non-broadcast • Virtual Link

Show Commands

show ip ospf interface

This field	Displays
Events	OSPF Interface Event: <ul style="list-style-type: none">• Interface_Up = 0x00• Wait_Timer = 0x01• Backup_Seen = 0x02• Neighbor_Change = 0x03• Loop_Indication = 0x04• Unloop_Indication = 0x05• Interface_Down = 0x06• Interface_Passive = 0x07
Timer intervals	The interval, in seconds, of the transmit-interval, retransmit-interval, hello-interval, and dead-interval timers.
DR	The router ID (IPv4 address) of the DR.
BDR	The router ID (IPv4 address) of the BDR.
Neighbor Count	The number of neighbors to which the interface is connected.
Adjacent Neighbor Count	The number of adjacent neighbor routers.
Neighbor:	The IP address of the neighbor.

Examples

This example shows sample output from the **show ip ospf interface** command when the **brief** keyword is used.

```
device# # show ip ospf interface brief
Number of Interfaces is 1
Interface Area IP Addr/Mask Cost State Nbrs(F/C)
eth 1/1/2    0    16.1.1.2/24    1    down 0/0
```

This example displays information about a specified OSPF-enabled VE interface.

```
device# show ip ospf interface ve 20

ve 20  admin up, oper up, ospf enabled, state up
IP Address 21.21.21.22, Area 0
Database Filter: Not Configured
State BDR, Pri 1, Cost 1, Options 2, Type broadcast Events 31
Timers(sec): Transmit 1, Retrans 5, Hello 10, Dead 40
DR:  Router ID 3.3.3.3           Interface Address 21.21.21.21
BDR: Router ID 2.2.2.2           Interface Address 21.21.21.22

          Packets Received      Packets Sent

```

History

Release version	Command history
8.0.30	This command was modified to include configured bandwidth status.

show ip multicast traffic

Displays status information for IGMP snooping traffic.

Syntax

show ip multicast traffic

Modes

User EXEC mode

Command Output

The **show ip multicast traffic** command displays the following information:

Output Field	Description
Q	Query
Qry	General Query
QryV2	Number of general IGMP V2 queries received or sent.
QryV3	Number of general IGMP V3 queries received or sent.
G-Qry	Number of group-specific queries received or sent.
GSQry	Number of group source-specific queries received or sent.
Mbr	The membership report.
MbrV2	The IGMP V2 membership report.
MbrV3	The IGMP V3 membership report.
IsIN	Number of source addresses that were included in the traffic.
IsEX	Number of source addresses that were excluded in the traffic.
ToIN	Number of times the interface mode changed from EXCLUDE to INCLUDE.
ToEX	Number of times the interface mode changed from INCLUDE to EXCLUDE.
ALLO	Number of times that additional source addresses were allowed on the interface.
BLK	Number of times that sources were removed from an interface.
Pkt-Err	Number of packets having errors, such as checksum.
Pimsm-snooping hello, join, prune	Number of PIM sparse hello, join, and prune packets

Examples

The following example shows information for IGMP snooping traffic.

```
device> show ip multicast traffic
IGMP snooping: Total Recv: 22, Xmit: 26
Q: query, Qry: general Q, G-Qry: group Q, GSQry: group-source Q, Mbr: member
Recv   QryV2   QryV3   G-Qry   GSQry   MbrV2   MbrV3   Leave
VL1    0        0        0        0        4        0        0
VL70   18       0        0        0        0        0        0
Recv   IsIN     IsEX     ToIN     ToEX     ALLOW    BLOCK    Pkt-Err
VL1    0        4        0        0        0        0        0
VL70   0        0        0        0        0        0        0
Send   QryV2   QryV3   G-Qry   GSQry   MbrV2   MbrV3
VL1    0        0        8        0        0        0
VL70   0        0        0        0        0        18
VL70   pimsm-snooping, Hello: 12, Join/Prune: 9
```

show ip pim bsr

Displays bootstrap router (BSR) information.

Syntax

```
show ip pim [ all-vrf | vrf vrf-name ] bsr
```

Parameters

all-vrf

Displays information for all VRFs.

vrf vrf-name

Displays information for a specific VRF instance.

bsr

Displays BSR information.

Modes

User EXEC mode

Usage Guidelines

When entered without the **vrf** option, this command displays information for the default VRF instance.

Command Output

The **show ip pim bsr** command displays the following information:

Output Field.	Description
BSR address	The IP address of the interface configured as the PIM Sparse BSR.
BSR priority	The priority assigned to the interface for use during the BSR election process. During BSR election, the priorities of the candidate BSRs are compared and the interface with the highest BSR priority becomes the BSR.
Hash mask length	The number of significant bits in the IP multicast group comparison mask. This mask determines the IP multicast group numbers for which the device can be a BSR. The default is 32 bits, which allows the device to be a BSR for any valid IP multicast group number. NOTE This field appears only if this device is a candidate BSR.

Output Field.	Description
Next bootstrap message in	Indicates how much time will pass before the BSR sends the next bootstrap message. The time is displayed in "hh:mm:ss" format. NOTE This field appears only if this device is the BSR.
Next Candidate-RP-advertisement message in	Indicates how much time will pass before the BSR sends the next candidate PR advertisement message. The time is displayed in "hh:mm:ss" format. NOTE This field appears only if this device is a candidate BSR.
RP	Indicates the IP address of the Rendezvous Point (RP). NOTE This field appears only if this device is a candidate BSR.
group prefixes	Indicates the multicast groups for which the RP listed by the previous field is a candidate RP. NOTE This field appears only if this device is a candidate BSR.
Candidate-RP-advertisement period	Indicates how frequently the BSR sends candidate RP advertisement messages. NOTE This field appears only if this device is a candidate BSR.

Examples

The following example shows information for a device that has been elected as the BSR.

```
device> show ip pim bsr
PIMv2 Bootstrap information for Vrf Instance : default-vrf
-----
This system is the Elected BSR
BSR address: 1.51.51.1. Hash Mask Length 32. Priority 255.
Next bootstrap message in 00:01:00
Configuration:
  Candidate loopback 2 (Address 1.51.51.1). Hash Mask Length 32. Priority 255.
Next Candidate-RP-advertisement in 00:01:00
RP: 1.51.51.1
  group prefixes:
    224.0.0.0 / 4
Candidate-RP-advertisement period: 60
```

Show Commands

show ip pim bsr

The following example shows information for a device that is not the BSR.

```
device(config)# show ip pim bsr
PIMv2 Bootstrap information for Vrf Instance : default-vrf
-----
  BSR address: 1.51.51.1. Hash Mask Length 32. Priority 255.
Next Candidate-RP-advertisement in 00:00:30
  RP: 1.51.51.3
     group prefixes:
     224.0.0.0 / 4
Candidate-RP-advertisement period: 60
```

show ip pim counter nsr

Displays multicast nonstop routing (NSR) counter and statistics information.

Syntax

show ip pim [**vrf** *vrf-name*] **counter nsr**

Parameters

vrf *vrf-name*

Displays information for a VRF instance.

counter nsr

Displays NSR counter and statistics information.

Modes

User EXEC mode

Usage Guidelines

When entered without the **vrf** option, this command displays information for the default VRF instance.

Command Output

The **show ip pim counter nsr** command displays the following information:

Output Field	Description
Mcache sync	The mcache NSR sync queue that carries the NSR sync message for mcache updates.
pack	The number of NSR sync messages that are packed from the active module to the standby module.
unpack	The number of NSR sync messages that are received and unpacked by the standby module.
ack	The number of NSR sync acknowledgements received by the active module.
RPset sync	The RPset sync queue that carries the NSR sync message for RPset update.
BSR status	The BSR status sync queue that carries the NSR sync message for BSR information update.

Show Commands

show ip pim counter nsr

Examples

The following example displays PIM NSR counter and statistic information.

```
device> show ip pim counter nsr
Mcache sync (entity id: 203)
  pack: 0
  unpack: 0
  ack: 0
RPset sync (entity id: 201)
  pack: 0
  unpack: 0
  ack: 0
BSR status (entity id: 202)
  pack: 1
  unpack: 0
  ack: 1
```

show ip pim dense

Displays PIM Dense configuration information.

Syntax

```
show ip pim [ vrf vrf-name ] dense
```

Parameters

vrf *vrf-name*

Specifies information for a VRF instance.

dense

Displays PIM Dense configuration information.

Modes

User EXEC mode

Usage Guidelines

When entered without the **vrf** option, this command displays information for the default VRF instance.

Command Output

The **show ip pim dense** command displays the following information:

Field	Description
Maximum Mcache	The maximum number multicast cache entries allowed on the device.
Current Count	The number of multicast cache entries currently used.
Hello interval	How frequently the device sends hello messages out the PIM dense interfaces.
Neighbor timeout	The interval after which a PIM device will consider a neighbor to be absent.
Join/Prune interval	How long a PIM device will maintain a prune state for a forwarding entry.
Inactivity interval	How long a forwarding entry can remain unused before the device deletes it.
Hardware Drop Enabled	Displays Yes if the Passive Multicast Route Insertion feature is enabled and No if it is not.
Prune Wait Interval	The amount of time a PIM device waits before stopping traffic to neighbor devices that do not want the traffic. The value can be from zero to three seconds. The default is three seconds.
Graft Retransmit interval	The interval between the transmission of graft messages.
Prune Age	The number of packets the device sends using the path through the RP before switching to using the SPT path.

Show Commands

show ip pim dense

Field	Description
Route Precedence	The route precedence configured to control the selection of routes based on the four route types: <ul style="list-style-type: none">• Non-default route from the mRTM• Default route from the mRTM• Non-default route from the uRTM• Default route from the uRTM

Examples

The following example displays PIM Dense configuration information.

```
device> show ip pim dense
```

```
Global PIM Dense Mode Settings
Maximum Mcache           : 12992   Current Count           : 2
Hello interval           : 30      Neighbor timeout        : 105
Join/Prune interval      : 60      Inactivity interval     : 180
Hardware Drop Enabled    : Yes     Prune Wait Interval     : 3
Graft Retransmit interval : 180   Prune Age               : 180
Route Precedence         : mc-non-default mc-default uc-non-default uc-default
```

show ip pim group

Displays PIM group information.

Syntax

```
show ip pim [ vrf vrf-name ] group
```

Parameters

vrf *vrf-name*

Displays information for a VRF instance.

Modes

User EXEC mode

Usage Guidelines

When entered without the **vrf** option, this command displays information for the default VRF instance.

Command Output

The **show ip pim group** command displays the following information:

Output Field	Description
Total number of groups	Lists the total number of IP multicast groups the device is forwarding. NOTE This list can include groups that are not PIM Sparse groups. If interfaces on the device are configured for regular PIM (dense mode), these groups are listed too.
Index	The index number of the table entry in the display.
Group	The multicast group address
Ports	The device ports connected to the receivers of the groups.

Show Commands
show ip pim group

Examples

The following example displays PIM group information.

```
device> show ip pim group
Total number of groups for VRF default-vrf: 7
1   Group 226.0.34.0
    Group member at e1/2/9: v59
    Group member at e1/1/16: v57
2   Group 226.0.77.0
    Group member at e1/2/9: v59
    Group member at e1/1/16: v57
3   Group 226.0.120.0
    Group member at e1/2/9: v59
    Group member at e1/1/16: v57
4   Group 226.0.163.0
    Group member at e1/2/9: v59
    Group member at e1/1/16: v57
5   Group 226.0.206.0
    Group member at e1/2/9: v59
    Group member at e1/1/16: v57
6   Group 226.0.249.0
    Group member at e1/2/9: v59
    Group member at e1/1/16: v57
7   Group 226.0.30.0
    Group member at e1/2/9: v59
    Group member at e1/1/16: v57
```

show ip pim hw-resource

Displays usage and fail-count information for SG entries.

Syntax

```
show ip pim { all-vrf | vrf vrf-name } hw-resource
```

Parameters

all-vrf

Displays information for all VRF instances.

vrf *vrf-name*

Displays information for the specified VRF instance.

Modes

User EXEC mode

Command Output

The **show ip pim hw-resource** command displays the following information:

Output field	Description
VRF	Name of the VRF.
Usage	Number of allocated SG entries in this VRF.
Fail	Number of failures while allocating SG entries in this VRF (due to the system-max limit).
Total usage	Total number of SG entries in the system (all VRFs).
System-max limit for SG entries	Configured system limit for pim-hw-mcache.

Examples

The following sample out from the show ip pim all-vrf hw-resource command displays usage and fail-count information for SG entries on each VRF.

```
device# show ip pim all-vrf hw-resource
VRF          Usage      Fail
default-vrf  3072       8
blue         3072       0
-----
Total usage  6144

System-max limit for SG entries: 6144
```

show ip pim interface

Displays information for PIM interfaces.

Syntax

show ip pim interface { **ethernet** *stackid/slot/port-id* | **loopback** *loopback-number* | **ve** *ve-number* }

Parameters

ethernet *stackid/slot/port-id*

Specifies a physical interface. On standalone devices specify the interface ID in the format slot/port-id; on stacked devices you must also specify the stack ID, in the format stack-id/slot/port-id.

loopback *loopback-number*

Specifies a loopback interface.

ve *ve-number*

Specifies a virtual interface.

Modes

Privileged EXEC mode

Examples

This example displays output from the **show ip pim interface** command, showing that ACL 10 is applied to interface 1/1/9 to control neighbor access.

```
device# show ip pim interface
Flags      : SM - Sparse Mode v2, DM - Dense Mode v2, P - Passive Mode

-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+

Total Number of Interfaces : 9
```

History

Release version	Command history
8.0.20a	This command was modified to display neighbor filter information.

show ip pim mcache

Displays the PIM multicast cache.

Syntax

```
show ip pim [vrf vrf-name ] mcache [ source-address | group-address | counts | dense | [ dit-idx dit-idx | g_entries |  
receiver | sg_entries | sparse | ssm]
```

Parameters

vrf *vrf-name*

Specifies information for a VRF instance.

source-address

Specifies the multicast cache source address.

group-address

Specifies the multicast cache group address.

counts

Specifies the number of entries.

dense

Specifies displaying only the PIM Dense Mode entries.

dit-idx *dit-idx*

Specifies displaying all entries that match a specified downstream interface (DIT).

g_entries

Specifies displaying only the (*, G) entries.

receiver

Specifies displaying all entries that egress a specified interface.

sg_entries

Specifies displaying only the (S, G) entries.

sparse

Specifies displaying only the PIM Sparse Mode entries.

ssm

Specifies displaying only the SSM entries.

Modes

Privileged EXEC mode

Command Output

The **show ip pim mcache** command displays the following information:

Show Commands
show ip pim mcache

Output Field	Description
Total entries in mcache	The total number of PIM mcache entries
MJ	Membership Join
MI	Membership Include
ME	Membership Exclude - Legend for the mcache entry printed once per page, it gives the explanation of each of the flags used in the entry.
BR	Blocked RPT
BA	Blocked Assert
BF	Blocked Filter
BI	Blocked IIF
Uptime	Shows the entry uptime
upstream neighbor	Shows the upstream neighbor for the Source/RP based on the type of entry. For (*,G) it shows the upstream neighbor towards the RP. For (S,G) entries it shows the upstream neighbor towards the source.
Flags	<p>Flags Represent Entry flags in hex format in the braces. And indicates the meaning of the flags set in abbreviated string whose explanations are as below. Only shows the flags which are set.</p> <p>SM - Shows If the entry is created by PIM Sparse Mode</p> <p>DM - Shows If DM mode entry is enabled</p> <p>SSM - Shows If the SSM mode entry is enabled</p> <p>RPT - Shows If the entry is on the rendezvous point (RP)</p> <p>SPT - Shows If the entry is on the source tree</p> <p>LSRC - Shows If the source is in a directly-connected interface</p> <p>LRcv - Shows If the receiver is directly connected to the router</p> <p>REG - if the data registration is in progress</p> <p>L2REG - if the source is directly connected to the router</p> <p>REGSUPP - if the register suppression timer is running</p> <p>RegProbe</p> <p>HW - Shows If the candidate for hardware forwarding is enabled</p> <p>FAST - Shows If the resources are allocated for hardware forwarding</p> <p>TAG - Shows If there is a need for allocating entries from the replication table</p> <p>MSDPADV - Shows If RP is responsible for the source and must be advertised to its peers.</p> <p>NEEDRTE - Shows If there is no route to the source and RP is available</p> <p>PRUNE - Shows If PIM DM Prune to upstream is required</p>
RP	Shows the IP address of the RP.
fast ports	Shows forwarding port mask.
AgeSlitMsk	Shows a value of 1 if the entry is programmed in hardware, and a value of 0 if it is not programmed in hardware.

Output Field	Description
L2 FID	Shows the hardware resource allocated for the traffic switched to receivers in the ingress VLAN.
DIT	Shows the hardware resource allocated for routed receivers.
RegPkt	Shows Count of Packets forwarded due to the Register decapsulation.
Number of matching entries	Shows the total number of mcache entries matching a particular multicast filter specified.
Outgoing interfaces Section	This section consists of three parts. L3 OIFs, L2OIFs and Blocked OIFs. And each section has Format of L3/L2/Blocked followed by (HW/SW) followed by count of the number of OIF in each section. Additionally, each section displays the OIFs one per line. And shows the OIF in the format eth/Tr(Vlan) followed by uptime/ expiry time, followed by the Flags associated with each OIF.
L3	Shows whether the traffic is routed out of the interface.
L2	Shows whether the traffic is switched out of the interface.
HW	Shows whether the entry is hardware forwarded.
SW	Shows whether the entry is software forwarded
Eth/Tr(VL1)	Shows the outgoing interface on the specified VLAN.
Flags (explanation of flags in the OIF section)	Shows the flags set in each of the Outgoing interface in abbreviated string format whose explanations are as below. Legend of this shown at the top of each entry IM - Immediate IH - Inherited MJ - Membership Join MI - Membership Include ME - Membership Exclude BR - Blocked due to SG RPT BA - Blocked due to Assert BF - Blocked due to Filter BI - Blocked IIF (Incoming interface) matches OIF
Src-Vlan	Shows the VLAN associated with the ingress interface.
MCTPEERF - Traffic Forw By Cluster Peer CCEP	Applies only to Layer 3 multicast routing over MCT. This means multicast traffic for this stream is forwarded by cluster peer [remote] CCEP port because of flow load balancing

Examples

This example shows all PIM multicast cache entries:

```
Brocade(config)# show ip pim mcache
IP Multicast Mcache Table
Entry Flags : SM - Sparse Mode, SSM - Source Specific Multicast, DM - Dense Mode
              RPT - RPT Bit, SPT - SPT Bit, LSRC - Local Source, LRCV - Local Receiver
              HW - HW Forwarding Enabled, FAST - Resource Allocated, TAG - Need For
              Replication Entry
              REGPROB - Register In Progress, REGSUPP - Register Suppression Timer
              MSDPADV - Advertise MSDP, NEEDRTE - Route Required for Src/RP, PRUN - DM
              Prune Upstream
Interface Flags: IM - Immediate, IH - Inherited, WA - Won Assert
              MJ - Membership Join, MI - Membership Include, ME - Membership Exclude
              BR - Blocked RPT, BA - Blocked Assert, BF - Blocked Filter, BI - Blocked IIF
Total entries in mcache: 20
1 (140.140.140.3, 225.0.0.1) in v340 (tag e8/1), Uptime 00:00:02

Show Commands
show ip pim mcache

History

Release version	Command history
8.0.50	The output of the command was modified to remove the AvgRate and Profile entries.
8.0.30h	The output of the command was modified to remove the rate counter.
8.0.40a	The output of the command was modified to remove the rate counter.
8.0.30	This command was modified to show output for Layer 3 multicast routing over MCT.

show ip pim neighbor

Displays information about PIM neighbors.

Syntax

```
show ip pim [ vrf vrf-name ] neighbor [ ethernet stack/slot/port | tunnel tunnel-id | ve ve-num ]
```

Parameters

vrf *vrf-name*

Displays information for the specified VRF instance.

ethernet *stack/slot/port*

Displays information for the specified Ethernet interface.

tunnel *tunnel-id*

Displays information for the specified Tunnel interface.

ve *ve-num*

Displays information for the specified VE interface.

Modes

User EXEC mode

Command Output

The **show ip pim neighbor** command displays the following information:

Output Field	Description
Port	The interface through which the device is connected to the neighbor.
Phyport	When there is a virtual interface, this is the physical port to which the neighbor is connected.
Neighbor	The IP interface of the PIM neighbor.
Holdtime sec	Indicates how many seconds the neighbor wants this device to hold the entry for this neighbor in memory. The neighbor sends the Hold Time in Hello packets: <ul style="list-style-type: none"> If the device receives a new Hello packet before the Hold Time received in the previous packet expires, the device updates its table entry for the neighbor. If the device does not receive a new Hello packet from the neighbor before the Hold time expires, the device assumes the neighbor is no longer available and removes the entry for the neighbor.
Age sec	The number of seconds since the device received the last hello message from the neighbor.
UpTime sec	The number of seconds the PIM neighbor has been up. This timer starts when the device receives the first Hello messages from the neighbor.

Show Commands
show ip pim neighbor

Output Field	Description
VRF	The VRF in which the interface is configured. This can be a VRF that the port was assigned to or the default VRF of the device.
Priority	The DR priority that is used in the DR election process. This can be a configured value or the default value of 1.

Examples

The following example shows information about PIM neighbors.

```
device(config)# show ip pim neighbor
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
Port    |PhyPort |Neighbor      |Holdtime|T  |PropDelay|Override |Age  |UpTime  |VRF      |Prio

v2      |e1/1/1  |2.1.1.2      |105     |1  |500      |3000     |0    |00:44:10|default-vrf|1
v4      |e1/2/2  |4.1.1.2      |105     |1  |500      |3000     |10   |00:42:50|default-vrf|1
v5      |e1/1/4  |5.1.1.2      |105     |1  |500      |3000     |0    |00:44:00|default-vrf|1
v22     |e1/1/1  |22.1.1.1     |105     |1  |500      |3000     |0    |00:44:10|default-vrf|1
Total Number of Neighbors : 4
```

show ip pim nsr

Displays the multicast nonstop routing (NSR) status information.

Syntax

```
show ip pim [ vrf vrf-name ] nsr
```

Parameters

vrf *vrf-name*

Specifies information for a VRF instance.

Modes

User EXEC mode

Usage Guidelines

When entered without the **vrf** option, this command displays information for the default VRF instance.

Command Output

The **show ip pim nsr** command displays the following information:

Output Field	Description
NSR	The NSR field indicates whether the ip multicast-nonstop-routing command is enabled (ON) or disabled (OFF).
Switchover in Progress Mode	The Switchover in Progress Mode field indicates whether the multicast traffic is in the middle of a switchover (displaying a TRUE status), or not (displaying a FALSE status).

Examples

The following example displays PIM NSR status information.

```
device> show ip pim nsr
Global Mcast NSR Status
NSR: ON
Switchover In Progress Mode: FALSE
```

show ip pim optimization

Displays PIM optimization information.

Syntax

show ip pim optimization [**dit-idx** | **vlan-fid**]

Parameters

dit-idx

Represents the IPMC index.

vlan-fid

Represents the software VLAN index that stores the Layer 2 OIF sets.

Modes

User EXEC mode

Privileged EXEC mode

Command Output

The **show ip pim optimization** command displays the following information:

Output field	Description
IPMC	The IP multicast entry number.
SetId	Identifies the internal software resource used in sharing (optimizing).
Set	The set manager database ID.
SW-VIDX	The internal software VLAN index used for sharing Layer 2 OIFs.

Examples

The following example displays optimization information for all VRFs.

```
device# show ip pim optimization dit-idx
Displaying Optimization information for all vrfs
Total IPMCs Allocated: 2; Available: 7831; Failed: 0
Index  IPMC      SetId      Users      Set
  1.    374      0x30eb38c8  100  {[VLAN <30>:Port <37/2/2>],}
  2.    363      0x305dd728  100  {[VLAN <30>:Port
<36/1/48>],[VLAN <30>:Port <31/1/48>],
                                         [VLAN <30>:Port <24/1/48>],}
Sharability Coefficient: 99%
```

The following example displays the PIM optimization vlan-fid information.

```
device# show ip pim optimization vlan-fid
Total SW-VIDXs Allocated: 2; Available: 4093; Failed: 0
Index  SW-VIDX      SetId      Users      Set
  1.    1          0x30e98448  1 {Port <37/2/2>,}
  2.    5          0x305d68a0  1 {Port <36/1/48>,Port
<31/1/48>,Port <24/1/48>,}
Sharability Coefficient: 0%
```

History

Release version	Command history
8.0.50	This command was introduced.

show ip pim prune

Displays all multicast cache entries that are currently in a pruned state and have not yet aged out.

Syntax

```
show ip pim [ vrf vrf-name ] prune
```

Parameters

vrf *vrf-name*

Displays information for a specific VRF instance.

Modes

Privileged EXEC mode

Usage Guidelines

When entered without the **vrf** option, this command displays information for the default VRF instance.

Examples

This example shows all multicast cache entries that are currently in a pruned state and have not yet aged out:

```
device> show ip pim prune
 1 (104.1.1.2 231.0.1.1):
 e1/2/2,1/2/2(150)
 2 (108.1.1.100 231.0.1.1):
 e1/2/2,1/2/2(150)
 3 (104.1.1.2 231.0.1.2):
 e1/2/2,1/2/2(150)
 4 (108.1.1.100 231.0.1.2):
 e1/2/2,1/2/2(150)
 5 (108.1.1.100 231.0.1.3):
 e1/2/2,1/2/2(150)
 6 (104.1.1.2 231.0.1.4):
 e1/2/2,1/2/2(150)
 7 (108.1.1.100 231.0.1.4):
 e1/2/2,1/2/2(150)
 8 (104.1.1.2 231.0.1.5):
 e1/2/2,1/2/2(150)
 9 (108.1.1.100 231.0.1.5):
 e1/2/2,1/2/2(150)
Total Prune entries: 9
```

show ip pim resource

Displays the hardware resource information, such as hardware allocation, availability, and limit, for software data structures.

Syntax

show ip pim [**all-vrf** | **vrf** *vrf-name*] **resource**

Parameters

all-vrf

Displays information for all virtual routing and forwarding instances (VRFs).

vrf *vrf-name*

Displays information for a particular VRF instance.

Modes

User EXEC mode

Command Output

The **show ip pim resource** command displays the following information:

Output Field	Description
Num alloc	Number of VRF instances allocated.
System max	Maximum number of VRFs allowed in the system.
Size	Size of one instance of the resource in bytes.
alloc	Number of nodes of that data that are currently allocated in memory.
in-use	Number of allocated nodes in use.
avail	Number of allocated nodes are not in use.
get-fail	Number of allocation failures for this node.
limit	Maximum number of nodes that can be allocated for a data structure. This may or may not be configurable, depending on the data structure
get-mem	Number of successful allocations for this node.
size	Size of the node in bytes.
init	Number of nodes that are allocated during initialization time.

Show Commands

show ip pim resource

Examples

The following example displays output from the **show ip pim resource** command.

```
device> show ip pim resource

show ip pim rp-candidate

Displays candidate rendezvous point (RP) information.

Syntax

```
show ip pim [ vrf vrf-name ] rp-candidate
```

Parameters

vrf *vrf-name*

Displays information for a specific VRF instance.

Modes

User EXEC mode

Usage Guidelines

When used without the **vrf** option, this command displays information for the default VRF.

Command Output

The **show ip pim rp-candidate** command displays the following information:

Output Field	Description
Candidate-RP-advertisement in	How time will pass before the BSR sends the next RP message. The time is displayed in "hh:mm:ss" format. NOTE This field appears only if this device is a candidate RP.
RP	The IP address of the RP. NOTE This field appears only if this device is a candidate RP.
group prefixes	The multicast groups for which the RP listed by the previous field is a candidate RP. NOTE This field appears only if this device is a candidate RP.
Candidate-RP-advertisement period	How frequently the BSR sends candidate RP advertisement messages. NOTE This field appears only if this device is a candidate RP.

Show Commands

show ip pim rp-candidate

Examples

The following example shows information for a candidate RP.

```
device> show ip pim rp-candidate
Next Candidate-RP-advertisement in 00:00:10
RP: 207.95.7.1
  group prefixes:
    224.0.0.0 / 4
Candidate-RP-advertisement period: 60
```

show ip pim rpf

Displays what PIM sees as the best reverse path to the source. While there may be multiple routes back to the source, the one displayed by this command is the one that PIM thinks is best.

Syntax

```
show ip pim [ vrf vrf-name ] rpf ip-address [ group-address ]
```

Parameters

vrf *vrf-name*

Displays information for the specified VRF instance.

ip-address

Specifies the source address for reverse-path forwarding (RPF) check.

group-address

Specifies the group address for reverse-path forwarding (RPF) check.

Modes

User EXEC mode

Examples

This example shows best reverse path to the specified source:

```
device# show ip pim vrf eng rpf 130.50.11.10  
Source 130.50.11.10 directly connected on e1/4/1
```

show ip pim rp-hash

Displays rendezvous-point (RP) information for a PIM Sparse group.

Syntax

```
show ip pim [vrf vrf-name] rp-hash group-addr
```

Parameters

vrf *vrf-name*

Displays information for the specified VRF instance.

Modes

Privileged EXEC mode

Command Output

The **show ip pim rp-hash** command displays the following information:

Output Field	Description
RP	Indicates the IP address of the RP for the specified PIM Sparse group.
Info source	Indicates the source of the RP information. It can be a static-RP configuration or learned via the bootstrap router. If RP information is learned from the boot strap, the BSR IP address is also displayed.

Examples

The following example shows RP information for a PIM Sparse group.

```
device# show ip pim rp-hash 239.255.162.1  
RP: 207.95.7.1, v2  
Info source: 207.95.7.1, via bootstrap
```

show ip pim rp-map

Displays rendezvous-point (RP)-to-group mapping information.

Syntax

show ip pim [vrf *vrf-name*] rp-map

Parameters

vrf *vrf-name*

Displays information for the specified VRF instance.

Modes

User EXEC mode

Command Output

The **show ip pim rp-map** command displays the following information:

Output Field	Description
Group address	Indicates the PIM Sparse multicast group address using the listed RP.
RP address	Indicates the IP address of the RP for the listed PIM Sparse group.

Examples

The following example shows RP-to-group mapping.

```
device> show ip pim rp-map
Number of group-to-RP mappings: 6
Group address      RP address
-----
1 239.255.163.1    99.99.99.5
2 239.255.163.2    99.99.99.5
3 239.255.163.3    99.99.99.5
4 239.255.162.1    99.99.99.5
5 239.255.162.2    43.43.43.1
6 239.255.162.3    99.99.99.5
```

show ip pim rp-set

Displays rendezvous-point (RP)-set list for the device elected as the bootstrap router (BSR).

Syntax

```
show ip pim [ all-vrf | vrf vrf-name ] rp-set
```

Parameters

all-vrf

Displays information for all VRF instances.

vrf *vrf-name*

Displays information for the specified VRF instance.

Modes

User EXEC mode

Command Output

The **show ip pim rp-set** command displays the following information:

Output Field	Description
Number of group prefixes	The number of PIM Sparse group prefixes for which the RP is responsible.
Group prefix	Indicates the multicast groups for which the RP listed by the previous field is a candidate RP.
RPs expected or received	Indicates how many RPs were expected and received in the latest bootstrap message.
RP <i>num</i>	Indicates the RP number. If there are multiple RPs in the PIM Sparse domain, a line of information for each RP is listed, in ascending numerical order.
priority	The RP priority of the candidate RP. During the election process, the candidate RP with the highest priority is elected as the RP.
age	The age (in seconds) of this RP-set.
holdtime	Indicates the time in seconds for which this rp-set information is valid. If this rp-set information is not received from BSR within the holdtime period, the rp-set information is aged out and deleted.

Examples

The following example shows the RP set list for the device elected as BSR.

```
device> show ip pim rp-set
Static RP
-----
Static RP count: 2
1.51.51.4
1.51.51.5
Number of group prefixes Learnt from BSR: 1
Group prefix = 224.0.0.0/4      # RPs: 2
  RP 1: 1.51.51.1    priority=0    age=60    holdtime=150
  RP 2: 1.51.51.3    priority=0    age=30    holdtime=150
```

The following example shows the RP set list for devices that are not elected as BSR.

```
device> show ip pim rp-set
Static RP
-----
Static RP count: 2
1.51.51.4
1.51.51.5
Number of group prefixes Learnt from BSR: 1
Group prefix = 224.0.0.0/4      # RPs expected: 2
  # RPs received: 2
  RP 1: 1.51.51.1    priority=0    age=60    holdtime=150
  RP 2: 1.51.51.3    priority=0    age=30    holdtime=150
```

show ip pim sparse

Displays PIM Sparse configuration information, including whether the hardware-drop feature is enabled or disabled, and information for PIM SSM range ACL configuration.

Syntax

```
show ip pim [ vrf vrf-name ] sparse
```

Parameters

vrf *vrf-name*

Displays information for the specified VRF instance.

Modes

User EXEC mode

Command Output

The **show ip pim sparse** command displays the following information:

Output field	Description
Global PIM Sparse mode settings	
Maximum mcache	Maximum number of multicast cache entries.
Current Count	Number of multicast cache entries used.
Hello interval	How often the device sends IPIM Sparse hello messages to its PIM Sparse neighbors. This field shows the number of seconds between hello messages. PIM Sparse routers use hello messages to discover one another.
Neighbor timeout	Number of seconds the device waits for a hello message from a neighbor before determining that the neighbor is no longer present and is not removing cached PIM Sparse forwarding entries for the neighbor. The default is 105 seconds.
Join or Prune interval	How frequently the device sends IPv6 PIM Sparse Join or Prune messages for the multicast groups it is forwarding. This field shows the number of seconds between Join or Prune messages. The device sends Join or Prune messages on behalf of multicast receivers that want to join or leave a PIM Sparse group. When forwarding packets from PIM Sparse sources, the device sends the packets only on the interfaces on which it has received join requests in Join or Prune messages for the source group.
Inactivity interval	Number of seconds a forwarding entry can remain unused before the router deletes it. The default is 180 seconds.

Output field	Description
Hardware Drop Enabled	Whether hardware drop is enabled or disabled. To prevent unwanted multicast traffic from being sent to the CPU, PIM Routing and Passive Multicast Route Insertion (PMRI) can be used together to ensure that multicast streams are only forwarded out ports with interested receivers and unwanted traffic is dropped in the hardware on Layer 3 Switches.
Prune Wait Interval	Number of seconds a PIM device waits before stopping traffic to neighbor devices that do not want the traffic. The range is 0 to 3 seconds. The default is 3 seconds.
Bootstrap Msg interval	How frequently the BSR configured on the device sends the RP set to the RPs within the PIM Sparse domain. The RP set is a list of candidate RPs and their group prefixes. The group prefix of a candidate RP indicates the range of PIM Sparse group numbers for which it can be an RP. NOTE This field contains a value only if an interface on the device is elected to be the BSR. Otherwise, the field is blank.
Candidate-RP Msg interval	Number of seconds the candidate RP configured on the Layer 3 switch sends candidate RP advertisement messages to the BSR. The default is 60 seconds.
Register Suppress Time	This is the mean interval between receiving a Register-Stop and allowing registers to be sent again. A lower value means more frequent register bursts at RP, while a higher value means longer join latency for new receivers. The default is 60 seconds.
Register Probe Time	Number of seconds the PIM router waits for a register-stop from an RP before it generates another NULL register to the PIM RP. The default is 10 seconds.
Register Stop Delay	Register stop message. The default is 10 seconds.
Register Suppress interval	Number of seconds that it takes the designated router to send a Register-encapsulated date to the RP after receiving a Register-Stop message. The default is 60 seconds.
SSM Enabled	If yes, source-specific multicast is configured globally on this router.
SPT threshold	Number of packets the device sends using the path through the RP before switching to the SPT path. The default is 1 packet.
SSM Group Range	Source-specific multicast group range.
Route Precedence	The route precedence configured to control the selection of routes based on the four route types: <ul style="list-style-type: none"> • Non-default route from the mRTM • Default route from the mRTM • Non-default route from the uRTM • Default route from the uRTM

Examples

The following example displays PIM Sparse configuration information.

```
device> show ip pim sparse
Global PIM Sparse Mode Settings
  Maximum Mcache      : 12992      Current Count          : 0
  Hello interval     : 30          Neighbor timeout      : 105
  Join/Prune interval : 60          Inactivity interval   : 180
  Hardware Drop Enabled : Yes      Prune Wait Interval   : 3
  Bootstrap Msg interval : 60      Candidate-RP Msg interval : 60
  Register Suppress Time : 60      Register Probe Time   : 10
  Register Stop Delay  : 10          Register Suppress interval : 60
  SSM Enabled         : Yes          SPT Threshold         : 1
  SSM Group Range     : 232.0.0.0/8
  Route Precedence    : mc-non-default mc-default uc-non-default uc-default
```

The following example displays PIM Sparse configuration for a VRF instance named my_vrf.

```
device> show ip pim my_vrf sparse
Global PIM Sparse Mode Settings
  Maximum Mcache      : 12992      Current Count          : 0
  Hello interval     : 30          Neighbor timeout      : 105
  Join/Prune interval : 60          Inactivity interval   : 180
  Hardware Drop Enabled : Yes      Prune Wait Interval   : 3
  Bootstrap Msg interval : 60      Candidate-RP Msg interval : 60
  Register Suppress Time : 60      Register Probe Time   : 10
  Register Stop Delay  : 10          Register Suppress interval : 60
  SSM Enabled         : Yes          SPT Threshold         : 1
  SSM Group Range     : 232.0.0.0/8
  Route Precedence    : mc-non-default mc-default uc-non-default uc-default
```

This example shows whether the hardware-drop feature has been enabled or disabled:

```
device> show ip pim sparse
Global PIM Sparse Mode Settings
  Maximum Mcache      : 12992      Current Count          : 0
  Hello interval     : 30          Neighbor timeout      : 105
  Join/Prune interval : 60          Inactivity interval   : 180
  Hardware Drop Enabled : Yes      Prune Wait Interval   : 3
  Bootstrap Msg interval : 60      Candidate-RP Msg interval : 60
  Register Suppress Time : 60      Register Probe Time   : 10
  Register Stop Delay  : 10          Register Suppress interval : 60
  SSM Enabled         : Yes          SPT Threshold         : 1
  SSM Group Range     : 232.0.0.0/8
  Route Precedence    : mc-non-default mc-default uc-non-default uc-default
```

The following example displays information for PIM SSM range ACL configuration.

```
device> show ip pim sparse
Global PIM Sparse Mode Settings
  Maximum Mcache      : 0          Current Count          : 0
  Hello interval     : 30          Neighbor timeout      : 105
  Join/Prune interval : 60          Inactivity interval   : 180
  Register Suppress Time : 60      Register Probe Time   : 10
  SPT Threshold      : 1          Hardware Drop Enabled : Yes
  Bootstrap Msg interval : 60      Candidate-RP Msg interval : 60
  Register Stop Delay  : 60          Register Suppress interval : 60
  SSM Enabled         : Yes
  SSM Group Range     : 224.1.1.1/24
  SSM Group Range ACL : xyz
  Route Precedence    : mc-non-default mc-default uc-non-default uc-default
```

show ip pim traffic

Displays IPv4 PIM traffic statistics.

Syntax

```
show ip pim traffic [ vrf vrf-name ] [ join-prune ] [ rx | tx ]
```

Parameters

vrf *vrf-name*

Specifies information for a VRF instance.

join-prune

Specifies displaying join and prune statistics.

rx

Specifies displaying received PIM traffic statistics.

tx

Specifies displaying transmitted PIM traffic statistics.

Modes

Privileged EXEC mode

Usage Guidelines

PIM control packet statistics for interfaces that are configured for standard PIM are listed first by the display.

Command Output

The **show ip pim traffic** command displays the following information:

Output Field	Description
Port	The port or virtual interface on which the PIM interface is configured.
HELLO	The number of PIM Hello messages sent or received on the interface.
JOIN-PRUNE	The number of Join or Prune messages sent or received on the interface. NOTE Unlike PIM Dense, PIM Sparse uses the same messages for Joins and Prunes.
ASSERT	The number of Assert messages sent or received on the interface.
REGISTER GRAFT (DM)	The number of Register messages sent or received on the interface.

Show Commands
show ip pim traffic

Output Field	Description
REGISTER STOP (SM)	The number of Register Stop messages sent or received on the interface.
BOOTSTRAP MSGS (SM)	The number of bootstrap messages sent or received on the interface.
CAND. RP ADV. (SM)	The total number of Candidate-RP-Advertisement messages sent or received on the interface.
Err	The total number of messages discarded, including a separate counter for those that failed the checksum comparison.

Examples

This example shows PIM join and prune traffic statistics for received and sent packets:

```
device(config)# show ip pim traffic
Port      HELLO      JOIN-PRUNE  ASSERT      REGISTER REGISTER BOOTSTRAP CAND. RP  Err
           GRAFT (DM) STOP (SM)  MSGS (SM)  ADV. (SM)

v30        0         0         0         0         0         0         0         0
v50       2526      1260      0         0         0         1263      0         0
v150      2531      0         0         0         0         1263      0         0
v200      2531      0         0         0         0         1         0         0
Port      HELLO      JOIN-PRUNE  ASSERT      REGISTER REGISTER BOOTSTRAP CAND. RP  Err
           GRAFT (DM) STOP (SM)  MSGS (SM)  ADV. (SM)
-----+-----+-----+-----+-----+-----+-----+-----+
           Tx      Tx      Tx      Tx      Tx      Tx      Tx
-----+-----+-----+-----+-----+-----+-----+
v30       2528      0         0         0         0         0         0
v50       2540      1263      0         0         0         2         0
v150      2529      0         0         0         0         1262      0
v200      2529      0         0         0         0         1262      0
```

This example shows the number of received IPv4 PIM Hello packets dropped on interface 1/1/9 because an ACL to control neighbor access is configured on it.

```
device# show ip pim traffic rx
Port      HLO      JN-PRNE  ASSERT REG      REG      BTSTRP  CAND RP  Err
           GRAFT (DM) STOP (SM)  MSGS (SM)  ADV. (SM)
-----+-----+-----+-----+-----+-----+-----+-----+
           Rx      Rx      Rx      Rx      Rx      Rx      Rx
-----+-----+-----+-----+-----+-----+-----+
e1/1/1    0         0         0         0         0         0         0
e1/1/9    764      0         0         0         0         0         0       757
e1/1/12   0         0         0         0         0         0         0
v20       758      0         0       1916      0         0         0
v60       0         0         0         0         0         0         0
v310     0         0         0         0         0         0         0
v360     0         0         0         0         0         0         0
```

This example shows PIM join and prune traffic statistics for sent packets:

```
device(config)# show ip pim traffic tx
Port      HELLO      JOIN-PRUNE  ASSERT      REGISTER REGISTER BOOTSTRAP CAND. RP  Err
           GRAFT (DM) STOP (SM)  MSGS (SM)  ADV. (SM)
-----+-----+-----+-----+-----+-----+-----+-----+
           Tx      Tx      Tx      Tx      Tx      Tx      Tx
-----+-----+-----+-----+-----+-----+-----+
v30       2528      0         0         0         0         0         0
v50       2540      1263      0         0         0         2         0
v150      2529      0         0         0         0         1262      0
v200      2530      0         0         0         0         1262      0
```

This example shows PIM join and prune traffic statistics.

```
device(config)# show ip pim traffic join-prune
Port Packet      Join      Prune      Avg Aggr  Last Aggr
-----+-----+-----+-----+-----+-----
      Rx      Rx      Rx      Rx      Rx

v50  1264       1263       1          1          1
v150  0          0          0          0          0
v200  0          0          0          0          0
```

History

Release version	Command history
8.0.20a	This command was modified to display, in the Err column, received Hello packets dropped on an interface because of an ACL to control neighbor access.

show ip pimsm-snooping cache

Displays the downstream PIM join/prune information for both source-path tree (SPT) and rendezvous-point tree (RPT).

Syntax

```
show ip pimsm-snooping cache [ vlan vlan-id ] ip-address [ resources ]
```

Parameters

ip-address

Specifies the IP address.

vlan *vlan-id*

Specifies snooping for a VLAN.

resources

Specifies PIM SM snooping resources.

Modes

Privileged EXEC mode

Usage Guidelines

Use the **show ip pimsm-snooping cache** command to check and verify the outgoing interfaces (OIFs) added by pimsm-snooping module.

Command Output

The **show ip pimsm-snooping cache** command displays the following information:

Output field	Description
SG	(s,g) downstream fsm state for SPT.
G	(*g) downstream fsm state for RPT

The **show ip pimsm-snooping cache** command displays the following information only when multi-chassis trunking (MCT) is enabled on the VLAN:

Output field	Description
CCEP	Cluster client edge port
CEP	Cluster edge port
Remote/Local	Join/Prune received on MCT peer or local

Examples

The following example shows PIM SM information when there is no traffic and the last-hop router (LHR) has joined the RPT. Only an (*,G) entry is created.

```
Device1#show ip pimsm-snooping cache
OIF Info:
TR - OIF Belongs to Trunk/LAG, Primary port is displayed
SG - (*,g)/(s,g) downstream fsm state:
  NI : No Info, J : Join, PP : Prune Pending, CLEAN : cleanup in progress
RPT - (s,g,rpt) downstream fsm state:
  NI : No Info, P : Pruned, PP : Prune Pending, Px : Temp step in (*,G)
  join processing, PPx : Temp State in (*,G) processing, CLEAN : cleanup
  in progress.

PIMSM Snoop cache for vlan 503
1 (* 225.1.1.1) Up Time: 5d 18:38:32
  OIFs: 2
  TR(e4/5) G : J(197) ET: 210, Up Time: 5d 18:38:32 , CCEP, Remote
  TR(e4/23) G : J(166) ET: 210, Up Time: 1d 19:36:23 , CEP, Local
```

The following example shows PIM SM information when there is traffic from source 30.0.0.10. An (S,G) entry is created and the LHR has joined the SPT.

```
Device2#show ip pimsm-snooping cache
OIF Info:
TR - OIF Belongs to Trunk/LAG, Primary port is displayed
SG - (*,g)/(s,g) downstream fsm state:
  NI : No Info, J : Join, PP : Prune Pending, CLEAN : cleanup in progress
RPT - (s,g,rpt) downstream fsm state:
  NI : No Info, P : Pruned, PP : Prune Pending, Px : Temp step in (*,G)
  join processing, PPx : Temp State in (*,G) processing, CLEAN : cleanup
  in progress.

1 (* 225.1.1.1) Up Time: 5d 18:44:28
  OIFs: 2
  TR(e4/5) G : J(195) ET: 210, Up Time: 5d 18:44:28 , CCEP, Remote
  TR(e4/23) G : J(170) ET: 210, Up Time: 1d 19:42:18 , CEP, Local

2 (30.0.0.10 225.1.1.1) Up Time: 00:00:58
  OIFs: 2
  TR(e4/5) SG : J(202) ET: 210, Up Time: 00:00:58 , CCEP, Remote
  TR(e4/23) SG : J(168) ET: 210, Up Time: 00:00:58 , CEP, Local
```

The following example shows PIM SM resource information.

```
Device#show ip pimsm-snooping resources
          alloc in-use avail get-fail   limit  get-mem  size init
pimsm group entry      1000    10   990     0  232000    10   61 1000
pimsm source entry     2000    20  1980     0  464000    40   65 2000
pimsm oif entry         2000    30  1970     0  464000    59   89 2000

Total memory in used: 369000 bytes
```

show ip reverse-path-check

Displays the global unicast Reverse Path Forwarding settings.

Syntax

show ip reverse-path-check

Modes

Privileged EXEC mode

Usage Guidelines

Command Output

The **show ip reverse-path-check** command displays the following information.

Output field	Description
CLI config	The command line configured on the device after device bootup.
Current state	The mode set during device bootup. This takes effect only after reload.

Examples

The following example shows the uRPF settings on ICX 7750 devices.

```
device# show ip reverse-path-check
Global uRPF Settings:
CLI config : Enabled
Current State : Enabled
```

History

Release version	Command history
08.0.30	This command was introduced.
8.0.40	Removed show output for the ICX 6610 device.

show ip reverse-path-check interface

Displays unicast Reverse Path Forwarding settings at the interface level on ICX devices.

Syntax

show ip reverse-path-check interface

Modes

Privileged EXEC mode

Usage Guidelines

Use this command to display the interface level unicast Reverse Path Forward settings such as the uRPF mode and whether uRPF excludes the default route for uRPF source IP lookup. Use the **show ip interface ethernet** command to view details about the interface level RPF mode configuration.

Command Output

The **show ip reverse-path-check interface** command displays the following information.

Output field	Description
Interface	The interface number.
uRPF mode	The uRPF mode enabled.
uRPF exclude default	Yes specifies that the exclude default option is enabled, while No specifies that the exclude default option is not enabled on the interface.

Examples

The following example shows the interface level uRPF settings on ICX devices.

```
device# show ip reverse-path-check interface
-----
Interface          uRPF mode          uRPF Exclude default
-----
Eth 1/1/11         Strict              No
```

History

Release version	Command history
08.0.30	This command was introduced.

show ip rip

Displays RIP filters.

Syntax

show ip rip

Modes

Privileged-EXEC mode

Command Output

The **show ip rip** command displays the following information:

Output field	Description
RIP Summary area	Shows the current configuration of RIP on the device.
Static metric	Shows the static metric configuration. "Not defined" means the route map has not been distributed.
OSPF metric	Shows what OSPF route map has been applied.
Neighbor Filter Table area	
Index	The filter number. You assign this number when you configure the filter.
Action	The action the Brocade device takes for RIP route packets to or from the specified neighbor: deny - If the filter is applied to an interface's outbound filter group, the filter prevents the Brocade device from advertising RIP routes to the specified neighbor on that interface. If the filter is applied to an interface's inbound filter group, the filter prevents the Brocade device from receiving RIP updates from the specified neighbor. permit - If the filter is applied to an interface's outbound filter group, the filter allows the Brocade device to advertise RIP routes to the specified neighbor on that interface. If the filter is applied to an interface's inbound filter group, the filter allows the Brocade device to receive RIP updates from the specified neighbor.
Neighbor IP Address	The IP address of the RIP neighbor.

Examples

The following example shows the current configuration of RIP on a device with a neighbor filter table configured to deny routes from source IP address 10.11.222.25.

```
device# show ip rip
RIP Summary
Default port 520
Administrative distance is 120
Updates every 30 seconds, expire after 180
Holddown lasts 180 seconds, garbage collect after 120
Last broadcast 29, Next Update 27
Need trigger update 0, Next trigger broadcast 1
Minimum update interval 25, Max update Offset 5
Split horizon is on; poison reverse is off
Import metric 1
Prefix List, Inbound : block_223
Prefix List, Outbound : block_223
Route-map, Inbound : Not set
Route-map, Outbound : Not set
Redistribute: CONNECTED Metric : 0 Routemap : Not Set

RIP Neighbor Filter Table
  Index  Action  Neighbor IP Address
    1    deny   10.11.222.55
    5    permit  any
```

show ip rip interface

Displays RIP filters for a specific interface.

Syntax

```
show ip rip interface [ ethernet unit/slot/port | lag number | ve number ]
```

Parameters

ethernet *unit / slot / port*

Designates an Ethernet interface for which RIP filters are displayed.

lag *number*

Designates the LAG for which RIP filters are displayed.

ve *number*

Designates a virtual Ethernet interface for which RIP filters are displayed.

Modes

Privileged EXEC mode

Command Output

The **show ip rip interface** command displays the following information:

Output field	Description
RIP mode: Version x	Specifies RIP version 1, version 2, or version 1-2 compatible.
Running: True/False	Indicates whether RIP protocol is active on the interface.
Route summarization	Indicates whether route summarization is enabled or disabled.
Split horizon is on/off; poison reverse is on/off	Indicates whether split horizon or poison reverse is enabled.
Default routes	Indicates whether default routes are accepted or not.
Metric-offset, Inbound	Indicates whether a value has been added to the metric for incoming (learned) routes.
Metric-offset, Outbound	Indicates whether a value has been added to the metric for outgoing (advertised) routes.
Prefix List, Inbound	Indicates whether a prefix list is applied to incoming routes.
Prefix List, Outbound	Indicates whether a prefix list is applied to outgoing routes.
Route-map, Inbound	Indicates whether a route-map is applied to incoming routes.
Route-map, Outbound	Indicates whether a route-map is applied to outgoing routes.
RIP Sent/Receive packet statistics	Provides number of requests and responses sent or received.
RIP Error packet statistics	Provides number of error packets by category: Rejected, Version, Response format, Address family, Metric, or Request format.

Examples

The following sample output shows that Ethernet interface 1/1/1 is running RIP Version 2 without prefix lists or route-maps and is adding 1 to the metric for learned RIP routes.

```
device# show ip rip interface ethernet 1/1/1
Interface e 1/1/1
RIP Mode : Version2 Running: TRUE
Route summarization disabled
Split horizon is on; poison reverse is off
Default routes not accepted
Metric-offset, Inbound 1
Metric-offset, Outbound 0
Prefix List, Inbound : Not set
Prefix List, Outbound : Not set
Route-map, Inbound : Not set
Route-map, Outbound : Not set
RIP Sent/Receive packet statistics:
Sent : Request 2 Response 34047
Received : Total 123473 Request 1 Response 123472 UnRecognised 0
RIP Error packet statistics:
Rejected 0 Version 0 RespFormat 0 AddrFamily 0
Metric 0 ReqFormat 0
```

show ip rip route

Displays RIP route information for a device or a specific interface.

Syntax

show ip rip route [*ip-address* | *ip-address / L*]

Parameters

ip-address

Specifies the IP address, in the format A.B.C.D, for which RIP routes are displayed.

ip-address / L

Specifies the IP address prefix and mask, in the format A.B.C.D/L, where "L" is the mask length. Information is displayed for IP addresses matching the mask.

Modes

Privileged EXEC mode

Command Output

The **show ip rip route** command displays the following information:

Output field	Description
RIP Routing Table - nn entries	Indicates the number of routes in the device's routing table.
RIP route designation	Designates each route by CIDR designation, originating IP address, and interface.
RIP route settings	For each designated route, indicates protocol, metric setting, tag, and non-default timer settings.

Examples

The following example shows RIP route information for the device.

```
device# show ip rip route
RIP Routing Table - 474 entries:
1.1.1.1/32, from 169.254.30.1, e 1/1/23 (820)
RIP, metric 4, tag 0, timers: aging 13
1.1.2.1/32, from 169.254.50.1, e 1/3/1 (482)
RIP, metric 3, tag 0, timers: aging 42
1.1.6.1/32, from 169.254.100.1, ve 101 (413)
RIP, metric 2, tag 0, timers: aging 42
169.254.40.0/24, from 192.168.1.2, e 1/1/1 (1894)
RIP, metric 3, tag 0, timers: aging 14
169.254.50.0/24, from 192.168.1.2, e 1/1/1 (1895)
RIP, metric 4, tag 0, timers: aging 14
169.254.100.0/24, from 192.168.1.2, e 1/1/1 (2040)
RIP, metric 2, tag 0, timers: aging 14
169.254.101.0/30, from 192.168.1.2, e 1/1/1 (2105)
223.229.32.0/31, from 169.254.50.1, e 1/3/1 (818)
RIP, metric 2, tag 0, timers: aging 21
```

show ip route

Displays the IP route table information.

Syntax

```
show ip route [ vrf vrf-name ] [ ip-addr | num | bgp | direct | ospf | rip | static | summary ]
```

Parameters

vrf *vrf-name*

Displays VRF routes.

ip-addr

Displays information for the subnet mask.

num

Displays route starting from index.

bgp

Displays BGP routes.

direct

Displays directly attached routes.

ospf

Displays OSPF routes.

rip

Displays RIP routes.

static

Displays static IP routes.

summary

Displays route summary.

Modes

User EXEC mode

Command Output

The **show ip route** command displays the following information:

Output field	Description
Destination	The destination network of the route.
Cost	The route's cost.

Show Commands

show ip route

Output field	Description
Type	<p>The route type, which can be one of the following:</p> <ul style="list-style-type: none">• B - The route was learned from BGP.• D - the destination is directly connected to this Ruckus device.• R - The route was learned from RIP.• S - The route is a static route.• * - The route is a candidate default route.• O - The route is an OSPF route. Unless you use the OSPF option to display the route table, 'O' is used for all OSPF routes. If you do not use the OSPF option, the following type codes are used:<ul style="list-style-type: none">- O - OSPF intra area route (within the same area.)- IA - The route is an OSPF inter area route (a route that passes from one area in another area.)- E1 - The route is an OSPF external type 1 route.- E2 - The route is an external type 2 route.

Examples

The following example shows the **show ip route** command:

```
device# show ip route
Total number of IP routes: 2
Type Codes - B:BGP D:Connected O:OSPF R:RIP S:Static; Cost - Dist/Metric
BGP Codes - i:iBGP e:eBGP
OSPF Codes - i:Inter Area 1:External Type 1 2:External Type 2
  Destination      Gateway          Port           Cost           Type    Uptime
1      0.0.0.0/0        10.25.224.1    e mgmt1        254/1          S       8d6h
2      10.25.224.0/24   DIRECT         e mgmt1         0/0            D       6h39
```

show ip source-guard

Displays the learned IP addresses for IP Source Guard ports.

Syntax

show ip source-guard ethernet *stack-id/slot/port*

Parameters

ethernet*stack-id/slot/port*

Specifies the Ethernet interface.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Command Output

The **show ip source-guard** command displays the following information:

Output field	Description
Interface	Displays the interface number for source guard entries learnt or configured statically.
Type	Displays the interface type - IP.
Filter mode	Displays the filter mode - active or inactive.
IP-address	The dynamically learned or statically configured address.
VLAN	Specifies the VLAN number.
Static	All the static source guard entries configured are populated as "Yes".

Examples

The following output displays the learned IP addresses for IP Source Guard ports.

```
device# show ip source-guard e 1/1/48
Total IP Source Guard entries on port 1/1/48: 33
No      Interface          Type   Flter-mode   IP-address      Vlan   Static
--      -
1       1/1/9*4/1/39       ip     active       15.15.15.127   1      Yes
2       1/1/9*4/1/39       ip     active       15.15.15.9     1      No
3       1/1/9*4/1/39       ip     active       15.15.15.10    1      No
4       1/1/9*4/1/39       ip     active       15.15.15.11    1      No
5       1/1/9*4/1/39       ip     active       15.15.15.12    1      No
6       1/1/9*4/1/39       ip     active       15.15.15.13    1      No
7       1/1/9*4/1/39       ip     active       15.15.15.14    1      No
8       1/1/9*4/1/39       ip     active       15.15.15.15    1      No
9       1/1/9*4/1/39       ip     active       15.15.15.16    1      No
10      1/1/9*4/1/39       ip     active       15.15.15.17    1      No
```

Show Commands
show ip source-guard

History

Release version	Command history
08.0.50	The output of this command was modified for static source guard entries.

show ip ssh

Displays SSH connections details.

Syntax

show ip ssh [config]

Parameters

config

Displays the SSH configuration details.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Command Output

The **show ip ssh** command displays the following information:

Output field	Description
Inbound	Connections listed under this heading are inbound.
Outbound	Connections listed under this heading are outbound.
Connection	The SSH connection ID.
Version	The SSH version number.
Encryption	The encryption method used for the connection.
Username	The username for the connection.
HMAC	The HMAC version.
Server Hostkey	The type of server host key. This can be DSA or RSA.
IP Address	The IP address of the SSH client.
SSH-v2.0 enabled	Indicates that SSHv2 is enabled.
hostkey	Indicates that at least one host key is on the device. It is followed by a list of the host key types and modulus sizes.

The **show ip ssh config** command displays the following information:

Output field	Description
SSH server	SSH server is enabled or disabled.
SSH port	SSH port number.

Show Commands

show ip ssh

Output field	Description
Encryption	The encryption used for the SSH connection. The following values are displayed when AES only is enabled: <ul style="list-style-type: none">AES-256, AES-192, and AES-128 indicate the different AES methods used for encryption.3-DES indicates 3-DES algorithm is used for encryption
Permit empty password	Empty password login is allowed or not allowed.
Authentication methods	The authentication methods used for SSH. The authentication can have one or more of the following values: <ul style="list-style-type: none">Password - Indicates that you are prompted for a password when attempting to log into the device.Public-key - Indicates that DSA or RSA challenge-response authentication is enabled.Interactive - Indicates the interactive authentication is enabled.
Authentication retries	The number of authentication retries. This number can be from 1 through 5.
Login timeout (seconds)	SSH login timeout value in seconds. This can be from 0 through 120.
Idle timeout (minutes)	SSH idle timeout value in minutes. This can be from 0 through 240.
Strict management VRF	Strict management VRF is enabled or disabled.
SCP	SCP is enabled or disabled.
SSH IPv4 clients	The list of IPv4 addresses to which SSH access is allowed. The default is "All".
SSH IPv6 clients	The list of IPv6 addresses to which SSH access is allowed. The default is "All".
SSH IPv4 access-list	The IPv4 ACL used to permit or deny access using SSH.
SSH IPv6 access-list	The IPv6 ACL used to permit or deny access using SSH.

Examples

The following example displays sample output of the **show ip ssh** command.

```
device# show ip ssh
Connection  Version  Encryption  Username  HMAC      Server Hostkey  IP Address
Inbound:
1          SSH-2    3des-cbc    Raymond   hmac-sha1  ssh-dss         10.120.54.2
Outbound:
6          SSH-2    aes256-cbc  Steve     hmac-sha1  ssh-dss         10.37.77.15
SSH-v2.0 enabled; hostkey: DSA(1024), RSA(2048)
```

The following example displays sample output of the **show ip ssh config** command.

```
device# show ip ssh config
SSH server : Disabled
SSH port : tcp\22
Host Key :
Encryption : AES-256, AES-192, AES-128, 3-DES
Permit empty password : No
Authentication methods : Password, Public-key, Interactive
Authentication retries : 3
Login timeout (seconds) : 120
Idle timeout (minutes) : 0
SCP : Enabled
SSH IPv4 clients : All
SSH IPv6 clients : All
SSH IPv4 access-group :
SSH IPv6 access-group :
SSH Client Keys :
```

show ip ssl

Displays SSL connection details.

Syntax

show ip ssl certificate

Parameters

certificate

Displays the SSL certificate details.

Modes

Privileged EXEC mode

Global configuration mode

Examples

The following example displays the output of the **show ip ssl** command.

```
device(config)#show ip ssl
Session Protocol Source IP      Source Port  Remote IP    Remote Port
1          TLS_1_2  10.20.157.102  634         10.25.105.201  60892
```

The following example displays the SSL certificate details.

```
device(config)#show ip ssl certificate

show ip static-arp

Displays the static ARP entries along with static inspect ARP entries.

Syntax

show ip static-arp

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Usage Guidelines

The display index for static inspect ARP entries is not be displayed in the command output.

Command Output

The **show ip static-arp** command displays the following information:

Output field	Description
Static ARP table size	The maximum number of static ARP entries that can be configured. The default value is 512, and can be changed to 1024 using the max-static-inspect-arp-entries command.

Examples

The following example displays the static ARP.

```
device# show ip static-arp
Static ARP table size: 512, configurable from 512 to 1024
Index   IP Address      MAC Address      Port
1       207.95.6.111    0800.093b.d210  1/1/1
3       207.95.6.123    0800.093b.d211  1/1/1
-       1.1.1.1         0800.0000.0001  Invalid
```

History

Release version	Command history
08.0.30b	This command was modified. The output does not display the index for static inspect ARP entries.

show ip static mroute

Displays information for configured multicast routes.

Syntax

show ip static mroute [**vrf** *vrf-name*] *ip-subnet mask*]

Parameters

vrf *vrf-name*

Specifies an optional VRF route.

ip-subnet mask

Specifies an IP address and an optional address mask.

Modes

Privileged EXEC mode

Usage Guidelines

Only resolved and best static mroutes are added to the mRTM table. These routes are prefixed with an asterisk in the output from the **show ip static mroute** command.

Examples

The following example displays information for configured multicast routes:

```
Device(config)# show ip static mroute
IP Static Routing Table - 2 entries:
  IP Prefix      Next Hop      Interface    Dis/Metric/Tag  Name
*20.20.20.0/24  220.220.220.1 -             1/1/0
20.20.20.0/24   50.50.50.2   -             1/2/0
21.21.21.0/24   1.2.3.4      -             1/1/0
```

History

Release version	Command history
8.0.10a	This command was introduced.

show ip traffic

Displays IP traffic statistics.

Syntax

show ip traffic

Modes

User EXEC mode

Command Output

The **show ip traffic** command displays the following information:

Output field	Description
IP statistics	
received	The total number of IP packets received by the device.
sent	The total number of IP packets originated and sent by the device.
fragmented	The total number of IP packets fragmented by this device to accommodate the MTU of this device or of another device.
reassembled	The total number of fragmented IP packets that this device re-assembled.
bad header	The number of IP packets dropped by the device due to a bad packet header.
no route	The number of packets dropped by the device because there was no route.
unknown proto	The number of packets dropped by the device because the value in the Protocol field of the packet header is unrecognized by this device.
no buffer	This information is used by Ruckus customer support.
other errors	The number of packets that this device dropped due to error types other than the types listed above.
ICMP statistics	
The ICMP statistics are derived from RFC 792, "Internet Control Message Protocol", RFC 950, "Internet Standard Subnetting Procedure", and RFC 1256, "ICMP Router Discovery Messages". Statistics are organized into Sent and Received. The field descriptions below apply to each.	
total	The total number of ICMP messages sent or received by the device.
errors	This information is used by Ruckus customer support.
unreachable	The number of Destination Unreachable messages sent or received by the device.
time exceed	The number of Time Exceeded messages sent or received by the device.
parameter	The number of Parameter Problem messages sent or received by the device.
source quench	The number of Source Quench messages sent or received by the device.
redirect	The number of Redirect messages sent or received by the device.
echo	The number of Echo messages sent or received by the device.
echo reply	The number of Echo Reply messages sent or received by the device.
timestamp	The number of Timestamp messages sent or received by the device.
timestamp reply	The number of Timestamp Reply messages sent or received by the device.

Output field	Description
addr mask	The number of Address Mask Request messages sent or received by the device.
addr mask reply	The number of Address Mask Replies messages sent or received by the device.
irdp advertisement	The number of ICMP Router Discovery Protocol (IRDP) Advertisement messages sent or received by the device.
irdp solicitation	The number of IRDP Solicitation messages sent or received by the device.
UDP statistics	
received	The number of UDP packets received by the device.
sent	The number of UDP packets sent by the device.
no port	The number of UDP packets dropped because the packet did not contain a valid UDP port number.
TCP statistics	
The TCP statistics are derived from RFC 793, "Transmission Control Protocol".	
input errors	
This information is used by Ruckus customer support.	
current active tcbs	The number of TCP Control Blocks (TCBs) that are currently active.
tcbs allocated	The number of TCBs that have been allocated.
tcbs freed	The number of TCBs that have been freed.
tcbs protected	This information is used by Ruckus customer support.
active opens	The number of TCP connections opened by this device by sending a TCP SYN to another device.
passive opens	The number of TCP connections opened by this device in response to connection requests (TCP SYNs) received from other devices.
failed attempts	This information is used by Ruckus customer support.
active resets	The number of TCP connections this device reset by sending a TCP RESET message to the device at the other end of the connection.
passive resets	The number of TCP connections this device reset because the device at the other end of the connection sent a TCP RESET message.
input errors	This information is used by Ruckus customer support.
in segments	The number of TCP segments received by the device.
out segments	The number of TCP segments sent by the device.
retransmission	The number of segments that this device retransmitted because the retransmission timer for the segment had expired before the device at the other end of the connection had acknowledged receipt of the segment.

Examples

The following is sample output from the **show ip traffic** command.

```
device# show ip traffic
IP Statistics
 875327 received, 120 sent, 0 forwarded
 0 filtered, 0 fragmented, 0 reassembled, 0 bad header
 0 no route, 0 unknown proto, 0 no buffer, 32124 other errors

ARP Statistics
553661 total rcv, 538907 req rcv, 78 req sent, 137 rep sent
 0 pending drop, 0 invalid source, 0 invalid dest
 0 mis-match dst-mac, 0 mis-match ip addr, 0 mis-match src-mac

ICMP Statistics
Received:
 1 total, 0 errors, 0 unreachable, 0 time exceed
 0 parameter, 0 source quench, 0 redirect, 1 echo,
 0 echo reply, 0 timestamp, 0 timestamp reply, 0 addr mask
 0 addr mask reply, 0 irdp advertisement, 0 irdp solicitation
Sent:
 1 total, 0 errors, 0 unreachable, 0 time exceed
 0 parameter, 0 source quench, 0 redirect, 0 echo,
 1 echo reply, 0 timestamp, 0 timestamp reply, 0 addr mask
 0 addr mask reply, 0 irdp advertisement, 0 irdp solicitation

UDP Statistics
 42046 received, 119 sent, 41930 no port, 0 input errors

TCP Statistics
 0 active opens, 0 passive opens, 0 failed attempts
 0 active resets, 0 passive resets, 0 input errors
 0 in segments, 0 out segments, 0 retransmission
```

show ip tunnel traffic

Displays the link status of the tunnel and the number of keepalive packets received and sent on the tunnel.

Syntax

show ip tunnel traffic

Modes

User EXEC mode

Command Output

The **show ip tunnel traffic** command displays the following information:

Output field	Description
Tunnel Status	Indicates whether the tunnel is up or down. Possible values are: <ul style="list-style-type: none"> Up/Up - The tunnel and line protocol are up. Up/Down - The tunnel is up and the line protocol is down. Down/Up - The tunnel is down and the line protocol is up. Down/Down - The tunnel and line protocol are down.
Packet Received	The number of packets received on the tunnel since it was last cleared by the administrator.
Packet Sent	The number of packets sent on the tunnel since it was last cleared by the administrator.
KA rcv	The number of keepalive packets received on the tunnel since it was last cleared by the administrator.
KA sent	The number of keepalive packets sent on the tunnel since it was last cleared by the administrator.

Examples

The following output from the **show ip tunnel traffic** command displays the link status of the tunnel and the number of keepalive packets received and sent on the tunnel.

```
device# show ip tunnel traffic
IP GRE Tunnels
Tunnel  Status      Packet Received  Packet Sent  KA rcv  KA sent
1       up/up        362              0            362     362
3       up/up        0                0            0       0
10      down/down    0                0            0       0
```

show ip vrrp

Displays information about IPv4 Virtual Router Redundancy Protocol (VRRP) sessions.

Syntax

```
show ip vrrp [ brief ]  
show ip vrrp [ ethernet slot/port | ve num ]  
show ip vrrp [ statistics [ ethernet slot/port | ve num ] ]  
show ip vrrp [ ve num [ vrid VRID ] ]  
show ip vrrp [ vrid VRID [ ethernet slot/port | ve num ] ]
```

Parameters

brief

Displays summary information about the VRRP session.

ethernet slot port

Displays IPv4 VRRP information only for the specified port. A forward slash "/" must be entered between the *slot* and *port* variables.

statistics

Displays statistical information about the VRRP session.

ve num

Displays IPv4 VRRP information only for the specified virtual Ethernet port.

vrid VRID

Displays IPv4 VRRP information only for the specified virtual-group ID.

Modes

User EXEC mode

Usage Guidelines

Use this command to display information about IPv4 VRRP sessions, either in summary or full-detail format. You can also specify a virtual group or interface for which to display output.

This command supports IPv4 VRRP. You can modify or redirect the displayed information by using the default Linux tokens (`|`, `>`).

Command Output

The **show ip vrrp** command displays the following information.

Output field	Description
Total number of VRRP routers defined	The total number of virtual routers configured and currently running on this Brocade device. For example, if the Brocade device is running VRRP-E, the total applies only to VRRP-E routers.
Interface	The interface on which VRRP or VRRP-E is configured. If VRRP or VRRP-E is configured on multiple interfaces, information for each interface is listed separately.
VRID	The ID of the virtual router configured on this interface. If multiple virtual routers are configured on the interface, information for each virtual router is listed in a separate row.
Current Priority	The current VRRP or VRRP-E priority of this Brocade device for the virtual router.
Flags Codes	Whether the backup preempt mode is enabled and which version of VRRP is enabled. If the backup preempt mode is enabled, this field contains a "P". If the mode is disabled, this field is blank. <ul style="list-style-type: none"> P:Preempt 2:V2—VRRP Version 2 3:V3—VRRP Version 3 S:Short-Path-Fwd—Short-path forwarding is enabled
State	This Brocade device's VRRP state for the virtual router. The state can be one of the following: <ul style="list-style-type: none"> Init—The virtual router is not enabled (activated). If the state remains Init after you activate the virtual router, make sure that the virtual router is also configured on the other routers and that the routers can communicate with each other. If the state is Init and the mode is incomplete, make sure that you have specified the IP address for the virtual router. Backup—This Brocade device is a backup for the virtual router. Master—This Brocade device is the master for the virtual router.
Master IP Address	The IP address of the router interface that is currently the Master for the virtual router. If the IP address is assigned on this device, "Local" is displayed here.
Backup IP Address	The IP addresses of the router interfaces that are currently backups for the virtual router. If the IP address is not known in the routing table, "Unknown" is displayed here.
Virtual IP Address	The virtual IP address that is being backed up by the virtual router.

Examples

The following example displays VRRP session information in summary format.

```
device(config)# show ip vrrp brief
```

```
Total number of VRRP routers defined: 2
Flags Codes - P:Preempt 2:V2 3:V3 S:Short-Path-Fwd
Inte- VRID  Current  Flags    State   Master IP Backup IP  Virtual IP
rface  Priority
-----
1/1/1  10    255     P2-     Master  Local   Unknown  10.30.30.2
1/1/3  13    100     P2-     Master  Local   Unknown  10.13.13.3
```

Show Commands

show ip vrrp

The following example displays IPv4 VRRP configuration information about VRID 1.

```
device# show ip vrrp vrid 1

Interface 1/1/1
-----
auth-type no authentication
VRID 1 (index 1)
interface 1/1/1
state master
administrative-status enabled
version v2
mode owner
virtual mac aaaa.bbbb.cccc (configured)
priority 255
current priority 255
track-priority 2
hello-interval 1 sec
backup hello-interval 6
```

show ip vrrp-extended

Displays information about IPv4 Virtual Router Redundancy Protocol Extended (VRRP-E) sessions.

Syntax

```
show ip vrrp-extended [ brief ]
```

```
show ip vrrp-extended [ ethernet slot/port | ve num ]
```

```
show ip vrrp-extended [ statistics [ ethernet slot/port | ve num ] ]
```

```
show ip vrrp-extended [ ve num [ vrid VRID ] ]
```

```
show ip vrrp-extended [ vrid VRID [ ethernet slot/port | ve num ] ]
```

Parameters

brief

Displays summary information about the VRRP-E session.

ethernet slot port

Displays IPv4 VRRP-E information only for the specified port. A forward slash "/" must be entered between the *slot* and *port* variables.

ve num

Displays IPv4 VRRP-E information only for the specified virtual Ethernet port.

statistics

Displays statistical information about the VRRP-E session.

vrid VRID

Displays IPv4 VRRP-E information only for the specified virtual-group ID.

Modes

User EXEC mode

Usage Guidelines

Use this command to display information about IPv4 VRRP-E sessions, either in summary or full-detail format. You can also specify a virtual group or interface for which to display output.

This command supports IPv4 VRRP-E. You can modify or redirect the displayed information by using the default Linux tokens (|, >).

This command can be entered in any mode on the device.

Command Output

The **show ip vrrp-extended** command displays the following information.

Show Commands

show ip vrrp-extended

Output field	Description
Total number of VRRP-E routers defined	The total number of virtual routers configured and currently running on this Brocade device. For example, if the Brocade device is running VRRP-E, the total applies only to VRRP-E routers.
Interface	The interface on which VRRP or VRRP-E is configured. If VRRP or VRRP-E is configured on multiple interfaces, information for each interface is listed separately.
VRID	The ID of the virtual router configured on this interface. If multiple virtual routers are configured on the interface, information for each virtual router is listed in a separate row.
Current Priority	The current VRRP or VRRP-E priority of this Brocade device for the virtual router.
Flags	Whether the backup preempt mode is enabled. If the backup preempt mode is enabled, this field contains a "P". If the mode is disabled, this field is blank. <ul style="list-style-type: none">• P:Preempt 2:V2 3:V3• 2: implies VRRP Version2• 3: implies VRRP Version3
State	This Brocade device's VRRP state for the virtual router. The state can be one of the following: <ul style="list-style-type: none">• Init—The virtual router is not enabled (activated). If the state remains Init after you activate the virtual router, make sure that the virtual router is also configured on the other routers and that the routers can communicate with each other. If the state is Init and the mode is incomplete, make sure that you have specified the IP address for the virtual router.• Backup—This Brocade device is a backup for the virtual router.• Master—This Brocade device is the master for the virtual router.
Master IP Address	The IP address of the router interface that is currently the Master for the virtual router. If the IP address is assigned on this device, "Local" is displayed here.
Backup IP Address	The IP addresses of the router interfaces that are currently backups for the virtual router. If the IP address is not known in the routing table, "Unknown" is displayed here.
Virtual IP Address	The virtual IP address that is being backed up by the virtual router.

Examples

The following example displays summary information for a VRRP-E session.

```
device# show ip vrrp-extended brief
```

```
Total number of VRRP-E routers defined: 2
Flags Codes - P:Preempt 2:V2 3:V3 S:Short-Path-Fwd
Inte- VRID Current Flags State Master IP Backup IP Virtual IP
rface Priority
-----
Ve 1 2 255 P2- Master Local 10.30.20.2 10.30.30.2
Ve 3 4 100 P2- Backup Local 10.30.20.2 10.30.30.2
```

The following example displays detailed information for a VRRP-E backup device.

```
device(config)# show ip vrrp-extended

Total number of vrrp-extended routers defined: 1
Interface v10
-----
auth-type no authentication
VRID 10 (index 1)
interface v10
state backup
administrative-status enabled
mode non-owner(backup)
virtual mac 02e0.52a0.c00a
priority 50
current priority 50
track-priority 5
hello-interval 1 sec
backup hello-interval 60 sec
slow-start timer (configured) 30 sec
advertise backup disabled
dead-interval 3600 ms
preempt-mode true
virtual ip address 10.10.10.254
next hello sent in 1000ms
track-port 1/1/1 (up)
master router 10.10.10.4 expires in 3.1 sec
short-path-forwarding enabled
```

The following example displays IPv4 VRRP-E statistics. The “received vrrp-extended packets with unknown or inactive vrid” shows the number of packets that contain virtual router IDs that are not configured on the device or its interface.

```
device> show ip vrrp-extended statistics

Global VRRP-Extended statistics
-----
- received vrrp-extended packets with checksum errors = 0
- received vrrp-extended packets with invalid version number = 0
- received vrrp-extended packets with unknown or inactive vrid = 1480
Interface v10
-----
VRID 1
- number of transitions to backup state = 1
- number of transitions to master state = 1
- total number of vrrp-extended packets received = 0
. received backup advertisements = 0
. received packets with zero priority = 0
. received packets with invalid type = 0
. received packets with invalid authentication type = 0
. received packets with authentication type mismatch = 0
. received packets with authentication failures = 0
. received packets dropped by owner = 0
. received packets with ip ttl errors = 0
. received packets with ip address mismatch = 0
. received packets with advertisement interval mismatch = 0
. received packets with invalid length = 0
- total number of vrrp-extended packets sent = 2004
. sent backup advertisements = 0
. sent packets with zero priority = 0
- received arp packets dropped = 0
- received proxy arp packets dropped = 0
- received ip packets dropped = 0
```

Show Commands

show ip vrrp-extended

The following example displays IPv4 VRRP-E configuration information about VRID 1.

```
device# show ip vrrp-extended vrid 1

Interface 1/1/1
-----
auth-type md5-authentication
VRID 1 (index 1)
interface 1/1/1
state master
administrative-status disabled
mode non-owner(backup)
virtual mac aaaa.bbbb.cccc (configured)
priority 100
current priority 100
track-priority 5
hello-interval 1 sec
backup hello-interval 60 sec
slow-start timer (configured) 30 sec
advertise backup disabled
dead-interval 0 ms
preempt-mode true
virtual ip address 10.20.1.100
short-path-forwarding disabled
```

show ipsec card-utilization

Displays information about the utilization of the IPsec interface module that includes the administration status of the module and traffic statistics.

Syntax

show ipsec card-utilization

Modes

Privileged EXEC mode

Usage Guidelines

Traffic utilization percentages have a variance of plus or minus percent.

Command Output

The **show ipsec card-utilization** command displays the following information:

Output field	Description
IPSEC Module	The module ID of the system where the ICX7400-SERVICE-MOD module is installed.
admin	The administration status of the ICX7400-SERVICE-MOD module. Possible values are UP or DOWN.
Tx pkt count	The total number of packets transmitted over the ICX7400-SERVICE-MOD module.
Rx pkt count	The total number of packets received from the ICX7400-SERVICE-MOD module.
Tx pkt/sec	The packet transmission rate over the ICX7400-SERVICE-MOD module.
Rx pkt/sec	The transmission rate of packets received from the ICX7400-SERVICE-MOD module.
Tx byte count	The total number of bytes transmitted over the ICX7400-SERVICE-MOD module.
Rx byte count	The total number of bytes received from the ICX7400-SERVICE-MOD module.
Tx bytes/sec	The packet transmission rate (in bytes) over the ICX7400-SERVICE-MOD module.
Rx bytes/sec	The transmission rate (in bytes) of packets received from the ICX7400-SERVICE-MOD module.
Encrypt In Utilization	Plain text packet received by the router for encryption.
Decrypt In Utilization	Encrypted packet received by the router for decryption.
Encrypt Out Utilization	Encrypted packet going out of the router.
Decrypt Out Utilization	Plain text packet going out of the router after decryption.

Show Commands

show ipsec card-utilization

Examples

The following example shows how to display information about utilization of the ICX7400-SERVICE-MOD interface module when the maximum amount of traffic is ingressing on the device.

```
device# show ipsec card-utilization

IPSEC Module      : 1/4, admin: UP

card-utilization :
Tx pkt count      : 2181783416  Rx pkt Count      : 2181782549
Tx pkt/sec        : 30104535   Rx pkt/sec        : 30104483
Tx byte count     : 208735473958 Rx byte Count     : 306526015230
Tx bytes/sec      : 4166829344  Rx bytes/sec      : 4890915108
Encrypt In Utilization : 53.75%   Encrypt Out Utilization : 100.00%
Decrypt In Utilization : 100.00%  Decrypt Out Utilization : 93.24%
```

History

Release version	Command history
8.0.50	This command was introduced.

show ipsec profile

Displays configuration information about IP security (IPsec) profiles.

Syntax

```
show ipsec profile [ profile-name ]
```

Parameters

profile-name

Specifies the name of an IPsec profile.

Modes

User EXEC mode

Usage Guidelines

This command may be entered in all configuration modes.

When an IPsec profile is not specified, this command displays configuration information for all IPsec profiles.

Command Output

The **show ipsec profile** command displays the following information:

Output field	Description
Name	The name of an IPsec profile.
Description	A description of the IPsec profile.
Ike Profile	The name of the IKEv2 profile that is attached to this IPsec profile.
Lifetime	The lifetime period (in minutes) for an IPsec SA. The range is from 10 through 1440. The default value is 480 minutes (8 hours). A value of 0 indicates that the IPsec SA remains up indefinitely.
Anti-replay service	
DH group	The Diffie-Hellman group that is used for IKEv2 negotiations.
Proposal	The name of any IPsec proposals that are attached to this IPsec profile.

Show Commands
show ipsec profile

Examples

The following example shows how to display IPsec profile configuration information.

```
device# show ipsec profile
=====
Name           : 17
Description    : 17
Ike Profile    : 17
Lifetime      : 28800 sec
Anti-Replay Service : Disabled
DH Group      : None
Proposal      : 17
```

History

Release version	Command history
8.0.50	This command was introduced.

show ipsec proposal

Displays configuration information about IP security (IPsec) proposals.

Syntax

show ipsec proposal [*proposal-name*]

Parameters

proposal-name

Specifies the name of an IPsec proposal.

Modes

User EXEC mode

Usage Guidelines

This command may be entered in all configuration modes.

When an IPsec proposal is not specified, this command displays configuration information for all IPsec proposals.

Command Output

The **show ipsec proposal** command displays the following information:

Output field	Description
Name	The name of the IPsec proposal.
Protocol	The transform type.
Encryption	A list of encryption algorithms that are supported.
Authentication	The authentication method for data traffic.
ESN	The Extended Sequence Number (ESN) status.
Mode	The packet encapsulation mode that is supported.
Ref Count	The number of IPsec profiles that refer to this IPsec proposal.

Show Commands
show ipsec proposal

Examples

The following example shows how to display configuration information for all IPsec proposals. In this example, only the default proposal (**def-ipsec-prop**) is configured on the device.

```
device# show ipsec proposal
=====
Name           : def-ipsec-prop
Protocol       : ESP
Encryption    : aes-gcm-256
Authentication : NULL
ESN           : Disable
Mode          : Tunnel
Ref Count     : 1
```

History

Release version	Command history
8.0.50	This command was introduced.

show ipsec sa

Displays IPsec security association (IPsec SA) database information.

Syntax

```
show ipsec sa [ [ tunnel-id | address ip-address | interface tunnel-id | peer ip-address ] [ detail ] | detail | identity  
{ address ip-address | email email-address | fqdn fqdn-address | key-id key-id } | ipv4 ]
```

Parameters

tunnel-id

Specifies the tunnel ID for an IPsec SA.

address *ip-address*

Specifies the local IPv4 address for an IPsec SA.

detail

Specifies the transform type for an IPsec proposal.

identity

Specifies the remote identity for the IPsec SA in any of the following formats.

address *ip-address*

Specifies the remote identity by using an IP address (in IPv4 format).

email *email-address*

Specifies the remote identity by using an email address.

fqdn *fqdn-address*

Specifies the remote identity by using a fully qualified domain name (FQDN).

key-id *key-id*

Specifies the remote identity by using a key ID.

interface *tunnel-id*

Specifies the tunnel ID for an IPsec SA..

ipv4

Specifies the display of information about the IPv4 IPsec SA database.

peer *ip-address*

Specifies the peer address (in IPv4 format) of an IPsec SA.

Modes

User EXEC mode

Usage Guidelines

This command may be entered in all configuration modes.

Command Output

The **show ipsec sa** command display the following information (when the **detail** option is specified).

Output field	Description
interface	The IPsec tunnel interface ID.
Local address	The source address of the IPsec SA.
Remote address	The destination address of the IPsec SA.
Inner VRF	The base VRF of the IPsec tunnel interface.
Local Identity	The total traffic selector.
Remote Identity	The received traffic selector.
DF-bit	The "Don't fragment" bit that indicates if fragmentation is enabled or disabled.
Profile-name	The name of the IPsec profile that is used by this IPsec SA.
DH group	The Diffie-Hellman group that is used by this IPsec SA.
Direction	The direction of the IPsec SA. Possible values are INBOUND or OUTBOUND.
Mode	The encapsulation type.
Protocol	The transform type.
ICV size	The integrity check value (ICV) size.
lifetime(sec)	The rekey time for this IPsec SA.
Anti-replay service	The anti-replay service configuration. Possible values are Enable or Disable.
ESN	The Extended Sequence Number (ESN) configuration. Possible values are Enable or Disable.
Status	The state of the IPsec SA.
Worry Metric	The rekey time for the IKEv2 SA.

Examples

The following example displays basic information about the IPsec SA database.

```
device# show ipsec sa

IPSEC Security Association Database is empty.
SPDID(vrf:if) Dir Encap SPI Destination AuthAlg EncryptAlg
IPSEC Security Association Database(child SA pair:4)
0:tnl 18 OUT IPSEC_ 0x00007935 10.18.3.4 Null aes-gcm-256
0:tnl 18 IN IPSEC_ 0x0000b278 10.18.3.5 Null aes-gcm-256
0:tnl 22 OUT IPSEC_ 0x000064b2 10.22.3.4 Null aes-gcm-256
0:tnl 22 IN IPSEC_ 0x00008dea 10.22.3.5 Null aes-gcm-256
0:tnl 19 OUT IPSEC_ 0x00006018 10.19.3.4 Null aes-gcm-256
0:tnl 19 IN IPSEC_ 0x000062df 10.19.3.5 Null aes-gcm-256
0:tnl 20 OUT IPSEC_ 0x0000de58 10.20.3.4 Null aes-gcm-256
0:tnl 20 IN IPSEC_ 0x0000acff 10.20.3.5 Null aes-gcm-256
```

The following example displays detailed information for an IPsec SA by specifying the local IP address of the SA.

```
device# show ipsec sa address 10.19.3.4 detail

IPSEC Security Association Database(child SA pair:0)
  interface           : tnl 19
  Local address:      10.3.3.4/500, Remote address: 10.19.3.5/500

  Direction           : outbound, SPI: 0x6018
  Mode                : tunnel,
  Protocol            : IPSEC_ESP , Encryption : aes-gcm-256 , Authentication : Null
  ICV size            : 16 bytes
  lifetime(sec)       : Expiring in 243 secs
  Anti-replay service : Disable
  ESN                 : Disable
  Status              : ACTIVE
  Worry Metric        : 0
```

History

Release version	Command history
8.0.50	This command was introduced.

show ipv6

Displays the details of the IPv6 configuration.

Syntax

show ipv6

Modes

- User EXEC mode
- Privileged EXEC mode
- Global configuration mode
- Interface configuration mode

Examples

The following is sample output from the **show ipv6** command.

```
device# show ipv6
DUT(config-if-mgmt-1)#sh ipv6
Global Settings
  IPv6 is enabled
  Link-local address(es):
    fe80::768e:f8ff:fef9:6d80 [Preferred]
  Global unicast address(es):
    2620:100:c:fe23:768e:f8ff:fef9:6d80 [Preferred],  subnet is 2620:100:c:fe23::/64
  Joined group address(es):
    ff02::1:fff9:6d80
    ff02::1
  Best Default Router : 2620:100:c:fe23:10:37:65:129  PMTUS : 0
  MTU is 1500 bytes
  ND DAD is enabled, number of DAD attempts: 3
  ND reachable time is 30000 milliseconds
  ND retransmit interval is 1000 milliseconds
  Current Hop Limit is 64
  Hosts use stateless autoconfig for addresses
  No Inbound Access List Set
  No Outbound Access List Set
  No IPv6 Domain Name Set
  No IPv6 DNS Server Address set
```

History

Release version	Command history
8.0.50	The output was updated to display the best default router for the default gateway.

show ipv6 access-list

Displays the IPv6 ACLs configured on a device.

Syntax

```
show ipv6 access-list [ acl-name ]
```

Parameters

acl-name

Specifies the IPv6 ACL name.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

ACL configuration mode

Usage Guidelines

From FastIron 8.0.50, sequence numbers are automatically added to existing ACL rules, as follows:

- The first rule within each ACL is numbered 10.
- The sequence number for each succeeding rule is incremented by 10.

Examples

The following example displays information about all the IPV6 ACLs configured.

```
device# show ipv6 access-list
ipv6 access-list v6-ACL1: 1 entries
10: deny ipv6 any any

ipv6 access-list v6-ACL2: 1 entries
10: permit ipv6 any any

ipv6 access-list v6-ACL3: 2 entries
10: deny ipv6 2001:DB8:10::/64 any
20: permit ipv6 any any

ipv6 access-list v6-ACL4: 2 entries
10: deny ipv6 2001:DB8::/64 any

```

The following example displays information for a specific IPv6 ACL.

```
device# show ipv6 access-list rtr
ipv6 access-list rtr: 3 entries
10: remark This entry permits ipv6 packets from 2001:DB8::2 to any destination permit ipv6 host
2001:DB8::2 any
20: remark This entry denies udp packets from any source to any destination deny udp any any
30: remark This entry denies IPv6 packets from any source to any destination deny ipv6 any any
```

History

Release version	Command history
8.0.50	Sequence numbers are automatically added to existing rules.

show ipv6 bgp

Displays entries in the BGP4+ routing table.

Syntax

show ipv6 bgp

show ipv6 bgp *ipv6-prefix /prefix-length*

show ipv6 bgp *ipv6-prefix /prefix-length* **longer-prefixes**

Parameters

ipv6-prefix

Specifies an IPv6 network number.

/prefix-length

Specifies the length of the IPv6 prefix.

longer-prefixes

Displays routes that match a specified or longer BGP prefix.

Modes

User EXEC mode

Command Output

The **show ipv6 bgp** command displays the following information:

Output field	Description
Total number of BGP Routes (appears in display of all BGP routes only)	The number of routes known by the device.
Number of BGP Routes matching display condition (appears in display that matches specified and longer prefixes)	The number of routes that matched the display parameters you entered. This is the number of routes displayed by the command.
Status codes	A list of the characters the display uses to indicate the route's status. The status code appears in the left column of the display, to the left of each route. The status codes are described in the command's output.
Origin codes	A character the display uses to indicate the route's origin. The origin code appears to the right of the AS path (Path field). The origin codes are described in the command's output.
Network	The network prefix and prefix length.
Next Hop	The next-hop router for reaching the network from the device.
MED	The value of the route's MED attribute. If the route does not have a metric, this field is blank.
LocPrf	The degree of preference for this route relative to other routes in the local AS. When the BGP4+ algorithm compares routes on the basis of local preferences, the route with the higher local preference is chosen. The preference can have a value from 0 - 4294967295.

Show Commands

show ipv6 bgp

Output field	Description
Weight	The value that this device associates with routes from a specific neighbor. For example, if the receives routes to the same destination from two BGP4+ neighbors, the prefers the route from the neighbor with the larger weight.
Path	The route's AS path.

Examples

The following example displays sample output from the **show ipv6 bgp** command.

```
device> show ipv6 bgp

Total number of BGP Routes: 4
Status codes: s suppressed, d damped, h history, * valid, > best, i internal, S
stale
Origin codes: i - IGP, e - EGP, ? - incomplete
  Network                Next Hop      MED      LocPrf      Weight Path
*> 2001:db8:10:10::/64  ::                1        100        32768  ?
*> 2001:db8:113:113::/64  ::                1        100        32768  i
*> 2001:db8:400:400::/64  ::1              0        100        32768  i
*i 2001:db8:400:400::/64 2001:db8:400:400::2  0        400        0        65005 65010 ?
*>i 2001:db8:824:824::/64 2001:db8:400:400::2  0        400        0        65005 65010 i
```

The following example displays sample output from the **show ipv6 bgp** command, showing information for prefix 2001:db8:400:400::/64, when the **longer-prefixes** keyword is used.

```
device> show ipv6 bgp 2001:db8:400:400::/64 longer-prefixes

Number of BGP Routes matching display condition : 2
Status codes: s suppressed, d damped, h history, * valid, > best, i internal
Origin codes: i - IGP, e - EGP, ? - incomplete
  Network                Next Hop      MED      LocPrf      Weight Path
*> 2001:db8:400:400::/64  ::                0        100        32768  i
*i 2001:db8:400:400::/64 2001:db8:400:400::2  0        400        0        65005 65010 ?
```

show ipv6 bgp attribute-entries

Displays BGP4+ route-attribute entries that are stored in device memory.

Syntax

show ipv6 bgp attribute-entries

Modes

User EXEC mode

Usage Guidelines

The route-attribute entries table lists the sets of BGP4+ attributes that are stored in device memory. Each set of attributes is unique and can be associated with one or more routes. In fact, the device typically has fewer attribute entries than routes. Use this command to view BGP4+ route-attribute entries that are stored in device memory.

Command Output

The **show ipv6 bgp attribute-entries** command displays the following information:

Output field	Description
Total number of BGP Attribute Entries	The number of entries contained in the device's BGP4+ route-attribute entries table.
Next Hop	The IPv6 address of the next hop router for routes that have this set of attributes.
MED	The cost of the routes that have this set of attributes.
Origin	<p>The source of the route information. The origin can be one of the following:</p> <ul style="list-style-type: none"> EGP - The routes with this set of attributes came to BGP4+ through EGP. IGP - The routes with this set of attributes came to BGP4+ through IGP. INCOMPLETE - The routes came from an origin other than one of the above. For example, they may have been redistributed from OSPFv3 or RIPng. <p>When BGP4+ compares multiple routes to a destination to select the best route, IGP is preferred over EGP, and both are preferred over INCOMPLETE.</p>
Originator	The originator of the route in a route-reflector environment.
Cluster List	The route-reflector clusters through which this set of attributes has passed.
Aggregator	<p>Aggregator information:</p> <ul style="list-style-type: none"> AS Number shows the AS in which the network information in the attribute set was aggregated. This value applies only to aggregated routes and is otherwise 0. Router-ID shows the router that originated this aggregator.

Show Commands

show ipv6 bgp attribute-entries

Output field	Description
Atomic	Whether the network information in this set of attributes has been aggregated and this aggregation has resulted in information loss: <ul style="list-style-type: none">• TRUE - Indicates information loss has occurred• FALSE - Indicates no information loss has occurred• None - Indicates this attribute is not present. <p>NOTE Information loss under these circumstances is a normal part of BGP4+ and does not indicate an error.</p>
Local Pref	The degree of preference for routes that use this set of attributes relative to other routes in the local AS.
Communities	The communities that routes with this set of attributes are in.
AS Path	The ASs through which routes with this set of attributes have passed. The local AS is shown in parentheses.
Address	For debugging purposes only.
Hash	For debugging purposes only.
Links	For debugging purposes only.
Reference Counts	For debugging purposes only.

Examples

The following example show sample output for the **show ip bgp attribute-entries** command.

```
device> show ipv6 bgp attribute-entries

Total number of BGP Attribute Entries: 4
1      Next Hop : ::                                MED :1
      Origin:IGP
      Originator:0.0.0.0          Cluster List:None
      Aggregator:AS Number :0     Router-ID:0.0.0.0      Atomic:None
      Local Pref:100              Communities:Internet
      AS Path : (length 0)
      AsPathLen: 0  AsNum: 0,      SegmentNum: 0, Neighboring As: 1, Source As 0
      Address: 0x2a8bd092 Hash:364 (0x1000000)
      Links: 0x0, 0x0
      Reference Counts: 2:0:4, Magic: 3
...
```

show ipv6 bgp config

Displays active BGP4+ configuration information.

Syntax

```
show ipv6 bgp config
```

Modes

User EXEC mode

Examples

The following example displays the active BGP4+ configuration information contained in the running configuration without displaying the entire running configuration.

```
device> show ipv6 bgp config

Current BGP configuration:
router bgp
local-as 65020
default-local-preference 400
neighbor 8.8.8.2 remote-as 65080
neighbor 140.140.140.1 remote-as 65020
neighbor 2001:db8:400:400::3 remote-as 65020
neighbor 2001:db8:400:400::3 soft-reconfiguration inbound
address-family ipv6 unicast
neighbor 2001:db8:400:400::3 activate
neighbor 2001:db8:400:400::3 route-map in bgp_map
exit-address-family
end
```

show ipv6 bgp dampened-paths

Displays all BGP4+ dampened routes.

Syntax

show ipv6 bgp dampened-paths

Modes

User EXEC mode

Command Output

The **show ip bgp dampened-paths** command displays the following information:

Output field	Description
Status codes	A list of the characters the display uses to indicate the path's status. The status code appears in the left column of the display, to the left of each route. The status codes are described in the command's output. The status column displays a "d" for each dampened route.
Network	The destination network of the route.
From	The IPv6 address of the advertising peer.
Flaps	The number of times the path has flapped.
Since	The amount of time (in hh:mm:ss) since the first flap of this route.
Reuse	The amount of time (in hh:mm:ss) after which the path is available again.
Path	The AS path of the route.

Examples

The following example displays BGP4+ paths that have been dampened (suppressed) by route flap dampening.

```
device> show ipv6 bgp dampened-paths

Status Code >:best d:damped h:history *:valid
  Network          From          Flaps      Since      Reuse      Path
*d  2001:db8::/13    2001:db8:1::1    1    0 :1 :14    0 :2 :20    100 1002 1000
*d  2001:db8::/16    2001:db8:1::1    1    0 :1 :14    0 :2 :20    100 1002 1000
*d  2001:db8::/14    2001:db8:1::1    1    0 :1 :14    0 :2 :20    100 1002 1000
*d  2001:db8::/15    2000:1:1::1      1    0 :1 :14    0 :2 :20    100 1002 1000
*d  2001:db8:8000::/17 2001:db8:1::1    1    0 :1 :14    0 :2 :20    100 1002 1000
*d  2001:db8:1:17::/64 2001:db8:1::1    1    0 :1 :18    0 :2 :20    100
```

show ipv6 bgp filtered-routes

Displays BGP4+ filtered routes that are received from a neighbor or peer group.

Syntax

```
show ipv6 bgp filtered-routes [ detail ] [ ipv6-addr { / mask } [ longer-prefixes ] | as-path-access-list name | prefix-list name ]
```

Parameters

detail

Displays detailed route information.

ipv6-addr

Specifies the IPv6 address of the destination network in dotted-decimal notation.

mask

Specifies the IPv6 mask of the destination network in CIDR notation.

longer-prefixes

Specifies all statistics for routes that match the specified route, or that have a longer prefix than the specified route.

as-path-access-list name

Specifies an AS-path ACL. The name must be between 1 and 32 ASCII characters in length.

prefix-list name

Specifies an IPv6 prefix list. The name must be between 1 and 32 ASCII characters in length.

name

Specifies the name of an AS-path ACL or prefix list.

Modes

User EXEC mode

Command Output

The **show ipv6 bgp filtered-routes** command displays the following information:

Output field	Description
Number of BGP4+ Routes matching display condition	The number of routes that matched the display parameters you entered. This is the number of routes displayed by the command.
Status codes	A list of the characters the display uses to indicate the route's status. The status code appears in the left column of the display, to the left of each route. The status codes are described in the command's output. The status column displays an "IF" for each filtered route.
Prefix	The network address and prefix.
Next Hop	The next-hop router for reaching the network from the device.

Show Commands

show ipv6 bgp filtered-routes

Output field	Description
MED	The value of the route's MED attribute. If the route does not have a metric, this field is blank.
LocPrf	The degree of preference for this route relative to other routes in the local AS. When the BGP4+ algorithm compares routes on the basis of local preferences, the route with the higher local preference is chosen. The preference can have a value from 0 - 4294967295.
Weight	The value that this device associates with routes from a specific neighbor. For example, if the receives routes to the same destination from two BGP4+ neighbors, the prefers the route from the neighbor with the larger weight.
Status	<p>The route's status, which can be one or more of the following:</p> <ul style="list-style-type: none">A - AGGREGATE - The route is an aggregate route for multiple networks.B - BEST - BGP4+ has determined that this is the optimal route to the destination.b - NOT-INSTALLED-BEST - BGP4+ has determined that this is the optimal route to the destination but did not install it in the IPv6 route table because the device received better routes from other sources (such as OSPFv3, RIPng, or static IPv6 routes).C - CONFED_EBGP - The route was learned from a neighbor in the same confederation and AS, but in a different sub-AS within the confederation.D - DAMPED - This route has been dampened (by the route dampening feature), and is currently unusable.E - EBGP - The route was learned through a in another AS.H - HISTORY - Route dampening is configured for this route, and the route has a history of flapping and is unreachable now.I - IBGP - The route was learned through a in the same AS.L - LOCAL - The route originated on this device.M - MULTIPATH - BGP4+ load sharing is enabled and this route was selected as one of the best ones to the destination. The best route among the multiple paths also is marked with "B". <p>NOTE If the "m" is shown in lowercase, the software was not able to install the route in the IPv6 route table.</p> <ul style="list-style-type: none">S - SUPPRESSED - This route was suppressed during aggregation and thus is not advertised to neighbors.F - FILTERED - This route was filtered out by BGP4+ route policies on the device, but the device saved updates containing the filtered routes.

Examples

The following example displays BGP4+ filtered routes.

```
device> show ipv6 bgp filtered-routes
```

```
Searching for matching routes, use ^C to quit...
```

```
Status A:AGGREGATE B:BEST b:NOT-INSTALLED-BEST C:CONFED_EBGP D:DAMPED

```

show ipv6 bgp flap-statistics

Displays BGP4+ route-dampening statistics for all dampened routes with a variety of options.

Syntax

```
show ipv6 bgp flap-statistics
show ipv6 bgp flap-statistics ipv6-addr { / mask } [ longer-prefix ]
show ipv6 bgp flap-statistics as-path-filter name
show ipv6 bgp flap-statistics neighbor ipv6-addr
show ipv6 bgp flap-statistics regular-expression name
```

Parameters

ipv6-addr
IPv6 address of a specified route in dotted-decimal notation.

mask
IPv6 mask of a specified route in CIDR notation.

longer-prefixes
Displays statistics for routes that match the specified route or have a longer prefix than the specified route.

as-path-filter *name*
Specifies an AS-path filter.

neighbor
Displays flap statistics only for routes learned from the specified neighbor.

ip-addr
IPv4 address of the neighbor.

regular-expression
Specifies a regular expression in the display output on which to filter.

name
Name of an AS-path filter or regular expression.

Modes

User EXEC mode

Command Output

The **show ipv6 bgp flap-statistics** command displays the following information:

Output field	Description
Total number of flapping routes	The total number of routes in the device's BGP4+ route table that have changed state and thus have been marked as flapping routes.

Output field	Description
Status code	Indicates the dampening status of the route, which can be one of the following: <ul style="list-style-type: none"> > - This is the best route among those in the BGP4+ route table to the route's destination. d - This route is currently dampened, and thus unusable. h - The route has a history of flapping and is unreachable now. * - The route has a history of flapping but is currently usable.
Network	The destination network of the route.
From	The IPv6 address of the advertising peer.
Flaps	The number of flaps (state changes) the route has experienced.
Since	The amount of time (in hh:mm:ss) since the first flap of this route.
Reuse	The amount of time (in hh:mm:ss) after which the path is again available.
Path	The AS path of the route.

Examples

The following example displays route dampening statistics.

```
device> show ipv6 bgp flap-statistics

Total number of flapping routes: 14
  Status Code >:best d:damped h:history *:valid
  Network      From      Flaps  Since   Reuse   Path
h> 2001:db8::/32 2001:db8::47 1      0 :0 :13 0 :0 :0 65001 4355 1 701
*> 2001:db8::/32 2001:db8::47 1      0 :1 :4  0 :0 :0 65001 4355 701 62
```

show ipv6 bgp neighbors

Displays configuration information and statistics for BGP4+ neighbors of the device.

Syntax

```
show ipv6 bgp neighbors
show ipv6 bgp neighbors ipv6-addr
show ipv6 bgp neighbors last-packet-with-error
show ipv6 bgp neighbors routes-summary
```

Parameters

ipv6-addr
IPv6 address of a neighbor in dotted-decimal notation.

last-packet-with-error
Displays information about the last packet from a neighbor that contained an error.

routes-summary
Displays information about all route information received in UPDATE messages from BGP neighbors.

Modes

User EXEC mode

Usage Guidelines

Use this command to view configuration information and statistics for BGP neighbors of the device. Output shows all configured parameters for the neighbors. Only the parameters whose values differ from defaults are shown.

Command Output

The **show ipv6 bgp neighbors** command displays the following information:

Output field	Description
IP Address	The IPv6 address of the neighbor.
AS	The AS in which the neighbor resides.
EBGP or IBGP	Whether the neighbor session is an IBGP session, an EBGP session, or a confederation EBGP session: <ul style="list-style-type: none">EBGP - The neighbor is in another AS.EBGP_Confed - The neighbor is a member of another sub-AS in the same confederation.IBGP - The neighbor is in the same AS.
RouterID	The neighbor's router ID.

Output field	Description
State	<p>The state of the device's session with the neighbor. The states are from the perspective of the session, not the neighbor's perspective. The state values can be one of the following:</p> <ul style="list-style-type: none"> • IDLE - The BGP4+ process is waiting to be started. Usually, enabling BGP4 or establishing a neighbor session starts the BGP4+ process. <ul style="list-style-type: none"> - A minus sign (-) indicates that the session has gone down and the software is clearing or removing routes. • ADMND - The neighbor has been administratively shut down. <ul style="list-style-type: none"> - A minus sign (-) indicates that the session has gone down and the software is clearing or removing routes. • CONNECT - BGP4+ is waiting for the connection process for the TCP neighbor session to be completed. • ACTIVE - BGP4+ is waiting for a TCP connection from the neighbor. <p>NOTE If the state frequently changes between CONNECT and ACTIVE, there may be a problem with the TCP connection.</p> <ul style="list-style-type: none"> • OPEN SENT - BGP4+ is waiting for an Open message from the neighbor. • OPEN CONFIRM - BGP4+ has received an OPEN message from the neighbor and is now waiting for either a KEEPALIVE or NOTIFICATION message. If the device receives a KEEPALIVE message from the neighbor, the state changes to Established. If the message is a NOTIFICATION, the state changes to Idle. • ESTABLISHED - BGP4+ is ready to exchange UPDATE messages with the neighbor. <ul style="list-style-type: none"> - If there is more BGP data in the TCP receiver queue, a plus sign (+) is also displayed. <p>NOTE If you display information for the neighbor using the show ipv6 bgp neighbor<ipv6-address> command, the TCP receiver queue value will be greater than 0.</p>
Time	The amount of time this session has been in its current state.
KeepAliveTime	The keep alive time, which specifies how often this device sends keep alive messages to the neighbor.
HoldTime	The hold time, which specifies how many seconds the device will wait for a KEEPALIVE or UPDATE message from a BGP4+ neighbor before deciding that the neighbor is dead.
RefreshCapability	Whether the device has received confirmation from the neighbor that the neighbor supports the dynamic refresh capability.
Messages Sent and Received	<p>The number of messages this device has sent to and received from the neighbor. The display shows statistics for the following message types:</p> <ul style="list-style-type: none"> • Open • Update • KeepAlive • Notification • Refresh-Req
Last Update Time	<p>Lists the last time updates were sent and received for the following:</p> <ul style="list-style-type: none"> • NLRIs • Withdraws

Show Commands

show ipv6 bgp neighbors

Output field	Description
Last Connection Reset Reason	<p>The reason the previous session with this neighbor ended. The reason can be one of the following:</p> <ul style="list-style-type: none">• No abnormal error has occurred.• Reasons described in the BGP specifications:<ul style="list-style-type: none">- Message Header Error- Connection Not Synchronized- Bad Message Length- Bad Message Type- OPEN Message Error- Unsupported Version Number- Bad Peer AS Number- Bad BGP Identifier- Unsupported Optional Parameter- Authentication Failure- Unacceptable Hold Time- Unsupported Capability- UPDATE Message Error- Malformed Attribute List- Unrecognized Well-known Attribute- Missing Well-known Attribute- Attribute Flags Error- Attribute Length Error- Invalid ORIGIN Attribute- Invalid NEXT_HOP Attribute- Optional Attribute Error- Invalid Network Field- Malformed AS_PATH- Hold Timer Expired- Finite State Machine Error- Rcv Notification
Last Connection Reset Reason (cont.)	<ul style="list-style-type: none">• Reasons specific to the implementation:<ul style="list-style-type: none">- Reset All Peer Sessions- User Reset Peer Session- Port State Down- Peer Removed- Peer Shutdown- Peer AS Number Change- Peer AS Confederation Change- TCP Connection KeepAlive Timeout- TCP Connection Closed by Remote- TCP Data Stream Error Detected

Output field	Description
Notification Sent	<p>If the device receives a NOTIFICATION message from the neighbor, the message contains an error code corresponding to one of the following errors. Some errors have subcodes that clarify the reason for the error. Where applicable, the subcode messages are listed underneath the error code messages.</p> <ul style="list-style-type: none"> • Message Header Error <ul style="list-style-type: none"> - Connection Not Synchronized - Bad Message Length - Bad Message Type - Unspecified • Open Message Error <ul style="list-style-type: none"> - Unsupported Version - Bad Peer As - Bad BGP Identifier - Unsupported Optional Parameter - Authentication Failure - Unacceptable Hold Time - Unspecified • Update Message Error <ul style="list-style-type: none"> - Malformed Attribute List - Unrecognized Attribute - Missing Attribute - Attribute Flag Error - Attribute Length Error - Invalid Origin Attribute - Invalid NextHop Attribute - Optional Attribute Error - Invalid Network Field - Malformed AS Path - Unspecified • Hold Timer Expired • Finite State Machine Error • Cease • Unspecified
Notification Received	See above.
Neighbor NLRI Negotiation	<p>The state of the device's NLRI negotiation with the neighbor. The states can include the following:</p> <ul style="list-style-type: none"> • Peer negotiated IPv6 unicast capability. • Peer configured for IPv6 unicast routes. • Peer negotiated IPv4 unicast capability. • Peer negotiated IPv4 multicast capability.

Show Commands

show ipv6 bgp neighbors

Output field	Description
TCP Connection state	<p>The state of the connection with the neighbor. The connection can have one of the following states:</p> <ul style="list-style-type: none"> • LISTEN - Waiting for a connection request. • SYN-SENT - Waiting for a matching connection request after having sent a connection request. • SYN-RECEIVED - Waiting for a confirming connection request acknowledgment after having both received and sent a connection request. • ESTABLISHED - Data can be sent and received over the connection. This is the normal operational state of the connection. • FIN-WAIT-1 - Waiting for a connection termination request from the remote TCP, or an acknowledgment of the connection termination request previously sent. • FIN-WAIT-2 - Waiting for a connection termination request from the remote TCP. • CLOSE-WAIT - Waiting for a connection termination request from the local user. • CLOSING - Waiting for a connection termination request acknowledgment from the remote TCP. • LAST-ACK - Waiting for an acknowledgment of the connection termination request previously sent to the remote TCP (which includes an acknowledgment of its connection termination request). • TIME-WAIT - Waiting for enough time to pass to be sure the remote TCP received the acknowledgment of its connection termination request. • CLOSED - There is no connection state.
Byte Sent	The number of bytes sent.
Byte Received	The number of bytes received.
Local host	The IPv6 address of the device.
Local port	The TCP port the Ruckus device is using for the BGP4+ TCP session with the neighbor.
Remote host	The IPv6 address of the neighbor.
Remote port	The TCP port the neighbor is using for the BGP4+ TCP session with the device.
ISentSeq	The initial send sequence number for the session.
SendNext	The next sequence number to be sent.
TotUnAck	The number of sequence numbers sent by the device that have not been acknowledged by the neighbor.
TotSent	The number of sequence numbers sent to the neighbor.
ReTrans	The number of sequence numbers that the device retransmitted because they were not acknowledged.
UnAckSeq	The current acknowledged sequence number.
IRcvSeq	The initial receive sequence number for the session.
RcvNext	The next sequence number expected from the neighbor.
SendWnd	The size of the send window.
TotalRcv	The number of sequence numbers received from the neighbor.
DupliRcv	The number of duplicate sequence numbers received from the neighbor.
RcvWnd	The size of the receive window.
SendQue	The number of sequence numbers in the send queue.
RcvQue	The number of sequence numbers in the receive queue.
CngstWnd	The number of times the window has changed.

Examples

The following is sample output from the **show ipv6 bgp neighbors** command when no arguments or keywords are used.

```
device> show ipv6 bgp neighbors

Total number of BGP Neighbors: 2
1  IP Address: 2001:1001::1, AS: 63753 (IBGP), RouterID: 1.0.0.1, VRF: default-vrf

show ipv6 bgp neighbors advertised-routes

Displays the routes that the device has advertised to the neighbor during the current BGP4+ session.

Syntax

```
show ipv6 bgp neighbors ipv6-addr advertised-routes [ detail | / mask-bits ]
```

Parameters

ipv6-addr

Specifies the IPv6 address of a neighbor in dotted-decimal notation.

detail

Specifies detailed information.

mask-bits

Specifies the number of mask bits in CIDR notation.

Modes

User EXEC mode

Command Output

The **show ipv6 bgp neighbor advertised-routes** command displays the following information:

Output field	Description
Number of BGP4+ Routes advertised to specified neighbor (appears only in display for all routes)	The number of routes displayed by the command.
Status codes	A list of the characters the display uses to indicate the route's status. The status code appears in the Status column of the display. The status codes are described in the command's output.
Prefix	The advertised route's prefix.
Next Hop	The next-hop for reaching the advertised route from the device.
MED	The value of the advertised route's MED attribute. If the route does not have a metric, this field is blank.
LocPrf	The degree of preference for the advertised route relative to other routes in the local autonomous system. When the BGP4+ algorithm compares routes on the basis of local preferences, the route with the higher local preference is chosen. The preference range is 0 - 4294967295.
Weight	The value that this device associates with routes from a specific neighbor. For example, if the receives routes to the same destination from two BGP4+ neighbors, the prefers the route from the neighbor with the larger weight.

Output field	Description
Status	<p>The advertised route's status, which can be one or more of the following:</p> <ul style="list-style-type: none"> • A - AGGREGATE. The route is an aggregate route for multiple networks. • B - BEST. BGP4+ has determined that this is the optimal route to the destination. • b - NOT-INSTALLED-BEST - BGP4+ has determined that this is the optimal route to the destination but did not install it in the IPv6 route table because the device received better routes from other sources (such as OSPFv3, RIPng, or static IPv6 routes). • E - EBGP. The route was learned through a in another AS. • I - IBGP. The route was learned through a in the same AS. • L - LOCAL. The route originated on this device.
AS-PATH	The AS-path information for the route.

Examples

The following example displays the routes the device has advertised to a specified neighbor.

```
device> show ipv6 bgp neighbor 2001:db8::110 advertised-routes
```

```
There are 2 routes advertised to neighbor 2001:db8::110
Status A:AGGREGATE B:BEST b:NOT-INSTALLED-BEST E:EBGP I:IBGP L:LOCAL
  Prefix      Next Hop  MED LocPrf  Weight Status
1   2001:db8::/32  ::        1          32768  BL
   AS_PATH:
2   2001:db8::/16  ::        1          32768  BL
   AS_PATH:
```

show ipv6 bgp neighbors flap-statistics

Displays the route flap statistics for routes received from or sent to a BGP4+ neighbor.

Syntax

show ipv6 bgp neighbors *ipv6-addr* flap-statistics

Parameters

ipv6-addr

Specifies the IPv4 address of a neighbor in dotted-decimal notation.

Modes

User EXEC mode

Command Output

The **show ipv6 bgp neighbor flap-statistics** command displays the following information:

Output field	Description
Total number of flapping routes	The total number of routes in the neighbor's BGP4+ route table that have changed state and thus have been marked as flapping routes.
Status code	Indicates the status of the route, which can be one of the following: <ul style="list-style-type: none">> - This is the best route among those in the neighbor's BGP4+ route table to the route's destination.d - This route is currently dampened, and thus unusable.h - The route has a history of flapping and is unreachable now.* - The route has a history of flapping but is currently usable.
Network	The destination network of the route.
From	The IPv6 address of the advertising peer.
Flaps	The number of flaps (state changes) the route has experienced.
Since	The amount of time (in hh:mm:ss) since the first flap of this route.
Reuse	The amount of time (in hh:mm:ss) after which the path is again available.
Path	The AS path of the route.

Examples

The following example displays route flap dampening statistics for a specified BGP4+ neighbor.

```
device> show ipv6 bgp neighbor 2001:db8::110 flap-statistics

Total number of flapping routes: 14
  Status Code >:best d:damped h:history *:valid
  Network      From          Flaps Since      Reuse      Path
h> 2001:db8::/32 10.90.213.77 1 0 :0 :13 0 :0 :0 65001 4355 1 701
*> 2001:db8::/32 10.90.213.77 1 0 :1 :4 0 :0 :0 65001 4355 701 62
```

show ipv6 bgp neighbors last-packet-with-error

Displays the last packets with an error from BGP4+ neighbors of the device.

Syntax

```
show ipv6 bgp neighbors ipv6-addr last-packet-with-error [ decode ]
```

Parameters

ipv6-addr

IPv6 address of a neighbor in dotted-decimal notation.

decode

Decodes the last packet that contained an error from any of a device's neighbors.

Modes

User EXEC mode

Command Output

The **show ipv6 bgp neighbor last-packet-with-error** command displays the following information:

Output field	Description
Total number of BGP Neighbors	The total number of configured neighbors for a device.
Last error	The error packet's contents decoded in a human-readable format or notification that no packets with an error were received.

Show Commands
show ipv6 bgp neighbors received

show ipv6 bgp neighbors received

Displays Outbound Route Filters (ORFs) received from BGP4+ neighbors of the device.

Syntax

```
show ipv6 bgp neighbors ipv6-addr received { extended-community | prefix-filter }
```

Parameters

ipv6-addr

Specifies the IPv6 address of a neighbor in dotted-decimal notation.

extended-community

Displays the results for ORFs that use the BGP Extended Community Attribute.

prefix-filter

Displays the results for ORFs that are prefix-based.

Modes

User EXEC mode

Examples

The following example displays sample output for the **show ipv6 bgp neighbors received** command when the **prefix-filter** keyword is used.

```
device> show ipv6 bgp neighbor 2001:db8::110 received prefix-filter

ip prefix-list 2001:db8::110: 4 entries
seq 5 permit 2001:db8:3::45/16 ge 18 le 28
seq 10 permit 2001:db8::4::88/24
seq 15 permit 2001:db8:5::37/8 le 32
seq 20 permit 2001:db8:6::83/16 ge 18
```

show ipv6 bgp neighbors received-routes

Lists all route information received in route updates from BGP4+ neighbors of the device since the soft-reconfiguration feature was enabled.

Syntax

show ipv6 bgp neighbors *ipv6-addr* received-routes [detail]

Parameters

ipv6-addr

IPv6 address of a neighbor in dotted-decimal notation.

detail

Displays detailed route information.

Modes

User EXEC mode

Command Output

The **show ipv6 bgp neighbor received-routes** command displays the following information:

Output field	Description
Number of BGP4+ Routes received from a neighbor	The number of routes displayed by the command.
Status codes	A list of the characters the display uses to indicate the route's status. The status code appears in the Status column of the display. The status codes are described in the command's output.
Prefix	The received route's prefix.
Next Hop	The IPv6 address of the next device that is used when forwarding a packet to the received route.
MED	The value of the route's MED attribute. If the route does not have a metric, this field is blank.
LocPrf	The degree of preference for the advertised route relative to other routes in the local autonomous system. When the BGP4+ algorithm compares routes on the basis of local preferences, the route with the higher local preference is chosen. The preference can have a value from 0 - 4294967295.
Weight	The value that this device associates with routes from a specific neighbor. For example, if the receives routes to the same destination from two BGP4+ neighbors, the prefers the route from the neighbor with the larger weight.

Show Commands

show ipv6 bgp neighbors received-routes

Output field	Description
Status	<p>The advertised route's status, which can be one or more of the following:</p> <p>A - AGGREGATE. The route is an aggregate route for multiple networks.</p> <p>B - BEST. BGP4+ has determined that this is the optimal route to the destination.</p> <p>b - NOT-INSTALLED-BEST - BGP4+ has determined that this is the optimal route to the destination but did not install it in the IPv6 route table because the device received better routes from other sources (such as OSPFv3, RIPv6, or static IPv6 routes).</p> <p>D - DAMPED. This route has been dampened (by the route dampening feature), and is currently unusable.</p> <p>E - EBGP. The route was learned through a in another AS.</p> <p>H - HISTORY. Route dampening is configured for this route, and the route has a history of flapping and is unreachable now.</p> <p>I - IBGP. The route was learned through a in the same autonomous system.</p> <p>L - LOCAL. The route originated on this device.</p> <p>M - MULTIPATH. BGP4+ load sharing is enabled and this route was selected as one of the best ones to the destination. The best route among the multiple paths also is marked with "B".</p> <p>NOTE If the "m" is shown in lowercase, the software was not able to install the route in the IPv6 route table.</p> <p>S - SUPPRESSED. This route was suppressed during aggregation and thus is not advertised to neighbors.</p> <p>F - FILTERED. This route was filtered out by BGP4+ route policies on the device, but the saved updates containing the filtered routes.</p>

Examples

The following example displays a summary of the route information received in route updates from neighbor 2001:db8::10.

```
device> show ipv6 bgp neighbor 2001:db8:400:400::2 received-route

```

show ipv6 bgp neighbors rib-out-routes

Displays information about the current BGP4+ Routing Information Base (Adj-RIB-Out) for specific neighbors and specific destination networks.

Syntax

```
show ipv6 bgp neighbors ipv6-addr rib-out-routes [ detail ] [ipv6-addr [ / mask ] ]
```

Parameters

ipv6-addr

IPv6 address of a neighbor in dotted-decimal notation.

last-packet-with-error

Displays the last packet with an error.

routes-summary

Displays routes received, routes accepted, number of routes advertised by peer, and so on.

Modes

User EXEC mode

Command Output

The **show ipv6 bgp neighbors rib-out-routes** command displays the following information:

Output field	Description
Number of RIB_out routes for a specified neighbor (appears only in display for all RIB routes)	The number of RIB routes displayed by the command.
Status codes	A list of the characters the display uses to indicate the route's status. The status code appears in the Status column of the display. The status codes are described in the command's output.
Prefix	The RIB route's prefix.
Next Hop	The next-hop router for reaching the route from the device.
MED	The value of the advertised route's MED attribute. If the route does not have a metric, this field is blank.
LocPrf	The degree of preference for the route relative to other routes in the local autonomous system. When the BGP4+ algorithm compares routes on the basis of local preferences, the route with the higher local preference is chosen. The preference can have a value from 0 - 4294967295.
Weight	The value that this device associates with routes from a specific neighbor. For example, if the receives routes to the same destination from two BGP4+ neighbors, the prefers the route from the neighbor with the larger weight.

Output field	Description
Status	<p>The RIB route's status, which can be one or more of the following:</p> <ul style="list-style-type: none"> • A - AGGREGATE. The route is an aggregate route for multiple networks. • B - BEST. BGP4+ has determined that this is the optimal route to the destination. • E - EBGP. The route was learned through a in another autonomous system. • I - IBGP. The route was learned through a in the same autonomous system. • L - LOCAL. The route originated on this device.
AS-PATH	The AS-path information for the route.

Examples

The following example displays a summary about all RIB routes for neighbor 2001:db8::110.

```
device> show ipv6 bgp neighbor 2001:db8::110 rib-out-routes

      There are 2 RIB_out routes for neighbor 2001:db8::110

```

show ipv6 bgp neighbors routes

Lists a variety of route information received in UPDATE messages from BGP4+ neighbors.

Syntax

show ipv6 bgp neighbors *ipv6-addr* routes

show ipv6 bgp neighbors *ipv6-addr* routes { best | not-installed-best | unreachable }

show ipv6 bgp neighbors *ipv6-addr* routes detail { best | not-installed-best | unreachable }

Parameters

ipv6-addr

IPv6 address of a neighbor in dotted-decimal notation.

best

Displays routes received from the neighbor that are the best BGP4+ routes to their destination.

not-installed-best

Displays routes received from the neighbor that are the best BGP4+ routes to their destination but were not installed in the route table because the device received better routes from other sources.

unreachable

Displays routes that are unreachable because the device does not have a valid RIP, OSPF, or static route to the next hop.

Modes

User EXEC mode

Command Output

The **show ipv6 bgp neighbors routes** command displays the following information:

Output field	Description
Number of accepted routes from a specified neighbor	The number of routes displayed by the command.
Status codes	A list of the characters the display uses to indicate the route's status. The status code appears in the Status column of the display. The status codes are described in the command's output.
Prefix	The route's prefix.
Next Hop	The next-hop router for reaching the route from the device.
MED	The value of the route's MED attribute. If the route does not have a metric, this field is blank.
LocPrf	The degree of preference for the route relative to other routes in the local autonomous system. When the BGP4+ algorithm compares routes on the basis of local preferences, the route with the higher local preference is chosen. The preference can have a value from 0 - 4294967295.

Output field	Description
Weight	The value that this device associates with routes from a specific neighbor. For example, if the receives routes to the same destination from two BGP4+ neighbors, the prefers the route from the neighbor with the larger weight.
Status	<p>The route's status, which can be one or more of the following:</p> <ul style="list-style-type: none"> • A - AGGREGATE. The route is an aggregate route for multiple networks. • B - BEST. BGP4+ has determined that this is the optimal route to the destination. • C - CONFED_EBGP. The route was learned from a neighbor in the same confederation and autonomous system, but in a different sub-AS within the confederation. • D - DAMPED. This route has been dampened (by the route dampening feature), and is currently unusable. • E - EBGP. The route was learned through a in another autonomous system. • H - HISTORY. Route dampening is configured for this route, and the route has a history of flapping and is unreachable now. • I - IBGP. The route was learned through a in the same autonomous system. • L - LOCAL. The route originated on this device. • M - MULTIPATH. BGP4+ load sharing is enabled and this route was selected as one of the best ones to the destination. The best route among the multiple paths also is marked with "B". <p>NOTE If the "m" is shown in lowercase, the software was not able to install the route in the IPv6 route table.</p> <ul style="list-style-type: none"> • S - SUPPRESSED. This route was suppressed during aggregation and thus is not advertised to neighbors. • F - FILTERED. This route was filtered out by BGP4+ route policies on the device, but the saved updates containing the filtered routes.
AS-PATH	The AS-path information for the route.

Examples

The following example shows sample output for the **show ip bgp neighbors routes** command when the **best** keyword is used.

```
device> show ipv6 bgp neighbor 2001:db8::106 routes best

      There are 2 accepted routes from neighbor 2001:db8::106
Searching for matching routes, use ^C to quit...

      AS_PATH: 65001
```

show ipv6 bgp neighbors routes-summary

Displays route summary information for all neighbors or a specified neighbor.

Syntax

show ipv6 bgp neighbors *ipv6-addr* routes-summary

Parameters

ipv6-addr

IPv6 address of a neighbor in dotted-decimal notation.

Modes

User EXEC mode

Command Output

The **show ipv6 bgp neighbor routes-summary** command displays the following information:

Output field	Description
IP Address	The IPv6 address of the neighbor
Routes Received	How many routes the device has received from the neighbor during the current BGP4+ session: <ul style="list-style-type: none"> Accepted or Installed - Indicates how many of the received routes the device accepted and installed in the BGP4+ route table. Filtered or Kept - Indicates how many routes were filtered out, but were nonetheless retained in memory for use by the soft reconfiguration feature. Filtered - Indicates how many of the received routes were filtered out.
Routes Selected as BEST Routes	The number of routes that the device selected as the best routes to their destinations.
BEST Routes not Installed in IPv6 Forwarding Table	The number of routes received from the neighbor that are the best BGP4+ routes to their destinations, but were nonetheless not installed in the IPv6 route table because the device received better routes from other sources (such as OSPFv3, RIPng, or static IPv6 routes).
Unreachable Routes	The number of routes received from the neighbor that are unreachable because the device does not have a valid RIPng, OSPFv3, or static IPv6 route to the next hop.
History Routes	The number of routes that are down but are being retained for route flap dampening purposes.
NLRIs Received in Update Message	The number of routes received in Network Layer Reachability (NLRI) format in UPDATE messages: <ul style="list-style-type: none"> Withdraws - The number of withdrawn routes the device has received. Replacements - The number of replacement routes the device has received.

Show Commands

show ipv6 bgp neighbors routes-summary

Output field	Description
NLRIs Discarded due to	Indicates the number of times the device discarded an NLRI for the neighbor due to the following reasons: <ul style="list-style-type: none">• Maximum Prefix Limit - The device's configured maximum prefix amount had been reached.• AS Loop - An AS loop occurred. An AS loop occurs when the BGP4+ AS-path attribute contains the local AS number.• Invalid Nexthop Address - The next hop value was not acceptable.• Duplicated Originator_ID - The originator ID was the same as the local router ID.• Cluster_ID - The cluster list contained the local cluster ID, or contained the local router ID (see above) if the cluster ID is not configured.
Routes Advertised	The number of routes the device has advertised to this neighbor: <ul style="list-style-type: none">• To be Sent - The number of routes the device has queued to send to this neighbor.• To be Withdrawn - The number of NLRIs for withdrawing routes the device has queued up to send to this neighbor in UPDATE messages.
NLRIs Sent in Update Message	The number of NLRIs for new routes the device has sent to this neighbor in UPDATE messages: <ul style="list-style-type: none">• Withdraws - The number of routes the device has sent to the neighbor to withdraw.• Replacements - The number of routes the device has sent to the neighbor to replace routes the neighbor already has.
Peer Out of Memory Count for	Statistics for the times the device has run out of BGP4+ memory for the neighbor during the current BGP4+ session: <ul style="list-style-type: none">• Receiving Update Messages - The number of times UPDATE messages were discarded because there was no memory for attribute entries.• Accepting Routes(NLRI) - The number of NLRIs discarded because there was no memory for NLRI entries. This count is not included in the Receiving Update Messages count.• Attributes - The number of times there was no memory for BGP4+ attribute entries.• Outbound Routes (RIB-out) - The number of times there was no memory to place a "best" route into the neighbor's route information base (Adj-RIB-Out) for routes to be advertised.• Outbound Routes Holder - For debugging purposes only.

Examples

The following example displays routes summary information for neighbor 2001:db8::110.

```
device> show ipv6 bgp neighbor 2001:db8::110 routes-summary

1  IP Address: 2001:db8::110
Routes Accepted/Installed:0,  Filtered/Kept:0,  Filtered:0
  Routes Selected as BEST Routes:0
    BEST Routes not Installed in IP Forwarding Table:0
  Unreachable Routes (no IGP Route for NEXTHOP):0
  History Routes:0
NLRIs Received in Update Message:0,  Withdraws:0 (0),  Replacements:0
  NLRIs Discarded due to
    Maximum Prefix Limit:0,  AS Loop:0
    Invalid Nexthop:0,  Invalid Nexthop Address:0.0.0.0
    Invalid Confed aspath:0,  maxas-limit aspath:0
    Duplicated Originator_ID:0,  Cluster_ID:0
  Routes Advertised:2,  To be Sent:0,  To be Withdrawn:0
  NLRIs Sent in Update Message:2,  Withdraws:0,  Replacements:0
Peer Out of Memory Count for:
  Receiving Update Messages:0,  Accepting Routes(NLRI):0
  Attributes:0,  Outbound Routes(RIB-out):0 Outbound Routes Holder:0
```

Show Commands
show ipv6 bgp peer-group

show ipv6 bgp peer-group

Displays peer-group information.

Syntax

show ipv6 bgp peer-group *peer-group-name*

Parameters

peer-group-name
Specifies a peer group name.

Modes

User EXEC mode

Usage Guidelines

Only the parameters that have values different from their defaults are listed.

Examples

The following example shows sample output from the **show ipv6 bgp peer-group** command.

```
device> show ipv6 bgp peer-group peer_group1

1  BGP peer-group is peer_group1
   Address family : IPV4 Unicast
   no activate
   Address family : IPV4 Multicast
   no activate
   Address family : IPV6 Unicast
   activate
   Address family : IPV6 Multicast
   no activate
   Address family : VPNV4 Unicast
   no activate
   Address family : L2VPN VPLS
   no activate
Members:
  IP Address: 2000:400:400:400::3, AS: 65020
```

show ipv6 bgp routes community

Displays BGP4+ route information that is filtered by community and other options.

Syntax

```
show ipv6 bgp routes community { num | aa:nn | internet | local-as | no-advertise | no-export }
```

Parameters

community

Displays routes filtered by a variety of communities.

num

Specifies a community number in the range from 1 to 4294967200.

aa:nn

Specifies an autonomous system-community number.

internet

Displays routes for the Internet community.

local-as

Displays routes for a local sub-AS within the confederation.

no-advertise

Displays routes with this community that cannot be advertised to any other BGP4 devices at all.

no-export

Displays routes for the community of sub-ASs within a confederation.

Modes

User EXEC mode

show ipv6 bgp routes

Displays statistics for the routes in the device's BGP4+ route table.

Syntax

```
show ipv6 bgp routes [ num | ipv6-address/prefix | age num | as-path-access-list name | best | cidr-only |  
community-access-list name | community-reg-expression expression | detail | local | neighbor ipv6-addr |  
nexthop ipv6-addr | no-best | not-installed-best | prefix-list string | regular-expression name | route-map  
name | summary | unreachable ]
```

Parameters

num

Table entry at which the display starts. For example, if you want to list entries beginning with table entry 100, specify 100.

ipv6-address/prefix

Specifies an IPv6 address and prefix.

age *num*

Displays BGP4+ route information that is filtered by age.

as-path-access-list *name*

Displays BGP4+ route information that is filtered by autonomous system (AS)-path access control list (ACL).

best

Displays BGP4+ route information that the device selected as best routes.

cidr-only

Displays BGP4+ routes whose network masks do not match their class network length.

community-access-list *name*

Displays BGP4+ route information for an AS-path community access list.

community-reg-expression *expression*

Displays BGP4+ route information for an ordered community list regular expression.

detail

Displays BGP4+ detailed route information.

local

Displays BGP4+ route information about selected local routes.

neighbor *ipv6-addr*

Displays BGP4+ route information about selected BGP neighbors.

nexthop *ipv6-addr*

Displays BGP4+ route information about routes that are received from the specified next hop.

no-best

Displays BGP4+ route information that the device selected as not best routes.

not-installed-best

Displays BGP4+ route information about best routes that are not installed.

prefix-list *string*

Displays BGP4+ route information that is filtered by a prefix list.

regular-expression *name*

Displays BGP4+ route information about routes that are associated with the specified regular expression.

route-map *name*

Displays BGP4+ route information about routes that use the specified route map.

summary

Displays BGP4+ summary route information.

unreachable

Displays BGP4+ route information about routes whose destinations are unreachable through any of the BGP4+ paths in the BGP route table.

Modes

User EXEC mode

Command Output

The **show ipv6 bgp routes detail** command displays the following information:

Output field	Description
Number of BGP4+ Routes	The number of routes displayed by the command.
Status codes	A list of the characters the display uses to indicate the route's status. The status code appears in the Status column of the display. The status codes are described in the command's output.
Prefix	The route's prefix.
Next Hop	For normal IPv6 routes, next hop is the next hop IPv6 router to reach the destination. For the 6PE routes, next hop is the IPv4-mapped IPv6 address of the peer 6PE router.
Metric	The value of the route's MED attribute. If the route does not have a metric, this field is blank.
LocPrf	The degree of preference for the advertised route relative to other routes in the local AS. When the BGP4+ algorithm compares routes on the basis of local preferences, the route with the higher local preference is chosen. The preference can have a value from 0 - 4294967295.
Weight	The value that this device associates with routes from a specific neighbor. For example, if the receives routes to the same destination from two BGP4+ neighbors, the prefers the route from the neighbor with the larger weight.

Show Commands

show ipv6 bgp routes

Output field	Description
Status	<p>The route's status, which can be one or more of the following:</p> <ul style="list-style-type: none">A - AGGREGATE. The route is an aggregate route for multiple networks.B - BEST. BGP4+ has determined that this is the optimal route to the destination.b - NOT-INSTALLED-BEST - BGP4+ has determined that this is the optimal route to the destination but did not install it in the IPv6 route table because the device received better routes from other sources (such as OSPFv3, RIPng, or static IPv6 routes).C - CONFED_EBGP. The route was learned from a neighbor in the same confederation and AS, but in a different sub-AS within the confederation.D - DAMPED. This route has been dampened (by the route dampening feature), and is currently unusable.E - EBGP. The route was learned through a in another AS.H - HISTORY. Route dampening is configured for this route, and the route has a history of flapping and is unreachable now.I - IBGP. The route was learned through a in the same AS.L - LOCAL. The route originated on this.M - MULTIPATH. BGP4+ load sharing is enabled and this route was selected as one of the best ones to the destination. The best route among the multiple paths also is marked with "B". <p>NOTE If the "m" is shown in lowercase, the software was not able to install the route in the IPv6 route table.</p> <ul style="list-style-type: none">S - SUPPRESSED. This route was suppressed during aggregation and thus is not advertised to neighbors.
AS-PATH	The AS-path information for the route.

Examples

The following example shows sample output from the **show ipv6 bgp routes** command.

```

```

show ipv6 bgp summary

Displays summarized information about the status of all BGP4+ connections.

Syntax

show ipv6 bgp summary

Modes

User EXEC mode

Command Output

The **show ipv6 bgp summary** command displays the following information.

Output field	Description
Router ID	The device's router ID.
Local AS Number	The BGP4+ AS number in which the device resides.
Confederation Identifier	The autonomous system number of the confederation in which the device resides.
Confederation Peers	The numbers of the local autonomous systems contained in the confederation. This list matches the confederation peer list you configure on the device.
Maximum Number of Paths Supported for Load Sharing	The maximum number of route paths across which the device can balance traffic to the same destination. The feature is enabled by default but the default number of paths is 1. You can increase the number from 2 - 8 paths.
Number of Neighbors Configured	The number of BGP4+ neighbors configured on this device.
Number of Routes Installed	The number of BGP4+ routes in the device's BGP4+ route table.
Number of Routes Advertising to All Neighbors	The total of the RtSent and RtToSend columns for all neighbors.
Number of Attribute Entries Installed	The number of BGP4+ route-attribute entries in the route-attributes table.
Neighbor Address	The IPv6 addresses of this BGP4+ neighbors.
AS#	The autonomous system number.

Output field	Description
State	<p>The state of this neighbor session with each neighbor. The states are from this perspective of the session, not the neighbor's perspective. The state values can be one of the following for each:</p> <ul style="list-style-type: none"> • IDLE - The BGP4+ process is waiting to be started. Usually, enabling BGP4+ or establishing a neighbor session starts the BGP4+ process. <ul style="list-style-type: none"> - A minus sign (-) indicates that the session has gone down and the software is clearing or removing routes. • ADMND - The neighbor has been administratively shut down. <ul style="list-style-type: none"> - A minus sign (-) indicates that the session has gone down and the software is clearing or removing routes. • CONNECT - BGP4+ is waiting for the connection process for the TCP neighbor session to be completed. • ACTIVE - BGP4+ is waiting for a TCP connection from the neighbor. <p>NOTE If the state frequently changes between CONNECT and ACTIVE, there may be a problem with the TCP connection.</p> <ul style="list-style-type: none"> • OPEN SENT - BGP4+ is waiting for an Open message from the neighbor. • OPEN CONFIRM - BGP4+ has received an OPEN message from the neighbor and is now waiting for either a KEEPALIVE or NOTIFICATION message. If the receives a KEEPALIVE message from the neighbor, the state changes to Established. If the message is a NOTIFICATION, the state changes to Idle. • ESTABLISHED - BGP4+ is ready to exchange UPDATE packets with the neighbor. <ul style="list-style-type: none"> - If there is more BGP data in the TCP receiver queue, a plus sign (+) is also displayed. <p>NOTE If you display information for the neighbor using the show ipv6 bgp neighbor<ipv6-address> command, the TCP receiver queue value will be greater than 0.</p> <p>Operational States:</p> <p>Additional information regarding the operational states of BGP described above may be added as described in the following:</p> <ul style="list-style-type: none"> • (+) - is displayed if there is more BGP data in the TCP receiver queue. Note : If you display information for the neighbor using the show ip bgp neighbor ip-addr command, the TCP receiver queue value will be greater than 0. • (>) - indicates that there is more BGP data in the outgoing queue. • (-) - indicates that the session has gone down and the software is clearing or removing routes. • (*) - indicates that the inbound or outbound policy is being updated for the peer. • (c) - indicates that the table entry is clearing. • (p) - indicates that the neighbor ribout group membership change is pending or in progress • (s) - indicates that the peer has negotiated restart, and the session is in a stale state. • (r) - indicates that the peer is restarting the BGP4 connection, through restart. • (^) - on the standby MP indicates that the peer is in the ESTABLISHED state and has received restart capability (in the primary MP). • (<) - indicates that the device is waiting to receive the "End of RIB" message the peer.
Time	The time that has passed since the state last changed.

Show Commands

show ipv6 bgp summary

Output field	Description
Accepted	The number of routes received from the neighbor that this installed in the BGP4+ route table. Usually, this number is lower than the RoutesRcvd number. The difference indicates that this filtered out some of the routes received in the UPDATE messages.
Filtered	The routes or prefixes that have been filtered out. <ul style="list-style-type: none">• If soft reconfiguration is enabled, this field shows how many routes were filtered out (not placed in the BGP4+ route table) but retained in memory.• If soft reconfiguration is not enabled, this field shows the number of BGP4+ routes that have been filtered out.
Sent	The number of BGP4+ routes that the has sent to the neighbor.
ToSend	The number of routes the has queued to send to this neighbor.

Examples

The following example displays sample output from the **show ipv6 bgp summary** command.

```
device> show ipv6 bgp summary
```

```
device> show ipv6 bgp summary
BGP4 Summary
Router ID: 113.1.1.1   Local AS Number: 65020
Confederation Identifier: not configured
Confederation Peers:
Maximum Number of IP ECMP Paths Supported for Load Sharing: 1
Number of Neighbors Configured: 2, UP: 1
Number of Routes Installed: 5, Uses 430 bytes
Number of Routes Advertising to All Neighbors: 7 (7 entries), Uses 336 bytes
Number of Attribute Entries Installed: 4, Uses 360 bytes
Neighbor Address      AS#    State  Time      Rt:Accepted Filtered Sent ToSend
2001:db8:113:113::2  65001 CONN   1d14h32m    0         0     0     4
2001:db8:400:400::2  65020 ESTAB   3h59m24s    2         0     3     0
```

show ipv6 cache

Displays IPv6 cache information.

Syntax

```
show ipv6 cache [ vrf vrf-nam ] [ index | ipv6-address | ipv6-prefix/prefix-length | resource | ethernet stack/slot/port | tunnel tunnel-id | ve ve-num]
```

Parameters

vrf *vrf-name*

Displays the IPv6 cache information for the specified Virtual Routing/Forwarding (VRF) instance.

index

Restricts the display to the entry for the specified index number and subsequent entries.

ipv6-address

Restricts the display to the entries for the specified IPv6 address. Specify this parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373.

ipv6-prefix/prefix-length

Restricts the display to the entries for the specified IPv6 prefix. Specify the *ipv6-prefix* parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373. Specify the *prefix-length* parameter as a decimal value. A slash mark (/) must follow the *ipv6-prefix* parameter and precede the *prefix-length* parameter.

resource

Displays the number of entries in the cache.

ethernet *stack/slot/port*

Restricts the display to the entries for the specified Ethernet interface.

tunnel *tunnel-id*

restricts the display to the entries for the specified tunnel interface.

ve *ve-num*

restricts the display to the entries for the specified VE interface.

Modes

User EXEC mode

Command Output

The **show ipv6 cache** command displays the following information:

Output field	Description
Total number of cache entries	The number of entries in the cache table.
IPv6 Address	The host IPv6 address.

Show Commands

show ipv6 cache

Output field	Description
Next Hop	The next hop, which can be one of the following: <ul style="list-style-type: none">• Direct - The next hop is directly connected to the router.• Local - The next hop is originated on this router.• IPv6 address - The IPv6 address of the next hop.
Port	The port on which the entry was learned.

Examples

The following example displays the IPv6 cache information.

```
device# show ipv6 cache
Total number of cache entries: 10
  IPv6 Address      Next Hop      Port
1  2001:DB8::2      LOCAL        tunnel 2
2  2001:DB8::106    LOCAL        ethe 1/3/2
3  2001:DB8::110    DIRECT       ethe 1/3/2
4  2001:DB8:46a::1  LOCAL        ethe 1/3/2
5  2001:DB8::2e0:52ff:fe99:9737 LOCAL        ethe 1/3/2
6  2001:DB8::ffff:ffff:feff:ffff LOCAL        loopback 2
7  2001:DB8::c0a8:46a LOCAL        tunnel 2
8  2001:DB8::c0a8:46a LOCAL        tunnel 6
9  2001:DB8::1      LOCAL        loopback 2
10 2001:DB8::2e0:52ff:fe99:9700 LOCAL        ethe 1/3/1
```

show ipv6 dhcp-relay

Displays the DHCPv6 relay agent information configured on the device.

Syntax

show ipv6 dhcp-relay

Modes

Global configuration mode

Usage Guidelines

Command Output

The **show ipv6 dhcp-relay** command displays the following information:

Output field	Description
Current DHCPv6 relay agent state	Displays whether the current relay agent state is enabled or disabled.
DHCPv6 enabled interface(s)	Displays the DHCPv6 enabled interfaces.
DHCPv6 Relay Agent Statistics	Displays statistics such as the total number of DHCPv6 packets received and transmitted.
Received DHCPv6 Packets	The number of release, relay forward and relay reply packets received.

Examples

The following example displays the IPv6 DHCP relay statistics.

```
device(config)# show ipv6 dhcp-relay
Current DHCPv6 relay agent state: Enabled
DHCPv6 enabled interface(s): e 1/1/3
DHCPv6 Relay Agent Statistics:
Total DHCPv6 Packets, Received:0, Transmitted:0
Received DHCPv6 Packets: RELEASE:0,RELAY_FORWARD:0,RELAY_REPLY:0
OtherServertoClient:0,OtherClienttoServer:0
```

History

Release version	Command history
08.0.10d	This command was introduced.
08.0.30	Support for this command was added in 08.0.30 and later releases.

show ipv6 dhcp-relay delegated-prefixes

Displays information about the IPv6 delegated prefixes.

Syntax

show ipv6 dhcp-relay delegated-prefixes interface *interface-id*

Parameters

interface *interface-id*

Displays delegated prefixes for the specified outgoing interface.

Modes

Privileged EXEC mode

Usage Guidelines

Command Output

The **show ipv6 dhcp-relay delegated-prefixes** command displays the following information.

Output field	Description
IPv6 Prefix	The IPv6 prefix delegated to the client.
Client	The IPv6 address of the client.
Interface	The interface on which the DHCPv6 messages are relayed to the client.
ExpireTime	The remaining lifetime of the delegated prefix.

Examples

The following example displays information about the delegated prefixes.

```
device# show ipv6 dhcp-relay delegated-prefixes interface ethernet 1/1/45

Prefix          Client          Interface  ExpireTime
fc00:2000:6:7:1::/96  fe80::210:94ff:fe00:e  1/1/45    29d23h53m0s
```

History

Release version	Command history
08.0.10d	This command was introduced.
08.0.30	Support for this command was added in 08.0.30 and later releases.

show ipv6 dhcp-relay destinations

Displays the IPv6 DHCP relay destinations.

Syntax

show ipv6 dhcp-relay destinations

Modes

Global configuration mode

Command Output

The **show ipv6 dhcp-relay destinations** command displays the following information:

Output field	Description
DHCPv6 Relay Destinations	The DHCPv6 relay agent configured destination information.

Examples

The following example displays the IPv6 DHCP relay destinations.

```
device# show ipv6 dhcp-relay destinations
DHCPv6 Relay Destinations:
Interface e 2/3:
Destination OutgoingInterface
2001::2 NA
fe80::224:38ff:febb:e3c0 e 2/5
```

History

Release version	Command history
08.0.10d	This command was introduced.
08.0.30	Support for this command was added in 08.0.30 and later releases.

show ipv6 dhcp-relay interface

Displays the IPv6 DHCP relay information for a specific interface.

Syntax

show ipv6 dhcp-relay interface *stack/slot/port*

Modes

Privileged EXEC mode

Usage Guidelines

Command Output

The **show ipv6 dhcp-relay interface** command displays the following information:

Output field	Description
DHCPv6 Relay Information for <i>interface interface-type port-num</i>	The DHCPv6 relay information for the specific interface.
Destination	The configured destination IPv6 address.
OutgoingInterface	The interface on which the packet will be relayed if the destination relay address is a link local or multicast address.
Options	The current information about the DHCPv6 relay options for the interface.
Interface-Id	The interface ID option indicating whether the option is used.
Option-79	Displays if option-79 is used or not.

Examples

The following example displays the DHCPv6 relay information for an interface.

```
device# show ipv6 dhcp-relay interface ethernet 1/1/1
DHCPv6 Relay Information for interface e 1/1/1:
Destinations:
  Destination                OutgoingInterface
  2001::2                    NA
Options:
  Interface-Id: No           Remote-Id:No           Option-79:Yes
Prefix Delegation Information:
  Current:0 Maximum:100 AdminDistance:10
```

History

Release version	Command history
08.0.10d	This command was introduced.
08.0.30	Support for this command was added in 08.0.30 and later releases.
8.0.40	Support for link-layer-option (option 79) was introduced.

show ipv6 dhcp-relay options

Displays information about the relay options available to the prefixed delegates for a specific interface.

Syntax

show ipv6 dhcp-relay options

Modes

Privileged EXEC mode

Usage Guidelines

Command Output

The **show ipv6 dhcp-relay options** command displays the following information:

Output field	Description
Interface	The interface name.
Interface-Id	The interface ID option. Yes indicates the option is used; No indicates the option is not used.
Remote-Id	The remote ID option. Yes indicates the option is used; No indicates the option is not used.
Option-79	The client link layer option. Yes indicates the option is used, No indicates the option is not used.

Examples

The following example displays relay options information.

```
device# show ipv6 dhcp-relay options
DHCPv6 Relay Options Information:
Interface      Interface-Id  Remote-Id    Option-79
e 1/1/1        No           No           No
```

History

Release version	Command history
08.0.10d	This command was introduced.
08.0.30	Support for this command was added in 08.0.30 and later releases.
8.0.40	Support for link-layer-option was added.

Show Commands

show ipv6 dhcp-relay prefix-delegation-information

show ipv6 dhcp-relay prefix-delegation-information

Displays information about the IPv6 DHCP prefix delegation.

Syntax

show ipv6 dhcp-relay prefix-delegation-information

Modes

Privileged EXEC mode

Usage Guidelines

Command Output

The **show ipv6 dhcp-relay prefix-delegation-information** command displays the following information:

Output field	Description
Interface	The interface name.
Current	The number of delegated prefixes currently learned on the interface.
Maximum	The maximum number of delegated prefixes that can be learned on the interface.
AdminDistance	The current administrative distance used for prefixes learned on this interface when added to the IPv6 static route table.

Examples

The following example displays information about the IPv6 DHCP delegated prefixes.

```
device# show ipv6 dhcp prefix-delegation-information
DHCPv6 Relay Prefix Delegation Notification Information:
Interface      Current      Maximum      AdminDistance
ve 100         20           20000        10
ve 101         4000         20000        10
ve 102         0            20000        10
ve 103         0            20000        10
ve 104         0            20000        10
ve 105         0            20000        10
```

History

Release version	Command history
08.0.10d	This command was introduced.
08.0.30	Support for this command was added in 08.0.30 and later releases.

show ipv6 dhcp6 snooping vlan

Displays the IPv6 DHCP snooping status on a VLAN.

Syntax

```
show ipv6 dhcp6 snooping vlan vlan-name
```

Parameters

vlan-name

The name of the VLAN.

Modes

User EXEC mode

Usage Guidelines

Examples

The following example shows the status of DHCPv6 snooping enabled on VLAN 10.

```
device# show ipv6 dhcp6 snooping vlan 10
IP dhcpv6 snooping VLAN 10: Enabled
Trusted Ports: ethernet 1/1/1
Untrusted Ports: ethernet 1/1/2 ethernet 1/1/3
```

Show Commands

show ipv6 dhcp6 snooping info

show ipv6 dhcp6 snooping info

Displays the DHCPV6 snooping binding database.

Syntax

show ipv6 dhcp6 snooping info

Modes

User EXEC mode

Usage Guidelines

Use this command to display information about the DHCPV6 snooping learnt entries.

Examples

The following example shows the DHCPV6 snooping learnt entries.

```
device# show ipv6 dhcp6 snooping info
IPv6 Address LinkLayer-Addr Age Port Virtual Port vlan VRF
15::4 0000.0006.0003 259199 e 22/1/48 v15 15 default-vrf

vrf
```

Total number of entries: 30

History

Release version	Command history
08.0.50	This output of this command was modified.

show ipv6 mld group

Displays the list of multicast listening discovery (MLD) groups.

Syntax

```
show ipv6 mld [ vrf vrf-name ] group [ ip-address [ detail | tracking ] ]
```

Parameters

vrf *vrf-name*

Displays information for the specified VRF instance.

group-address

Specifies the IPv6 address of the MLD group.

detail

Displays detailed information on the MLD group identified by the IPv6 address.

tracking

Displays information about who sends the reports.

Modes

User EXEC mode

Command Output

The **show ipv6 mld group** command displays the following information:

Output Field	Description
IDX	Index for the MLD group.
Group Address	IPv6 address of the multicast group.
Port	The physical port to which the group belongs.
Intf	The routing interface to which the port belongs.
GrpCmpV	The version of the MLD group report message.
Mode	Indicates if the filter mode of the multicast group is in INCLUDE or EXCLUDE.
Timer	The number of seconds the interface can remain in its current mode.
Total number of groups	The total number of MLD groups.

Examples

The following example shows MLD statistics.

```
device> show ipv6 mld group  
Total 2 groups
```

```
-----  
Idx  Group Address                Port  Intf  GrpCmpV Mode  Timer Srcs  
-----+-----+-----+-----+-----+-----  
  1  ff05::4422                    e3/1/1 v170    Ver1 exclude  221  0  
  2  ff3f::300                      e3/1/1 v170    Ver2 include   0  1  
Total number of groups 2
```

show ipv6 mld interface

Displays multicast listening discovery (MLD) parameters on an interface, including timers, the current querying router, and whether MLD is enabled.

Syntax

```
show ipv6 mld [ vrf vrf-name ] interface [ ethernet stack/slot/port | ve ve-num [ group A.B.C.D ] | tunnel tunnel-id ]
```

Parameters

vrf *vrf-name*

Displays information for the specified VRF instance.

ethernet *stack/slot/port*

Displays information for a specific Ethernet interface.

ve *num*

Displays information for a specific VE interface.

group *A.B.C.D*

Specifies displaying information for a specific group address.

tunnel *tunnel-id*

Displays information for a specific Tunnel interface.

Modes

User EXEC mode

Command Output

The **show ipv6 mld interface** command displays the following information:

Output Field	Description
version	Version of the MLD being used.
query int	Query interval in seconds.
max resp time	Number of seconds multicast groups have to respond to queries.
group mem time	Number of seconds multicast groups can be members of this group before aging out.
(details)	The following is displayed for each interface: <ul style="list-style-type: none">• The port ID• The default MLD version being used• The multicast protocol used• IPv6 address of the multicast interface• If the interface has groups, the group source list, IPv6 multicast address, and the filter mode are displayed.

show ipv6 mld settings

Displays multicast listening discovery (MLD) settings.

Syntax

```
show ipv6 mld [ vrf vrf-name ] settings
```

Parameters

vrf *vrf-name*

Displays information for the specified VRF instance.

Modes

User EXEC mode

Command Output

The **show ipv6 mld settings** command displays the following information:

Output Field	Description
Query Interval	How often the router will query an interface for group membership.
Configured Interval	The interval that has been configured for the router.
Max Response Time	The length of time in seconds that the router will wait for an IGMP (V1 or V2) response from an interface before concluding that the group member on that interface is down and removing it from the group.
Group Membership Time	The length of time in seconds that a group will remain active on an interface in the absence of a group report.
Operating Version	The IGMP version operating on the router.
Configured Version	The IGMP version configured on the router.
Robustness Variable	Used to fine-tune for unexpected loss on the subnet. The value is used to calculate the group interval.
Last Member Query Interval	Indicates when a leave is received; a group-specific query is sent. The last member query count is the number of queries with a time interval of (LMQT) is sent.
Last Member Query Count	Specifies the number of group-specific queries when a leave is received.

Examples

The following example shows MLD settings for the VRF named my_vrf.

```
device# show ipv6 mld vrf my_vrf settings
MLD Global Configuration
  Query Interval           : 125s   Configured Interval      : 125s
  Max Response Time       : 10s
  Group Membership Time   : 260s
  Operating Version       : 2       Configured Version       : 0
  Robustness Variable     : 2
  Last Member Query Interval: 1s   Last Member Query Count: 2
  Older Host Present Timer : 260s
```

show ipv6 mld static

Displays static multicast listening discovery (MLD) groups.

Syntax

show ipv6 mld [**vrf** *vrf-name*] **static**

Parameters

vrf *vrf-name*

Displays information for the specified VRF instance.

Modes

User EXEC mode

Command Output

The **show ipv6 mld static** command displays the following information:

Output Field	Description
Group Address	The address of the multicast group.
Interface Port List	The physical ports on which the multicast groups are received.

Examples

The following example shows MLD settings for the VRF named my_vrf.

```
device# show ipv6 mld vrf my_vrf static
Group Address                               Interface Port List
-----+-----+-----
ffle:1::1                                   v3          ethe 1/2/10
ffle:a::7f                                   v3          ethe 1/2/10
```

show ipv6 mld traffic

Displays information about multicast listening discovery (MLD) traffic.

Syntax

```
show ipv6 mld [ vrf vrf-name ] traffic
```

Parameters

vrf *vrf-name*

Displays information for the specified VRF instance.

Modes

User EXEC mode

Command Output

The **show ipv6 mld traffic** command displays the following information:

Output Field	Description
QryV1	Number of general MLDv1 queries received or sent by the virtual routing interface.
QryV2	Number of general MLDv2 queries received or sent by the virtual routing interface.
G-Qry	Number of group-specific queries received or sent by the virtual routing interface.
GSQry	Number of source specific queries received or sent by the virtual routing interface.
MbrV1	Number of MLDv1 membership reports received.
MbrV2	Number of MLDv2 membership reports received.
Leave	Number of MLDv1 "leave" messages on the interface. (See 2_Ex for MLDv2.)
Is_IN	Number of source addresses that were included in the traffic.
Is_EX	Number of source addresses that were excluded in the traffic.
ToIN	Number of times the interface mode changed from exclude to include.
ToEX	Number of times the interface mode changed from include to exclude.
ALLOW	Number of times that additional source addresses were allowed or denied on the interface.
BLK	Number of times that sources were removed from an interface.

Show Commands
show ipv6 mld traffic

Examples

The following example shows MLD traffic.

```
device# show ipv6 mld traffic

```

show ipv6 mroute

Displays information on IPv6 multicast routes. You can specify displaying information either from static or connected mroutes or from a particular mroute.

Syntax

show ipv6 mroute [**vrf** *vrf-name*] { *ipv6-address ipv6-prefix/prefix-length* | **static** | **connect** | **summary** }

Parameters

vrf *vrf-name*

Specifies displaying mroutes for a particular VRF.

ipv6-address ipv6-prefix/prefix-length

Displays an IPv6 mroute for the specified destination.

static

Displays only static multicast routes.

connect

Displays only connected multicast routes.

summary

Displays summary information.

Modes

Privileged EXEC mode

Examples

The following example displays information for IPv6 multicast routes:

```
Device(config)# show ipv6 mroute
IPv6 Routing Table - 7 entries:
Type Codes - B:BGP C:Connected S:Static
Type IPv6 Prefix      Next Hop Router  Interface      Dis/Metric      Uptime
S   1::1:1:0/120      ::              ve 90          1/1             2d16h
C   2090::/64        ::              ve 90          0/0             6d21h
C   2100::/64        ::              ve 100         0/0             1d21h
C   2110::/64        ::              ve 110         0/0             1d21h
C   2120::/64        ::              ve 120         0/0             1d21h
C   2130::/64        ::              ve 130         0/0             6d21h
C   8811::1/128     ::              loopback 1     0/0             6d21h
```

The following example displays information for static IPv6 multicast routes:

```
Device(config)# show ipv6 mroute static
Type Codes - B:BGP C:Connected S:Static
Type IPv6 Prefix      Next Hop Router  Interface      Dis/Metric      Uptime
S   1::1:1:0/120      ::              ve 90          1/1             2d16h
```

Show Commands

show ipv6 mroute

The following example displays information for directly attached (connected) IPv6 multicast routes:

```
Device(config)#show ipv6 mroute connect
Type Codes - B:BGP C:Connected S:Static
Type IPv6 Prefix      Next Hop Router      Interface      Dis/Metric      Uptime
C    2090::/64         ::                   ve 90          0/0              6d21h
C    2100::/64         ::                   ve 100         0/0              1d21h
C    2110::/64         ::                   ve 110         0/0              1d21h
C    2120::/64         ::                   ve 120         0/0              1d21h
C    2130::/64         ::                   ve 130         0/0              6d21h
C    8811::1/128       ::                   loopback 1     0/0              6d21h
```

The following example displays information for IPv6 multicast route 2090::1:

```
Device(config)# show ipv6 mroute 2090::1
Type Codes - B:BGP C:Connected S:Static
Type IPv6 Prefix      Next Hop Router      Interface      Dis/Metric      Uptime

```

History

Release version	Command history
8.0.10a	This command was introduced.

show ipv6 multicast

Displays IPv6 IGMP snooping information.

Syntax

show ipv6 multicast

Modes

User EXEC mode

Usage Guidelines

You can use the **show ipv6 multicast** command to display information for VLANs.

Examples

The following example shows IGMP snooping information.

```
device# show ipv6 multicast vlan 4050
Version=1, Intervals: Query=125, Group Age=260, Max Resp=10, Other Qr=255,
                Leave Wait=2, Robustness=2

VL4050: dft V1, glb cfg passive, , pimsm (glb cfg), 0 grp, 1 (*G) cache, rtr ports,
        router ports: e2/1/6(200) fe80::4050:3, e1/1/4(85) fe80::4050:5,
        My Query address: fe80::ce4e:24ff:fe6f:980 (link-local)
        e1/1/1 has 0 grp, non-QR (QR=fe80::4050:3, age=40), dft V1 trunk
        e1/1/4 has 0 grp, non-QR (passive), dft V1 trunk
        e1/1/41 has 0 grp, non-QR (passive), dft V1 trunk
```

History

Release version	Command history
8.0.50	The output of this command was modified to display the robustness variable and leave-wait timer.

show ipv6 multicast error

Displays information about possible multicast listening discovery (MLD) errors.

Syntax

show ipv6 multicast error

Modes

User EXEC mode

Command Output

The **show ipv6 multicast error** command displays the following information:

Output Field	Description
SW processed pkt	The number of IPv6 multicast packets processed by MLD snooping.
up-time	The MLD snooping up time.

Examples

The following example shows information about possible MLD errors.

```
device# show ipv6 multicast error  
snoop SW processed pkt: 173, up-time 160 sec
```

show ipv6 multicast mcache

Displays information in the IPv6 multicast forwarding mcache (multicast listening discovery [MLD]).

Syntax

show ipv6 multicast mcache

Modes

Privileged EXEC mode

Command Output

The **show ipv6 multicast mcache** command displays the following information:

Output Field	Description
(abcd:ef50 0:100):	The lowest 32 bits of source and group. It is displayed in XXXX:XXXX hex format. Here XXXX is a 16-bit hex number.
cnt	The number of packets processed in software.
OIF	Output interfaces.
age	The mcache age in seconds. The mcache is reset to 0 if traffic continues to arrive, otherwise it is aged out when it reaches the time defined by the ipv6 multicast mcache-age command.
uptime	The up time of this mcache in seconds.
vidx	The vidx is shared among mcaches using the same output interfaces. The vidx specifies the output port list, which shows the index. Valid range is from 4096 to 8191.
ref-cnt	The number of mcaches using this vidx.

Examples

This example shows information in the multicast forwarding mcache:

```
Device#show ipv6 multicast mcache
Example: (S G) cnt=: (S G) are the lowest 32 bits, cnt: SW proc. count
        OIF: 1/22 TR(1/32,1/33), TR is trunk, 1/32 primary, 1/33 output
vlan 1, has 2 cache
 1  (abcd:ef50 0:100), cnt=121
    OIF: 1/11 1/9
    age=0s up-time=120s vidx=4130 (ref-cnt=1)
 2  (abcd:ef50 0:101), cnt=0
    OIF: entire vlan
    age=0s up-time=0s vidx=8191 (ref-cnt=1)
vlan 70, has 0 cache
```

show ipv6 multicast group

Displays information about multicast listening discovery (MLD) groups.

Syntax

```
show ipv6 multicast group [group-address [detail] [tracking]]
```

Parameters

group-address

Specifies information for a particular group.

detail

Specifies the source list of a specific VLAN.

tracking

Specifies tracking information on interfaces that have tracking enabled.

Modes

Privileged EXEC mode

Command Output

The **show ipv6 multicast group** command displays the following information:

Output Field	Description
group	The address of the IPv6 group (destination IPv6 address).
p-port	The physical port on which the group membership was received.
ST	Yes indicates that the MLD group was configured as a static group; No means it was learned from reports.
QR	Yes means the port is a querier port; No means it is not. A port becomes a non-querier port when it receives a query from a source with a lower source IP address than the port.
life	The number of seconds the group can remain in EXCLUDE mode. An EXCLUDE mode changes to INCLUDE if it does not receive an IS_EX or TO_EX message during a specified period of time. The default is 140 seconds. There is no <code>life</code> displayed in INCLUDE mode.
mode	The current mode of the interface: INCLUDE or EXCLUDE. If the interface is in INCLUDE mode, it admits traffic only from the source list. If the interface is in EXCLUDE mode, it denies traffic from the source list and accepts the rest.
source	Identifies the source list that will be included or excluded on the interface. An MLDv1 group is in EXCLUDE mode with a source of 0. The group excludes traffic from 0 (zero) source list, which actually means that all traffic sources are included.

Output Field	Description
group	<p>If you requested a <i>detailed</i> report, the following information is displayed:</p> <ul style="list-style-type: none"> The multicast group address The mode of the group Sources from which traffic will be admitted (INCLUDE) or denied (EXCLUDE) on the interface. The life of each source list. <p>If you requested a <i>tracking/fast leave</i> report, the clients from which reports were received are identified.</p>

Examples

This example shows that an MLDv1 group is in EXCLUDE mode with a source of 0. The group excludes only traffic from the 0 (zero) source list, which means that all traffic sources are included.

```
Device#show ipv6 multicast group
p-:physical, ST:static, QR:querier, EX:exclude, IN:include, Y:yes, N:no
VL1 : 263 grp, 263 grp-port, tracking_enabled
  group
1   ff0e::ef00:a0e3          1/7   N   Y   120 EX   0
2   ff01::1:f123:f567       1/9   N   Y           IN   1
```

This example displays detailed MLD group information for multicast group ff0e::ef00:a096:

```
Device#show ipv6 multicast group ff0e::ef00:a096 detail
Display group ff0e::ef00:a096 in all interfaces in details.
p-:physical, ST:static, QR:querier, EX:exclude, IN:include, Y:yes, N:no
VL1 : 1 grp, 1 grp-port, tracking_enabled
  group
1   ff0e::ef00:a096          1/7   N   Y   100 EX   0
  group: ff0e::ef00:a096, EX, permit 0 (source, life):
  life=100, deny 0:
```

This example displays the list of clients that belong to multicast group ff0e::ef00:a096 when tracking and fast leave are enabled:

```
Device#show ipv6 multicast group ff0e::ef00:a096 tracking
Display group ff0e::ef00:a096 in all interfaces with tracking enabled.
p-:physical, ST:static, QR:querier, EX:exclude, IN:include, Y:yes, N:no
VL1 : 1 grp, 1 grp-port, tracking_enabled
  group
1   ff0e::ef00:a096          1/7   N   Y   80   EX   0
  receive reports from 1 clients: (age)
  (2001:DB8::1011:1213:1415 60)
```

show ipv6 multicast mcache

Displays information in the IPv6 multicast forwarding mcache (multicast listening discovery [MLD]).

Syntax

show ipv6 multicast mcache

Modes

Privileged EXEC mode

Command Output

The **show ipv6 multicast mcache** command displays the following information:

Output Field	Description
(abcd:ef50 0:100):	The lowest 32 bits of source and group. It is displayed in XXXX:XXXX hex format. Here XXXX is a 16-bit hex number.
cnt	The number of packets processed in software.
OIF	Output interfaces.
age	The mcache age in seconds. The mcache is reset to 0 if traffic continues to arrive, otherwise it is aged out when it reaches the time defined by the ipv6 multicast mcache-age command.
uptime	The up time of this mcache in seconds.
vidx	The vidx is shared among mcaches using the same output interfaces. The vidx specifies the output port list, which shows the index. Valid range is from 4096 to 8191.
ref-cnt	The number of mcaches using this vidx.

Examples

This example shows information in the multicast forwarding mcache:

```
Device#show ipv6 multicast mcache
Example: (S G) cnt=: (S G) are the lowest 32 bits, cnt: SW proc. count
       OIF: 1/22 TR(1/32,1/33), TR is trunk, 1/32 primary, 1/33 output
vlan 1, has 2 cache
 1  (abcd:ef50 0:100), cnt=121
    OIF: 1/11 1/9
    age=0s up-time=120s vidx=4130 (ref-cnt=1)
 2  (abcd:ef50 0:101), cnt=0
    OIF: entire vlan
    age=0s up-time=0s vidx=8191 (ref-cnt=1)
vlan 70, has 0 cache
```

show ipv6 multicast pimsm-snooping

Displays information related to PIM sparse mode (SM) snooping on the mcache.

Syntax

```
show ipv6 multicast pimsm-snooping [ vlan vlan-id ] [ cache ipv6-address ] [ resources ]
```

Parameters

cache *ipv6-address*

Specifies the PIM SM Snooping cache.

vlan *vlan-id*

Specifies snooping for a VLAN.

resources

Specifies PIM SM snooping resources.

Modes

Privileged exec mode

Usage Guidelines

Use the **show ipv6 pimsm-snooping cache** command to display information related to the PIM SM snooping outgoing interface (OIF) in the mcache.

Examples

The following example shows PIM SM information for the mcache:

```
Device#show ipv6 multicast pimsm-snooping
Example: Port: 7/3 (ref_count=1)
       ref_count: no of entries in pimsm snoop cache added this oif)

vlan 503, has 1 caches.
1    (* 2:3) has 1 pim join ports out of 1 OIF
    1/1/4 (ref_count=2),
```

show ipv6 multicast resource

Displays information about the software resources used.

Syntax

show ipv6 multicast resource [**vlan** *vlan-num*]

Parameters

vlan *vlan-num*

Displays information for the specified VLAN only.

Modes

User EXEC mode

Command Output

The **show ipv6 multicast resource** command displays the following information:

Output Field	Displays
alloc	The allocated number of units.
in-use	The number of units currently used.
avail	The number of available units.
get-fail	The number of resource failures NOTE It is important to pay close attention to this field.
limit	The upper limit of this expandable field. The multicast listening discovery (MLD) group limit is configured using the system-max mld-snoop-group-addr command. The snoop mcache entry limit is configured using the system-max mld-snoop-mcache command.
get-mem	The current memory allocation. This number should continue to increase.
size	The size of a unit (in bytes).
init	The initial allocated amount of memory. NOTE This number can be increased. (More memory can be allocated if necessary.)
Available vidx	The output interface (OIF) port mask used by mcache. The entire device has a maximum of 4096 vidx. Different mcaches with the same OIF share the same vidx. If vidx is not available, the stream cannot be hardware-switched.

Show Commands

show ipv6 multicast resource

Examples

This example shows information about the software resources:

```
device> show ipv6 multicast resource
          alloc in-use  avail get-fail   limit  get-mem  size init
mld group      512     9    503     0    32000    272   28 256
mld phy port   1024    16   1008     0   200000    279   21 1024
snoop group hash  512     9    503     0   59392    272   20 256
... Entries deleted
total pool memory 194432 bytes
has total 1 forwarding hash
Available vidx: 4061
```

show ipv6 multicast traffic

Displays status information for multicast listening discovery (MLD) snooping traffic.

Syntax

show ipv6 multicast traffic

Modes

User EXEC mode

Command Output

The **show ipv6 multicast traffic** command displays the following information:

Output Field	Description
Q	Query
Qry	General Query
QryV1	Number of general MLDv1 queries received or sent.
QryV2	Number of general MLDv2 snooping queries received or sent.
G-Qry	Number of group specific queries received or sent.
GSQry	Number of group source specific queries received or sent.
MBR	The membership report.
MbrV1	The MLDv1 membership report.
MbrV2	The MLDv2 membership report.
IsIN	Number of source addresses that were included in the traffic.
IsEX	Number of source addresses that were excluded in the traffic.
ToIN	Number of times the interface mode changed from EXCLUDE to INCLUDE.
ToEX	Number of times the interface mode changed from INCLUDE to EXCLUDE.
ALLO	Number of times additional source addresses were allowed on the interface.
BLK	Number of times sources were removed from an interface.
Pkt-Err	Number of packets having errors such as checksum errors.

Show Commands

show ipv6 multicast traffic

Examples

The following example shows information for MLD snooping traffic.

```
device> show ipv6 multicast traffic
MLD snooping: Total Recv: 32208, Xmit: 166
Q: query, Qry: general Q, G-Qry: group Q, GSQry: group-source Q, Mbr: member
Recv   QryV1   QryV2   G-Qry   GSQry   MbrV1   MbrV2   Leave
VL1    0        0        0        0       31744   208     256
VL70   0        0        0        0        0        0        0
Recv   IsIN    IsEX    ToIN    ToEX    ALLOW   BLOCK   Pkt-Err
VL1    1473    31784   0        1        1        7        0
VL70   0        0        0        0        0        0        0
Send   QryV1   QryV2   G-Qry   GSQry   MbrV1   MbrV2
VL1    0        0        166     0        0        0
VL70   0        0        0        0        0        0
```

show ipv6 multicast vlan

Displays multicast listening discovery (MLD) snooping information for all VLANs or for a specific VLAN.

Syntax

show ipv6 multicast vlan *vlan-id*

Parameters

vlan-id

Specifies the VLAN for which you want information. If you do not specify a *vlan-id*, information for all VLANs is displayed.

Modes

Privileged EXEC mode

Command Output

The **show ipv6 multicast vlan** command displays the following information:

Output Field	Description
version	The MLD version number.
query-t	How often a querier sends a general query on the interface.
group-aging-t	Number of seconds membership groups can be members of this group before aging out.
rtr-port	The router ports which are the ports receiving queries. The display router ports: 1/36(120) 2001:DB8::2e0:52ff:fe00:9900 means port 1/36 has a querier with 2001:DB8::2e0:52ff:fe00:9900 as the link-local address, and the remaining life is 120 seconds.
max-resp-t	The maximum number of seconds a client can wait before it replies to the query.
non-QR	Indicates that the port is a non-querier.
QR	Indicates that the port is a querier.
Unregistered IPv6 Multicast Packets Flooding	Indicates whether flooding is enabled.

Examples

The following example shows MLD snooping information for VLAN 70:

```
Device#show ipv6 multicast vlan 70
version=1, query-t=60, group-aging-t=140, max-resp-t=3, other-qr-present-t=123
VL70: cfg V2, vlan cfg passive, 2 grp, 0 (SG) cache, rtr ports,
  router ports: 1/36(120) 2001:DB8::2e0:52ff:fe00:9900,
  My Query address: fe80::ce4e:24ff:fe6f:980 (link-local)
  1/26 has 2 grp, non-QR (passive), cfg V1
  1/26 has 2 grp, non-QR (passive), cfg V1
    group: ff10:1234::5679, life = 100
    group: ff10:1234::5678, life = 100
  1/35 has 0 grp, non-QR (QR=2001:DB8::2e0:52ff:fe00:9900, age=20), dft V2 trunk
```

Show Commands

show ipv6 multicast vlan

The following example shows MLD snooping information when flooding of unregistered IPv6 multicast frames is disabled:

```
Device#show ipv6 multicast vlan
Summary of all vlans. use "sh ipv6 multicast vlan vlan-id" for details
Version=1, Intervals: Query=125, Group Age=260, Max Resp=10, Other Qr=255
Leave Wait=2, Robustness=2
Unregistered IPv6 Multicast Packets Flooding: Disabled.

VL500: dft V1, vlan cfg active, 0 grp, 0 (*G) cache, no rtr port,
VL600 no snoop: no global or local config
My Query address: fe80::ce4e:24ff:fe6f:980 (link-local)
```

History

Release version	Command history
8.0.30	This command was modified to display flooding information.
8.0.50	The output of this command was modified to display the My Query address field.

show ipv6 neighbor

Displays the IPv6 neighbor table, which contains an entry for each IPv6 neighbor with which the router exchanges IPv6 packets.

Syntax

```
show ipv6 neighbor [ vrf vrf-nam ] [ index | ipv6-address | ipv6-prefix/prefix-length | ethernet stack/slot/port | ve ve-num ]
```

Parameters

vrf vrf-name

Displays the IPv6 neighbor information for the specified Virtual Routing/Forwarding (VRF) instance.

ipv6-address

Restricts the display to the entries for the specified IPv6 address. Specify this parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373.

ipv6-prefix/prefix-length

Restricts the display to the entries for the specified IPv6 prefix. Specify the *ipv6-prefix* parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373. Specify the *prefix-length* parameter as a decimal value. A slash mark (/) must follow the *ipv6-prefix* parameter and precede the *prefix-length* parameter.

ethernet stack/slot/port

Restricts the display to the entries for the specified Ethernet interface.

ve ve-num

restricts the display to the entries for the specified VE interface.

Modes

User EXEC mode

Command Output

The **show ipv6 neighbor** command displays the following information:

Output field	Description
Total number of neighbor entries	The total number of entries in the IPv6 neighbor table.
IPv6 Address	The 128-bit IPv6 address of the neighbor.
Link-Layer Address	The 48-bit interface ID of the neighbor.

Show Commands

show ipv6 neighbor

Output field	Description
State	The current state of the neighbor. Possible states are as follows: <ul style="list-style-type: none">• INCOMPLETE - Address resolution of the entry is being performed.• *REACH - The static forward path to the neighbor is functioning properly.• REACH - The forward path to the neighbor is functioning properly.• STALE - This entry has remained unused for the maximum interval. While stale, no action takes place until a packet is sent.• DELAY - This entry has remained unused for the maximum interval, and a packet was sent before another interval elapsed.• PROBE - Neighbor solicitation are transmitted until a reachability confirmation is received.
Age	The number of seconds the entry has remained unused. If this value remains unused for the number of seconds specified by the ipv6 nd reachable-time command (the default is 30 seconds), the entry is removed from the table.
Port	The physical port on which the entry was learned.
vlan	The VLAN on which the entry was learned.
IsR	Determines if the neighbor is a router or host: <ul style="list-style-type: none">• 0 - Indicates that the neighbor is a host.• 1 - Indicates that the neighbor is a router.

Examples

The following example displays the IPv6 neighbor table.

```
device> show ipv6 neighbor
Total number of Neighbor entries: 3
IPv6 Address      LinkLayer-Addr  State   Age   Port      vlan   IsR
2001:DB8::55     0000.0002.0002 *REACH  0     e 1/3/11  -     0
2000:4::110      0000.0091.bb37 REACH   20    e 1/3/1   5     1
fe80::2e0:52ff:fe91:bb37 0000.0091.bb37 DELAY   1     e 1/3/2   4     1
fe80::2e0:52ff:fe91:bb40 0000.0091.bb40 STALE   5930  e 1/3/3   5     1
```

show ipv6 ospf interface

Displays interface information for all or specific OSPFv3-enabled interfaces.

Syntax

```
show ipv6 ospf interface [ brief ] [ ethernet mappedID/slot/port ] [ loopback number ] [ tunnel number ] [ ve vlan_id ]
```

Parameters

brief

Displays brief summary information about OSPFv3-enabled interfaces.

ethernet *mappedID/slot/port*

Specifies the physical interface. On standalone devices specify the interface ID in the format slot/port-id; on stacked devices you must also specify the stack ID, in the format stack-id/slot/port-id.

loopback *number*

Specifies a loopback port number in the range of 1 to 255.

tunnel *number*

Specifies a tunnel interface.

ve *vlan_id*

Specifies the VLAN number.

Modes

Privileged EXEC mode

Usage Guidelines

Use the **brief** keyword to limit the display to the following fields:

- Interface
- Area
- Status
- Type
- Cost
- State
- Nbrs(F/C)

Command Output

The **show ipv6 ospf interface** command displays the following information:

Show Commands

show ipv6 ospf interface

This field	Displays
Interface status	The status of the interface. Possible status includes the following: <ul style="list-style-type: none">• Up.• Down.
Type	The type of OSPFv3 circuit running on the interface. Possible types include the following: <ul style="list-style-type: none">• BROADCAST• POINT TO POINT UNKNOWN• POINT TO POINT
IPv6 Address	The IPv6 address assigned to the interface.
Instance ID	An identifier for an instance of OSPFv3.
Router ID	The IPv4 address of the device. By default, the router ID is the IPv4 address configured on the lowest numbered loopback interface. If the device does not have a loopback interface, the default router ID is the lowest numbered IPv4 address configured on the device.
Area ID	The IPv4 address or numerical value of the area in which the interface belongs.
Cost	The overhead required to send a packet through the interface.
Interface bandwidth	The configured bandwidth on a tunnel interface for routing metric purposes only.
default	Shows whether or not the default passive state is set.
State	The state of the interface. Possible states include the following: <ul style="list-style-type: none">• DR - The interface is functioning as the Designated Router for OSPFv3.• BDR - The interface is functioning as the Backup Designated Router for OSPFv3.• Loopback - The interface is functioning as a loopback interface.• P2P - The interface is functioning as a point-to-point interface.• Passive - The interface is up but it does not take part in forming an adjacency.• Waiting - The interface is trying to determine the identity of the BDR for the network.• None - The interface does not take part in the OSPF interface state machine.• Down - The interface is unusable. No protocol traffic can be sent or received on such a interface.• DR other - The interface is a broadcast or NBMA network on which another router is selected to be the DR.• Active - The interface sends or receives all the OSPFv3 control packets, and forms the adjacency.
Transmit delay	The amount of time, in seconds, it takes to transmit Link State Updates packets on the interface.
Priority	The priority used when selecting the DR and the BDR. If the priority is 0, the interface does not participate in the DR and BDR election.
Timer intervals	The interval, in seconds, of the hello-interval, dead-interval, and retransmit-interval timers.

This field	Displays
DR	The router ID (IPv4 address) of the DR.
BDR	The router ID (IPv4 address) of the BDR.
Number of I/F scoped LSAs	The number of interface LSAs scoped for a specified area, AS, or link.
DR Election	The number of times the DR election occurred.
Delayed LSA Ack	The number of the times the interface sent a delayed LSA acknowledgement.
Neighbor Count	The number of neighbors to which the interface is connected.
Adjacent Neighbor Count	The number of neighbors with which the interface has formed an active adjacency.
Neighbor	The router ID (IPv4 address) of the neighbor. This field also identifies the neighbor as a DR or BDR, if appropriate.
Interface statistics	<p>The following statistics are provided for the interface:</p> <ul style="list-style-type: none"> • Unknown - The number of Unknown packets transmitted and received by the interface. Also, the total number of bytes associated with transmitted and received Unknown packets. • Hello - The number of Hello packets transmitted and received by the interface. Also, the total number of bytes associated with transmitted and received Hello packets. • DbDesc - The number of Database Description packets transmitted and received by the interface. Also, the total number of bytes associated with transmitted and received Database Description packets. • LSReq - The number of link-state requests transmitted and received by the interface. Also, the total number of bytes associated with transmitted and received link-state requests. • LSUpdate - The number of link-state updates transmitted and received by the interface. Also, the total number of bytes associated with transmitted and received link-state requests. • LSAck - The number of link-state acknowledgements transmitted and received by the interface. Also, the total number of bytes associated with transmitted and received link-state acknowledgements.

Show Commands

show ipv6 ospf interface

Examples

This example shows sample output from the **show ipv6 ospf interface** command when no arguments or keywords are used.

```
device# show ipv6 ospf interface

e 1/1/9 admin up, oper up, IPv6 enabled
IPv6 Address:
  fe80::224:10ff:fe76:4bc0
  201::1/64
Instance ID 0, Router ID 2.2.2.2
Area ID 0, Cost 1, Type BROADCAST
MTU: 1500

History

Release version	Command history
8.0.30	This command was modified to include configured bandwidth status.

show ipv6 neighbor inspection

Displays the status of the neighbor discovery (ND) inspection configuration, details of the VLANs on which ND inspection is enabled, ND static entries, and ND inspection statistics.

Syntax

```
show ipv6 neighbor [ vrf vrf-name ] inspection [static-entry | statistics | vlan vlan-number ]
```

Parameters

static-entry

Specifies the manually configured static ND inspection entries that are used to validate the packets received on untrusted ports.

statistics

Specifies the total number of neighbor discovery messages received and the number of packets discarded after ND inspection.

vlan

Specifies the VLANs on which ND inspection is enabled.

vlan-number

Specifies the ID of the configured VLAN.

vrf

Specifies the VRF instance.

vrf-name

Specifies the ID of the VRF instance.

inspection

Specifies that the neighbor discovery messages are verified against the static ND inspection entries or dynamically learned DHCPv6 snoop entries.

Modes

Privileged EXEC mode

Global configuration mode

VRF configuration mode

Command Output

The **show ipv6 neighbor inspection** command displays the following information.

Output field	Description
VLAN	The list of VLANs on which ND inspection is enabled.
IPv6 Address	The IPv6 addresses of the hosts that are added as static ND inspection entries.
LinkLayer-Addr	The MAC addresses of the hosts that are added as static ND inspection entries.

Output field	Description
Total number of ND Solicit received	The total number of neighbor solicitation messages received.
Total number of ND Advert received	The total number of neighbor advertisement messages received.
Total number of Router Solicit received	The total number of router solicitation messages received.
Total number of ND dropped	The total number of neighbor discovery messages that are discarded because of the IP-to-MAC address binding discrepancy.
IPv6 Neighbor inspection VLAN <i>vlan-number</i>	The status of ND inspection on a VLAN.
Untrusted Ports	The interfaces or member ports on which trust mode is not enabled.
Trusted Ports	The interfaces or member ports on which trust mode is enabled.

Examples

The following example shows the output of the **show ipv6 neighbor inspection** command.

```
device(config)# show ipv6 neighbor inspection
IPv6 Neighbor inspection enabled on 2 VLAN(s):
  VLAN: 2
  VLAN: 3
```

The following example shows the output of the ND inspection configuration details for a VRF.

```
device(config-vrf-3)# show ipv6 neighbor vrf 3 inspection
IPv6 Neighbor inspection enabled on 2 VLAN(s):
  VLAN: 2
  VLAN: 3
```

The following example shows the output of the **show ipv6 neighbor inspection static-entry** command.

```
device(config)# show ipv6 neighbor inspection static-entry
Total number of ND Inspect entries: 3
IPv6 Address          LinkLayer-Addr
2001::1              0000.0000.1234
2001::3              0000.1234.4567
2001::2              0000.0000.4567
```

The following example shows the ND static entries of a VRF.

```
device(config-vrf-3)# show ipv6 neighbor vrf 3 inspection static-entry
Total number of ND Inspect entries: 1
IPv6 Address          LinkLayer-Addr
2001:201:1:1::34     cc4e.246d.2038
```

The following example shows the output of the **show ipv6 neighbor inspection statistics** command.

```
device(config)# show ipv6 neighbor inspection statistics
Total number of ND Solicit received    11
Total number of ND Advert received     29
Total number of Router Solicit received 20
Total number of ND dropped              6
```

The following example shows the ND inspection statistics of a VRF.

```
device(config-vrf-3)# show ipv6 neighbor vrf 3 inspection statistics
Total number of ND Solicit received    11
Total number of ND Advert received     29
Total number of Router Solicit received 20
Total number of ND dropped              6
```

Show Commands

show ipv6 neighbor inspection

The following example shows the output of the **show ipv6 neighbor inspection vlan *vlan-number*** command.

```
device (config)# show ipv6 neighbor inspection vlan 2
IPv6 Neighbor inspection VLAN 2: Enabled
  Untrusted Ports : ethe 1/1/1 to 1/1/2
  Trusted Ports  : ethe 1/1/3
```

The following example shows the details of the VLANs on which ND inspection is enabled for a VRF.

```
device (config-vrf-3)# show ipv6 neighbor vrf 3 inspection vlan 2
IPv6 Neighbor inspection VLAN 2: Enabled
  Untrusted Ports : ethe 1/1/1 to 1/1/2
  Trusted Ports  : ethe 1/1/3
```

History

Release version	Command history
08.0.20	This command was introduced.

show ipv6 pim anycast-rp

Displays information for an IPv6 PIM Anycast rendezvous point (RP) interface.

Syntax

show ipv6 pim [vrf *vrf-name*] anycast-rp

Parameters

vrf *vrf-name*

Displays information for the specified VRF instance.

Modes

User EXEC mode

Command Output

The **show ipv6 pim anycast-rp** command displays the following information:

Output Field	Description
Number of Anycast RP	Specifies the number of Anycast RP sets in the multicast domain.
Anycast RP	Specifies a shared RP address used among multiple PIM routers.
ACL ID	Specifies the ACL ID assigned.
ACL Name	Specifies the name of the Anycast RP set.
ACL Filter	Specifies the ACL filter state SET or UNSET.
Peer List	Specifies host addresses that are permitted in the Anycast RP set.

Examples

The following example shows information for an IPv6 PIM Anycast RP interface.

```
device> show ipv6 pim anycast-rp
Number of Anycast RP: 1
Anycast RP: 1001::1
ACL ID: 200
ACL Name: my-anycast-rp-set
ACL Filter: SET
Peer List:
1:1:1::1
2:2:2::2
3:3:3::3
```

show ipv6 pim bsr

Displays information on a device that has been elected as the bootstrap router (BSR).

Syntax

```
show ipv6 pim [ all-vrf | vrf vrf-name ] bsr
```

Parameters

all-vrf

Displays information for all VRF instances.

vrf vrf-name

Displays information for the specified VRF instance.

Modes

User EXEC mode

Command Output

The **show ipv6 pim bsr** command displays the following information:

Output Field	Description
BSR address	The IPv6 address of the interface configured as the IPv6 PIM Sparse (BSR).
BSR priority	The priority assigned to the interface for use during the BSR election process. During BSR election, the priorities of the candidate BSRs are compared and the interface with the highest BSR priority becomes the BSR.
Hash mask length	The number of significant bits in the IPv6 multicast group comparison mask. This mask determines the IPv6 multicast group numbers for which the device can be a BSR. The default is 32 bits, which allows the device to be a BSR for any valid IPv6 multicast group number. NOTE This field appears only if this device is a candidate BSR.
Next bootstrap message in	Indicates how many seconds will pass before the BSR sends its next Bootstrap message. NOTE This field appears only if this device is the BSR.
Next Candidate-RP-advertisement message in	Indicates how many seconds will pass before the BSR sends its next candidate RP advertisement message. NOTE This field appears only if this device is a candidate BSR.

Output Field	Description
RP	Indicates the IPv6 address of the Rendezvous Point (RP). NOTE This field appears only if this device is a candidate BSR.
group prefixes	Indicates the multicast groups for which the RP listed by the previous field is a candidate RP. NOTE This field appears only if this device is a candidate BSR.
Candidate-RP-advertisement period	Indicates how frequently the BSR sends candidate RP advertisement messages. NOTE This field appears only if this device is a candidate BSR.

Examples

The following example shows information for a device that has been elected as the BSR.

```
device> show ipv6 pim bsr
PIMv2 Bootstrap information for Vrf Instance : default-vrf
-----
This system is the Elected BSR
BSR address: 2006:1001::1. Hash Mask Length 64. Priority 32.
Next bootstrap message in 00:01:00
Configuration:
Candidate loopback 1 (Address 2006:1001::1). Hash Mask Length 64. Priority 32.
Next Candidate-RP-advertisement in 00:00:50
RP: 2006:1001::1
  group prefixes:
  ff00:: / 8
Candidate-RP-advertisement period: 60
Candidate-RP-advertisement period: 60

Candidate-RP-advertisement period: 60
```

The following example shows information for a device that is not the BSR.

```
device> show ipv6 pim bsr
PIMv2 Bootstrap information for Vrf Instance : default-vrf
-----
BSR address: 2006:1001::1. Hash Mask Length 64. Priority 32.
This system is not a Candidate-RP.
This system is not a Candidate-RP.
```

show ipv6 pim counter

Displays the number of default VLAN ID changes that occurred and how many times a tagged port was placed in a VLAN since the applicable VRF was created.

Syntax

```
show ipv6 pim [ vrf vrf-name ] counter
```

Parameters

vrf *vrf-name*

Displays information for the specified VRF instance.

Modes

User EXEC mode

Command Output

The **show ipv6 pim counter** command displays the following information:

Output Field	Description
DFTVlanChange	The number of default VLAN ID changes that have occurred since the applicable VRF was created.
VlanPort	The number of times that a tagged port was placed in a VLAN since the applicable VRF was created.

Examples

The following example displays default-VLAN-ID change and tagged-port information.

```
device> show ipv6 pim vrf eng counter
Event Callback:
  DFTVlanChange : 0      VlanPort : 0
LP to MP IPCs:
  SM_REGISTER : 8315    MCAST_CREATE : 0
  S_G_AGEOUT : 3        WRONG_IF : 0
  ABOVE_THRESHOLD: 0    MCAST_FIRST_DATA : 3
  SET_KAT : 3           SET_KAT_INFINITY : 3
MP to LP IPCs:
  INIT : 25             INSERT_VPORT : 30
  DELETE_VPORT : 186    DELETE_VIF : 162
  MOVE_VPORT : 0        DEL_ENTRY : 16
  INSERT_SOURCE : 0     DELETE_SOURCE : 0
  RESET_SRC_LIST : 0    MOVE_TNNL_PORT : 0
  FLAG_CHANGE : 6       FDB_VIDX_CHANGE: 0
  OIF_FLAG_CHANGE : 0
Error Counters:
  PIM_PKT_DRP : 0       PIM_PKT_DRP(Glb) : 0
  MCGRP_PKT_DRP: 0     MCGRP_PKT_DRP(G1): 0
  RPSET_MAXED : 0
```

show ipv6 pim group

Displays IPv6 PIM group information.

Syntax

show ipv6 pim [**vrf** *vrf-name*] **group**

Parameters

vrf *vrf-name*

Displays information for the specified VRF instance.

Modes

User EXEC mode

Command Output

The **show ipv6 pim group** command displays the following information:

Output Field	Description
Total number of Groups	Lists the total number of IPv6 multicast groups the device is forwarding.
Group	The multicast group address.
Group member at	Interface name and number.

Examples

The following example displays IPv6 PIM group information.

```
device# show ipv6 pim group
Total number of groups: 1
1   Group ff7e:a40:2001:3e8:27:0:1:2
    Group member at  e3/1: v31
```

show ipv6 pim hw-resource

Displays usage and fail-count information for SG entries on virtual routing and forwarding instances (VRFs).

Syntax

show ipv6 pim [**all-vrf** | **vrf** *vrf-name*] **hw-resource**

Parameters

all-vrf

Displays hardware resource information for all VRFs.

vrf *vrf-name*

Specifies displaying hardware resource information for a particular VRF instance.

Modes

User EXEC mode

Command Output

The **show ipv6 pim hw-resource** command displays the following information:

Output Field	Description
VRF	Name of the VRF.
Usage	Number of allocated SG entries in this VRF.
Fail	Number of failures while allocating SG entries in this VRF (due to system-max limit).
Total usage	Total number of SG entries in the system (All-VRFs).
System-max limit for SG entries	Configured system limit using the pim6-hw-mcache command.

Examples

The following example displays hardware resource information for all VRFs.

```
device> show ipv6 pim all-vrf hw-resource
      VRF  In-Use   Fail
  default-vrf  3072     8
      blue   3072     0
-----
      Total usage  6144

      System-max limit for SG entries: 6144
```

show ipv6 pim interface

Displays information for IPv6 PIM interfaces.

Syntax

show ipv6 pim interface { **ethernet***stackid/slot/port-id* | **loopback** *loopback-number* | **ve** *ve-number* }

Parameters

ethernet*stackid/slot/port-id*

Specifies a physical interface. On standalone devices specify the interface ID in the format slot/port-id; on stacked devices you must also specify the stack ID, in the format stack-id/slot/port-id.

loopback *loopback-number*

Specifies a loopback interface.

ve *ve-number*

Specifies a virtual interface.

Modes

Privileged EXEC mode

Examples

The following example displays output from the **show ipv6 pim interface** command, showing that ACL f10 is applied to interface 1/1/9 to control neighbor access.

```
Device# show ipv6 pim interface
Flags      : SM - Sparse Mode v2
```

```

Total Number of Interfaces : 9
```

History

Release version	Command history
8.0.20a	This command was modified to display neighbor filter information.

show ipv6 pim mcache

Displays the IPv6 PIM multicast cache.

Syntax

```
show ipv6 pim [vrf vrf-name ] mcache [ counts ] [ source-address group-address | dit-idx dit-idx | g_entries | receiver  
  { ethernet stack/slot/port | vlan vlan-num } | sg_entries | sparse | ssm ]
```

Parameters

vrf *vrf-name*

Specifies IPv6 PIM multicast cache information for a VRF instance.

source-address

Specifies the multicast cache source address.

group-address

Specifies the multicast cache group address.

counts

Specifies the number of entries.

dense

Displays only the PIM Dense Mode entries.

dit-idx *dit-idx*

Displays all entries that match a specified directory information tree (DIT).

g_entries

Displays only the (*, G) entries.

receiver

Displays all entries that egress a specified interface.

ethernet *stack/slot/port*

Specifies the Ethernet interface which is the receiver.

vlan *vlan-num*

Specifies the VLAN which is the receiver.

sg_entries

Displays only the (S, G) entries.

sparse

Displays only the PIM Sparse Mode entries.

ssm

Displays only the SSM entries.

Modes

User EXEC mode

Command Output

The **show ipv6 pim mcache** command displays the following information:

Field	Description
Total entries in mcache	Shows the total number of IPv6 PIM mcache entries.
upstream neighbor	Shows the upstream neighbor for the Source/RP based on the type of entry. For (*,G) it shows the upstream neighbor towards the RP. For (S,G) entries it shows the upstream neighbor towards the source.
Flags	Show the flags associated with the forward entry.
slow ports ethe	Shows the forwarding port ID of the mcache entry which is in the software forwarding path.
AgeSlitMsk	Shows the slot number on which MP expects ingress traffic.
L2 FID	Shows the hardware resource allocated for the traffic switched to receivers in the ingress VLAN.
DIT	Shows the hardware resource allocated for routed receivers.
Forwarding_oif	Shows the number of outgoing interfaces of the mcache entry.
immediate_oifs	Shows the local immediate outgoing interface of the mcache entry.
blocked_oifs	Shows the PIM Sparse mode blocked outgoing interfaces.
L3 (SW) 1	Shows whether the traffic is switched or routed out of the interface.
L3 (HW) 1	The forwarding entries by using hardware.
Src-Vlan	VLAN associated with the ingress interface.

Examples

The following example displays the IPv6 PIM multicast cache.

```
device> show ipv6 pim mcache
IP Multicast Mcache Table
Entry Flags      : SM - Sparse Mode, SSM - Source Specific Multicast, DM - Dense Mode
                  RPT - RPT Bit, SPT - SPT Bit, LSRC - Local Source, LRCV - Local Receiver
                  HW - HW Forwarding Enabled, FAST - Resource Allocated, TAG - Need For Replication Entry
                  REGPROB - Register In Progress, REGSUPP - Register Suppression Timer
                  MSDPADV - Advertise MSDP, NEEDRTE - Route Required for Src/RP, PRUN - DM Prune

Upstream
Interface Flags: IM - Immediate, IH - Inherited, WA - Won Assert
                  MJ - Membership Join, MI - Membership Include, ME - Membership Exclude

```

History

Release version	Command history
8.0.50	The output of the command was modified to remove the AvgRate and Profile entries.

show ipv6 pim neighbor

Displays information about IPv6 PIM neighbors.

Syntax

```
show ipv6 pim [ all-vrf | vrf vrf-name ] neighbor [ ethernet stack/slot/port | ve ve-num ]
```

Parameters

all-vrf

Displays information for all VRF instances.

vrf vrf-name

Displays information for the specified VRF instance.

ethernet stack/slot/port

Displays information for the specified Ethernet interface through which the device is connected to the neighbor.

ve ve-num

Displays information for the specified VE interface through which the device is connected to the neighbor.

Modes

User EXEC mode

Command Output

The **show ipv6 pim neighbor** command displays the following information:

Output Field	Description
Port	The routing interface through which the device is connected to the neighbor.
Phyport	The physical interface through which the device is connected to the neighbor.
Neighbor	The IPv6 interface of the IPv6 PIM neighbor interface.
Holdtime sec	Indicates how many seconds the neighbor wants this device to hold the entry for this neighbor in memory. The neighbor sends the Hold Time in its hello packets. <ul style="list-style-type: none"> If the device receives a new hello packet before the Hold Time received in the previous packet expires, the device updates its table entry for the neighbor. If the device does not receive a new hello packet from the neighbor before the Hold time expires, the device assumes the neighbor is no longer available and removes the entry for the neighbor.
T Bit	Specifies the ability of the sending router to disable joins suppression.
PropDelay msec	Expected propagation delay over the local link.

Show Commands

show ipv6 pim neighbor

Output Field	Description
Override msec	Default delay interval over which to randomize, when scheduling a delayed join message.
Age sec	The number of seconds since the device received the last hello message from the neighbor.
UpTime	The number of seconds the PIM neighbor has been up. This timer starts when the device receives the first hello messages from the neighbor.
VRF	
Prio	The DR priority that is used in the DR election process. This can be a configured value or the default value of 1.

Examples

The following example shows information about IPv6 PIM neighbors.

```
device> show ipv6 pim neighbor
-----+-----+-----+-----+-----+-----+
PPort |PhyPort |Neighbor                |Holdtime|T |
|      |        |                        |sec     |Bit|
-----+-----+-----+-----+-----+-----+
vv503  e2/1/11 fe80::204:ff:fe05:6      105     1
        + 2006:503::1001
vv503  e2/1/11 fe80::768e:f8ff:fe2c:cb80 105     1
        + 2006:503::1004
Total Number of Neighbors : 2
```

[output continued]

```
+-----+-----+-----+-----+-----+-----+
|PropDelay|Override |Age |UpTime  |VRF   |Prio
|msec    |msec    |sec |        |      |
+-----+-----+-----+-----+-----+-----+
500      3000    25  06:50:10 default 1
500      3000    12  06:50:10 default 1
```

show ipv6 pim resource

Displays the hardware resource information, such as hardware allocation, availability, and limit, for software data structures.

Syntax

show ipv6 pim [**all-vrf** | **vrf** *vrf-name*] **resource**

Parameters

all-vrf

Displays information for all virtual routing and forwarding instances (VRFs).

vrf *vrf-name*

Displays information for a particular VRF instance.

Modes

User EXEC mode

Command Output

The **show ipv6 pim resource** command displays the following information:

Output Field	Description
Num alloc	Number of allocated PIM resources.
System max	Maximum number of VRF resources.
Size	Internal size.
alloc	Number of nodes of that data that are currently allocated in memory.
in-use	Number of allocated nodes in use.
avail	Number of allocated nodes are not in use.
get-fail	Number of allocated notes that failed.
limit	Maximum number of nodes that can be allocated for a data structure. This may or may not be configurable, depending on the data structure
get-mem	Current memory allocation.
size	Unit size.
init	Initial number.

Show Commands

show ipv6 pim resource

Examples

The following example displays output from the **show ipv6 pim resource** command.

```
device> show ipv6 pim vrf white res

```

show ipv6 pim rp-candidate

Displays candidate rendezvous point (RP) information.

Syntax

show ipv6 pim [vrf *vrf-name*] rp-candidate

Parameters

vrf *vrf-name*

Displays information for the specified VRF instance.

Modes

User EXEC mode

Command Output

The **show ipv6 pim rp-candidate** command displays the following information:

Field	Description
Candidate-RP-advertisement in	Indicates how many seconds will pass before the BSR sends its next RP message. NOTE This field appears only if this device is a candidate RP.
RP	Indicates the IPv6 address of the RP. NOTE This field appears only if this device is a candidate RP.
group prefixes	Indicates the multicast groups for which the RP listed by the previous field is a candidate RP. NOTE This field appears only if this device is a candidate RP.
Candidate-RP-advertisement period	Indicates how frequently the BSR sends candidate RP advertisement messages. NOTE This field appears only if this device is a candidate RP.

Show Commands

show ipv6 pim rp-candidate

Examples

The following example shows information for a candidate RP.

```
device> show ipv6 pim rp-candidate
Next Candidate-RP-advertisement in 00:00:10
  RP: 1be::11:21
    group prefixes:
      ff00:: / 8
Candidate-RP-advertisement period: 60
```

show ipv6 pim rpf

Displays what PIM sees as the best reverse path to the source. While there may be multiple routes back to the source, the one displayed by this command is the one that PIM thinks is best.

Syntax

```
show ipv6 pim [ vrf vrf-name ] rpf ipv6-address [ group-address ]
```

Parameters

vrf *vrf-name*

Displays information for a VRF instance.

ipv6-address

Specifies the source IPv6 address for reverse-path forwarding (RPF) check.

group-address

Specifies the group IPv6 address for reverse-path forwarding (RPF) check.

Modes

User EXEC mode

Examples

The following example shows best reverse path to the specified source.

```
device> show ipv6 pim rpf 2008:165::1010  
upstream nbr 2006:503::1001 on v503
```

show ipv6 pim rp-hash

Displays rendezvous-point (RP) information for an IPv6 PIM Sparse group.

Syntax

```
show ipv6 pim [vrf vrf-name] rp-hash group-addr
```

Parameters

vrf *vrf-name*

Displays information for the specified VRF instance.

group-addr

Specifies the address of an IPv6 PIM Sparse IP multicast group.

Modes

User EXEC mode

Command Output

The **show ipv6 pim rp-hash** command displays the following information:

Output Field	Description
RP	Indicates the IPv6 address of the RP for the specified IPv6 PIM Sparse group. Following the IPv6 address is the port or virtual interface through which this device learned the identity of the RP.
Info source	Indicates the IPv6 address on which the RP information was received. Following the IPv6 address is the method through which this device learned the identity of the RP.

Examples

The following example shows RP information for an IPv6 PIM Sparse group.

```
device# show ipv6 pim rp-hash ffile::1:2
RP: 2001:3e8:255:255::17, v2
Info source: 2001:3e8:255:255::17, via bootstrap
```

show ipv6 pim rp-map

Displays rendezvous-point (RP)-to-group mapping information.

Syntax

show ipv6 pim [vrf *vrf-name*] rp-map

Parameters

vrf *vrf-name*

Displays information for the specified VRF instance.

Modes

User EXEC mode

Command Output

The **show ipv6 pim rp-map** command displays the following information:

Output Field	Description
Index	The index number of the table entry in the display.
Group address	Indicates the IPv6 PIM Sparse multicast group address using the listed RP.
RP address	Indicates the IPv6 address of the RP for the listed PIM Sparse group.

Examples

The following example shows RP-to-group mapping.

```
device #show ipv6 pim rp-map
Number of group-to-RP mappings: 3
-----
S.No  Group address  RP address
-----
1     ff07::c:1      3200:12::32
2     ff07::c:2      3200:12::32
3     ff07::c:3      3200:12::32
Number of group-to-RP mappings: 3
```

show ipv6 pim rp-set

Displays rendezvous-point (RP)-set list for the device elected as the bootstrap router (BSR).

Syntax

```
show ipv6 pim [ all-vrf | vrf vrf-name ] rp-set
```

Parameters

all-vrf

Displays information for all VRF instances.

vrf vrf-name

Displays information for the specified VRF instance.

Modes

User EXEC mode

Command Output

The **show ipv6 pim rp-set** command displays the following information:

Output Field	Description
Number of group prefixes	The number of IPv6 PIM Sparse group prefixes for which the RP is responsible.
Group prefix	Indicates the multicast groups for which the RP listed by the previous field is a candidate RP.
RPs expected or received	Indicates how many RPs were expected and received in the latest Bootstrap message.
RP num	Indicates the RP number. If there are multiple RPs in the IPv6 PIM Sparse domain, a line of information for each of them is listed, and they are numbered in ascending numerical order.
priority	The RP priority of the candidate RP. During the election process, the candidate RP with the highest priority is elected as the RP.
age	The age (in seconds) of this RP-set. NOTE If this device is not a BSR, this field contains zero. Only the BSR ages the RP-set.

Examples

The following example shows the RP set list.

```
device> show ipv6 pim rp-set
Static RP
-----
Static RP count: 1
100::1
Number of group prefixes Learnt from BSR: 0
No RP-Set present
```

show ipv6 pim sparse

Displays PIM Sparse configuration information for IPv6, including whether the hardware-drop feature is enabled or disabled, information for PIM SSM range ACL configuration, and route-precedence settings.

Syntax

```
show ipv6 pim [ vrf vrf-name ] sparse
```

Parameters

vrf *vrf-name*

Displays IPv6 PIM information for a virtual routing and forwarding instance (VRF).

Modes

User EXEC mode

Command Output

The **show ipv6 pim sparse** command displays the following information:

Output Field	Displays
Global PIM Sparse mode settings	
Maximum mcache	Maximum number of multicast cache entries.
Current Count	Number of multicast cache entries used.
Hello interval	How frequently the device sends IPv6 PIM Sparse hello messages to its IPv6 PIM Sparse neighbors. This field shows the number of seconds between hello messages. IPv6 PIM Sparse routers use hello messages to discover one another.
Neighbor timeout	Number of seconds the device waits for a hello message from a neighbor before determining that the neighbor is no longer present and is not removing cached IPv6 PIM Sparse forwarding entries for the neighbor. Default is 105 seconds.
Join or Prune interval	How frequently the device sends IPv6 PIM Sparse Join or Prune messages for the multicast groups it is forwarding. This field shows the number of seconds between Join or Prune messages. The device sends Join or Prune messages on behalf of multicast receivers that want to join or leave an IPv6 PIM Sparse group. When forwarding packets from IPv6 PIM Sparse sources, the device sends the packets only on the interfaces on which it has received join requests in Join or Prune messages for the source group.
Inactivity interval	Number of seconds a forwarding entry can remain unused before the router deletes it. Default is 180 sec.

Output Field	Displays
Hardware Drop Enabled	Indicates whether hardware drop is enabled or disabled. To prevent unwanted multicast traffic from being sent to the CPU, PIM Routing and Passive Multicast Route Insertion (PMRI) can be used together to ensure that multicast streams are only forwarded out ports with interested receivers and unwanted traffic is dropped in the hardware on Layer 3 Switches.
Prune Wait Interval	Number of seconds a PIM device waits before stopping traffic to neighbor devices that do not want the traffic. Range is from zero to three seconds. Default is three seconds.
Bootstrap Msg interval	How frequently the BSR configured on the device sends the RP set to the RPs within the IPv6 PIM Sparse domain. The RP set is a list of candidate RPs and their group prefixes. The group prefix of a candidate RP indicates the range of IPv6 PIM Sparse group numbers for which it can be an RP. NOTE This field contains a value only if an interface on the device is elected to be the BSR. Otherwise, the field is blank.
Candidate-RP Msg interval	Number of seconds the candidate RP configured on the Layer 3 switch sends candidate RP advertisement messages to the BSR. Default is 60 seconds.
Register Suppress Time	This is the mean interval between receiving a Register-Stop and allowing registers to be sent again. A lower value means more frequent register bursts at RP, while a higher value means longer join latency for new receivers. Default: 60 seconds.
Register Probe Time	Number of seconds the PIM router waits for a register-stop from an RP before it generates another NULL register to the PIM RP. Default is 10 seconds.
Register Stop Delay	Register stop message. Default is 10 seconds.
Register Suppress interval	Number of seconds that it takes the designated router to send Register-encapsulated data to the RP after receiving a Register-Stop message. Default is 60 seconds.
SSM Enabled	If yes, source-specific multicast is configured globally on this router.
SPT threshold	Number of packets the device sends using the path through the RP before switching to the SPT path. Default is 1 packet.
SSM Group Range	Source-specific multicast group range.
Route Precedence	The route precedence configured to control the selection of routes based on the four route types: <ul style="list-style-type: none"> • Non-default route from the mRTM • Default route from the mRTM • Non-default route from the uRTM • Default route from the uRTM
Embedded RP Enabled	Indicates whether the embedded RP is enabled or disabled.

Show Commands

show ipv6 pim sparse

Examples

The following example shows whether the hardware-drop feature has been enabled or disabled.

```

```

show ipv6 pim traffic

Displays IPv6 PIM traffic statistics.

Syntax

```
show ipv6 pim traffic [ vrf vrf-name ] [ join-prune ] [ rx | tx ]
```

Parameters

vrf *vrf-name*

Specifies information for a VRF instance.

join-prune

Specifies displaying join and prune statistics.

rx

Specifies displaying received PIM traffic statistics.

tx

Specifies displaying transmitted PIM traffic statistics.

Modes

Privileged EXEC mode

Usage Guidelines

PIM control packet statistics for interfaces that are configured for standard PIM are listed first by the display.

Command Output

The **show ipv6 pim traffic** command displays the following information:

Output Field	Description
Port	The port or virtual interface on which the IPv6 PIM interface is configured.
HELLO	The number of IPv6 PIM Hello messages sent or received on the interface.
JOIN-PRUNE	The number of Join or Prune messages sent or received on the interface. NOTE Unlike PIM dense, PIM Sparse uses the same messages for Joins and Prunes.
ASSERT	The number of Assert messages sent or received on the interface.
REGISTER GRAFT (DM)	The number of Register messages sent or received on the interface.

Show Commands
show ipv6 pim traffic

Output Field	Description
REGISTER STOP (SM)	The number of Register Stop messages sent or received on the interface.
BOOTSTRAP MSGS (SM)	The number of bootstrap messages sent or received on the interface.
CAND. RP ADV. (SM)	The total number of Candidate-RP-Advertisement messages sent or received on the interface.
Err	The total number of MLD messages discarded, including a separate counter for those that failed the checksum comparison.

Examples

This example shows PIM traffic statistics:

```
Device# show ipv6 pim traffic
Port    HELLO    JOIN-PRUNE  ASSERT    REGISTER  REGISTER  BOOTSTRAP  CAND. RP  Err
          GRAFT(DM) STOP(SM)  MSGS (SM) ADV. (SM)

```

History

Release version	Command history
8.0.20a	This command was modified to display, in the Err column, received Hello packets dropped on an interface because of an ACL to control neighbor access.

show ipv6 pimsm-snooping cache

Displays the downstream PIM join/prune information for both source-path tree (SPT) and rendezvous-point tree (RPT).

Syntax

```
show ipv6 pimsm-snooping cache [ vlan vlan-id ] ipv6-address [ resources ]
```

Parameters

ipv6-address

Specifies the IP address.

vlan *vlan-id*

Specifies snooping for a VLAN.

resources

Specifies PIM SM snooping resources.

Modes

Privileged exec mode

Command Output

The **show ipv6 pimsm-snooping cache** command displays the following information:

Output field	Description
SG	(s,g) downstream fsm state for SPT.
G	(*g) downstream fsm state for RPT

The **show ipv6 pimsm-snooping cache** command displays the following information only when multi-chassis trunking (MCT) is enabled on the VLAN:

Output field	Description
CCEP	Cluster-client-edge port
CEP	Cluster-edge port
Remote/Local	Join/Prune received on MCT peer or local

Show Commands

show ipv6 pimsm-snooping cache

Examples

The following example shows PIM SM information.

```
Device#show ipv6 pimsm-snooping cache
OIF Info:
TR - OIF Belongs to Trunk/LAG, Primary port is displayed
SG - (s,g) downstream fsm state:
G - (*,g) downstream fsm state:
  NI : No Info, J : Join, PP : Prune Pending, CLEAN : cleanup in progress
RPT - (s,g,rpt) downstream fsm state:
  NI : No Info, P : Pruned, PP : Prune Pending, Px : Temp step in (*,G)
  join processing, PPx : Temp State in (*,G) processing, CLEAN : cleanup
  in progress.

PIMSM Snoop cache for vlan 503
1   (* ff7e::1:2:3) Up Time: 03:43:40
    OIF: 1
    TR(e1/1/4) G : J(183) ET: 210, Up Time: 03:43:40

2   (3000::10 ff7e::1:2:3) Up Time: 00:02:52
    OIF: 1
    TR(e1/1/4) SG : J(185) ET: 210, Up Time: 00:02:52
```

The following example shows PIM SM information for a VLAN.

```
Device#show ipv6 pimsm-snooping vlan 503
OIF Info:
TR - OIF Belongs to Trunk/LAG, Primary port is displayed
SG - (s,g) downstream fsm state:
G - (*,g) downstream fsm state:
  NI : No Info, J : Join, PP : Prune Pending, CLEAN : cleanup in progress
RPT - (s,g,rpt) downstream fsm state:
  NI : No Info, P : Pruned, PP : Prune Pending, Px : Temp step in (*,G)
  join processing, PPx : Temp State in (*,G) processing, CLEAN : cleanup
  in progress.

PIMSM Snoop cache for vlan 503
1   (* ff7e::1:2:3) Up Time: 03:43:46
    OIF: 1
    TR(e1/1/4) G : J(177) ET: 210, Up Time: 03:43:46

2   (3000::10 ff7e::1:2:3) Up Time: 00:02:58
    OIF: 1
    TR(e1/1/4) SG : J(179) ET: 210, Up Time: 00:02:58
```

The following example shows PIM SM resource information.

```
Device#show ipv6 pimsm-snooping resources
      alloc in-use  avail get-fail   limit  get-mem  size init
pimsm group entry   1000     1    999         0  232000     2    64 1000
pimsm source entry  2000     1   1999         0  464000     2    68 2000
pimsm oif entry     2000     1   1999         0  464000     2    89 2000

Total memory in used: 378000 bytes
```

show ipv6 raguard

Displays the Router Advertisement (RA) guard configuration details.

Syntax

```
show ipv6 raguard { counts | policy } { name | all }
```

```
show ipv6 raguard whitelist { number | all }
```

Parameters

counts

Displays the RA guard permit or drop counts.

policy

Displays the RA guard policy details.

whitelist

Displays the RA guard whitelist associated with the RA guard policy.

name

An ASCII string indicating the name of the RA guard policy, when used along with **counts** keyword, displays the permit or drop counts for the specified RA guard policy. When used with **policy** keyword, displays the configuration of the specified RA guard policy.

all

When used with **counts**, **policy**, and **whitelist** keywords, displays the permit or drop counts for all the RA guard policies, configuration of all RA guard policies, and all the associated RA guard whitelists respectively.

number

Displays the specific whitelist based on the ID number.

Modes

Privileged EXEC mode

Global configuration mode

Usage Guidelines

The **show ipv6 raguard counts** command is applicable only when logging is enabled on the policy.

Examples

The following example shows the RA guard drop or permit counts for all RA guard policies:

```
device#show ipv6 raguard counts all
POLICY: policy1
DROPPED-host port: 1
DROPPED-whitelist: 4
DROPPED-prefixlist: 1
DROPPED-max pref: 3
PASSED-trusted port: 0
PASSED-untrusted port: 0
POLICY: policy2
DROPPED-host port: 1
DROPPED-whitelist: 0
DROPPED-prefixlist: 3
DROPPED-max pref: 1
PASSED-trusted port: 0
PASSED-untrusted port: 0
```

The following example shows the details of a RA guard policy p1:

```
device#show ipv6 raguard policy p1
policy:p1
    whitelist:1
```

The following example shows all RA guard whitelist:

```
device#show ipv6 raguard whitelist all
whitelist #1 : 3 entries
    permit fe80:db8::db8:10/128
    permit fe80:db8::db8:5/128
    permit fe80:db8::db8:12/128
```

show ipv6 rip

Shows RIPng configuration information for the device.

Syntax

show ipv6 rip

Modes

Privileged EXEC mode or any configuration mode

Command Output

The **show ipv6 rip** command displays the following information:

Output field	Description
IPv6 RIP status/port	The status of RIPng on the device. Possible status is "enabled" or "disabled." The UDP port number over which RIPng is enabled.
Administrative distance	The setting of the administrative distance for RIPng.
Updates/expiration	The settings of the RIPng update and timeout timers.
Holddown/garbage collection	The settings of the RIPng hold-down and garbage-collection timers.
Split horizon/poison reverse	The status of the RIPng split horizon and poison reverse features. Possible status for each is "on" or "off."
Default routes	The status of RIPng default routes.
Periodic updates/trigger updates	The number of periodic updates and triggered updates sent by the RIPng device.
Distribution lists	The inbound and outbound distribution lists applied to RIPng.
Redistribution	The types of IPv6 routes redistributed into RIPng. The following types of routes can be redistributed: STATIC CONNECTED BGP - BGP4+ OSPF - OSPFv3

Examples

The following example shows settings for RIPng, which is enabled on UDP port 521. Connected, static, OSPFv3, and BGP4+ routes are redistributed through IPv6.

```
device# show ipv6 rip
IPv6 rip enabled, port 521
Administrative distance is 120
Updates every 30 seconds, expire after 180
Holddown lasts 180 seconds, garbage collect after 120
Split horizon is on; poison reverse is off
Default routes are not generated
Periodic updates 5022, trigger updates 10
Distribute List, Inbound : Not set
Distribute List, Outbound
Redistribute: CONNECTED STATIC OSPF BGP
```

show ipv6 rip route

Displays the RIPng routing table.

Syntax

show ipv6 rip route [*ipv6-prefix/prefix-length* | *ipv6-address*]

Parameters

ipv6-prefix/prefix-length

Restricts the display to the entries for the specified IPv6 prefix. You must specify the *ipv6-prefix* parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373. You must specify the *prefix-length* parameter as a decimal value. A slash mark (/) must follow the *ipv6-prefix* parameter and precede the *prefix-length* parameter.

ipv6-address

Restricts the display to the entries for the specified IPv6 address. You must specify this parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373.

Modes

Privileged EXEC mode or any configuration mode

Command Output

The **show ipv6 rip route** command displays the following information:

Output field	Description
IPv6 RIP Routing Table entries	The total number of entries in the RIPng routing table.
ipv6-prefix /prefix-length	The IPv6 prefix and prefix length.
ipv6-address	The IPv6 address.
Next-hop router	The next-hop router for this Brocade device. If :: appears, the route is originated locally.
Interface	The interface name. If "null" appears, the interface is originated locally.
Source of route	The source of the route information. The source can be one of the following: RIP - routes learned by RIPng. CONNECTED - IPv6 routes redistributed from directly connected networks. STATIC - IPv6 static routes are redistributed into RIPng. BGP - BGP4+ routes are redistributed into RIPng. OSPF - OSPFv3 routes are redistributed into RIPng.
Metric number	The cost of the route. The number parameter indicates the number of hops to the destination.
Tag number	The tag value of the route.
Timers	Indicates if the hold-down (aging) timer or the garbage-collection timer is set.

Examples

The following example shows information for a routing table with four entries.

```
device# show ipv6 rip route
IPv6 RIP Routing Table - 4 entries:
ada::1:1:1:2/128, from fe80::224:38ff:fe8f:3000, e 1/3/4
RIP, metric 2, tag 0, timers: aging 17
2001:db8::/64, from fe80::224:38ff:fe8f:3000, e 1/3/4
RIP, metric 3, tag 0, timers: aging 17
bebe::1:1:1:4/128, from ::, null (0)
CONNECTED, metric 1, tag 0, timers: none
cccc::1:1:1:3/128, from fe80::768e:f8ff:fe94:2da, e 2/1/23
RIP, metric 2, tag 0, timers: aging 50
```

show ipv6 route

Displays the IPv6 route table information.

Syntax

```
show ipv6 route [ vrf vrf-nam ] [ ipv6-address | ipv6-prefix/prefix-length | bgp | connect | ospf | rip | static | summary ]
```

Parameters

vrf vrf-name

Displays the IPv6 route table information for the specified Virtual Routing/Forwarding (VRF) instance.

ipv6-address

Restricts the display to the entries for the specified IPv6 address. Specify this parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373.

ipv6-prefix/prefix-length

Restricts the display to the entries for the specified IPv6 prefix. Specify the *ipv6-prefix* parameter in hexadecimal using 16-bit values between colons as documented in RFC 2373. Specify the *prefix-length* parameter as a decimal value. A slash mark (/) must follow the *ipv6-prefix* parameter and precede the *prefix-length* parameter.

bgp

Displays BGP routes.

connect

Displays directly attached routes.

ospf

Displays OSPF routes.

rip

Displays RIP routes.

static

Displays static IPv6 routes.

summary

Displays a summary of the prefixes and different route types.

Modes

User EXEC mode

Command Output

The **show ipv6 route** command displays the following information:

Output field	Description
Number of entries	The number of entries in the IPv6 route table.

Output field	Description
Type	The route type, which can be one of the following: <ul style="list-style-type: none"> • C - The destination is directly connected to the router. • S - The route is a static route. • R - The route is learned from RIPng. • O - The route is learned from OSPFv3. • B - The route is learned from BGP4.
IPv6 Prefix	The destination network of the route.
Next-Hop Router	The next-hop router.
Interface	The interface through which this router sends packets to reach the route's destination.
Dis/Metric	The route's administrative distance and metric value.

The show ipv6 route summary command displays the following information:

Output field	Description
Number of entries	The number of entries in the IPv6 route table.
Number of route types	The number of entries for each route type.
Number of prefixes	A summary of prefixes in the IPv6 route table, sorted by prefix length.

Examples

The following sample output from the **show ipv6 route** command display the IPv6 route table.

```
device# show ipv6 route
IPv6 Routing Table - 7 entries:
Type Codes: C - Connected, S - Static, R - RIP, O - OSPF, B - BGP
OSPF Sub Type Codes: O - Intra, Oi - Inter, O1 - Type1 external, O2 - Type2 external
Type   IPv6 Prefix      Next Hop Router      Interface      Dis/Metric
C       2000:4::/64       ::                   ethe 1/3/2    0/0
S       2001:DB8::/16     ::                   tunnel 6       1/1
S       2001:DB8:1234::/32 ::                   tunnel 6       1/1
C       2001:DB8:46a::/64 ::                   ethe 1/3/2    0/0
C       2001:DB8::1/128  ::                   loopback 2     0/0
O       2001:DB8::2/128  fe80::2e0:52ff:fe91:bb37 ethe 1/3/2    110/1
C       2001:DB8::/64    ::                   tunnel 2       0/0
```

The following sample output displays a summary of the IPv6 route table.

```
device# show ipv6 route summary
IPv6 Routing Table - 7 entries:
 4 connected, 2 static, 0 RIP, 1 OSPF, 0 BGP
Number of prefixes:
 /16: 1 /32: 1 /64: 3 /128: 2
```

show ipv6 router

Displays information about the IPv6 routers connected to an IPv6 host.

Syntax

show ipv6 router

Modes

User EXEC mode

Usage Guidelines

The Brocade device can function as an IPv6 host, instead of an IPv6 router, if you configure IPv6 addresses on its interfaces but do not enable IPv6 routing using the `ipv6 unicast-routing` command. From the IPv6 host, you can display information about IPv6 routers to which the host is connected. The host learns about the routers through their router advertisement messages.

If you configure your Brocade device to function as an IPv6 router (you configure IPv6 addresses on its interfaces and enable IPv6 routing using the `ipv6 unicast-routing` command) and then enter the **show ipv6 router** command, you will get a message that there are no IPv6 router in the table.

Command Output

The **show ipv6 router** command displays the following information:

Output field	Description
Router IPv6 address on interface port	The IPv6 address for a particular router interface.
Last update	The amount of elapsed time (in minutes) between the current and previous updates received from a router.
Hops	The default value that should be included in the Hop Count field of the IPv6 header for outgoing IPv6 packets. The hops value applies to the router for which you are displaying information and should be followed by IPv6 hosts attached to the router. A value of 0 indicates that the router leaves this field unspecified.
Lifetime	The amount of time (in seconds) that the router is useful as the default router.
Reachable time	The amount of time (in milliseconds) that a router assumes a neighbor is reachable after receiving a reachability confirmation. The reachable time value applies to the router for which you are displaying information and should be followed by IPv6 hosts attached to the router. A value of 0 indicates that the router leaves this field unspecified.
Retransmit time	The amount of time (in milliseconds) between retransmissions of neighbor solicitation messages. The retransmit time value applies to the router for which you are displaying information and should be followed by IPv6 hosts attached to the router. A value of 0 indicates that the router leaves this field unspecified.

Examples

The following example displays information about the IPv6 routers connected to an IPv6 host.

```
device# show ipv6 router
Router fe80::2e0:80ff:fe46:3431 on Ethernet 50, last update 0 min
Hops 64, Lifetime 1800 sec
Reachable time 0 msec, Retransmit time 0 msec
```

show ipv6 static mroute

Displays information for configured IPv6 multicast routes.

Syntax

show ipv6 static mroute [*vrf vrf-name* | *ipv6-address-prefix/prefix-length*]

Parameters

- vrf vrf-name**
Specifies a VRF route.
- ipv6-address-prefix/prefix-length**
Specifies an IPv6 address.

Modes

- Privileged EXEC mode
- Global configuration mode

Usage Guidelines

Only resolved and best static mroutes are added to the mRTM table. These routes are prefixed with an asterisk in the output from the **show ipv6 static mroute** command.

Examples

The following example displays information for configured IPv6 multicast routes:

```
Device(config)# show ipv6 static mroute
IPv6 Static Routing Table - 1 entries:
 IPv6 Prefix          Interface  Next Hop Router  Met/Dis/Tag Name
*1::1::1:0/120       ve 90     ::              1/1/0
```

History

Release version	Command history
8.0.10a	This command was introduced.

show ipv6 tcp connections

Displays general information about each TCP connection on the router, including the percentage of free memory for each of the internal TCP buffers.

Syntax

show ipv6 tcp connections [*port-num* | *ipv6-address*]

Parameters

port-num

Displays the information for the specific port number. Values are SSH:22 TELNET:23 HTTP:80 BGP:179 SSL:443 MSDP:639 LDP:646.

ipv6-address

Displays information for the specified IPv6 address of the remote device.

Modes

User EXEC mode

Command Output

The **show ipv6 tcp connections** command displays the following information:

Output field	Description
Local IP address:port	The IPv4 or IPv6 address and port number of the local router interface over which the TCP connection occurs.
Remote IP address:port	The IPv4 or IPv6 address and port number of the remote router interface over which the TCP connection occurs.

Show Commands

show ipv6 tcp connections

Output field	Description
TCP state	The state of the TCP connection. Possible states include the following: <ul style="list-style-type: none">• LISTEN - Waiting for a connection request.• SYN-SENT - Waiting for a matching connection request after having sent a connection request.• SYN-RECEIVED - Waiting for a confirming connection request acknowledgment after having both received and sent a connection request.• ESTABLISHED - Data can be sent and received over the connection. This is the normal operational state of the connection.• FIN-WAIT-1 - Waiting for a connection termination request from the remote TCP, or an acknowledgment of the connection termination request previously sent.• FIN-WAIT-2 - Waiting for a connection termination request from the remote TCP.• CLOSE-WAIT - Waiting for a connection termination request from the local user.• CLOSING - Waiting for a connection termination request acknowledgment from the remote TCP.• LAST-ACK - Waiting for an acknowledgment of the connection termination request previously sent to the remote TCP (which includes an acknowledgment of its connection termination request).• TIME-WAIT - Waiting for enough time to pass to be sure the remote TCP received the acknowledgment of its connection termination request.• CLOSED - There is no connection state.
FREE TCP = percentage	The percentage of free TCP control block (TCP) space.
FREE TCP QUEUE BUFFER = percentage	The percentage of free TCP queue buffer space.
FREE TCP SEND BUFFER = percentage	The percentage of free TCP send buffer space.
FREE TCP RECEIVE BUFFER = percentage	The percentage of free TCP receive buffer space.
FREE TCP OUT OF SEQUENCE BUFFER = percentage	The percentage of free TCP out of sequence buffer space.

Examples

The following sample output from the show ipv6 tcp connections command displays general information about each TCP connection on the router.

```
device# show ipv6 tcp connections
Local IP address:port <-> Remote IP address:port TCP state
10.168.182.110:23 <-> 10.168.8.186:4933 ESTABLISHED
10.168.182.110:8218 <-> 10.168.182.106:179 ESTABLISHED
10.168.182.110:8039 <-> 10.168.2.119:179 SYN-SENT
10.168.182.110:8159 <-> 10.168.2.102:179 SYN-SENT
2000:4::110:179 <-> 2000:4::106:8222 ESTABLISHED (1440)
Total 5 TCP connections
TCP MEMORY USAGE PERCENTAGE
FREE TCP = 98 percent
FREE TCP QUEUE BUFFER = 99 percent
FREE TCP SEND BUFFER = 97 percent
FREE TCP RECEIVE BUFFER = 100 percent
FREE TCP OUT OF SEQUENCE BUFFER = 100 percent
```

show ipv6 tcp status

Displays detailed information about a specified TCP connection.

Syntax

shpw ipv6 tcp status *local-ipv6-address local-port-num remote-ipv6-address remote-port-num*

Parameters

local-ipv6-address

Specifies the IPv6 address of the local interface over which the TCP connection is taking place

local-port-num

Specifies the local port number over which a TCP connection is taking place.

remote-ipv6-address

Specifies the IPv6 address of the remote interface over which the TCP connection is taking place.

remote-port-num

Specifies the remote port number over which a TCP connection is taking place.

Modes

User EXEC mode

Command Output

The **show ipv6 tcp status** command displays the following information:

Output field	Description
TCP = location	The location of the TCP.
Send: initial sequence number	The initial sequence number sent by the local router.
Send: first unacknowledged sequence number	The first unacknowledged sequence number sent by the local router.
Send: current send pointer	The current send pointer.
Send: next sequence number to send	The next sequence number sent by the local router.
Send: remote received window	The size of the remote received window.
Send: total unacknowledged sequence number	The total number of unacknowledged sequence numbers sent by the local router.
Send: total used buffers number	The total number of buffers used by the local router in setting up the TCP connection
Receive: initial incoming sequence number	The initial incoming sequence number received by the local router.
Receive: expected incoming sequence number	The incoming sequence number expected by the local router.
Receive: received window	The size of the local router's receive window.
Receive: bytes in receive queue	The number of bytes in the local router's receive queue.
Receive: congestion window	The size of the local router's receive congestion window.

Show Commands
show ipv6 tcp status

Examples

The following sample output displays detailed information about TCP connection.

```
device# show ipv6 tcp status 2000:4::110 179 2000:4::106 8222
TCP: TCP = 0x217fc300
TCP: 2000:4::110:179 <-> 2000:4::106:8222: state: ESTABLISHED Port: 1
Send: initial sequence number = 242365900
Send: first unacknowledged sequence number = 242434080
Send: current send pointer = 242434080
Send: next sequence number to send = 242434080
Send: remote received window = 16384
Send: total unacknowledged sequence number = 0
Send: total used buffers 0
Receive: initial incoming sequence number = 740437769
Receive: expected incoming sequence number = 740507227
Receive: received window = 16384
Receive: bytes in receive queue = 0
Receive: congestion window = 1459
```

show ipv6 traffic

Displays IPv6 traffic statistics.

Syntax

show ipv6 traffic

Modes

User EXEC mode

Command Output

The **show ipv6 traffic** command displays the following information:

Output Field	Description
IPv6 statistics	
received	The total number of IPv6 packets received by the router.
sent	The total number of IPv6 packets originated and sent by the router.
forwarded	The total number of IPv6 packets received by the router and forwarded to other routers.
delivered	The total number of IPv6 packets delivered to the upper layer protocol.
rawout	This information is used by Ruckus Technical Support.
bad vers	The number of IPv6 packets dropped by the router because the version number is not 6.
bad scope	The number of IPv6 packets dropped by the router because of a bad address scope.
bad options	The number of IPv6 packets dropped by the router because of bad options.
too many hdr	The number of IPv6 packets dropped by the router because the packets had too many headers.
no route	The number of IPv6 packets dropped by the router because there was no route.
can not forward	The number of IPv6 packets the router could not forward to another router.
redirect sent	This information is used by Ruckus Technical Support.
frag rcv	The number of fragments received by the router.
frag dropped	The number of fragments dropped by the router.
frag timeout	The number of fragment timeouts that occurred.
frag overflow	The number of fragment overflows that occurred.
reassembled	The number of fragmented IPv6 packets that the router reassembled.
fragmented	The number of IPv6 packets fragmented by the router to accommodate the MTU of this router or of another device.

Show Commands

show ipv6 traffic

Output Field	Description
ofragments	The number of output fragments generated by the router.
can not frag	The number of IPv6 packets the router could not fragment.
too short	The number of IPv6 packets dropped because they are too short.
too small	The number of IPv6 packets dropped because they do not have enough data.
not member	The number of IPv6 packets dropped because the recipient is not a member of a multicast group.
no buffer	The number of IPv6 packets dropped because there is no buffer available.
forward cache miss	The number of IPv6 packets received for which there is no corresponding cache entry.
ICMP6 statistics	
Some ICMP statistics apply to both Received and Sent, some apply to Received only, some apply to Sent only, and some apply to Sent Errors only.	
Applies to received and sent	
dest unreachable	The number of Destination Unreachable messages sent or received by the router.
pkt too big	The number of Packet Too Big messages sent or received by the router.
time exceeded	The number of Time Exceeded messages sent or received by the router.
param prob	The number of Parameter Problem messages sent or received by the router.
echo req	The number of Echo Request messages sent or received by the router.
echo reply	The number of Echo Reply messages sent or received by the router.
mem query	The number of Group Membership Query messages sent or received by the router.
mem report	The number of Membership Report messages sent or received by the router.
mem red	The number of Membership Reduction messages sent or received by the router.
router soli	The number of Router Solicitation messages sent or received by the router.
router adv	The number of Router Advertisement messages sent or received by the router.
nei soli	The number of Neighbor Solicitation messages sent or received by the router.
nei adv	The number of Router Advertisement messages sent or received by the router.
redirect	The number of redirect messages sent or received by the router.
Applies to received only	
bad code	The number of Bad Code messages received by the router.
too short	The number of Too Short messages received by the router.
bad checksum	The number of Bad Checksum messages received by the router.
bad len	The number of Bad Length messages received by the router.

Output Field	Description
nd toomany opt	The number of Neighbor Discovery Too Many Options messages received by the router.
badhopcount	The number of Bad Hop Count messages received by the router.
Applies to sent only	
error	The number of Error messages sent by the router.
can not send error	The number of times the node encountered errors in ICMP error messages.
too freq	The number of times the node has exceeded the frequency of sending error messages.
Applies to sent errors only	
unreach no route	The number of Unreachable No Route errors sent by the router.
admin	The number of Admin errors sent by the router.
beyond scope	The number of Beyond Scope errors sent by the router.
address	The number of Address errors sent by the router.
no port	The number of No Port errors sent by the router.
pkt too big	The number of Packet Too Big errors sent by the router.
time exceed transit	The number of Time Exceed Transit errors sent by the router.
time exceed reassembly	The number of Time Exceed Reassembly errors sent by the router.
param problem header	The number of Parameter Problem Header errors sent by the router.
nextheader	The number of Next Header errors sent by the router.
option	The number of Option errors sent by the router.
redirect	The number of Redirect errors sent by the router.
unknown	The number of Unknown errors sent by the router.
UDP statistics	
received	The number of UDP packets received by the router.
sent	The number of UDP packets sent by the router.
no port	The number of UDP packets dropped because the packet did not contain a valid UDP port number.
input errors	This information is used by Ruckus Technical Support.
TCP statistics	
active opens	The number of TCP connections opened by the router by sending a TCP SYN to another device.
passive opens	The number of TCP connections opened by the router in response to connection requests (TCP SYNs) received from other devices.
failed attempts	This information is used by Ruckus Technical Support.
active resets	The number of TCP connections the router reset by sending a TCP RESET message to the device at the other end of the connection.
passive resets	The number of TCP connections the router reset because the device at the other end of the connection sent a TCP RESET message.
input errors	This information is used by Ruckus Technical Support.
in segments	The number of TCP segments received by the router.

Show Commands

show ipv6 traffic

Output Field	Description
out segments	The number of TCP segments sent by the router.
retransmission	The number of segments that the router retransmitted because the retransmission timer for the segment had expired before the device at the other end of the connection had acknowledged receipt of the segment.

Examples

The following sample output displays the IPv6 traffic statistics.

```
device# show ipv6 traffic
IP6 Statistics
 36947 received, 66818 sent, 0 forwarded, 36867 delivered, 0 rawout
 0 bad vers, 23 bad scope, 0 bad options, 0 too many hdr
 0 no route, 0 can not forward, 0 redirect sent
 0 frag rcv, 0 frag dropped, 0 frag timeout, 0 frag overflow
 0 reassembled, 0 fragmented, 0 ofragments, 0 can not frag
 0 too short, 0 too small, 11 not member
 0 no buffer, 66819 allocated, 21769 freed
 0 forward cache hit, 46 forward cache miss
ICMP6 Statistics
Received:
 0 dest unreachable, 0 pkt too big, 0 time exceeded, 0 param prob
 2 echo req, 1 echo reply, 0 mem query, 0 mem report, 0 mem red
 0 router soli, 2393 router adv, 106 nei soli, 3700 nei adv, 0 redirect
 0 bad code, 0 too short, 0 bad checksum, 0 bad len
 0 reflect, 0 nd toomany opt, 0 badhopcount
Sent:
 0 dest unreachable, 0 pkt too big, 0 time exceeded, 0 param prob
 1 echo req, 2 echo reply, 0 mem query, 0 mem report, 0 mem red
 0 router soli, 2423 router adv, 3754 nei soli, 102 nei adv, 0 redirect
 0 error, 0 can not send error, 0 too freq
Sent Errors:
 0 unreachable no route, 0 admin, 0 beyond scope, 0 address, 0 no port
 0 pkt too big, 0 time exceed transit, 0 time exceed reassembly
 0 param problem header, 0 nexthead, 0 option, 0 redirect, 0 unknown
UDP Statistics
 470 received, 7851 sent, 6 no port, 0 input errors
TCP Statistics
 57913 active opens, 0 passive opens, 57882 failed attempts
 159 active resets, 0 passive resets, 0 input errors
 565189 in segments, 618152 out segments, 171337 retransmission
```

show ipv6 tunnel

Displays a summary of IPv6 tunnel information.

Syntax

```
show ipv6 tunnel [ config ]
```

Parameters

config

Displays IPv6 tunnel configurations.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Command Output

The **show ipv6 tunnel** command displays the following information.

Output field	Description
Tunnel	The tunnel interface number.
Mode	The tunnel mode: <ul style="list-style-type: none">configured: Indicates a manually configured tunnel.
Tunnel Status	The status of the tunnel. <ul style="list-style-type: none">Active: Indicates that tunnel is in active state.
Packet Received	The number of packets received by a tunnel interface. Note that this is the number of packets received by the CPU. It does not include the number of packets processed in hardware.
Packet Sent	The number of packets sent by a tunnel interface. Note that this is the number of packets sent by the CPU. It does not include the number of packets processed in hardware.

Examples

The following is sample output from the **show ipv6 tunnel** command.

```
device# show ipv6 tunnel
```

```
IP6 Tunnels
Tunnel      Mode           Tunnel Status Packet Received  Packet Sent
1           configured    Active           0                0
2           configured    Active           0                22419
```

show ipv6 vrrp

Displays information about IPv6 Virtual Router Redundancy Protocol (VRRP) sessions.

Syntax

```
show ipv6 vrrp [ brief ]  
show ipv6 vrrp [ ethernet slot/port | ve num ]  
show ipv6 vrrp [ statistics [ ethernet slot/port | ve num ] ]  
show ipv6 vrrp [ ve num [ vrid VRID ] ]  
show ipv6 vrrp [ vrid VRID [ ethernet slot/port | ve num ] ]
```

Parameters

brief

Displays summary information about the IPv6 VRRP session.

ethernet slot port

Displays IPv6 VRRP information only for the specified Ethernet port. A forward slash "/" must be entered between the *slot* and *port* variables.

ve num

Displays IPv6 VRRP information only for the specified virtual Ethernet port.

statistics

Displays statistical information about the IPv6 VRRP session.

vrid VRID

Displays IPv6 VRRP information only for the specified virtual router ID (VRID).

Modes

User EXEC mode

Usage Guidelines

This command can be entered in any mode. This command supports IPv6 VRRP; to display information about VRRP Extended (VRRP-E) sessions, use the **show ipv6 vrrp-extended** command.

Command Output

The following is a partial list of output field descriptions for the **show ipv6 vrrp** command.

Output field	Description
Total number of VRRP routers defined	The total number of virtual routers configured and currently running on this Brocade device. For example, if the Brocade device is running VRRP-E, the total applies only to VRRP-E routers.

Output field	Description
Interface	The interface on which VRRP is configured. If VRRP is configured on multiple interfaces, information for each interface is listed separately.
VRID	The ID of the virtual router configured on this interface. If multiple virtual routers are configured on the interface, information for each virtual router is listed in a separate row.
state	This Brocade device's VRRP state for the virtual router. The state can be one of the following: <ul style="list-style-type: none"> init—The virtual router is not enabled (activated). If the state remains init after you activate the virtual router, make sure that the virtual router is also configured on the other routers and that the routers can communicate with each other. If the state is init and the mode is incomplete, make sure you have specified the IP address for the virtual router. backup—This Brocade device is a backup for the virtual router. master—This Brocade device is the master for the virtual router.
current priority	The current VRRP priority of this Brocade device for the virtual router.
preempt-mode	Whether the backup preempt mode is enabled. If the backup preempt mode is enabled, this field contains a "true." If the mode is disabled, this field is blank.

Examples

The following example displays IPv6 VRRP session information in detail.

```
device(config)# show ipv6 vrrp

Total number of VRRP routers defined: 1
Interface 1/1/3
-----
auth-type no authentication
VRID 13 (index 2)
interface 1/1/3
state master
administrative-status enabled
version v3
mode non-owner(backup)
virtual mac 0000.5e00.0217
priority 100
current priority 100
track-priority 1
hello-interval 1000 ms
backup hello-interval 60000 ms
advertise backup disabled
dead-interval 3000 ms
preempt-mode true
ipv6-address 3013::1
next hello sent in 700 ms
short-path-forwarding disabled
```

Show Commands

show ipv6 vrrp

The following example displays IPv6 VRRP statistical information.

```
device# show ipv6 vrrp statistics

Global IPv6 VRRP statistics
-----
- received vrrp packets with checksum errors = 0
- received vrrp packets with invalid version number = 0
- received vrrp packets with unknown or inactive vrid = 0
Interface 1/1/3
-----
VRID 13
- number of transitions to backup state = 1
- number of transitions to master state = 1
- total number of vrrp packets received = 0
. received backup advertisements = 19
. received packets with zero priority = 0
. received packets with invalid type = 0
. received packets with invalid authentication type = 0
. received packets with authentication type mismatch = 0
. received packets with authentication failures = 0
. received packets dropped by owner = 0
. received packets with ttl errors = 0
. received packets with ipv6 address mismatch = 0
. received packets with advertisement interval mismatch = 0
. received packets with invalid length = 0
- total number of vrrp packets sent = 1175
. sent backup advertisements = 0
. sent packets with zero priority = 0
- received neighbor solicitation packets dropped = 0
- received proxy neighbor solicitation packets dropped = 0
- received ipv6 packets dropped = 0
```

The following example displays IPv6 VRRP configuration information about VRID 1.

```
device# show ipv6 vrrp vrid 1

Interface 1/1/1
-----
auth-type no authentication
VRID 1 (index 1)
interface 1/1/1
state master
administrative-status enabled
version v3
mode non-owner(backup)
virtual mac dddd.eeee.ffff (configured)
priority 100
current priority 100
track-priority 1
hello-interval 1000 ms
backup hello-interval 60000 ms
advertise backup disabled
dead-interval 3600 ms
preempt-mode true
ipv6 address 10:20:1::100
next hello sent in 400 ms
```

The following example displays an auto-generated IPv6 virtual link-local address used in the VRRPv3 VRID 1 instance.

NOTE

This example is applicable only to the auto-generation of an IPv6 virtual link-local address.

```
device# show ipv6 vrrp vrid 1

VRID 1 (index 1)
  interface 1/1/1
  state master
  administrative-status enabled
  version v3
  mode owner
  virtual mac 0000.5e00.0101
  virtual link-local fe80::200:5eff:fe00:201
  priority 255
  current priority 255
  track-priority 2
  hello-interval 1000 ms
  backup hello-interval 60000 ms
  number of configured virtual address 2
  ipv6-address 1:2:45::2
  ipv6-address 1:2:46::2
  next hello sent in 300 ms
  Track MCT-VPLS-State: Disable
```

show ipv6 vrrp-extended

Displays information about IPv6 Virtual Router Redundancy Protocol Extended (VRRP-E) sessions.

Syntax

show ipv6 vrrp-extended [**brief**]

show ipv6 vrrp-extended [**ethernet** *slot/port* | **ve** *num*]

show ipv6 vrrp-extended [**statistics** [**ethernet** *slot/port* | **ve** *num*]]

show ipv6 vrrp-extended [**ve** *num* [**vrid** *VRID*]]

show ipv6 vrrp-extended [**vrid** *VRID* [**ethernet** *slot/port* | **ve** *num*]]

Parameters

brief

Displays summary information about the IPv6 VRRP-E session.

ethernet *slot port*

Displays IPv6 VRRP-E information only for the specified port.

statistics

Displays statistical information about the IPv6 VRRP-E session.

ve *num*

Displays IPv6 VRRP-E information only for the specified virtual Ethernet port.

vrid *VRID*

Displays IPv4 VRRP-E information only for the specified virtual-group ID.

Modes

User EXEC mode

Usage Guidelines

Use this command to display information about IPv6 VRRP-E sessions, either in summary or full-detail format. You can also specify a virtual group or interface for which to display output.

This command supports IPv6 VRRP-E. You can modify or redirect the displayed information by using the default Linux tokens (|, >).

Command Output

The **show ipv6 vrrp-extended** command displays the following information:

Output field	Description
Total number of VRRP-E routers defined	The total number of virtual routers configured on this Brocade device. NOTE The total applies only to the protocol the Brocade device is running. For example, if the Brocade device is running VRRP-E, the total applies only to VRRP-E routers.
Interface	The interface on which VRRP-E is configured. If VRRP-E is configured on multiple interfaces, information for each interface is listed separately.
VRID	The ID of the virtual router configured on this interface. If multiple virtual routers are configured on the interface, information for each virtual router is listed in a separate row.
Current Priority	The current VRRP-E priority of this Brocade device for the virtual router.
Flags	Whether the backup preempt mode is enabled. If the backup preempt mode is enabled, this field contains a "P". If the mode is disabled, this field is blank. <ul style="list-style-type: none"> • P:Preempt 2:V2 3:V3 • 2: implies VRRP Version2 • 3: implies VRRP Version3
Short-Path-Fwd	This Brocade device's VRRP state for the virtual router. The state can be one of the following: <ul style="list-style-type: none"> • Init—The virtual router is not enabled (activated). If the state remains Init after you activate the virtual router, make sure that the virtual router is also configured on the other routers and that the routers can communicate with each other. <p style="text-align: center;">NOTE If the state is Init and the mode is incomplete, make sure you have specified the IP address for the virtual router.</p> <ul style="list-style-type: none"> • Backup—This Brocade device is a backup for the virtual router. • Master—This Brocade device is the master for the virtual router.
Master IP Address	The IPv6 address of the router interface that is currently the Master for the virtual router.
Backup IP Address	The IPv6 addresses of the router interfaces that are currently backups for the virtual router.
Virtual IP Address	The virtual IPv6 address that is being backed up by the virtual router.

Examples

The following example displays summary information for an IPv6 VRRP-E session.

```
device(config)# show ipv6 vrrp-extended brief

Total number of VRRP routers defined: 1
Flags Codes - P:Preempt 2:V2 3:V3 S:Short-Path-Fwd
Intf  VRID  CurrPrio  Flags  State  Master-IPv6  Backup-IPv6  Virtual-IPv6
-----
1/1/3  2      100      P3-   Master  Local        3013::2     3013::99
```

Show Commands

show ipv6 vrrp-extended

The following example displays detailed IPv6 VRRP-E configuration information about VRID 1.

```
device# show ipv6 vrrp-extended vrid 1

Interface 1/1/1
-----
auth-type md5-authentication
VRID 1 (index 1)
interface 1/1/1
state master
administrative-status enabled
mode non-owner(backup)
virtual mac dddd.eeee.ffff (configured)
priority 100
current priority 100
track-priority 5
hello-interval 1 sec
backup hello-interval 60 sec
advertise backup disabled
dead-interval 0 ms
preempt-mode true
virtual ipv6 address 10:20:1::100

device# show ipv6 vrrp-extended vrid 1

Interface 1/1
-----
auth-type md5-authentication
VRID 1 (index 1)
interface 1/1
state master
administrative-status enabled
mode non-owner(backup)
virtual mac dddd.eeee.ffff (configured)
priority 100
current priority 100
track-priority 5
hello-interval 1 sec
backup hello-interval 60 sec
advertise backup disabled
dead-interval 0 ms
preempt-mode true
virtual ipv6 address 10:20:1::100
```

show issu errors

Displays stack upgrade error information when an upgrade is in progress.

Syntax

show issu errors

Modes

Privileged EXEC mode

Examples

Use the following command to get ISSU error information.

```
device# show issu errors
ISSU State: UPGRADE ABORT
Abort reason: UNABLE TO UPGRADE UNIT
Unit 1 did not join the stack after upgrade
```

History

Release version	Command history
08.0.50	This command was introduced.

show issu sequence

Displays the sequence in which units will be upgraded.

Syntax

show issu sequence

Modes

Privileged EXEC mode

Command Output

The **show issu sequence** command displays the following information:

Output field	Description
ID	The stack unit.
Type	Platform and model.
Role	active, member, or standby

Examples

Use this command to display the sequence of the stack unit upgrade.

```
device# show issu sequence
Stack units will be upgraded in the following order
ID      Type           Role
1       ICX7450-32ZP   standby
3       ICX7450-32ZP   member
4       ICX7450-32ZP   active
```

History

Release version	Command history
08.0.50	This command was introduced.

show issu status

Runs a pre-ISSU check and monitors the status of the current upgrade.

Syntax

show issu status

Modes

Privileged EXEC mode

Usage Guidelines

Use this command to show the ISSU status before or during an upgrade.

Examples

Output for a successful upgrade in progress.

```
device# show issu status
ISSU Status: In Progress
Upgrade State: UNIT JOIN

Upgrade Option: issu primary
ID   Type           Role    State
1    ICX7450-32ZP  member  UPGRADING
3    ICX7450-32ZP  member  UPGRADE PENDING
4    ICX7450-32ZP  active  UPGRADE PENDING
```

Output of the command when errors are encountered.

```
device# show issu status
ISSU Status: Aborted
Upgrade State: UPGRADE ABORT
Upgrade Option: issu primary
Reason for Abort: UNABLE TO UPGRADE

ID   Type           Role    State
1    ICX7450-32ZP  member  UPGRADE ABORT
3    ICX7450-32ZP  standby UPGRADE PENDING
4    ICX7450-32ZP  active  UPGRADE PENDING
```

NOTE

An error condition is indicated by three asterisks (***)

If a manual abort is done or ISSU detects an abort condition (with ISSU started with the no **on-error** option), the stack is left as it is and a manual recovery is required by running either the **reload-primary** or **reload-secondary** command.

Show Commands

show issu status

If an upgrade is not in progress, this command displays information about whether the system is ready for an upgrade.

```
device# show issu status
Topology is Ring                Yes
Standby Present                 Yes
Standby ready for upgrade       Yes
Flash use in progress           No
Secure Setup in progress        No
ISSU in progress or aborted     No
Election pending                No
Election in progress            No
Reload pending                  No
CPU utilization high            No
All units in ready state        Yes
Primary Image is upgrade compatible Yes
Secondary Image is upgrade compatible Yes
Startup config and Running Config Same Yes
User in Config mode             No
System ready for issu
ISSU not in progress
```

If an upgrade is completed, this command displays the following information,

```
device# show issu status
Last upgrade time                00:02:19.367 GMT+00 Tue Mar 20 2016
The older image before-ISSU      SPR08050b433.bin
Topology is Ring                Yes
Standby Present                 Yes
Standby ready for upgrade       Yes
Flash use in progress           No
Secure Setup in progress        No
ISSU in progress or aborted     No
Election pending                No
Election in progress            No
Reload pending                  No
CPU utilization high            No
All units in ready state        Yes
Primary Image is upgrade compatible Yes
Secondary Image is upgrade compatible Yes
Startup config and Running Config Same Yes
User in Config mode             No
System ready for issu
ISSU not in progress
```

History

Release version	Command history
08.0.50	This command was introduced.

show lag

Displays Link Aggregation Group (LAG) information.

Syntax

```
show lag [ lag-name | brief | deployed | dynamic | id number | keep-alive | static ]
```

Parameters

lag-name

Displays the LAG specified by the LAG name.

brief

Displays the LAG information summary.

deployed

Displays information about all the deployed LAGs.

dynamic

Displays information about dynamic LAGs.

id number

Displays information about the LAG specified by the ID number.

keep-alive

Displays information about keep-alive LAGs.

static

Displays information about static LAGs.

Modes

User EXEC mode

Privileged EXEC mode

LAG configuration mode

Command Output

The **show lag** command displays the following information:

Output field	Description
Total number of LAGS	The total number of LAGs that have been configured on the device.
Total number of deployed LAGS	The total number of LAGs on the device that are currently deployed.
Total number of trunks created	The total number of trunks that have been created on the LAG. The total number of LAGs available are shown also. Because keep-alive LAGs do not use LAG IDs, they are not listed and do not subtract from the number of LAGs available.
LACP System Priority /ID	The system priority configured for the device. The ID is the system priority that is the base MAC address of the device.

Show Commands
show lag

Output field	Description
LACP Long timeout	The number of seconds used for the LACP long timeout mode. This is only applicable for dynamic or keep-alive LAGs.
LACP Short timeout	The number of seconds used for the LACP short timeout mode. This is only applicable for dynamic or keep-alive LAGs.

The following information is displayed per-LAG in the **show lag brief** command:

Output field	Description
LAG	The name of the LAG, LAG ID number, the configured type of the LAG: static, dynamic, or keep-alive, status of LAG deployment: deployed or not.

The following information is displayed per-LAG in the **show lag** command for each LAG configured:

Output field	Description
LAG Configuration	
Ports	List of ports configured with the LAG.
Port Count	Number of ports configured on the LAG.
Primary Port	The primary port configured on the LAG.
Trunk Type	The load sharing method configured for the LAG. The trunk types are hash-based and resilient-hash.
LACP Key	The link aggregation key for the LAG.

The following information is displayed for the **show lag deployed** command:

Output field	Description
Deployment	
LAG ID	The LAG ID number.
Active Primary	The port within the LAG where most protocol packets are transmitted. This is not the same as the configured primary port of the LAG.
Port	The chassis slot and port number of the interface.
Link	The status of the link, which can be one of the following: <ul style="list-style-type: none"> up down
State	The Layer 2 state for the port.
Dupl	The duplex state of the port, which can be one of the following: <ul style="list-style-type: none"> Full Half None
Speed	The bandwidth of the interface.
Trunk	The LAG ID of the port.
Tag	Indicates whether the ports have 802.1q VLAN tagging. The value can be Yes or No.
Pri	Indicates the Quality of Service (QoS) priority of the ports. The priority can be a value from 0 through 7.
MAC	The MAC address of the port.

Output field	Description
Name	The name (if any) configured for the port.
Sys P	Lists the system priority configured for the device.
Port P	Lists the port's link aggregation priority.
Key	Lists the link aggregation key.
Act	Indicates the link aggregation mode, which can be one of the following: <ul style="list-style-type: none"> No: The mode is passive on the port. If link aggregation is enabled (and the mode is passive), the port can send and receive LACPDU messages to participate in negotiation of an aggregate link initiated by another port, but cannot search for a link aggregation port or initiate negotiation of an aggregate link. Yes: The mode is active. The port can send and receive LACPDU messages.
Tio	Indicates the timeout value of the port. The timeout value can be one of the following: <ul style="list-style-type: none"> L: Long. The LAG group has already been formed and the port is therefore using a longer message timeout for the LACPDU messages exchanged with the remote port. Typically, these messages are used as confirmation of the health of the aggregate link. S: Short. The port has just started the LACPDU message exchange process with the port at the other end of the link. The S timeout value also can mean that the link aggregation information received from the remote port has expired and the ports are starting a new information exchange.
Agg	Indicates the link aggregation state of the port. The state can be one of the following: <ul style="list-style-type: none"> Agg: Link aggregation is enabled on the port. No: Link aggregation is disabled on the port.
Syn	Indicates the synchronization state of the port. The state can be one of the following: <ul style="list-style-type: none"> No: The port is out of sync with the remote port. The port does not understand the status of the LACPDU process and is not prepared to enter a LAG link. Syn: The port is in sync with the remote port. The port understands the status of the LACPDU message exchange process, and therefore knows the LAG group to which it belongs, the link aggregation state of the remote port, and so on.
Dis	Indicates the collection state of the port, which determines whether the port is ready to send traffic over the LAG link: <ul style="list-style-type: none"> Col: The port is ready to send traffic over the LAG link. No: The port is not ready to send traffic over the LAG link.
Col	Indicates the distribution state of the port, which determines whether the port is ready to receive traffic over the LAG link: <ul style="list-style-type: none"> Dis: The port is ready to receive traffic over the LAG link. No: The port is not ready to receive traffic over the LAG link.
Def	Indicates whether the port is using default link aggregation values. The port uses default values if it has not received link aggregation information through LACP from the port at the remote end of the link. This field can have one of the following values: <ul style="list-style-type: none"> Def: The port has not received link aggregation values from the port at the other end of the link and is therefore using its default link aggregation LACP settings. No: The port has received link aggregation information from the port at the other end of the link and is using the settings negotiated with that port.

Show Commands
show lag

Output field	Description
Exp	<p>Indicates whether the negotiated link aggregation settings have expired. The settings expire if the port does not receive an LACPDU message from the port at the other end of the link before the message timer expires. This field can have one of the following values:</p> <ul style="list-style-type: none"> • Exp: The link aggregation settings this port negotiated with the port at the other end of the link have expired. The port is now using its default link aggregation settings. • No: The link aggregation values that this port negotiated with the port at the other end of the link have not expired. The port is still using the negotiated settings.
Ope	<ul style="list-style-type: none"> • Ope (operational): The port is operating normally. • Blo (blocked): The port is blocked because the adjacent port is not configured with link aggregation or because it is not able to join a LAG. An LACP port is blocked until it becomes part of a LAG. Also, an LACP port is blocked if its state becomes "default". To unblock the port and bring it to an operational state, enable link aggregation on the adjacent port and ensure that the ports have the same key. • Frc (force-up): The port is in "force-up" mode. If you have configured the force-up ethernet command on the member port of a dynamic LAG, the port goes into "force-up" mode and is logically operational when the dynamic LAG is not operating. • Err: If there is a peer information mismatch, then that particular port is moved to the Error disable state (Err).
Port	The chassis slot and port number of the interface.
Partner System ID	The partner system ID indicating the system's priority and the MAC address of the port.
Partner Key	The partner key value. Valid key values range from 1 to 65535.
LACP Rx Count	This is the counter for LACPDUs received on this port.
LACP Tx Count	This is the counter for LACPDUs transmitted from this port.

Examples

The following example shows sample output of the **show lag** command.

```
device(config)# show lag
Total number of LAGs:          5

```

History

Release version	Command history
08.0.30d	This command was modified to display a changed output for the deployed keyword.
08.0.50	This command was modified to display a changed output for the "resilient-hash" trunk type in the LAG configuration.

show license

Displays general information about all software licenses for all units in a device.

Syntax

```
show license [ unit unit_id ] [ index index_number ]
```

```
show license [ node-locked ] [ non-node-locked ]
```

Parameters

unit *unit_id*

Indicates the unit ID number. The *unit_id* can be from 1 through 12.

index *index_number*

Specifies the software license file for a specific stack.

node-locked

Specifies node-locked licensing information.

non-node-locked

Specifies non-node-locked licensing information.

Modes

Privileged EXEC level.

Usage Guidelines

The command can be used to display software licensing information for all available Ruckus product families supporting software-based licensing, including node and non-node locked licensing.

Command Output

The **show license** command displays the following information:

Output field	Description
Index	The index number specifies the software license file for a specific stack. The index number is generated by the member unit.
Lid	The license ID. This number is embedded in the Brocade device.
Lic Mode	Indicates whether the license is a non-node-locked license or node-locked license.
License name	The name of the license installed for the license index number on the stack unit.

Output field	Description
Lid/Serial No	The license ID. The number is embedded in the Brocade device. The serial number for only a non-node locked license. The serial number is generated when you request a license through the license portal. The serial number is not the device name.
License Type	Indicates whether the license is normal (permanent) or trial (temporary).
Status	Indicates the status of the license: <ul style="list-style-type: none"> Valid - A license is valid if the LID matches the license ID of the device for which the license was purchased, and the package name is recognized by the system. Invalid - The LID does not match the license ID of the device for which the license was purchased. Active - The license is valid and in effect on the device. Not used - The license is not in effect on the device. Expired - For trial licenses only, this indicates that the trial license has expired. Duplicated - For non-node-locked licenses, this indicates that the same serial number is used for devices in a stacking system.
License Period	If the license type is trial (temporary), this field displays the number of days the license is valid. If the license type is normal (permanent), this field displays Unlimited.
License Capacity	The port capacity of the Ports of Demand (PoD) license.
Trial license information	Indicates the trial license information details as displayed in the show license command output. <ul style="list-style-type: none"> days used - The number of days the trial license has been effect. hours used - The number of hours the trail license has been in effect. days left - The number of days left before the trial license expires. hours left - The number of hours left before the trial license expires.

Examples

The following **show license** command output displays software licensing information for a Ruckus ICX 7450 unit. The hardware license information is not displayed.

```
device# show license
Index   Lic Mode      Lic Name                               Lid/Serial No  Lic Type   Status   Lic Period  Lic
Capacity
Stack unit 1:
1       Non-Node Lock ICX7450-PREM-LIC-SW                   EN0E5FDBC90   Normal    Active    Unlimited   1
Stack unit 2:
1       Non-Node Lock ICX7450-PREM-LIC-SW                   EN0DD67E7C0   Normal    Active    Unlimited   1
```

The **show license node-locked** command displays all node-locked license information on the active unit and other member units in a stacking system.

```
device# show license node-locked
Index          Lic Mode   Lic Name          Lid/Serial No  Lic Type  Status  Lic Period  Lic
Capacity
Stack unit 1:
1
Node Lock     ICX7250-10G-LIC-POD  fwpIHJKmFFt   Normal    Active   Unlimited  8
Stack unit 11:
1
Node Lock     ICX7250-10G-LIC-POD  fwpIHJKmFGc   Normal    Active   Unlimited  8
```

show link-error-disable

Displays the ports that are enabled with the port flap dampening feature.

Syntax

```
show link-error-disable [ all ]
```

Parameters

all

Displays all ports with the port flap dampening feature enabled.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Usage Guidelines

Ports that have been disabled due to the port flap dampening feature are identified in the output of the **show link-error-disable** command.

Command Output

The **show link-error-disable** command displays the following information.

Output field	Description
Port	Specifies the port number.
threshold	The number of times that the port link state goes from up to down and down to up before the wait period is activated.
sampling_period	The number of seconds during which the specified toggle threshold can occur before the wait period is activated.
waiting_period	The number of seconds during which the port remains disabled (down) before it becomes enabled.

Examples

The following is sample output from the **show link-error-disable all** command.

```
device# show link-error-disable all

Port1/1/1 is configured for link-error-disable
    threshold:1, sampling_period:10, waiting_period:0
Port1/1/2 is configured for link-error-disable
    threshold:1, sampling_period:10, waiting_period:0
Port1/1/3 is configured for link-error-disable
    threshold:1, sampling_period:10, waiting_period:0
Port1/1/4 is configured for link-error-disable
    threshold:1, sampling_period:10, waiting_period:0
Port1/1/5 is configured for link-error-disable
    threshold:4, sampling_period:10, waiting_period:2
Port1/1/9 is configured for link-error-disable
    threshold:2, sampling_period:20, waiting_period:0
```

show link-keepalive

Displays the UDLD information.

Syntax

show link-keepalive [**ethernet** *stackid/slot/port*]

Parameters

ethernet *stackid/slot/port*

Displays UDLD information for the specified Ethernet port.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Command Output

The **show link-keepalive** command displays the following information:

Output field	Description
Total link-keepalive enabled ports	The total number of ports on which UDLD is enabled.
Keepalive Retries	The number of times a port will attempt the health-check before concluding that the link is down.
Keepalive Interval	The number of seconds between health check packets.
Port	The port number.
Physical Link	The state of the physical link. This is the link between the Brocade port and the directly connected device.
Logical Link	The state of the logical link. This is the state of the link between this Brocade port and the Brocade port on the other end of the link.
State	The traffic state of the port.
Link-vlan	The ID of the tagged VLAN in the UDLD packet.

The **show link-keepalive ethernet** command displays the following information:

Output field	Description
Current State	The state of the logical link. This is the link between this Brocade port and the Brocade port on the other end of the link.
Remote MAC Addr	The MAC address of the port or device at the remote end of the logical link.
Local Port	The port number on this Brocade device.
Remote Port	The port number on the Brocade device at the remote end of the link.
Local System ID	A unique value that identifies this Brocade device. The ID can be used by Brocade technical support for troubleshooting.

Output field	Description
Remote System ID	A unique value that identifies the Brocade device at the remote end of the link.
Packets sent	The number of UDLD health-check packets sent on this port.
Packets received	The number of UDLD health-check packets received on this port.
Transitions	The number of times the logical link state has changed between up and down.
Port blocking	Information used by Brocade technical support for troubleshooting.
Link-vlan	The ID of the tagged VLAN in the UDLD packet.
BM disabled	Information used by Brocade technical support for troubleshooting.

Examples

The following example shows the UDLD information for all ports.

```
device# show link-keepalive
Total link-keepalive enabled ports: 4
Keepalive Retries: 3    Keepalive Interval: 1 Sec.
Port   Physical Link  Logical Link  State          Link-vlan
1/1/1   up              up            FORWARDING    3
1/1/2   up              up            FORWARDING
1/1/3   down           down          DISABLED
1/1/4   up              down          DISABLED
```

The following example show the UDLD information for a specific port.

```
device# show link-keepalive ethernet 1/4/1
Current State   : up           Remote MAC Addr : 0000.00d2.5100
Local Port      : 1/4/1         Remote Port     : 1/2/1
Local System ID : e0927400      Remote System ID : e0d25100
Packets sent    : 254           Packets received : 255
Transitions     : 1             Link-vlan       : 100
```

show link-oam info

Displays the OAM information on EFM-OAM-enabled ports.

Syntax

```
show link-oam info [ detail [ ethernet stackid/slot/port [ [ to stackid/slot/port ] [ ethernet stackid/slot/port ]... ] ] ]
```

Parameters

detail

Displays detailed EFM-OAM information.

ethernet

Displays the detailed EFM-OAM information for a specific Ethernet interface.

stackid/slot/port

Specifies the interface details.

to

Configures a range of interfaces.

Modes

Privileged EXEC mode

Global configuration mode

EFM-OAM protocol configuration mode

Command Output

The **show link-oam info** command displays the following information:

Output field	Description
Ethernet	Displays the interface details
Link Status	Displays the status of the link (up or down)
OAM Status	Displays the status of OAM
Mode	Displays the operational mode of EFM-OAM
Local Stable	Displays the local OAM status
Remote Stable	Displays the remote OAM status
multiplexer action	Displays the local/remote multiplexer action
parse action	Displays the local/remote parse action
stable	Displays the local/remote OAM status
state	Displays the local/remote EFM-OAM state
loopback support	Indicates whether there is support for loopback for remote/local
dying-gasp	Indicates whether there is support for dying gasp for remote/local
critical-event	Indicates whether there is support for critical-event for remote/local

Output field	Description
link-fault	Indicates whether there is support for link-fault for remote/local

Examples

The following example displays the OAM information on all EFM-OAM-enabled ports.

```
device(config)# show link-oam info
Ethernet Link Status      OAM Status      Mode      Local Stable      Remote Stable
1/1/1      up              up             active      satisfied          satisfied
1/1/2      up              up             passive     satisfied          satisfied
1/1/3      up              up             active      satisfied          satisfied
1/1/4      up              init           passive     unsatisfied        unsatisfied
1/1/5      down           down           passive     unsatisfied        unsatisfied
1/1/6      down           down           passive     unsatisfied        unsatisfied
1/1/7      down           down           passive     unsatisfied        unsatisfied
```

Show Commands

```

History

Release version	Command history
08.0.30	This command was introduced.

show link-oam statistics

Displays the OAM statistics of OAM-enabled ports.

Syntax

```
show link-oam statistics [ detail [ ethernet stackid/slot/port [ [ to stackid/slot/port ] [ ethernet stackid/slot/port ]... ] ] ]
```

Parameters

detail

Displays detailed EFM-OAM statistics.

ethernet

Displays the detailed EFM-OAM statistics of a specific ethernet interface.

stackid/slot/port

Specifies the interface details.

to

Configures a range of interfaces.

Modes

Privileged EXEC mode

Global configuration mode

EFM-OAM protocol configuration mode

Command Output

The **show link-oam statistics** command displays the following information:

Output field	Description
Tx PDUs	Displays the number of PDUs transmitted
Rx PDUs	Displays the number of PDUs received
information OAMPDUs	Displays the number of information OAMPDUs transmitted/received
loopback control OAMPDUs	Displays the number of loopback control OAMPDUs transmitted/received
variable request OAMPDUs	Displays the number of variable request OAMPDUs transmitted/received
variable response OAMPDUs	Displays the number of variable response OAMPDUs transmitted/received
unique event notification OAMPDUs	Displays the number of unique event notification OAMPDUs transmitted/received
duplicate event notification OAMPDUs	Displays the number of duplicate event notification OAMPDUs transmitted/received
organization specific OAMPDUs	Displays the number of organization specific OAMPDUs transmitted/received
link-fault records	Displays the number of link-fault records transmitted/received
critical-event records	Displays the number of critical-event records transmitted/received
dying-gasp records	Displays the number of dying-gasp records transmitted/received
loopback control OAMPDUs dropped	Displays the number of dropped loopback control OAMPDUs

Output field	Description
unsupported OAMPDUs	Displays the number of unsupported OAMPDUs
discarded TLVs	Displays the number of discarded TLVs
unrecognized TLVs	Displays the number of unrecognized TLVs

Examples

The following example displays the OAM statistics on all EFM-OAM-enabled ports.

```
device(config)# show link-oam statistics
Ethernet Tx Pdus      Rx Pdus
10/1/1    377908      377967
10/1/3    400         44
10/1/4    400        385
10/1/5    400        385
10/1/6    400        385
```

```

History

Release version	Command history
08.0.30	This command was introduced.

show lldp

Displays a summary of the Link Layer Discovery Protocol (LLDP) configuration settings.

Syntax

show lldp

Modes

- User EXEC mode
- Privileged EXEC mode
- Global configuration mode
- Interface configuration mode

Command Output

The **show lldp** command displays the following information.

Output field	Description
LLDP transmit interval	The number of seconds between regular LLDP packet transmissions.
LLDP transmit hold multiplier	The multiplier used to compute the actual time-to-live (TTL) value of an LLDP advertisement. The TTL value is the transmit interval multiplied by the transmit hold multiplier.
LLDP transmit delay	The number of seconds that the LLDP agent will wait after transmitting an LLDP frame before transmitting another LLDP frame.
LLDP SNMP notification interval	The number of seconds between transmission of SNMP LLDP traps (lldpRemTablesChange) and SNMP LLDP-MED traps (lldpXMedTopologyChangeDetected).
LLDP reinitialize delay	The minimum number of seconds that the device will wait from when LLDP is disabled on a port, until a request to re-enable LLDP on that port is honored.
LLDP-MED fast start repeat count	The number of seconds between LLDP frame transmissions when an LLDP-MED endpoint is newly detected.
LLDP maximum neighbors	The maximum number of LLDP neighbors for which LLDP data will be retained, per device.
LLDP maximum neighbors per port	The maximum number of LLDP neighbors for which LLDP data will be retained, per port.

Examples

The following is sample output from the **show lldp** command.

```
device# show lldp

LLDP transmit interval           : 10 seconds
LLDP transmit hold multiplier    : 4 (transmit TTL: 40 seconds)
LLDP transmit delay              : 1 seconds
LLDP SNMP notification interval  : 5 seconds
LLDP reinitialize delay          : 1 seconds
LLDP-MED fast start repeat count : 3
LLDP maximum neighbors          : 392
LLDP maximum neighbors per port  : 4
```

Related Commands

[show lldp local-info](#), [show lldp neighbors](#), [show lldp statistics](#)

show lldp local-info

Displays the details of the Link Layer Discovery Protocol (LLDP) advertisements that will be transmitted on each port.

Syntax

```
show lldp local-info ports { all | ethernet stack-id/slot/port [ to stack-id/slot/port | [ethernet stack-id/slot/port to stack-id/slot/port | ethernet stack-id/slot/port ] ... ] }
```

Parameters

ports

Displays the details of the LLDP advertisements that will be transmitted on the specified port.

all

Displays the details of the LLDP advertisements that will be transmitted on all LLDP-enabled ports.

ethernet stack-id/slot/port

Displays the details of the LLDP advertisements that will be transmitted on the specified Ethernet port.

to stack- id/slot/port

Displays the details of the LLDP advertisements that will be transmitted on a range of ports.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Usage Guidelines

The contents of the show output will vary depending on which Threshold Limit Values (TLVs) are configured to be advertised.

If you do not specify any ports or use the **all** keyword, by default, the report shows the local information advertisements for all ports.

Examples

The following is a sample output of the **show lldp local-info** command.

```
device# show lldp local-info

Local port: 1/1/9:1

<<output truncated>>
```

show lldp neighbors

Displays a list of current LLDP neighbors and details of the latest advertisements received from Link Layer Discovery Protocol (LLDP) neighbors.

Syntax

```
show lldp neighbors [ detail ports { all | ethernet stack-id/slot/port [ to stack-id/slot/port | [ ethernet stack-id/slot/port to stack-id/slot/port | ethernet stack-id/slot/port ] ... ] } ]
```

Parameters

detail

Displays detailed neighbor data.

ports

Displays the details of the latest advertisements received from LLDP neighbors for the specified port.

all

Displays the details of the latest advertisements received from LLDP neighbors for all LLDP-enabled ports.

ethernet stack-id/slot/port

Displays the details of the latest advertisements received from LLDP neighbors for the specified Ethernet port.

to stack-id/slot/port

Displays the details of the latest advertisements received from LLDP neighbors for a range of ports.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Command Output

The **show lldp neighbors** command displays the following information.

Output field	Description
Lcl Port	The local LLDP port number.
Chassis ID	The identifier for the chassis. Brocade devices use the base MAC address of the device as the Chassis ID.
Port ID	The identifier for the port. Brocade devices use the permanent MAC address associated with the port as the port ID.
Port Description	The description for the port. Brocade devices use the ifDescr MIB object from MIB-II as the port description.
System Name	The administratively-assigned name for the system. Brocade devices use the sysName MIB object from MIB-II, which corresponds to the CLI hostname command setting.

Examples

The following is sample output from the **show lldp neighbors** command.

```
device# show lldp neighbors

Lcl Port Chassis ID      Port ID      Port Description      System Name
1/1/9:1  0000.0126.2057  748e.f8f9.7489  10GigabitEthernet1/1/10  7750Stk

1/1/13        0         0         0         0         0         0         0
1/1/14        0         0         0         0         0         0         0
1/1/15        0         0         0         0         0         0         0
1/1/16        0         0         0         0         0         0         0
1/1/17        0         0         0         0         0         0         0
1/1/18        0         0         0         0         0         0         0
1/1/19        0         0         0         0         0         0         0
1/1/20        0         0         0         0         0         0         0
1/2/1         0         0         0         0         0         0         0
1/2/2         0         0         0         0         0         0         0
1/2/3         0         0         0         0         0         0         0
1/2/4         0         0         0         0         0         0         0
1/2/5         0         0         0         0         0         0         0
1/2/6         0         0         0         0         0         0         0
1/3/1         0         0         0         0         0         0         0
1/3/2         0         0         0         0         0         0         0
1/3/3         0         0         0         0         0         0         0
1/3/4         0         0         0         0         0         0         0
1/3/5         0         0         0         0         0         0         0
1/3/6         0         0         0         0         0         0         0
```

show local-userdb

Displays a list of local user databases configured on the device and the number of users in each database.

Syntax

show local-userdb [*db-name* [*user-name*]]

Parameters

db-name

Displays information for the specified local user database. The database name and the username can be up to 31 characters.

user-name

Displays information for the specified user in the specified user database.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Web Authentication configuration mode

Examples

The following example displays the list of all local user databases and the number of users in each database.

```
device# show local-userdb
=====
Local User Database Name : My_Database
Number of users in the database : 4
=====
Local User Database Name : test
Number of users in the database : 3
=====
Local User Database Name : test123
Number of users in the database : 3
```

The following example displays the details of a particular user database. The passwords are encrypted in the example.

```
device#show local-userdb test
=====
Local User Database : test
Username           Password
-----
user1              $e$&Z9'%'&+
user2              $e$,)A=) 65N,%-3*%1?@U
user3              $e$5%&-5%YO&&A1%6%<@U
```

Show Commands

show local-userdb

The following example displays details of a particular user in a specific database.

```
device# show local-userdb db1 user1
Username = user1 Password = $e$%U*V
```

show logging

Displays the Syslog messages in the device local buffer.

Syntax

show logging

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Command Output

The **show logging** command displays the following information.

Output field	Description
Syslog logging	The state (enabled or disabled) of the Syslog buffer.
messages dropped	The number of Syslog messages dropped due to user-configured filters. By default, the software logs messages for all Syslog levels. You can disable individual Syslog levels, in which case the software filters out messages at those levels. Each time the software filters out a Syslog message, this counter is incremented.
flushes	The number of times the Syslog buffer has been cleared by the clear logging command or equivalent Web Management Interface option.
overruns	The number of times the dynamic log buffer has filled up and been cleared to hold new entries. For example, if the buffer is set for 100 entries, the 101st entry causes an overrun. After that, the 201st entry causes a second overrun.
level	The message levels that are enabled. Each letter represents a message type and is identified by the key (level code) below the value. If you disable logging of a message level, the code for that level is not listed.
messages logged	The total number of messages that have been logged since the software was loaded.
level code	The message levels represented by the one-letter codes.

Examples

The following is sample output from the **show logging** command.

```
device# show logging

Syslog logging: enabled (0 messages dropped, 0 flushes, 24 overruns)
  Buffer logging: level ACDMEINW, 50 messages logged
  level code: A=alert C=critical D=debugging M=emergency E=error
              I=informational N=notification W=warning

Static Log Buffer:
Jan  1 00:00:47:I:System: Stack unit 1 PSU fan direction mismatch

Dynamic Log Buffer (50 lines):

```

show loop-detection resource

Displays the hardware and software resource information about loop detection.

Syntax

show loop-detection resource

Modes

- User EXEC mode
- Privileged EXEC mode
- Global configuration mode
- Interface configuration mode

Command Output

The **show loop-detection resource** command displays the following information.

Output field	Description
alloc	Memory allocated
in-use	Memory in use
avail	Available memory
get-fail	The number of get requests that have failed
limit	The maximum memory allocation
get-mem	The number of get-memory requests
size	The size of the memory
init	The number of requests initiated

Examples

The following is sample output from the **show loop-detection resource** command.

```
device# show loop-detection resource

Vlans configured loop-detection use 1 HW MAC
Vlans not configured but use HW MAC: 1 10
alloc          in-use  avail    get-fail  limit  get-mem  size  init
configuration pool 16      6        10       0         3712   6     15
linklist pool   16     10       6         0         3712  10     16      16
```

Related Commands

[show loop-detection status](#)

show loop-detection status

Displays loop detection status.

Syntax

show loop-detection status

Modes

- User EXEC mode
- Privileged EXEC mode
- Global configuration mode
- Interface configuration mode

Examples

The following is sample output from the **show loop-detection status** command. If a port is disabled in Strict mode, it shows "ERR-DISABLE by itself." If it is disabled due to its associated VLAN, it shows "ERR-DISABLE by vlan<num>."

```
device# show loop-detection status

loop detection packets interval: 10 (unit 0.1 sec)
Number of err-disabled ports: 3
You can re-enable err-disable ports one by one by "disable" then "enable"
under interface config, re-enable all by "clear loop-detect", or
configure "errdisable recovery cause loop-detection" for automatic recovery

index   port/vlan   status                               #errdis  sent-pkts  rcv-pkts
1       1/1/13     untag, LEARNING                      0         0          0
2       1/1/15     untag, BLOCKING                      0         0          0
3       1/1/17     untag, DISABLED                      0         0          0

5       1/1/19     ERR-DISABLE by vlan12                0         0          0
6       vlan12     ERR-DISABLE ports                    2        24         2
```

show loop-detect no-shutdown-status

Shows the status of interfaces in a loop.

Syntax

show loop-detect no-shutdown-status

Modes

Privileged EXEC mode

Usage Guidelines

Command Output

The **show loop-detect no-shutdown-status** command displays the following information:

Output field	Description
Port	The specific interface
Loop status	The duration the port has been in a loop

Examples

The following example shows the ports and their loop statuses.

```
device# show loop-detection no-shutdown-status

loop detection no shutdown syslog interval : 5      (unit 1 min /Default 5 min)
loop detection no shutdown port status      :
Note: Port's loop status gets cleared if loop is not detected in a particular interval window
```

```

      Port      || Loop Status
=====||=====
 ethernet 1/1/7 || (In Loop For 2309 Seconds)
 ethernet 1/1/15 || (In Loop For 2309 Seconds)
```

History

Release version	Command history
08.0.20	This command was introduced.

show mac-address

Displays the MAC address table.

Syntax

```
show mac-address [ ethernet stack/slot/port | vlan vlan-id ] [ mac-address [ mac-address-mask ] ]  
show mac-address [ all | session | statistics ]
```

Parameters

ethernet *stack/slot/port*

Displays information for the specific Ethernet port.

vlan *vlan-id*

Displays the MAC address for the specified VLAN ID.

mac-address

Displays the information for the specified Ethernet MAC address.

mac-address-mask

Displays the information for the specified Ethernet MAC address mask.

all

Displays MAC address of all ports including the blocked ports.

session

Displays the MAC address of the ports in the session.

statistics

Displays the MAC address statistics.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Cluster configuration mode

Command Output

The **show mac-address** command displays the following information:

Output field	Description
MAC-Address	The MAC address.
Type	Indicates whether the MAC entry is static or dynamic. A static entry is one you create using the static-mac-address command. A dynamic entry is one that is learned by the software from network traffic.

Usage Guidelines

The **show mac-address** command output does not include MAC addresses for management ports, because these ports do not support typical MAC learning and MAC-based forwarding.

Examples

The following example displays sample output of the **show mac-address** command.

```
device# show mac-address
Total active entries from all ports = 3
Total static entries from all ports = 1
MAC-Address      Port      Type      VLAN
0000.0034.1234   1/1/15    Static    1
0000.0038.2f24   1/1/14    Dynamic   1
0000.0038.2f00   1/1/13    Dynamic   1
0000.0086.b159   1/1/10    Dynamic   1
```

The following example displays sample output of the **show mac-address** command for a VLAN.

```
device# show mac-address vlan 1 0000.0000.0001
Total active entries from all ports = 16
MAC-Address      Port      Type      Index
0000.0000.0001   1/1/1     Dynamic   NA
Present in following devices (at hw index) :-
0 (8196 )         4 (8196 )
```

History

Release version	Command history
08.0.40	The following options are removed as they were supported only on FSX devices: mdup-status , mdb , source-rbridge <i>source-rbridgeid</i> , client-rbridge <i>client-rbridgeid</i> .

show mac-address cluster

Displays all the MAC address entries for a cluster.

Syntax

```
show mac-address cluster { cluster-name | cluster-id } [ vlan vlan-id ] [ client [ client-name | client-id ] ] [ local | remote ] [ exclude-interface | interface ]
```

Parameters

cluster-name

Displays the details for the cluster with the specified cluster name.

cluster-id

Displays the details for the cluster with the specified cluster ID.

vlan *vlan-id*

Displays the details for the VLAN with the specified VLAN ID.

client

Displays the details for the configured client.

client-name

Displays the details for the configured client with the specified client name.

client-id

Displays the details for the configured client with the specified client ID.

local

Displays the cluster local MAC address.

remote

Displays the cluster remote MAC address.

exclude-interface

Displays the MAC address of the remote cluster excluding the interface MAC address of the remote cluster.

interface

Displays the cluster remote interface MAC address.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Cluster configuration mode

Usage Guidelines

The **exclude-interface** and **interface** keywords are available only with the **remote** option. They are not available when the **client** option or the **vlan** option is used. When the **vlan** option is used, you can specify only the client name and not the client ID.

Examples

The following example shows the output of the **show mac-address cluster** command.

```
device# show mac-address cluster 1000
Total Cluster Enabled(CL+CR+CCL+CCR) MACs: 1
Total Cluster Local(CL) MACs: 1
CCL: Cluster Client Local CCR:Cluster Client Remote CL:Local CR:Remote
Total active entries from all ports = 1
Total static entries from all ports = 3
MAC-Address      Port      Type      Index  MCT-Type  VLAN
0000.0022.3333   1/1/1     Static    4254    CML        20
0000.0022.3333   1/1/3     Static    4254    CML        20
0000.0022.3333   1/1/13    Static    4254    CML        20
```

Show Commands
show mac-address mdb

show mac-address mdb

Displays information about the MAC database used in cluster configuration.

Syntax

```
show mac-address mdb [ source-rbridge rbridge-id client-rbridge client-rbridge-id ]
```

Parameters

source-rbridge *rbridge-id*

Displays information about MAC database corresponding to a particular source RBridge. The range is from 1 to 4095.

client-rbridge *client-rbridge-id*

Displays information about MAC database corresponding to a particular client RBridge. The range is from 1 to 4095.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Examples

show mac-authentication configuration

Displays the global or interface level MAC authentication configuration.

Syntax

show mac-authentication configuration [**all** | **ethernet** *device/slot/port*]

Parameters

all

Displays the MAC authentication configuration on all interfaces.

ethernet *device/slot/port*

Displays the MAC authentication configuration for a specific interface.

Modes

EXEC or Privileged EXEC mode

Global configuration mode

Usage Guidelines

Command Output

The **show mac-authentication configuration** command displays the following information.

Output field	Description
Status	Displays if MAC authentication is enabled or disabled
Auth-order	The authentication order enabled on the device
Default VLAN	The default VLAN specified on the device
Restricted VLAN	The restricted VLAN specified on the device
Critical VLAN	The critical VLAN specified on the device
Action on Auth failure	The action to be taken on authentication failure
MAC Session Aging	The status of the MAC session aging
Filter Strict Security	The status of filter strict security
Re-authentication	The status of re-authentication
Dot1x Override	The status of dot1x override
Password Override	The status of password override
Password Format	The configured password format
Reauth-period	The re-authentication period specified in seconds
Session max sw-age	The maximum software age configured on the device
Session max hw-age	The maximum hardware age configured on the device

Show Commands

show mac-authentication configuration

The **show mac-authentication configuration all** | **ethernet***device/slot/port* command displays the following information.

Output field	Description
Auth Order	Displays the authentication order
Action on Auth failure	Displays the action to be taken on authentication failure
Action on Auth timeout	Displays the action to be taken on authentication timeout
Filter Strict Security	Displays if filter strict security is enabled or disabled
DoS Protection	Displays if DoS protection is enabled or disabled
Source-guard Protection	Displays if Source-Guard Protection is enabled or disabled
Aging	Displays if aging is enabled or disabled
Max-sessions	Displays the count of the maximum sessions
Ingress-filtering	Displays if ingress filtering is enabled or disabled

Examples

The following example displays the system level MAC authentication configuration.

```
device# show mac-authentication configuration
```

```
Status : Enabled
Auth Order : dot1x mac-auth
Default VLAN : 4
Restricted VLAN : Not configured
Critical VLAN : Not configured
Action on Auth failure : Block traffic
MAC Session Aging : Enabled
Filter Strict Security : Enabled
Re-authentication : Enabled
Dot1x Override : Disabled
Password Override : Disabled
Password Format : xxxx.xxxx.xxxx
Reauth-period : 600 seconds
Session max sw-age : 120 seconds
Session max hw-age : 70 seconds
```

The following example displays the MAC authentication configuration for port 1/1/15.

```
device# configure terminal
device(config)# show mac-authentication configuration 1/1/15
```

```
Port 1/1/15 Configuration:
Auth Order                : dot1x mac-auth
Action on Auth failure    : Block traffic
Action on Auth timeout    : Treat as a failed authentication
Filter Strict Security    : Enabled
DoS Protection            : Disabled (limit = 512)
Source-guard Protection   : Disabled
Aging                    : Enabled
Max-sessions              : 32
Auth Filter List (Filter/VLAN) : 1/2
```

The following example displays the MAC authentication information on all interfaces.

```
device# configure terminal
device(config)# show mac-authentication configuration all

Port 1/1/1 Configuration:
Auth Order                : dot1x mac-auth
Action on Auth failure    : Block traffic
Action on Auth timeout    : Treat as a failed authentication
Filter Strict Security    : Enabled
DoS Protection            : Disabled (limit = 512)
Source-guard Protection   : Disabled
Reauth-timeout            : 60 seconds
Aging                     : Enabled
Max-sessions              : 2

Port 1/1/3 Configuration:
Auth Order                : dot1x mac-auth
Action on Auth failure    : Block traffic
Action on Auth timeout    : Treat as a failed authentication
Filter Strict Security    : Enabled
DoS Protection            : Disabled (limit = 512)
Source-guard Protection   : Disabled
Reauth-timeout            : 60 seconds
Aging                     : Enabled
Max-sessions              : 2
```

History

Release version	Command history
08.0.20	This command was introduced.

show mac-authentication ip-acl

Shows the Layer 3 access lists (ACLs) for MAC authentication.

Syntax

```
show mac-authentication ip-acl { all | ethernet unit/slot/port }
```

Parameters

all

Specifies the ACLs at the global level.

ethernet unit/slot/port

Specifies the ACLs at the interface level.

Modes

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Command Output

The **show mac-authentication ip-acl** command displays the following information.

Output field	Description
Port	The port number.
MAC Addr	The MAC address of the client.
Inbound IPv4 ACL	The IPv4 ACL applied to the authenticated port in the inbound direction.
Outbound IPv4 ACL	The IPv4 ACL applied to the authenticated port in the outbound direction.
Inbound IPv6 ACL	The IPv6 ACL applied to the authenticated port in the inbound direction.
Outbound IPv6 ACL	The IPv6 ACL applied to the authenticated port in the inbound direction.

Examples

The following example displays 802.1X IP ACL authentication information for Ethernet interface 1/1/15.

```
device# show mac-authentication ip-acl ethernet 1/1/15
-----
Port      MAC          Inbound   Outbound   Inbound   Outbound
  Addr    IPv4 ACL   IPv4 ACL  IPv6 ACL  IPv6 ACL
-----
1/1/15    0180.c200.0003  10        11         20        21
1/1/15    0180.c300.0005  100       101        120       121
```

History

Release version	Command history
08.0.20	This command was introduced.
08.0.50	The output for this command was updated.

show mac-authentication sessions

Displays MAC authentication sessions at the global and interface level.

Syntax

show mac-authentication sessions { **all** | **brief** | **ethernet** *unit/slot/port* }

Parameters

all

Specifies the MAC authentication sessions for all ports.

brief

Specifies details of MAC authentication sessions in brief.

ethernet *unit/slot/port*

Specifies the MAC authentication sessions of an interface.

Modes

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Authentication configuration mode

Command Output

The **show mac-authentication sessions** command displays the following information.

Output field	Description
Port	The port number.
MAC Addr	The MAC address of the client.
IP Addr	The IP address of the client. The IP address of the authenticated host is displayed only if an IP ACL is applied to the interface based on the RADIUS server response.
Vlan	The VLAN.
Auth State	The authentication state.
ACL	The specific ACL applied.
Age	The age of the session.

Examples

The following example displays MAC authentication sessions for all interfaces.

```
device# show mac-authentication sessions all
```

Port	MAC Addr	IP Addr	Vlan	Auth State	ACL	Age
1/1/2	0010.94ab.0021	N/A	300	Yes	no	Ena

The following example displays MAC authentication sessions for a specified interface.

```
device# show mac-authentication sessions ethernet 1/1/2
```

Port	MAC Addr	IP Addr	Vlan	Auth State	ACL	Age
1/1/2	0010.94ab.0021	N/A	300	Yes	no	Ena

The following example displays MAC authentication sessions brief.

```
device# show mac-authentication sessions in brief
```

Port	Number of Attempted Users	Number of Authorized Users	Number of Denied Users	Untagged VLAN Type	Dynamic Port ACL
1/1/2	1	1	0	Radius-VLAN	No
1/1/3	0	0	0	Auth-Default-VLAN	No
1/1/4	0	0	0	Auth-Default-VLAN	No
1/1/5	0	0	0	Auth-Default-VLAN	No
2/1/1	0	0	0	Auth-Default-VLAN	No
2/1/2	0	0	0	Auth-Default-VLAN	No
2/1/4	0	0	0	Auth-Default-VLAN	No

History

Release version	Command history
08.0.20	This command was introduced.
08.0.50	The command output was updated.

show mac-authentication statistics

Displays the MAC authentication statistics.

Syntax

show mac-authentication statistics { **all** | **ethernet** *device/slot/port* }

Parameters

all

Displays the MAC authentication statistics for all interfaces.

ethernet *device/slot/port*

Displays the MAC authentication statistics for the specified interface.

Modes

Privileged EXEC mode

Usage Guidelines

Command Output

The **show mac-authentication statistics** command displays the following information:

Output field	Description
Accepted Sessions	The number of accepted sessions
Rejected Sessions	The number of rejected sessions
Inprogress Sessions	The number of in-progress sessions
Attempted Sessions	The number of attempted sessions
Number of Errors	The number of errors

Examples

The following example displays MAC authentication statistics for all interfaces.

```
device# show mac-authentication statistics all

Port 1/1/15 Statistics:
Accepted Sessions      :    2
Rejected Sessions      :    0
Inprogress Sessions    :    0
Attempted Sessions     :    0
Number of Errors       :    0

Port 2/1/15 Statistics:
Accepted Sessions      :    1
Rejected Sessions      :    0
Inprogress Sessions    :    0
Attempted Sessions     :    0
Number of Errors       :    0
```

The following example displays MAC authentication statistics for Ethernet interface 1/1/15.

```
device# show mac-auth statistics ethernet 1/1/15

Port 1/1/15 Statistics:
Accepted Sessions      :    2
Rejected Sessions      :    0
Inprogress Sessions    :    0
Attempted Sessions     :    0
Number of Errors       :    0
```

History

Release version	Command history
08.0.20	This command was introduced.

show macsec statistics ethernet

Displays status information and secure channel statistics for the designated MACsec interface.

Syntax

show macsec statistics ethernet *device/slot/port*

Parameters

device/slot/port

Interface for which MACsec status information is to be displayed. The interface is designated by device number in stack/slot on the device/interface on the slot.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

dot1x-mka configuration mode

dot1x-mka-interface configuration mode

Usage Guidelines

MACsec commands are supported only on the ICX 7450.

It is recommended that you use the **clear macsec ethernet** command to clear previous results for the **show macsec statistics ethernet** command before re-executing it.

Command Output

The **show macsec statistics ethernet** command displays the following information:

Output field	Description
Interface (Device/slot/port)	The information that follows describes the designated interface.
Replay Protection (Enabled, Disabled)	Indicates whether replay protection is applied on the interface.
Replay Window (0 through 127)	If out-of-order packets are allowed, indicates allowable window within which an out-of-order packet can be received.
Frame Validation (Enabled, Disabled)	Indicates whether MACsec frame headers are checked.
Secure Channel Statistics:	The fields that follow describe activity on a secure channel established over the designated interface.
TxPktProtectedOnly	Number of transmitted packets with integrity protection only.
TxOctetProtectedOnly	Number of bytes transmitted in packets with integrity protection only.
TxPktEncrypted	Number of transmitted packets that are encrypted.
TxOctetEncrypted	Number of bytes transmitted in encrypted packets.

Output field	Description
TxPktMiss	Number of transmitted packets that are neither encrypted nor protected by integrity check.
TxOctetMiss	Number of bytes transmitted in packets that are neither encrypted nor protected by integrity checking.
TxPktDrop	Number of packets dropped at transmission because SAK has been exhausted.
TxPktBad	Number of transmitted packets marked as bad.
RxPktDecryptedAuth	Number of packets received, decrypted, and checked for integrity protection.
RxOctetTotal	Number of bytes received.
RxOctetAuthOnly	Number of bytes received with Integrity protection only.
RxOctetDecrypted	Number of bytes received and decrypted.
RxPktFailReplayCheck	Number of packets received out of order.
RxPktFailICVCheck	Number of packets received that failed Integrity checking.
RxPktNoMACsecTag	Number of packets received without a MACSec Tag.
RxPktFrameValFail	Number of packets received that failed MACsec frame validation.
RxPktMiss	Number of packets received that did not find a key for decryption.
RxOctetMiss	Number of bytes received that did not find a key for decryption.
RxPktDrop	Number of received packets that were dropped.

Examples

The following example shows details for Ethernet interface 1/3/1 (device 1, slot 3, port 1). The interface is verifying MACsec frames and is providing strict replay protection. Based on counter statistics, transmitted packets are being encrypted. A smaller number of packets have been received, have passed integrity checking, and have been decrypted. No packets have been received out of order, and no packets have been dropped. No packets have failed integrity checking. A number of packets have been received without MACsec headers, and numerous bytes did not have a decryption key.

```

device(config-dot1x-mka-1/3/1)# clear macsec ethernet 1/3/1
device(config-dot1x-mka-1/3/1)# show macsec statistics ethernet 1/3/1

Interface                : 1/3/1

Replay Protection       : Enabled
Replay Window          : 0
Frame Validation       : Check

Secure Channel Statistics:
TxPktProtectedOnly    165074761  TxOctetProtectedOnly    20491766144
TxPktEncrypted         0          TxOctetEncrypted         0
TxPktMiss              0          TxOctetMiss              0
TxPktDrop              0          TxPktBad                 0

RxPktDecryptedAuth    3455          RxOctetTotal             257506
RxOctetAuthOnly       230740        RxOctetDecrypted         0
RxPktFailReplayCheck  0          RxPktFailICVCheck        0
RxPktNoMACsecTag      414          RxPktFrameValFail        0
RxPktMiss              414          RxOctetMiss              26766
RxPktDrop              0

```

Show Commands

show macsec statistics ethernet

The following example shows output for an ICX 7450 device. The output for the ICX 7450 is different from the output for other devices.

```

History

Release version	Command history
08.0.20	This command was introduced.
08.0.20a	This command was modified. The show macsec ethernet command name was changed to show macsec statistics ethernet .

show management traffic exclusion

Displays the port types and application types that are excluded from in-band or out-of-band (OOB) management ports.

Syntax

show management traffic exclusion

Modes

- User EXEC mode
- Privileged EXEC mode
- Global configuration mode
- Interface configuration mode
- VLAN configuration mode

Examples

To display port and application status:

```
device# show management traffic exclusion
Port      App
Inband    all
oob       all
```

History

Release version	Command history
8.0.50	This command was introduced.

show management-vrf

Displays packet and session rejection statistics due to failure in management Virtual Routing and Forwarding (VRF) validation.

Syntax

show management-vrf

Modes

- User EXEC mode
- Privileged EXEC mode
- Global configuration mode
- Interface configuration mode

Usage Guidelines

Make sure that the management VRF is configured before executing the **show management-vrf** command.

Command Output

The **show management-vrf** command displays the following information.

Output field	Description
Management VRF name	Displays the configured management VRF name.
Management Application	Displays the management application names.
Rx Drop Pkts	Displays the number of packets dropped in the inbound traffic.
Tx Drop Pkts	Displays the number of packets dropped in the outbound traffic.
TCP Connection rejects	Displays the number of TCP connections per application rejected due to management VRF validation.

Examples

The following is sample output from the **show management-vrf** command.

```
device(config)# show management-vrf

Management VRF name : sflow
Management Application      Rx Drop Pkts      Tx Drop Pkts
SNMP Engine                 0                 11
RADIUS Client               0                 0
TFTP Client                 0                 0
Traps                       -                 0
SysLogs                    -                 0
TCP Connection rejects:
Telnet                      : 0
SSH (Strict)                : 685
TACACS+ Client              : 0
```

show media

Displays information about the media devices installed per device, per stack, and per port.

Syntax

```
show media [ validation ] [ ethernet unit/slot/port | stack stack ]
```

Parameters

validation

Displays detailed information about the optics inventory and shows if the optics are official Brocade optics.

ethernet *unit/slot/port*

Displays the media type for the specified Ethernet interface.

stack *stack*

Displays the media type for the specified stack.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

802.1br PE local mode

Command Output

The show flash command displays the Type, Vendor, Part number, Version and Serial number of the SFP, SFP+, QSPF, or QSPF+ optical device installed in the port. If none of these optical devices are installed in a port, the "Type" field will display "EMPTY".

Examples

The following example sample output displays information about the media installed on a device.

```
device# show media

Port 1/1/1 :      Type : 1G M-C (Gig-Copper)
Port 1/1/2 :      Type : 1G M-C (Gig-Copper)
Port 1/1/3 :      Type : 1G M-C (Gig-Copper)
Port 1/1/4 :      Type : 1G M-C (Gig-Copper)
Port 1/1/5 :      Type : 1G M-C (Gig-Copper)
Port 1/1/6 :      Type : 1G M-C (Gig-Copper)
Port 1/1/7 :      Type : 1G M-C (Gig-Copper)
Port 1/1/8 :      Type : 1G M-C (Gig-Copper)
Port 1/1/9 :      Type : 1G M-C (Gig-Copper)

```

The following sample output displays the media type for the specified Ethernet interface.

```

device# show media ethernet 1/3/1
Port 1/3/1: Type : 40GE-SR4 100m (QSFP+)
Vendor: BROCADE      Version: A
Part# : 57-1000128-01      Serial#: LTA112251000543

```

Show Commands

show media

The following sample output displays the media type for an 802.1br CB interface from the local display of an attached PE unit.

```
device# show media ethernet 4/4/1
Port 4/4/1: Type : 40GE-LR4 10km (QSFP+ LC)
            Vendor: BROCADE          Version: 2
            Part# : 57-1000263-01     Serial#: LDJ21325C230002
```

show memory

Displays the memory usage for system tasks, transmission control protocol, and stack units.

Syntax

show memory [**task** | **tcp** | **unit** *unit-id*]

Parameters

task

Displays memory usage per system task.

tcp

Displays Transmission Control Protocol (TCP) memory usage.

unit *unit-id*

The ID of the stack unit.

Modes

Global configuration mode

User EXEC mode

Usage Guidelines

Command Output

The **show memory task** command displays the following information:

Output field	Description
Task	The name of the task.
Alloc	The amount memory allocated for the task.
Free	The amount of free memory available.
Used	The amount of memory used by the specific task.
TCB usage	The availability of Transmission Control Block for the TCP connection.
TCP QUEUE BUFFER usage	The availability of the Queue buffer used to hold the TCP messages that need to be sent.
TCP SEND BUFFER usage	The availability of buffers which will be used to send the TCP packets from the device.
TCP RECEIVE BUFFER usage	The availability of buffers which will be used to receive the TCP packets to the device.
TCP OUT OF SEQUENCE BUFFER usage	The availability of re-sequence buffer used for the TCP connection.

Examples

The following example command displays the memory usage per task.

```

Release version	Command history
08.0.30	This command was introduced.

show metro-ring

Displays the metro ring details.

Syntax

show metro-ring *ring-id* [**diagnostics**]

Parameters

ring-id

Displays the details of the metro ring specified by the ring ID.

diagnostics

Displays the diagnostic results for the specified metro ring.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

VLAN configuration mode

VSRP VRID configuration mode

Command Output

The **show metro-ring** *ring-id* **diagnostics** command displays the following information:

Output field	Description
Ring id	The metro ring ID.
Diag state	The state of ring diagnostics.
RHP average time	The average round-trip time for an Ring Hello Packet (RHP) packet on the ring. The calculated time has a granularity of 1 microsecond.
Recommended hello time	The hello time recommended by the software based on the RHP average round-trip time.
Recommended Prefwing time	The preforwarding time recommended by the software based on the RHP average round-trip time.
Diag frame sent	The number of diagnostic RHPs sent for the test.
Diag frame lost	The number of diagnostic RHPs lost during the test.

The **show metro-ring** *ring-id* command displays the following information:

Output field	Description
Ring id	The metro ring ID.
State	The state of MRP. The state can be enabled or disabled.

Output field	Description
Ring role	Whether this node is the master for the ring. The role can be master or member.
Master vlan	The ID of the master VLAN in the topology group used by this ring. If a topology group is used by MRP, the master VLAN controls the MRP settings for all VLANs in the topology group. The topology group ID is 0 if the MRP VLAN is not the master VLAN in a topology group. Using a topology group for MRP configuration is optional.
Topo group	The topology group ID.
Hello time	The interval, in milliseconds, at which the forwarding port on the ring master node sends RHPs.
Prefwing time	The number of milliseconds an MRP interface that has entered the preforwarding state will wait before changing to the forwarding state.
Ring interfaces	The ring interfaces in the device. If the interfaces are part of a LAG, only the primary ports of the groups are listed.
Interface role	The interface role can be one of the following: <ul style="list-style-type: none"> • primary <ul style="list-style-type: none"> - Master node - The interface generates RHPs. - Member node - The interface forwards RHPs received on the other interface (the secondary interface). • secondary - The interface does not generate RHPs. <ul style="list-style-type: none"> - Master node - The interface listens for RHPs. - Member node - The interface receives RHPs.
Forwarding state	Whether MRP forwarding is enabled on the interface. The forwarding state can be one of the following: <ul style="list-style-type: none"> • blocking - The interface is blocking Layer 2 data traffic and RHPs. • disabled - The interface is down. • forwarding - The interface is forwarding Layer 2 data traffic and RHPs. • preforwarding - The interface is listening for RHPs but is blocking Layer 2 data traffic.
Active interface	The physical interfaces that are sending and receiving RHPs. If a port is disabled, its state is shown as "disabled". If an interface is part of a LAG, the member port which comes up first is listed.
Interface Type	Shows if the interface is a regular port or a tunnel port.
RHPs sent	The number of RHPs sent on the interface. <p>NOTE This field applies only to the master node. On non-master nodes, this field contains 0. This is because the RHPs are forwarded in hardware on the non-master nodes.</p>
RHPs rcvd	The number of RHPs received on the interface. <p>NOTE On most Brocade devices, this field applies only to the master node. On non-master nodes, this field contains 0. This is because the RHPs are forwarded in hardware on the non-master nodes. However, on the FastIron devices, the RHP received counter on non-master MRP nodes increments. This is because, on FastIron devices, the CPU receives a copy of the RHPs forwarded in hardware.</p>
TC RHPs rcvd	The number of Topology Change RHPs received on the interface. A Topology Change RHP indicates that the ring topology has changed.
State changes	The number of MRP interface state changes that have occurred. The state can be one of the states listed in the Forwarding state field.

Examples

The following example displays the MRP diagnostics result on the master node.

```
device# show metro-ring 1 diagnostics
Metro Ring 1 - custA
=====

```

show mirror

Displays the port mirroring configuration details.

Syntax

show mirror ethernet *stackid/slot/port*

Parameters

ethernet *stackid/slot/port*

Displays the details for the specified Ethernet port.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Examples

The following example displays sample output of the **show mirror** command.

```
device(config)# show mirror ethernet 1/2/1
Mirror port 1/2/1
  Input monitoring      : (U1/M1)   2
  Output monitoring    : None
```

show module

Displays module information for stack members.

Syntax

show module

Modes

User EXEC mode

Usage Guidelines

This command may be entered in all configuration modes.

Command Output

The **show module** command displays the following information:

Output field	Description
Module	Identifies the module by stack unit ID, module number, and module type.
Status	The status of this module.
Ports	The number of ports in this module.
Starting MAC	The starting MAC address for this module.

Examples

The following example displays stack module information.

```
device# show module

      Module                               Status Ports Starting MAC
U1:M1 ICX7450-48 48-port Management Module    OK    48    cc4e.248d.f8d0
U1:M2 ICX7400-4X10GF 4-port 40G Module        OK     4    cc4e.248d.f901
U1:M3 ICX7400-1X40GQ 1-port 40G Module        OK     1    cc4e.248d.f905
U2:M1 ICX7450-48 48-port Management Module    OK    48    cc4e.248e.4990

device#
```

show monitor

Displays the monitored ports configurations.

Syntax

```
show monitor ethernet stackid/slot/port
```

Parameters

ethernet *stackid/slot/port*

Displays the information for the specified monitored Ethernet port.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Examples

The following example displays sample output of the **show monitor** command.

```
device> show monitor ethernet 1/1/2
Input mirrored by      : (U1/M2)  1
Output mirrored by    : None
```

show mstp

Displays the MSTP information.

Syntax

```
show mstp { [ detail ] mstp-id | configuration }
```

Parameters

detail

Displays detailed MSTP information for the specified ID.

mstp-id

Displays the MSTP information for a specific ID.

configuration

Displays MSTP configuration information.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

VLAN configuration mode

Command Output

The **show mstp** command displays the following information:

Output field	Description
MSTP Instance	The ID of the MSTP instance whose statistics are being displayed. For the CIST, this number is 0.
VLANs	The number of VLANs that are included in this instance of MSTP. For the CIST, this number will always be 1.
Bridge Identifier	The MAC address of the bridge.
Bridge MaxAge sec	Displays the configured maximum age.
Bridge Hello sec	Displays the configured Hello variable.
Bridge FwdDly sec	Displays the configured FwdDly variable.
Bridge Hop cnt	Displays the configured Max Hop count variable.
Root MaxAge sec	The maximum age configured on the root bridge.
Root Hello sec	Hello interval configured on the root bridge.
Root FwdDly sec	FwdDly interval configured on the root bridge.
Root Hop Cnt	Maximum hop count left from the root bridge.
Root Bridge	Bridge identifier of the root bridge.

Show Commands

show mstp

Output field	Description
ExtPath Cost	The configured path cost on a link connected to this port to an external MSTP region.
Regional Root Bridge	The Regional Root Bridge is the MAC address of the root bridge for the local region.
IntPath Cost	The configured path cost on a link connected to this port within the internal MSTP region.
Designated Bridge	The MAC address of the bridge that sent the best BPDU that was received on this port.
Root Port	Port indicating shortest path to root. Set to "Root" if this bridge is the root bridge.
Port Num	The port number of the interface.
Pri	The configured priority of the port. The default is 128.
PortPath Cost	Configured or auto-detected path cost for port.
P2P Mac	Indicates if the port is configured with a point-to-point link: <ul style="list-style-type: none">• T - The port is configured in a point-to-point link.• F - The port is not configured in a point-to-point link.
Edge	Indicates if the port is configured as an operational edge port: <ul style="list-style-type: none">• T - Indicates that the port is defined as an edge port.• F - Indicates that the port is not defined as an edge port.
Role	The port current spanning tree state. A port can have one of the following states: <ul style="list-style-type: none">• Forwarding• Discarding• Learning• Disabled
Designated Cost	Port path cost to the root bridge.
Max Hop cnt	The maximum hop count configured for this instance.

Examples

The following example displays the MSTP information for a specified MSTP instance.

```
device# show mstp 1
MSTP Instance 1 - VLANs: 2
-----
Bridge          Max      RegionalRoot  IntPath  Designated  Root  Root
Identifier      Hop      Bridge        Cost     Bridge      Port  Hop
hex             cnt     hex          Cost     hex         cnt
8001000cdb80af01 20      8001000cdb80af01 0        8001000cdb80af01 Root 20
Port    Pri   PortPath  Role State  Designa-  Designated
Num     Cost          ted cost  bridge
3/1 128 2000    MASTER  FORWARDING  0        8001000cdb80af01
```

The following example displays the detailed MSTP information.

```
device# show mstp detail
MSTP Instance 0 (CIST) - VLANs: 4093
-----
Bridge: 800000b000c00000 [Priority 32768, SysId 0, Mac 00b000c00000]
FwdDelay 15, HelloTime 2, MaxHops 20, TxHoldCount 6
Port 6/54 - Role: DESIGNATED - State: FORWARDING
PathCost 20000, Priority 128, OperEdge T, OperPt2PtMac F, Boundary T
Designated - Root 800000b000c00000, RegionalRoot 800000b000c00000,
Bridge 800000b000c00000, ExtCost 0, IntCost 0
ActiveTimers - helloWhen 1
MachineState - PRX-DISCARD, PTX-IDLE, PPM-SENDING_RSTP, PIM-CURRENT
PRT-ACTIVE_PORT, PST-FORWARDING, TCM-INACTIVE
BPDUs - Rcvd MST 0, RST 0, Config 0, TCN 0
Sent MST 6, RST 0, Config 0, TCN 0
```

The following example displays the MSTP configuration details.

```
device# show mstp configuration
MSTP CONFIGURATION
-----
Name : Reg1
Revision : 1
Version : 3 (MSTP mode)
Status : Started
Instanc VLANs
-----
0          4093
```

show notification-mac

Displays whether MAC-notification for SNMP traps is enabled or disabled.

Syntax

show notification-mac

Modes

Privileged EXEC mode

Usage Guidelines

You can view statistics such as the configured interval, the number of traps sent, and the number of events sent.

Examples

The following example displays the MAC-notification statistics:

```
device# show notification-mac
Mac-notification SNMP trap is ENABLED
Configured Interval: 40 seconds
Number of trap messages sent: 2
Number of mac-notification events sent: 20
```

History

Release version	Command history
08.0.10	This command was introduced.

show notification mac-movement

Displays the MAC address movement notifications.

Syntax

show notification mac-movement { interval-history | threshold-rate }

Parameters

interval-history

Displays the collected history of MAC address movement notification and how the history interval is configured.

threshold-rate

Displays the configuration of the MAC address movement threshold rate.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Command Output

The **show notification mac-movement interval-history** command displays the following information:

Output field	Description
Interval-History Mac Movement Notification	Specifies whether the interval history data collection is enabled.
Configured Interval	The interval over which the MAC address movement statistics were collected.
Number of macs that moved in the interval	The number of MAC addresses that moved during the configured interval regardless of how many times each address moved.
Total number of moves in the interval	The total number of MAC address moves over the configured interval.
Interval Move-Count	The number of times the MAC address has moved within the interval.

The **show notification mac-movement threshold-rate** command displays the following information:

Output field	Description
Threshold-Rate Mac Movement Notification	Specifies whether the MAC movement notification threshold rate is enabled.
Configured Threshold-Rate	The rate in MAC address moves per sampling interval after which a notification is issued. The range is from 1 through 50000.
Configured Sampling-Interval	The sampling interval in seconds over which the number of MAC address moves is measured. The range is from 1 through 86400, which is the number of seconds in a day.

Show Commands

show notification mac-movement

Output field	Description
Number of entries in the notification table	One entry for each time a MAC address notification threshold was reached.
MAC-Address	The MAC address that has moved to a different port.
from-Port	The port from which the MAC address moved.
to-Port	The port to which the MAC address moved.
Last Move-Time	The time the last move occurred. The system uptime is used if there is no time server configured.
Vlan-id	The VLAN for the port where the MAC address movement was detected.

Examples

The following example displays the notification interval history.

```
device# show notification mac-movement interval-history
Interval-History Mac Movement Notification is ENABLED
Configured Interval : 30 seconds
Number of macs that moved in the interval : 100
Total number of moves in the interval : 98654
MAC-Address      from-Port  to-Port  Interval Move-Count  Last Move-Time  Vlan-id
-----
0000.0000.0052   7/1       7/2      1000                May 15 01:13:20  10
0000.0000.0051   7/1       7/2      1002                May 15 01:13:20  10

```

show ntp associations

Displays association information for all NTP servers and peers.

Syntax

show ntp associations [**detail** [*ipv4-address* | *ipv6-address*]]

Parameters

detail

Displays the detailed NTP server and peer association information for the specifies address.

ipv4-address

Displays the NTP server and peer association information for a specific IPv4 address.

ipv6-address

Displays the NTP server and peer association information for a specific IPv6 address.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

NTP configuration mode

Interface configuration mode

Command Output

The **show ntp associations** command displays the following information.

Output Field	Description
*	The peer has been declared the system peer and lends its variables to the system variables.
#	This peer is a survivor in the selection algorithm.
+	This peer is a candidate in the combine algorithm.
-	This peer is discarded as an outlier in the clustering algorithm.
x	This peer is discarded as a "falseticker" in the selection algorithm.
~	The server or peer is statically configured.
address	IPv4 or IPv6 address of the peer.
ref clock	IPv4 address or first 32 bits of the MD5 hash of the IPv6 address of the peer to which the clock is synchronized.
st	Stratum setting for the peer.
when	Time, in seconds, since the last NTP packet was received from the peer.
poll	Polling interval (seconds).
reach	Peer reachability (bit string, in octal).

Show Commands

show ntp associations

Output Field	Description
delay	Round-trip delay to the peer, in milliseconds.
offset	Relative time difference between a peer clock and a local clock, in milliseconds.
disp	Dispersion.

The **show ntp associations detail** command displays the following information.

Output field	Description
server	Indicates that the server is statically configured.
symmetric active peer	Indicates that the peer is statically configured.
symmetric passive peer	Indicates that the peer is dynamically configured.
sys_peer	This peer is the system peer.
candidate	This peer is chosen as a candidate in the combine algorithm.
reject	This peer is rejected by the selection algorithm.
falsekick	This peer is dropped as a falsekicker by the selection algorithm.
outlier	This peer is dropped as an outlier by the clustering algorithm.
stratum	The stratum number.
ref ID	The IPv4 address or hash of the IPv6 address of the upstream time server to which the peer is synchronized.
time	The last time stamp that the peer received from its master.
our mode	This system's mode relative to the peer (active/passive/client/server/bdcast/bdcast client).
peer mode	Mode of the peer relative to this system.
our poll intvl	This system's poll interval to this peer.
peer poll intvl	Poll interval of the peer to this system.
root delay	The delay along the path to root (the final stratum 1 time source).
root disp	Dispersion of the path to root.
reach	The peer reachability (bit string in octal).
delay	Round-trip delay to the peer.
offset	Offset of the peer clock relative to this clock.
dispersion	Dispersion of the peer clock.
precision	Precision of the peer clock.
version	NTP version number of the peer.
org time	The originate time stamp of the last packet.
rcv time	The receive time stamp of the last packet.
xmt time	The transmit time stamp of the last packet.
filter delay	The round-trip delay, in milliseconds, of the last 8 samples.
filter offset	The clock offset, in milliseconds, of the last eight samples.
filter error	Approximate error of the last eight samples.

Examples

The following is sample output from the **show ntp associations** command.

```
device# show ntp associations

address      ref          clock  st  when  poll  reach  delay  offset  disp
172.19.69.1  172.24.114.33  3      25  64    3     2.89   0.234  39377

```

show ntp status

Displays the Network Time Protocol (NTP) status.

Syntax

show ntp status

Modes

- User EXEC mode
- Privileged EXEC mode
- Global configuration mode
- Interface management configuration mode
- NTP configuration mode

Command Output

The **show ntp status** command displays the following information.

Output field	Description
synchronized	Indicates that the system clock is synchronized to the NTP server or peer.
stratum	Indicates that the stratum number that this system is operating. Range is from 2 to 15.
reference clock	The IPv4 address or the first 32 bits of the MD5 hash of the IPv6 address of the peer to which the clock is synchronized.
precision	Precision of the clock of this system, in Hz.
reference time	Reference time stamp.
clock offset	Offset of clock (in milliseconds) to synchronized peer.
root delay	Total delay (in milliseconds) along the path to the root clock.
root dispersion	Dispersion of the root path, in milliseconds.
peer dispersion	Dispersion of the root path, in milliseconds.
system poll interval	Poll interval of the local system.
last clock update	Elapsed time since the router last updated its NTP information.
server mode	Status of the NTP server mode for this device.
client mode	Status of the NTP client mode for this device.
NTP master mode	Status of the master mode.
NTP master stratum	The stratum number that will be used by this device when the master is enabled and no upstream time servers are accessible.
panic mode	The status of the panic mode.

Examples

The following is sample output from the **show ntp status** command.

```
device# show ntp status

Clock is synchronized, stratum 4, reference clock is 10.20.99.174
precision is 2**-16
reference time is D281713A.80000000 (03:21:29.3653007907 GMT+00 Thu Dec 01 2011)
msec, root delay is 24.6646 msec
root dispersion is 130.3376 msec, peer dispersion is 84.3335 msec
system poll interval is 64, last clock update was 26 sec ago
NTP server mode is enabled, NTP client mode is enabled
NTP master mode is disabled, NTP master stratum is 8
NTP is not in panic mode
```

show openflow

Displays the configured OpenFlow parameters.

Syntax

show openflow

Modes

EXEC and Privileged EXEC mode

Global configuration mode

Command Output

The **show openflow** command displays the following information:

Output field	Description
Administrative Status	Enable or disable status
Controller Type	OpenFlow 1.0 or OpenFlow1.3 controller
Controller	Number of controllers

Examples

```
device#show openflow
```

```
Administrative Status:      Enabled
Controller Type:          OFV 130
Number of Controllers:    4

Controller 1:
Connection Mode:         passive, TCP
Listening Address:       0.0.0.0
Connection Port:         6633
Connection Status:      TCP_LISTENING
Role:                    Equal
Asynchronous Configuration: Packet-in (no-match|action|invalid-ttl)
                          Port-status (add|delete|modify)
                          Flow-removed (idle-timeout|hard-timeout|delete|grp-delete)

Controller 2:
Connection Mode:         active, TCP
Controller Address:      10.25.128.243
Connection Port:         2001
Connection Status:      OPENFLOW_ESABLISHED
Role:                    Master
Asynchronous Configuration: Packet-in (no-match|action|invalid-ttl)
                          Port-status (add|delete|modify)
                          Flow-removed (idle-timeout|hard-timeout|delete|grp-delete)

Controller 3:
Connection Mode:         active, TCP
Controller Address:      10.25.128.242
Connection Port:         6633
Connection Status:      OPENFLOW_ESABLISHED
Role:                    Slave
Asynchronous Configuration: Port-status (add|delete|modify)

Controller 4:
Connection Mode:         active, TCP
Controller Address:      10.25.128.250
Connection Port:         2002
Connection Status:      OPENFLOW_ESABLISHED
Role:                    Slave
Asynchronous Configuration: Port-status (add|delete|modify)

Match Capability:
Port, Destination MAC, Vlan, Vlan PCP
Openflow Enabled Ports:  e1/1 e1/2
```

History

Release version	Command history
08.0.20	This command was introduced.

show openflow controller

Displays the controller information in a flow.

Syntax

show openflow controller

Modes

EXEC and Privileged EXEC mode

Global configuration mode

Command Output

The **show openflow controller** command displays the following information:

Output field	Description
Mode	Gives the active and passive connection of the controller.
IP address	IP address of the port
Port	Port number
Status	After the connection and OpenFlow handshake, the controller gives the role of OpenFlow channel.
Role	Equal, Master and Slave role for the controller.

Examples

```
device# show openflow controller
```

```
-----  
Contlr Mode  TCP/SSL IP-address  Port    Status  Role  
-----  
1  (Equal)   passive TCP    0.0.0.0  6633   TCP_LISTENING  
2  (Master)  active  TCP    10.25.128.179  6633   OPENFLOW_ESABLISHED  
3  (Slave)   active  TCP    10.25.128.177  6633   OPENFLOW_ESABLISHED  
3  (Equal)   active  TCP    10.25.128.165  6633   OPENFLOW_ESABLISHED
```

History

Release version	Command history
08.0.20	This command was introduced.

show openflow flows

Displays the flows information on the OpenFlow ports.

Syntax

show openflow flows

Modes

User EXEC mode

Command Output

The **show openflow flows** command displays the following information:

Output field	Description
Flow	Number of flows
Packet	Total Number of data packets trapped to be sent to controller
Byte	Total Number of data bytes trapped to be sent to controller

Examples

The following example displays the output for flows.

```
device# show openflow flows

Total Number of data packets sent to controller:          0
Total Number of data bytes sent to controller  :          0
Total Number of data packets from controller   :          0
Total Number of data bytes from controller    :          0

Total Number of Flows: 1
  Total Number of Port based Flows: 1
  Total Number of L2 Generic Flows: 0
  Total Number of L3 Generic Flows: 0
  Total Number of L2+L3 Generic Flows: 0
  Total Number of L23 Generic Flows: 0

Total Number of Hardware entries for flows: 1
  Total Number of Hardware entries for Port flow: 1
  Total Number of Hardware entries for Generic flow: 0

Total Number of Openflow interfaces: 6
  Total Number of L2 interfaces: 2
  Total Number of L3 interfaces: 4
  Total Number of L23 interfaces: 0

Flow ID: 2 Priority: 32768 Status: Active
Rule:
  In Port:      e1/1/1
  Ether type:   0x800
  Destination IP: 19.0.0.19      Subnet IP: 255.255.255.255
Instructions: Apply-Actions
  Action: FORWARD
              Out Group: 11

Statistics:
  Total Pkts: 0
  Total Bytes: 0
Idle and Hard timeouts:
  Received Flow idle timeout = 0
  Received Flow hard timeout = 0
```

History

Release version	Command history
08.0.20	This command was introduced.
08.0.50	This command was modified for out group and timeouts.

show openflow groups

For a group or a range of groups, displays the maximum number of actions in a bucket, the maximum number of buckets in a group, and the maximum number of groups.

Syntax

show openflow groups [*group-id*]

show openflow groups *group-id to group-id*

Parameters

groups *group-id*

Displays details of an OpenFlow group or range of groups.

to

Indicates a range of groups.

Modes

User EXEC mode

Command Output

The **show openflow groups** command displays the following information:

Output field	Description
Group	Maximum number of groups in a flow
Bucket	Number of buckets per group
Action	Number of actions per bucket

Examples

The following example displays the output from the **show openflow groups** command.

```
device#show openflow groups

Max number of groups           : 512
Max number of buckets per group : 64
Max number of actions per bucket : 6

Max number of SELECT groups     : 512
Max number of buckets in SELECT group: 32
Starting Trunk ID for SELECT groups : 49664
Group id 11

Transaction id      410
Type                SELECT
Packet Count       0
Byte Count         0

show openflow interfaces

Displays the information about the interfaces in a OpenFlow flow.

Syntax

show openflow interfaces

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Usage Guidelines

show openflow interfaces

Command Output

The **show openflow interfaces** command displays the following information:

Output field	Description
Port	Port Number
Link	Link status
Speed	Configured speed
Tag	Tag status
Mac Address	MAC address of the port
Mode	Gives the information about the layers

Examples

```
device# openflow enable layer3 hybrid
device# show openflow interfaces
```

Total number of Openflow interfaces: 5

Port	Link	Speed	Tag	MAC	OF-portid	Name	Mode
1/1	Up	1G	Yes	000c.dbf5.bd00	1		Layer2
1/2	Up	1G	Yes	000c.dbf5.bd01	2		Layer2
1/3	Up	1G	Yes	000c.dbf5.bd01	3		Hybrid-Layer3
1/4	Up	1G	Yes	000c.dbf5.bd01	4		Hybrid-Layer3
1/5	Up	1G	Yes	000c.dbf5.bd01	5		Hybrid-Layer3

Show Commands

show openflow interfaces

This command displays information for a particular interface on a specific slot and port..

```
device# show interface ethernet 1/1/6

GigabitEthernet1/1/6 is up, line protocol is up
  Port up for 51 minutes 53 seconds
  Hardware is GigabitEthernet, address is 748e.f8e7.d901 (bia 748e.f8e7.d901)
  Configured speed auto, actual 1Gbit, configured duplex fdx, actual fdx
  Configured mdi mode AUTO, actual MDI
  Member of L2 VLAN ID 100, port is untagged, port state is FORWARDING
  BPDU guard is Disabled, ROOT protect is Disabled, Designated protect is Disabled
  Link Error Dampening is Disabled
  STP configured to ON, priority is level0, mac-learning is enabled
  OpenFlow enabled, Openflow Index 1, Flow Type Layer2
  Flow Control is config enabled, oper enabled, negotiation disabled
  Mirror disabled, Monitor disabled
  Not member of any active trunks
  Not member of any configured trunks
  No port name
  Inter-Packet Gap (IPG) is 96 bit times
  MTU 1500 bytes, encapsulation ethernet
  300 second input rate: 3904 bits/sec, 7 packets/sec, 0.00% utilization
  300 second output rate: 0 bits/sec, 0 packets/sec, 0.00% utilization
  23153 packets input, 1530094 bytes, 0 no buffer
  Received 1721 broadcasts, 21432 multicasts, 0 unicasts
  0 input errors, 0 CRC, 0 frame, 0 ignored
  0 runts, 0 giants
  0 packets output, 0 bytes, 0 underruns
  Transmitted 0 broadcasts, 0 multicasts, 0 unicasts
  0 output errors, 0 collisions
  Relay Agent Information option: Disabled

Egress queues:
Queue counters      Queued packets      Dropped Packets
  0                   0                    0
  1                   0                    0
  2                   0                    0
  3                   0                    0
  4                   0                    0
  5                   0                    0
  6                   0                    0
  7                   0                    0
```

show openflow meters

Displays all the meters in a OpenFlow flow.

Syntax

show openflow meters *meter-id*

Parameters

meters *meter-id*

Shows details of a specific OpenFlow meter.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Command Output

The **show openflow meters** command displays the following information:

Output field	Description
Meter-id	Meter number
Band	Number of bands in a meter
Band type	Band type (supported type: Drop, DSCP_REMARK)
Rate	Rate of the band
Counter	Band specific counter

Examples

The following example displays output with single meter band.

```
device(config)# show openflow meters 1
Meter id: 1

Transaction id:      1437
Meter Flags:         KBPS BURST STATS
Flow Count:         0
Number of bands:    1
In packet count:    -NA-
In byte count:      0

Band Type:          DROP

Rate:                750000
Burst size:          1500          kb
In packet band count: -NA-
In byte band count:  0
```

Show Commands

show openflow meters

The following example displays output with two meter bands.

```
device(config)# show openflow meters 2
Meter id: 2

Transaction id:      1438
Meter Flags:         KBPS BURST STATS
Flow Count:         0
Number of bands:    2
In packet count:    -NA-
In byte count:      0

Band Type:    DSCP-REMARK

Rate:          750000
Burst size:    1500          kb
Prec level:    1
In packet band count: -NA-
In byte band count:  0

Band Type:    DROP

Rate:          1000000
Burst size:    2000          kb
In packet band count: -NA-
In byte band count:  0
```

History

Release version	Command history
08.0.20	This command was introduced.

show optic

Displays the optic temperature and power information for qualified QSFP+, SFP, or SFP+ transceivers installed in a device.

Syntax

```
show optic [ threshold ] unit/slot/port
```

Parameters

threshold

Displays the thresholds for a qualified optical transceiver for the specified port.

unit/slot/port

Displays optics information for the QSFP+, SFP, or SFP+ transceiver in the specified interface.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

NTP configuration mode

Usage Guidelines

The **show optic** command takes advantage of information stored and supplied by the manufacturer of the QSFP+, SFP, or SFP+ transceiver. This information is an optional feature of the Multi-Source Agreement standard defining the optical interface. Not all component suppliers have implemented this feature set. When the QSFP+, SFP, or SFP+ transceiver does not supply the information, a "Not Available" message is displayed for the specific port on which the module is installed.

Command Output

The **show optic** command displays the following information.

Output field	Description
Temperature	The operating temperature, in degrees Celsius, of the optical transceiver, followed by the alarm status.
Tx Power	The transmit power signal, in decibels (dB), of the measured power referenced to one milliwatt (mW), followed by the alarm status.
Rx Power	The receive power signal, in decibels (dB), of the measured power referenced to one milliwatt(mW), followed by the alarm status.
Tx Bias Current	The transmit bias power signal, in milliamperes (mA), followed by the alarm status.

For Temperature, Tx Power, Rx Power, and Tx Bias Current in the **show optic** command output, values are displayed along with one of the following alarm status values: Low-Alarm, Low-Warn, Normal, High-Warn, or High-Alarm. The thresholds that determine these status values are set by the manufacturer of the optical transceivers. The following table describes each of these alarm status values.

TABLE 9 Alarm status values

Status value	Description
Low-Alarm	The monitored level has dropped below the "low-alarm" threshold set by the manufacturer of the optical transceiver.
Low-Warn	The monitored level has dropped below the "low-warn" threshold set by the manufacturer of the optical transceiver.
Normal	The monitored level is within the "normal" range set by the manufacturer of the optical transceiver.
High-Warn	The monitored level has climbed above the "high-warn" threshold set by the manufacturer of the optical transceiver.
High-Alarm	The monitored level has climbed above the "high-alarm" threshold set by the manufacturer of the optical transceiver.

Examples

The following sample output displays optics information for the specified interface if you are displaying for a port equipped with SFP or SFP+ transceivers.

```
device(config)# show optic 2/1/1
Port      Temperature    Tx Power      Rx Power      Tx Bias Current
-----+-----+-----+-----+-----+
2/1/1    32.2578 C     -002.5157 dBm -002.8091 dBm  5.966 mA
         Normal      Normal        Normal        Normal
```

This example displays optics information for a specified interface if you are displaying for a port equipped with QSFP+ transceivers, where there are 4 TX bias and 4 RX channels or lanes.

```
device(config)# show optic 1/2/6

                40GBASE_SR4
                =====
Port  Temperature  Tx Power      Rx Power      Tx Bias Current
1/2/6  37.4531 C     005.1838 dBm -002.1752 dBm  7.154 mA
      Normal      Normal        Normal        Normal

Chan  Rx Power #1    Rx Power #2    Rx Power #3    Rx Power #4
-----+-----+-----+-----+-----+
      -002.1752 dBm -003.1704 dBm -001.4466 dBm -001.6241 dBm
      Normal      Normal        Normal        Normal

Chan  Tx Bias #1    Tx Bias #2    Tx Bias #3    Tx Bias #4
-----+-----+-----+-----+-----+
      7.154 mA     6.962 mA     6.972 mA     7.014 mA
      Normal      Normal        Normal        Normal
```

The following sample output displays the thresholds for the qualified optical transceiver for the specified port

```
device(config)# show optic threshold 2/1/1
show optic thresholds 2/1/1
Port 2/1/1 sfp monitor thresholds:
Temperature High alarm      5a00      90.0000 C
Temperature Low alarm      fb00      -5.0000 C
Temperature High warning   5500      85.0000 C
Temperature Low warning    0000      0.0000 C
TX Bias High alarm         1482      10.500 mA
TX Bias Low alarm          04e2      2.500 mA
TX Bias High warning       1482      10.500 mA
TX Bias Low warning        04e2      2.500 mA
TX Power High alarm        4e20      003.0102 dBm
TX Power Low alarm         04ec      -008.9962 dBm
TX Power High warning      1edc      -001.0237 dBm
TX Power Low warning       0c62      -004.9894 dBm
RX Power High alarm        4e20      003.0102 dBm
RX Power Low alarm         013b      -015.0168 dBm
RX Power High warning      1edc      -001.0237 dBm
RX Power Low warning       013b      -015.0168 dBm
```

History

Release version	Command history
8.0.20	This command was introduced.

show optic-timer

Displays the digital optical monitoring (DOM) time interval setting.

Syntax

show optic-timer [*unit/slot/port*]

Parameters

unit/slot/port

Specifies a particular Ethernet port.

Modes

Global configuration mode

Usage Guidelines

Examples

The following example displays the DOM time interval setting.

```
device(config)# show optic-timer
Optical monitoring timer interval is 8 mins
```

History

Release version	Command history
8.0.40	This command was introduced.

show packet-inerror-detect

Displays details related to the monitoring for inError packets for configured ports.

Syntax

show packet-inerror-detect

Modes

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Usage Guidelines

Use this show command to view details related to the monitoring of inError packets for configured ports.

Command Output

The **show packet-inerror-detect** command displays the following information:

Output field	Description
Sampling interval	Displays the configured sampling interval.
Port	Identifies a port.
Packet inError count	The number of inError packets received in the sampling interval for the specific port.
State	Displays the status for the specific port.

Examples

The following example displays details related to the monitoring for inError packets for configured ports.

```
device# show packet-inerror-detect

Sampling interval 5 secs

Port      Packet inError count State
1/1/1    30                    Operational
1/1/37   10                    ERR-DISABLED
2/1/1    100                   Operational
```

History

Release version	Command history
07.3.00g	This command was introduced.

show pod

Displays Ports on Demand (PoD) licensing information.

Syntax

show pod [**unit** *unit_id*]

Parameters

unit *unit_id*

Indicates the PoD unit ID number. The *unit_id* can be from 1 through 12.

Modes

Privileged EXEC level.

Usage Guidelines

The command displays PoD license configuration for all ports in a stack unit. The command is supported on Ruckus ICX 7250 devices.

Command Output

The **show pod** command displays the following information:

Output field	Description
Unit-Id	The unit ID number of the PoD port.
PoD license capacity	The port capacity of the PoD license that is purchased.
PoD license capacity used	The number of PoD ports that are upgraded to 10 Gbps port speed.
PoD-ports	The list of PoD ports in the PoD unit.
Lic-Available	Displays whether the license is available for the port.
Lic-Used	Displays whether the license is used by the port.

Examples

The following **show pod** command example output displays PoD licensing information

```
device#show pod
Unit-Id: 1
PoD license capacity: 8
PoD license capacity used: 8

PoD-ports    Lic-Available Lic-Used
1/2/1        Yes           Yes
1/2/2        Yes           Yes
1/2/3        Yes           Yes
1/2/4        Yes           Yes
1/2/5        Yes           Yes
1/2/6        Yes           Yes
1/2/7        Yes           Yes
1/2/8        Yes           Yes
```

```
Unit-Id: 11
PoD license capacity: 8
PoD license capacity used: 8

PoD-ports    Lic-Available Lic-Used
11/2/1       Yes           Yes
11/2/2       Yes           Yes
11/2/3       Yes           Yes
11/2/4       Yes           Yes
11/2/5       Yes           Yes
11/2/6       Yes           Yes
11/2/7       Yes           Yes
11/2/8       Yes           Yes
```

History

Release version	Command history
07.3.00	This command was introduced.

show port security

Displays the port security information.

Syntax

show port security [**ethernet** *stack/slot/port* [**restricted-macs**]]

show port security mac [**ethernet** *stack/slot/port* | **unit** *stack-unit-num*]

show port security statistics [**ethernet** *stack/slot/port* | **unit** *stack-unit-num* [**brief**]]

Parameters

ethernet *stack/slot/port*

Specified Ethernet interface.

restricted-macs

Displays information about restricted MAC addresses on the specified port.

mac

Displays secure MAC addresses configured on a device.

unit *stack-unit-num*

Specifies the stack unit number.

statistics

Displays port security statistics.

brief

Displays brief information.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Port security configuration mode

Port security interface configuration mode

Usage Guidelines

The **show port security** command without any options displays the port security settings for all the ports.

Command Output

The **show port security ethernet** command displays the following information:

Output field	Description
Port	The slot and port number of the interface.
Security	Whether port security has been enabled on the interface.
Violation	The action to be undertaken when a security violation occurs, either "shutdown" or "restrict".
Shutdown-Time	The number of seconds a port is shut down following a security violation, if the port is set to "shutdown" when a violation occurs.
Age-Time	The amount of time, in minutes, MAC addresses learned on the port will remain secure.
Max-MAC	The maximum number of secure MAC addresses that can be learned on the interface.

The **show port security mac** command displays the following information:

Output field	Description
Port	The slot and port number of the interface.
Num-Addr	The number of MAC addresses secured on this interface.
Secure-Src-Addr	The secure MAC address.
Resource	Whether the address was secured using a local or global resource.
Age-Left	The number of minutes the MAC address will remain secure.
Shutdown/Time-Left	Whether the interface has been shut down due to a security violation and the number of seconds before it is enabled again.

NOTE

After every switchover or failover, the MAC "Age-Left" timer is reset to start because it is not synchronized between the master and the standby stack unit.

The **show port security statistics** command displays the following information:

Output field	Description
Port	The slot and port number of the interface.
Total-Addrs	The total number of secure MAC addresses on the interface.
Maximum-Addrs	The maximum number of secure MAC addresses on the interface.
Violation	The number of security violations on the port.
Shutdown/Time-Left	Whether the port has been shut down due to a security violation and the number of seconds before it is enabled again.

Examples

The following example displays the port security settings for port 1/1/1.

```
device# show port security ethernet 1/1/1
Port Security Violation Shutdown-Time Age-Time Max-MAC
-----
1/1/1 disabled shutdown 10 10 1
```

The following example shows the list of secure MAC addresses configured on the device.

```
device# show port security mac
Port Num-Addr Secure-Src-Addr Resource Age-Left Shutdown/Time-Left
-----
1/1/1 1 0000.018.747c Local 10 no
```

Show Commands

show port security

The following example displays port security statistics for interface 1/1/1.

```
device# show port security statistics ethernet 1/1/1
Port      Total-Addr  Maximum-Addr  Violation  Shutdown/Time-Left
-----
1/1/1     1           1              0          no
```

show power-savings-statistics

Displays the power savings statistics for the device.

Syntax

show power-savings-statistics

Modes

Global configuration mode

Usage Guidelines

Examples

The following example displays the power savings statistics for the device.

```
device(config)# show power-savings-statistics
```

```
Warning - The below is a theoretical calibrated estimation, there may be +- 5% deviation on the data.
```

```
The Power statistics of the switch for the last 5 minutes is
```

```
The total power consumption of the switch for the past 5 minutes is -----> 76064  
milli Watts
```

```
The total power savings after enabling EEE for the past 5 minutes is -----> 3598  
milli Watts
```

```
The power efficiency of the Switch after Enabling EEE for the past 5 min is -----> 4%
```

```
The Port specific statistics for the past 5 minutes is
```

Port	EEE-State	Traffic	Power_Rating	Power_Consumed	Power_Conserved	
Power_Efficiency		Port Utilization%	in mW	in mW	in mW	in%
1/1/1	Enable	0	333	7	257	77
1/1/2	Enable	0	33	76	257	77
1/1/3	Enable	0	333	76	257	77
1/1/4	Enable	0	333	76	257	77

Show Commands
show power-savings-statistics

History

Release version	Command history
08.0.30	This command was introduced.

show priority-flow-control

Displays the priority flow control (PFC) on the system.

Syntax

show priority-flow-control

Modes

Privileged EXEC mode

Examples

The following example shows the PFC status of all priority groups.

```
Device# show priority-flow-control

Global PFC Status: Enabled
PFC Enabled on PG0
PFC Disabled on PG1
PFC Disabled on PG2
PFC Disabled on PG3
```

The following example shows the PFC status disabled.

```
Device# show priority-flow-control

Global PFC Status: Disabled
```

History

Release version	Command history
8.0.10	This command was introduced.

show pvlan

Displays the PVLAN information.

Syntax

```
show pvlan [ vlan-id ]
```

Parameters

vlan-id

Displays the information for the PVLAN with the specified VLAN ID.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

VLAN configuration mode

Usage Guidelines

If the VLAN ID is not specified, the command displays the default VLAN ID information. The **show pvlan** command is not supported on software-forwarding platforms.

This command displays the PVLAN configuration with respect to the primary VLAN and its associated secondary VLANs and to display the member ports, promiscuous ports, and inter-switch link ports of a PVLAN.

Examples

The following example displays sample output of the **show pvlan** command.

```
device# show pvlan
PVLAN: primary VLAN 100
  Port 1/1/4 1/1/10 1/1/11
Community VLAN 102
  Port 1/1/1 1/1/2 1/1/10 1/1/11
  Promiscuous Port: 1/1/4
  Inter switch link Port: 1/1/10 1/1/11
  BpduGuard enabled Port: 1/1/1 1/1/2
Isolate VLAN 101
  Port 1/1/3 1/1/10 1/1/11
  Promiscuous Port: 1/1/4
  Inter switch link Port: 1/1/10 1/1/11
  BpduGuard enabled Port: 1/1/1 1/1/2
```

show qd-buffer-profile

Displays the user-configurable buffer profile configuration on the device.

Syntax

show qd-buffer-profile { *profile-name* | **all** }

Parameters

profile-name

Displays the user-configurable buffer profile for a specific buffer profile.

all

Displays all the user-configurable buffer profiles on the device.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Command Output

The **show qd-buffer-profile** command displays the following information:

Output field	Description
User Buffer Profile	The name of the user-configurable buffer profile.
Port-type	The type of the port: 1 Gbps or 10 Gbps or All.
Total Buffers	The total number of buffers allocated to the port.
Total Descriptors	The total number of descriptors allocated to the port.
Per Queue details	The names of the queues.
Buffers	The total number of buffers allocated to the queue.
Descriptors	The total number of descriptors allocated to the queue.

Show Commands

show qd-buffer-profile

Examples

The following example displays sample output of the **show qd-buffer-profile** command.

```
device(config)# show qd-buffer-profile OneGigProfile
User Buffer Profile: OneGigProfile Port-type: 1Gig
Total Buffers = 8096 Total Descriptors = 8096
Per Queue details: Buffers    Descriptors
Traffic Class 0      50         38
Traffic Class 1      50         38
Traffic Class 2      50         38
Traffic Class 3      50         38
Traffic Class 4      50         38
Traffic Class 5      50         38
Traffic Class 6     132        132
Traffic Class 7      20         20
```

show qos egress-buffer-profile

Displays information about egress buffer profiles.

Syntax

```
show qos egress-buffer-profile [ user-profile-name | all ]
```

Parameters

user-profile-name

Displays information for the specified egress buffer profile.

all

Displays information for all egress buffer profiles configured in the system and a list of all ports attached to any egress buffer profile.

Modes

Global configuration mode

Examples

The following example displays information for an egress buffer profile named egress1.

```
Device(config)# show qos egress-buffer-profile egress1
```

```
Egress Buffer Profile: egress1
Ports attached: 1/1/2
Per Queue Details:      Share Level:
Queue 0                 level4-1/9
Queue 1                 level3-1/16
Queue 2                 level3-1/16
Queue 3                 level3-1/16
Queue 4                 level3-1/16
Queue 5                 level3-1/16
Queue 6                 level3-1/16
Queue 7                 level2-1/32
```

History

show qos ingress-buffer-profile

Displays information about ingress buffer profiles.

Syntax

show qos ingress-buffer-profile [*user-profile-name* | **all**]

Parameters

user-profile-name

Displays information for the specified ingress buffer profile.

all

Displays information for all the ingress buffer profiles configured in the system and a list of their XOFF threshold levels.

Modes

Global configuration mode

Examples

The following example displays information for all the ingress buffer profiles configured in the system and their XOFF threshold levels.

```
Device(config)# show qos ingress-buffer-profile all
```

```
Ingress Buffer Profile: i1  
Ports attached: 1/1/1  
Per PG Detail:          XOFF Level:  
PG 0                    level11-1/64  
PG 1                    level13-1/16  
PG 2                    level14-1/9  
PG 3                    level15-1/5
```

```
Ingress Buffer Profile: ing1  
Ports attached: --  
Per PG Detail:          XOFF Level:  
PG 0                    level6-1/3  
PG 1                    level2-1/32  
PG 2                    level2-1/32  
PG 3                    level2-1/32
```

show qos-internal-trunk-queue

Displays the queue-share level of inter-packet-processor (inter-pp) links used to connect master and slave units in ICX 7450 devices.

Syntax

show qos-internal-trunk-queue

Modes

Global configuration mode

Examples

The following example displays the queue-share level applied on egress queues of inter-pp links in a system.

```
device(config)#show qos-internal-trunk-queue
Per Queue Details:      Share Level:
Queue 0                  level7-1/2
Queue 1                  level3-1/16
Queue 2                  level3-1/16
Queue 3                  level3-1/16
Queue 4                  level3-1/16
Queue 5                  level3-1/16
Queue 6                  level3-1/16
Queue 7                  level3-1/16
```

History

08.0.20	This command was introduced.

show qos priority-to-pg

Displays priority-to-priority-group (PG) mapping for priority flow control (PFC).

Syntax

show qos priority-to-pg

Modes

Global configuration mode

Usage Guidelines

This command displays priority-to-PG mapping for the following flow control modes:

- PFC
- Symmetrical flow control
- Asymmetrical flow control

Examples

The following example shows priority-to-PG mapping for PFC.

```
Device(config)# show qos priority-to-pg

QoS Internal Priority 0 mapped to Priority Group 0
QoS Internal Priority 1 mapped to Priority Group 0
QoS Internal Priority 2 mapped to Priority Group 1
QoS Internal Priority 3 mapped to Priority Group 1
QoS Internal Priority 4 mapped to Priority Group 1
QoS Internal Priority 5 mapped to Priority Group 2
QoS Internal Priority 6 mapped to Priority Group 2
QoS Internal Priority 7 mapped to Priority Group 4
```

The following example shows priority-to-PG mapping for 802.3x (Flow-Control). Honor is enabled.

```
Device(config)# show qos priority-to-pg

QoS Internal Priority 0 mapped to Priority Group 0
QoS Internal Priority 1 mapped to Priority Group 0
QoS Internal Priority 2 mapped to Priority Group 1
QoS Internal Priority 3 mapped to Priority Group 1
QoS Internal Priority 4 mapped to Priority Group 1
QoS Internal Priority 5 mapped to Priority Group 2
QoS Internal Priority 6 mapped to Priority Group 2
QoS Internal Priority 7 mapped to Priority Group 4
```

The following example shows priority-to-PG mapping for symmetrical flow control for 802.3x (Flow-Control) in Both mode (Generate and Honor are enabled) or Generate-only mode.

```
Device(config)# symmetrical-flow-control enable
Device(config)# show qos priority-to-pg

QoS Internal Priority 0 mapped to Priority Group 7
QoS Internal Priority 1 mapped to Priority Group 7
QoS Internal Priority 2 mapped to Priority Group 7
QoS Internal Priority 3 mapped to Priority Group 7
QoS Internal Priority 4 mapped to Priority Group 7
QoS Internal Priority 5 mapped to Priority Group 2
QoS Internal Priority 6 mapped to Priority Group 2
QoS Internal Priority 7 mapped to Priority Group 4
```

The following example enables flow control on all priorities and shows the priority-to-PG mapping.

```
Device(config)# symmetrical-flow-control enable all
Device(config)# show qos priority-to-pg

QoS Internal Priority 0 mapped to Priority Group 7
QoS Internal Priority 1 mapped to Priority Group 7
QoS Internal Priority 2 mapped to Priority Group 7
QoS Internal Priority 3 mapped to Priority Group 7
QoS Internal Priority 4 mapped to Priority Group 7
QoS Internal Priority 5 mapped to Priority Group 7
QoS Internal Priority 6 mapped to Priority Group 7
QoS Internal Priority 7 mapped to Priority Group 4
```

History

Release version	Command history
8.0.10	This command was introduced.

show qos-profiles

Displays information about QoS profiles

Syntax

```
show qos-profiles { all | name }
```

Parameters

all

Displays information for all profiles.

name

Displays information for the specified profile.

Modes

Global configuration mode

Examples

The following example displays information, including multicast queue weights, for all the queues.

```
device# show qos-profiles all
bandwidth scheduling mechanism: mixed weighted priority with strict priority
Unicast Traffic
Profile qosp7      : Priority7(Highest) Set as strict priority
Profile qosp6      : Priority6          Set as strict priority
Profile qosp5      : Priority5          bandwidth requested 25% calculated 25%
Profile qosp4      : Priority4          bandwidth requested 15% calculated 15%
Profile qosp3      : Priority3          bandwidth requested 15% calculated 15%
Profile qosp2      : Priority2          bandwidth requested 15% calculated 15%
Profile qosp1      : Priority1          bandwidth requested 15% calculated 15%
Profile qosp0      : Priority0(Lowest)  bandwidth requested 15% calculated 15%
Multicast Traffic
Profile qosp7+qosp6 : Priority7(Highest),6 Set as strict priority
Profile qosp5       : Priority5          bandwidth requested 25%
calculated 25%
Profile qosp4+qosp3+qosp2 : Priority4,3,2 bandwidth requested 45%
calculated 45%
Profile qosp1+qosp0 : Priority1,0(Lowest) bandwidth requested 30%
calculated 30%
```

History

Release version	Command history
08.0.20	This command was modified to display information for multicast queue weights on ICX 7450 and ICX 7750 devices.

show qos-tos

Displays mappings in the DSCP to the forwarding priority portion of the QoS information display.

Syntax

show qos-tos

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Examples

The following example displays mappings in the DSCP to forwarding priority portion of the QoS information display. To read this part of the display, select the first part of the DSCP value from the d1 column and select the second part of the DSCP value from the d2 row.

```
device# show qos-tos
DSCP-Priority map: (dscp = d1d2)
  d2| 0  1  2  3  4  5  6  7  8  9
d1  |
-----+-----
0  | 1
0  | 1  1  1
0  | 0  0  5
1
1  | 6  1  1  1  1  1  4
2  | 2  2
2  | 2  2  2  2  2
3  | 3  3  3  3
3  | 3  3  0
4  | 4  4  4  4  4  4
4  | 7
5  | 5  5  5  5  5  3
6
5  | 6  6  6  6  6  6  6
7  | 7  7
6  | 7  7  7  7
```

show qos scheduler-profile

Displays information about scheduler profiles.

Syntax

```
show qos scheduler-profile { all user-profile-name}
```

Parameters

all

Displays information for all the scheduler profiles configured in the system and a list of all the ports attached to any scheduler profile.

user-profile-name

Displays information for the specified scheduler profile only.

Modes

Global configuration mode

Usage Guidelines

A scheduler profile must be configured before it can be displayed.

Information can be displayed for a maximum of eight scheduler profiles.

On ICX 7750 and ICX 7450 devices this command also displays information for multicast queue weights.

Examples

The following example displays information for a scheduler profile named user1.

```
Device(config)# show qos scheduler-profile user1

User Scheduler Profile: user1   Scheduling Option: Weighted round-robin
Ports attached: 1/1/1
Per Queue details:      Bandwidth%
Traffic Class 0         1%
Traffic Class 1         1%
Traffic Class 2         10%
Traffic Class 3         10%
Traffic Class 4         10%
Traffic Class 5         10%
Traffic Class 6         20%
Traffic Class 7         38%
```

The following example displays information for all the scheduler profiles configured in the system.

```
Device(config)# show qos scheduler-profile all

User Scheduler Profile: user1   Scheduling Option: Weighted round-robin
Ports attached: 1/1/1
Per Queue details:      Bandwidth%
Traffic Class 0         1%
Traffic Class 1         1%
Traffic Class 2         10%
Traffic Class 3         10%
Traffic Class 4         10%
Traffic Class 5         10%
Traffic Class 6         20%
Traffic Class 7         38%

User Scheduler Profile: user2   Scheduling Option: Strict scheduling
Ports attached:  --

User Scheduler Profile: user3   Scheduling Option: Mixed-SP-WRR
Ports attached:  --
Per Queue details:      Bandwidth%
Traffic Class 0         15%
Traffic Class 1         15%
Traffic Class 2         15%
Traffic Class 3         15%
Traffic Class 4         15%
Traffic Class 5         25%
Traffic Class 6         sp
Traffic Class 7         sp

User Scheduler Profile: user4   Scheduling Option: Weighted round-robin
Ports attached:  --
Per Queue details:      Bandwidth%
Traffic Class 0         3%
Traffic Class 1         3%
Traffic Class 2         3%
Traffic Class 3         3%
Traffic Class 4         3%
Traffic Class 5         3%
Traffic Class 6         7%
Traffic Class 7         75%
```

The following example displays information, including multicast queue weights, for a scheduler profile named profile1 on ICX 7450 and ICX 7750 devices.

```
Device(config)# show qos scheduler-profile profile1
User Scheduler Profile: profile1   Scheduling Option: Weighted round-robin
Unicast per Queue details:      Bandwidth%
Traffic Class 0                 8%
Traffic Class 1                 8%
Traffic Class 2                 8%
Traffic Class 3                 8%
Traffic Class 4                 8%
Traffic Class 5                 8%
Traffic Class 6                 8%
Traffic Class 7                 44%
Multicast per Queue details:    Bandwidth%
Traffic Class 0,1               16%
Traffic Class 2,3,4             24%
Traffic Class 5                 8%
Traffic Class 6,7               52%
```

Show Commands
show qos scheduler-profile

8.0.10	This command was introduced.
8.0.20	This command was modified to display information for multicast queue weights on ICX 7450 and ICX 7750 devices.

show qos sflow-rate-limit

Displays the CPU rate limit for sFlow.

Syntax

show qos sflow-rate-limit

Modes

Global configuration mode

Examples

To view the CPU rate limit for sFlow use the following command.

```
device(config)# show qos sflow-rate-limit
Queue-Num      Rate-Limit      Burst-Size
Queue13        100             5000
device(config)#
```

History

Release version	Command history
8.0.40	This command was introduced.

show rate-limit broadcast

Displays the broadcast limit configured on the device.

Syntax

show rate-limit broadcast

Modes

- User EXEC mode
- Privileged EXEC mode
- Global configuration mode
- Interface configuration mode

Examples

The following example is sample output from the **show rate-limit broadcast** command. The output displays the broadcast limit or broadcast and multicast limit for each port to which it applies.

```
device# show rate-limit broadcast

Broadcast/Multicast Limit Settings:
Port      Limit      Packets/Bytes  Packet Type(s)
4         1245184    Bytes         Broadcast + Multicast Bytes
14        65536     Packets       Broadcast only
23        131072    Packets       Broadcast + Multicast
```

show rate-limit input

Displays the fixed rate limiting configuration.

Syntax

show rate-limit input

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Command Output

The **show rate-limit input** command displays the following information.

Output field	Description
Total rate-limited interface count	The total number of ports that are configured for fixed rate limiting.
Port	The configured port number.
Configured Input Rate	The maximum rate requested for inbound traffic. The rate is measured in kilobits per second (kbps).
Actual Input Rate	The actual maximum rate provided by the hardware. The rate is measured in kbps.

Examples

The following example is sample output from the **show rate-limit input** command. The command lists the ports on which fixed rate limiting is configured.

```
device# show rate-limit input
Total rate-limited interface count: 5.
  Port      Configured Input Rate  Actual Input Rate
  1/1/1     65000                  65000
  1/1/2     195000                 195000
  1/1/6     1950                   1950
  1/5/2     230432                 230000
  1/5/6     234113                 234000
```

Show Commands

show rate-limit output-shaping

show rate-limit output-shaping

Displays the configured outbound rate shaper.

Syntax

show rate-limit output-shaping

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Examples

The following example is sample output from the **show rate-limit output-shaping** command. The display lists the ports on a device, the configured outbound rate shaper on a port and for a priority for a port.

```
device# show rate-limit output-shaping
```

```
Outbound Rate Shaping Limits in Kbps:
Port      PortMax      Prio0      Prio1      Prio2      Prio3      Prio4      Prio5      Prio6      Prio7
1/1/1     -            -          -          -          -          -          -          651      -
1/1/2     1302        -          -          -          -          -          -          -          -
1/1/5     651         -          -          -          -          -          -          -          -
```

show rate-limit unknown-unicast

Displays the unknown unicast limit for each port region to which it applies.

Syntax

show rate-limit unknown-unicast

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Examples

The following example is sample output from the **show rate-limit unknown-unicast** command. The output displays the unknown unicast limit for each port region to which it applies.

```
device# show rate-limit unknown-unicast
Unknown Unicast Limit Settings:
Port Region    Combined Limit  Packets/Bytes
1 - 12         524288         Packets
13 - 24        65536          Bytes
```

show relative-utilization

Displays utilization percentages for an uplink.

Syntax

show relative-utilization *num*

Parameters

num

Specifies the utilization list number. The value can range from 1 to 4.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Usage Guidelines

After you configure an uplink utilization list, you can display the list to observe the percentage of uplink bandwidth that each downlink port used during the most recent 30-second port statistics. The number of packets sent and received between the two ports is listed, as well as the ratio of each downlink port's packets relative to the total number of packets on the uplink.

Examples

The following is sample output from the **show relative-utilization** command.

```
device# show relative-utilization 1

uplink: ethe 1/1/1
30-sec total uplink packet count = 2996
packet count ratio (%)
1 /2:100 1/ 3:---
```

show reserved-vlan-map

Displays the assigned VLAN IDs for reserved VLANs.

Syntax

show reserved-vlan-map

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Usage Guidelines

To view the assigned VLAN IDs for reserved VLANs 4091 and 4092, use the **show reserved-vlan-map** command. The reassigned VLAN IDs also display in the output of the **show running-config** and **show config** commands.

Command Output

The **show reserved-vlan-map** command displays the following information:

Output field	Description
Reserved Purpose	The reason the VLAN is reserved.
Default	The default VLAN ID of the reserved VLAN.
Re-assign	The VLAN ID to which the reserved VLAN was reassigned.
Current	The current VLAN ID for the reserved VLAN.

NOTE

If you reassign a reserved VLAN without saving the configuration and reloading the software, the reassigned VLAN ID will display in the Re-assign column. However, the previously configured or default VLAN ID will display in the Current column until the configuration is saved and the device reloaded.

Examples

The following is a sample output of the **show reserved-vlan-map** command.

```
device> show reserved-vlan-map
Reserved Purpose      Default  Re-assign  Current
CPU VLAN             4091     10         33
All Ports VLAN       4092     10         33
```

show rmon

Displays the Remote monitoring (RMON) agent status and information about RMON alarms, events, history, logs, and statistics on the interface.

Syntax

```
show rmon { alarm alarm-number | event event-number | history history-index | logs event-index | statistics [number  
| interface-type | interface-number ] }
```

Parameters

alarm

Specifies to display the RMON alarm table.

alarm-number

Specifies the alarm index identification number. Valid values range from 1 through 65535.

event

Specifies to display the RMON event table.

event-number

Specifies the event index identification number. Valid values range from 1 through 65535.

history

Specifies to display the history control data entries for port or interface.

history-number

Specifies the history index identification number of the history entry.

logs

Specifies to display the RMON logging table where RMON log entries are stored.

event-index

Specifies the event index identification number. Valid values range from 1 through 65535.

statistics

Specifies to display the RMON Ethernet statistics; and the statistics group that collects statistics on promiscuous traffic across an interface and total traffic into and out of the agent interface. Valid values range from 1 through 65535.

statistics-number

Specifies the statistics index identification number of the statistics entry.

interface-type

Specifies the ethernet interface or management port.

interface-number

Specifies the interface or management port number.

Modes

Privileged EXEC mode

Global configuration mode

Command Output

The **show rmon** command displays the following information:

Output field	Description
Rising threshold	The sampling value limit, beyond which the rising alarm is triggered.
Falling threshold	The sampling value limit, beyond which the falling alarm is triggered.
Octets	The total number of octets of data received on the network. This number includes octets in bad packets. This number does not include framing bits but does include Frame Check Sequence (FCS) octets.
Drop events	Indicates an overrun at the port. The port logic could not receive the traffic at full line rate and had to drop some packets as a result. The counter indicates the total number of events in which packets were dropped by the RMON probe due to lack of resources. This number is not necessarily the number of packets dropped, but is the number of times an overrun condition has been detected.
Packets	The total number of packets received. This number includes bad packets, broadcast packets, and multicast packets.
Broadcast pkts	The total number of good packets received that were directed to the broadcast address. This number does not include multicast packets.
Multicast pkts	The total number of good packets received that were directed to a multicast address. This number does not include packets directed to the broadcast address.
CRC align errors	The total number of packets received that were from 64 - 1518 octets long, but had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). The packet length does not include framing bits but does include FCS octets.
Undersize pkts	The total number of packets received that were less than 64 octets long and were otherwise well formed. This number does not include framing bits but does include FCS octets.
Fragments	The total number of packets received that were less than 64 octets long and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). It is normal for this counter to increment, since it counts both runts (which are normal occurrences due to collisions) and noise hits. This number does not include framing bits but does include FCS octets.
Oversize packets	<p>The total number of packets received that were longer than 1518 octets and were otherwise well formed. This number does not include framing bits but does include FCS octets.</p> <p>NOTE 48GC modules do not support count information on oversized packets and report 0.</p>
Jabbers	<p>The total number of packets received that were longer than 1518 octets and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).</p> <p>NOTE This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition where any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.</p> <p>This number does not include framing bits but does include FCS octets.</p> <p>NOTE 48GC modules do not support count information on jabbers and report 0.</p>
Collisions	The best estimate of the total number of collisions on this Ethernet segment.

Show Commands

show rmon

Output field	Description
64 octets pkts	The total number of packets received that were 64 octets long. This number includes bad packets. This number does not include framing bits but does include FCS octets.
65 to 127 octets pkts	The total number of packets received that were 65 - 127 octets long. This number includes bad packets. This number does not include framing bits but does include FCS octets.
128 to 255 octets pkts	The total number of packets received that were 128 - 255 octets long. This number includes bad packets. This number does not include framing bits but does include FCS octets.
256 to 511 octets pkts	The total number of packets received that were 256 - 511 octets long. This number includes bad packets. This number does not include framing bits but does include FCS octets.
512 to 1023 octets pkts	The total number of packets received that were 512 - 1023 octets long. This number includes bad packets. This number does not include framing bits but does include FCS octets.
1024 to 1518 octets pkts	The total number of packets received that were 1024 - 1518 octets long. This number includes bad packets. This number does not include framing bits but does include FCS octets.
Event Index	The event index identification number.
Log Index	The log index identification number.
Log Generated time	The time at which the log is generated.
Log Description	Indicates the type of alarm; whether it is a rising or falling alarm.

Examples

The following example shows the output of the **show rmon alarm** command.

```
device(config)# show rmon alarm
Alarm 1 is active, owned by monitor
Monitors etherStatsPkts.13 every 5 seconds
Taking absolute samples, last value was 675
Rising threshold is 100, assigned to event 1
Falling threshold is 0, assigned to event 1
On startup enable rising or falling alarm

Alarm 2 is active, owned by monitor
Monitors etherStatsPkts.2 every 5 seconds
Taking absolute samples, last value was 414
Rising threshold is 100, assigned to event 3
Falling threshold is 0, assigned to event 3
On startup enable rising or falling alarm
```

The following example shows the output of the **show rmon event** command.

```
device(config)# show rmon event
Event 1 is active, owned by monitor
Description is testing
Event firing causes log, community
Batch ID 0, argument <none>
Last fired at system up time 3 minutes 52 seconds

Event 2 is active, owned by monitor
Description is logging
Event firing causes log and trap, community public
Batch ID 0, argument <none>
Last fired at system up time 8 minutes 12 seconds
```

The following example shows the output of the **show rmon history** *history-index* command.

```
device(config)# show rmon history 1
History 1 is active, owned by monitor
Monitors interface mgmt1 (ifIndex 25) every 30 seconds
25 buckets were granted to store statistics
```

The following example shows the output of the **show rmon logs** command.

```
device(config)# show rmon logs
Event Index = 1
  Log Index = 1
  Log Generated time = 00:03:52 (23200)
  Log Description = rising alarm

Event Index = 2
  Log Index = 1
  Log Generated time = 00:08:12 (49200)
  Log Description = rising alarm

Event Index = 3
  Log Index = 1
  Log Generated time = 00:05:12 (31200)
  Log Description = rising alarm

Event Index = 4
  Log Index = 1
  Log Generated time = 00:01:32 (9200)
  Log Description = falling alarm

  Log Index = 2
  Log Generated time = 00:02:52 (17200)
  Log Description = rising alarm
```

The following example shows the output of the **show rmon logs** *event-index* command.

```
device(config)# show rmon logs 2
Event Index = 2
  Log Index = 1
  Log Generated time = 00:08:12 (49200)
  Log Description = rising alarm
```

The following example shows the output of the **show rmon statistics** *number* command.

```
device(config)# show rmon statistics 1
Ethernet statistics 1 is active, owned by monitor
Interface 1/1/1 (ifIndex 1) counters
  Octets          0
  Drop events     0          Packets          0
  Broadcast pkts 0          Multicast pkts  0
  CRC align errors 0          Undersize pkts  0
  Oversize pkts   0          Fragments       0
  Jabbers         0          Collisions      0

Packet size counters
  64              0          65 to 127      0
  128 to 255     0          256 to 511     0
  512 to 1023    0          1024 to 1518  0
```

Show Commands

show rmon

The following example shows the statistics of the ethernet interface 1/2/1.

```
device(config)# show rmon statistics ethernet 1/2/1
Ethernet statistics 65 is active, owned by monitor
Interface 1/2/1 (ifIndex 65) counters
  Octets          30170677670
  Drop events      0
  Broadcast pkts  0
  CRC align errors 0
  Oversize pkts   0
  Jabbers         0
  Packets          72281139
  Multicast pkts  66309417
  Undersize pkts  0
  Fragments       0
  Collisions      0

Packet size counters
  64              0
  128 to 255     19353559
  512 to 1023    17980963
  65 to 127     10703415
  256 to 511    18658554
  1024 to 1518  5584648
```

History

Release version	Command history
08.0.20	The logs keyword was introduced.

show rmon statistics

Displays a textual summary of the Remote Monitoring (RMON) statistics for all ports.

Syntax

show rmon statistics [*ifIndex* | **ethernet** *stack-id/slot/port* | **management** *number*]

Parameters

ifIndex

Specifies the ifIndex number, in decimal.

ethernet *stack-id/slot/port*

Displays the RMON statistics for a specific Ethernet interface.

management *number*

Displays the RMON statistics table for the management interface.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Usage Guidelines

Counts of multicast and broadcast packets, total packets sent, undersized and oversized packets, CRC alignment errors, jabbers, collisions, fragments, and dropped events are collected for each port on a Brocade Layer 2 switch or Layer 3 switch. The statistics group collects statistics on promiscuous traffic across an interface. The interface group collects statistics on total traffic in and out the agent interface. No configuration is required to collect statistics for the Layer 2 switch or Layer 3 switch. This activity is by default automatically activated at system startup.

Though 48GC modules receive oversized packets and jabbers, they do not support counts of oversized packets and jabbers, and the output of the **show rmon statistics** command reports 0 for both of these counters.

Command Output

The **show rmon statistics** command displays the following information.

Output field	Description
Octets	The total number of octets of data received on the network. This number includes octets in bad packets. This number does not include framing bits but does include Frame Check Sequence (FCS) octets.

Output field	Description
Drop events	The total number of times an overrun condition has been detected at the port. The port logic could not receive the traffic at full line rate and had to drop some packets as a result. The counter indicates the total number of events in which packets were dropped by the RMON probe due to lack of resources. This number is not necessarily the number of packets dropped, but it is the number of times an overrun condition has been detected.
Packets	The total number of packets received. This number includes bad packets, broadcast packets, and multicast packets.
Broadcast pkts	The total number of good packets received that were directed to the broadcast address. This number does not include multicast packets.
Multicast pkts	The total number of good packets received that were directed to a multicast address. This number does not include packets directed to the broadcast address.
CRC align errors	The total number of packets received that were from 64 to 1518 octets long, but had either a bad FCS with an integral number of octets (FCS error) or a bad FCS with a nonintegral number of octets (alignment error). The packet length does not include framing bits but does include FCS octets.
Fragments	The total number of packets received that were less than 64 octets long and had either a bad FCS with an integral number of octets (FCS error) or a bad FCS with a nonintegral number of octets (alignment error). It is normal for this counter to increment, because it counts both runts (which are normal occurrences due to collisions) and noise hits. This number does not include framing bits but does include FCS octets.
Undersize pkts	The total number of packets received that were less than 64 octets long but were otherwise well formed. This number does not include framing bits but does include FCS octets.
Oversize packets	The total number of packets received that were longer than 1518 octets but were otherwise well formed. This number does not include framing bits but does include FCS octets. NOTE 48GC modules do not support counts of oversized packets and report 0.
Jabbers	The total number of packets received that were longer than 1518 octets and had either a bad FCS with an integral number of octets (FCS error) or a bad FCS with a nonintegral number of octets (alignment error). This number does not include framing bits but does include FCS octets. NOTE This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms. NOTE 48GC modules do not support counts of jabbers and report 0.
Collisions	The best estimate of the total number of collisions on this Ethernet segment.
64 octets pkts	The total number of packets received that were 64 octets long. This number includes bad packets. This number does not include framing bits but does include FCS octets.
65 to 127 octets Pkts	The total number of packets received that were from 65 to 127 octets long. This number includes bad packets. This number does not include framing bits but does include FCS octets.
128 to 255 octets Pkts	The total number of packets received that were from 128 to 255 octets long. This number includes bad packets. This number does not include framing bits but does include FCS octets.
256 to 511 octets Pkts	The total number of packets received that were from 256 to 511 octets long. This number includes bad packets. This number does not include framing bits but does include FCS octets.

Output field	Description
512 to 1023 octets Pkts	The total number of packets received that were from 512 to 1023 octets long. This number includes bad packets. This number does not include framing bits but does include FCS octets.
1024 to 1518 octets pkts	The total number of packets received that were from 1024 to 1518 octets long. This number includes bad packets. This number does not include framing bits but does include FCS octets.

Examples

The following is sample output from the **show rmon statistics** command.

```
device# show rmon statistics

Ethernet statistics 1 is active, owned by monitor
Interface 1/1/1 (ifIndex 1) counters
  Octets          0
  Drop events     0          Packets          0
  Broadcast pkts 0          Multicast pkts 0
  CRC align errors 0        Undersize pkts 0
  Oversize pkts  0          Fragments      0
  Jabbers        0          Collisions     0

Packet size counters
  64              0          65 to 127    0
  128 to 255     0          256 to 511   0
  512 to 1023    0          1024 to 10200 0

Ethernet statistics 2 is active, owned by monitor
Interface 1/1/2 (ifIndex 2) counters
  Octets          0
  Drop events     0          Packets          0
  Broadcast pkts 0          Multicast pkts 0
  CRC align errors 0        Undersize pkts 0
  Oversize pkts  0          Fragments      0
  Jabbers        0          Collisions     0

Packet size counters
  64              0          65 to 127    0
  128 to 255     0          256 to 511   0
  512 to 1023    0          1024 to 10200 0
```

The following is sample output from the **show rmon statistics** command for ifIndex 9.

```
device# show rmon statistics 9

Ethernet statistics 9 is active, owned by monitor
Interface 1/1/6 (ifIndex 9) counters
  Octets          0
  Drop events     0          Packets          0
  Broadcast pkts 0          Multicast pkts 0
  CRC align errors 0        Undersize pkts 0
  Oversize pkts  0          Fragments      0
  Jabbers        0          Collisions     0

Packet size counters
  64              0          65 to 127    0
  128 to 255     0          256 to 511   0
  512 to 1023    0          1024 to 10200 0
```

show running ikev2

Displays current Internet Key Exchange version 2 (IKEv2) configuration information.

Syntax

show running ikev2

Modes

User EXEC mode

Usage Guidelines

This command may be entered in all configuration modes.

Use this command to display the IKEv2 configuration that is currently active on the device.

Examples

The following example displays the current IKEv2 configuration.

```
device# show running ikev2
!
ikev2 proposal ikev2_propA
!
ikev2 auth-proposal ikev2_auth_propA
pre-shared-key 2 $M1VzZCFAb1p80A==
!
ikev2 policy ikev2_policyA
proposal ikev2_propA
match address-local 10.100.100.1 255.255.255.255
!
ikev2 profile ikev2_profA
authentication ikev2_auth_propA
local-identifier address 10.1.1.1
remote-identifier address 10.4.4.4
match-identity local address 10.1.1.1
match-identity remote address 10.4.4.4
!
!
ipsec proposal ipsec_propA
!
ipsec profile ipsec_profA
proposal ipsec_propA
ike-profile ikev2_profA
!
```

History

Release version	Command history
8.0.50	This command was introduced.

show running interface

Displays information about the interface.

Syntax

show running interface [**ethernet** *stack/slot/port* [**to ethernet** *stack/slot/port*] | **loopback** *loopback-number* | **management** *por-id* | **tunnel** *tunnel-id* | **ve** *ve-number*]

Parameters

ethernet *stack/slot/port*

Specifies the configuration on a physical interface. On standalone devices specify the interface ID in the format slot/port-id; on stacked devices you must also specify the stack ID, in the format stack-id/slot/port-id.

to

Specifies information for a range of physical interfaces.

loopback *loopback-number*

Specifies information for a loopback interface.

management *port-id*

Specifies information for a management port.

tunnel *tunnel-id*

Specifies information for a tunnel interface.

ve *ve-number*

Specifies information for a virtual interface.

Modes

Privileged EXEC mode

Examples

The following example displays output from the **show running interface** command, showing that ACLs 10 and f10 are applied to interface 1/1/9 to control neighbor access.

```
Device#show running interface ethernet 1/1/9
interface ethernet 1/1/9
 ip address 15.1.1.5 255.255.255.0
 ip pim-sparse
 ip pim neighbor-filter 10
 ip ospf area 0
 ipv6 address 201::1/64
 ipv6 ospf area 0
 ipv6 pim-sparse
 ipv6 pim neighbor-filter f10
```

Show Commands
show running interface

History

Release version	Command history
8.0.20a	This command was modified to display neighbor filter information.

show running-config

Displays the current running configuration.

Syntax

```
show running-config [ interface { ethernet stack/slot/port [ [ ethernet stack/slot/port to stack/port/slot | ethernet stack/slot/port ] ... ] | loopback loopback-port-num | management mgmt-port-num | tunnel tunnel-port-num | ve ve-port-num } ]
```

```
show running-config [ vlan vlan-id ]
```

```
show running-config [ vrf ]
```

Parameters

interface

Displays the running configuration for the specified interface type.

ethernet *stack/sport/slot*

Displays the running configuration on the specified Ethernet interface.

to *stack/sport/slot*

Specifies the range of the Ethernet interface for which to display the running configuration.

loopback *loopback-port-num*

Displays the running configuration information for the specified loopback interface.

management *mgmt-port-num*

Displays the running configuration information for the specified management interface.

tunnel *tunnel-port-num*

Displays the running configuration information for the specified tunnel interface.

ve *ve-port-num*

Displays the running configuration information for the specified VE port.

vlan *vlan-id*

Specifies that web management should be enabled on the clients of the specified VLAN.

vrf

Displays the VRF-Lite running configuration.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Show Commands
show running-config

Usage Guidelines

Use this command to display the configuration that is currently active on the local switch but which is not saved persistently.

Examples

The following example displays sample output of the **show running-config** command.

```
device(config)# show running-config
Current configuration:
!

Show Commands

show running-config interface ethernet

show running-config interface ethernet

Displays the status of a specific Ethernet interface.

Syntax

show running-config interface ethernet { *stackid / slot / port* }

Parameters

stackid / slot / port

Stack ID number, slot number, and port number for an existing Ethernet interface.

Modes

Privileged EXEC mode

Examples

This example displays the running configuration for an Ethernet interface including the configured bandwidth.

```
device# show running-config interface ethernet 1/1/9
interface ethernet 1/1/9
  bandwidth 2000
  ip address 10.1.1.5 10.255.255.0
  ip pim
  ip ospf area 0
  ipv6 address 201::1/64
  ipv6 ospf area 0
  ipv6 pim-sparse
  ipv6 pim dr-priority 50
  ipv6 pim border
  ipv6 mld version 2
```

History

Release version	Command history
8.0.30	This command was modified to include configured bandwidth status.

show running-config interface tunnel

Displays the status of a specific tunnel interface.

Syntax

```
show running-config interface tunnel { tunnel-number }
```

Parameters

tunnel-number

Specifies the tunnel number.

Modes

Privileged EXEC mode

Examples

This example displays the running configuration for a tunnel interface, including the configured bandwidth.

```
device# show running-config interface tunnel 2

interface tunnel 2
 tunnel mode gre ip
 tunnel source 10.0.0.1
 tunnel destination 10.10.0.1
 ip address 10.0.0.1/24
 bandwidth 2000
```

History

Release version	Command history
8.0.30	This command was modified to include configured bandwidth status.

Show Commands
show running-config interface ve

show running-config interface ve

Displays the status of a specific Virtual Ethernet (VE) interface.

Syntax

show running-config interface ve { *vlan_id* }

Parameters

vlan_id

Specifies the configured corresponding VLAN interface.

Modes

Privileged EXEC mode

Examples

This example displays the running configuration for a VE interface, including the configured bandwidth.

```
device# show running-config interface ve 20
interface ve 20
 ip address 10.21.21.22 10.255.255.0
 ip pim-sparse
 ip ospf area 0
 bandwidth 2000
 ipv6 address 2000::2/64
 ipv6 ospf area 0
```

History

Release version	Command history
8.0.30	This command was modified to include configured bandwidth status.

show scheduler-profile

Displays the user-configurable scheduler profile configuration.

Syntax

show scheduler-profile { *user-profile-name* | **all** }

Parameters

user-profile-name

Displays the configured scheduler profile for the specified profile.

all

Displays all scheduler profiles in the runtime configuration for the system.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Examples

The following example is sample output from the **show scheduler-profile all** command.

```
device(config)# show scheduler-profile all

User Profile: profile1  Scheduling Option: Mixed-SP-WRR
Per Queue details:    Bandwidth%
Traffic Class 0      15%
Traffic Class 1      15%
Traffic Class 2      15%
Traffic Class 3      15%
Traffic Class 4      15%
Traffic Class 5      25%
Traffic Class 6      sp
Traffic Class 7      sp
User Profile: profile2  Scheduling Option: Weighted round-robin
Per Queue details:    Bandwidth%
Traffic Class 0      3%
Traffic Class 1      3%
Traffic Class 2      3%
Traffic Class 3      3%
Traffic Class 4      3%
Traffic Class 5      3%
Traffic Class 6      7%
Traffic Class 7      75%
```

show sflow

Displays the sFlow configuration and statistics.

Syntax

show sflow

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Usage Guidelines

You can display the rates that you configured for the default sampling rate, module rates, and all sFlow-enabled ports. You can view the agent IP address and several other details.

Command Output

The **show sflow** command displays the following information.

Output field	Description
sFlow version	The version of sFlow enabled on the device, which can be 2 or 5.
sFlow services	The feature state, which can be enabled or disabled.
sFlow agent IP address	The IP address that sFlow is using in the agent_address field of packets sent to the collectors.
Collector	The collector information. The following information is displayed for each collector: <ul style="list-style-type: none">• IP address• UDP port If more than one collector is configured, the line above the collectors indicates how many have been configured.
Configured UDP source	The UDP source port used to send data to the collector.
Polling interval	The polling interval of the port counter.
Configured default sampling rate	The configured global sampling rate. If you change the global sampling rate, the value you enter is shown here. The actual rate calculated by the software based on the value you enter is listed on the next line, "Actual default sampling rate."
Actual default sampling rate	The actual default sampling rate.
The maximum sFlow sample size	The maximum size of a flow sample sent to the sFlow collector.
exporting cpu-traffic	Indicates whether the sFlow agent is configured to export data destined to the CPU (for example, Telnet sessions) to the sFlow collector: <ul style="list-style-type: none">• enabled• disabled

Output field	Description
exporting cpu-traffic sample rate	The sampling rate for CPU-directed data, which is the average ratio of the number of incoming packets on an sFlow-enabled port, to the number of flow samples taken from those packets.
exporting system-info	Indicates whether the sFlow agent is configured to export information about CPU and memory usage to the sFlow collector: <ul style="list-style-type: none"> • enabled • disabled
exporting system-info polling interval	Specifies the interval, in seconds, at which sFlow data is sent to the sFlow collector.
UDP packets exported	The number of sFlow export packets the Brocade device has sent. NOTE Each UDP packet can contain multiple samples.
sFlow samples collected	The number of sampled packets that have been sent to the collectors.
sFlow ports	The ports on which you enabled sFlow.
Module Sampling Rates	The configured and actual sampling rates for each module. If a module does not have any sFlow-enabled ports, the rates are listed as 0.
Port Sampling Rates	The configured and actual sampling rates for each sFlow-enabled port. The subsampling factor indicates how many times the sampling rate of the port's module is multiplied to achieve the port's sampling rate. Because of the way in which the actual sampling rates are computed, the subsampling factors are always whole numbers.

Examples

The following is sample output from the **show sflow** command.

```
device# show sflow

sFlow version: 5
sFlow services are enabled.

sFlow agent IP address: 10.1.1.1
3 collector destinations configured:
Collector IP 10.2.2.2, UDP 6343
Collector IP 10.3.3.3, UDP 6343
Collector IP 10.4.4.4, UDP 6343
Configured UDP source port: 9999
Polling interval is 30 seconds.
Configured default sampling rate: 1 per 566 packe
Actual default sampling rate: 1 per 566 packets.
The maximum sFlow sample size: 1200.
Sample mode: All packets including dropped packet
exporting cpu-traffic is enabled.
exporting cpu-traffic sample rate: 18.
exporting system-info is enabled
exporting system-info polling interval: 30 second
22 UDP packets exported
0 sFlow flow samples collected.
sFlow ports: ethe 1/1/1 to 1/1/2
Module Sampling Rates
-----
U1:M1 configured rate=300, actual rate=300
Port Sampling Rates
-----
Port=1/1/1, configured rate=300, actual rate=300
Port=1/1/2, configured rate=400, actual rate=400
```

show snmp

Displays various SNMP statistics.

Syntax

```
show snmp [ engineid | group | server | user ]
```

Parameters

engineid

Displays local and remote SNMP engine IDs.

group

Displays SNMP groups.

server

Displays SNMP server status and trap information

user

Displays SNMPv3 users details.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Command Output

The **show snmp engineid** command displays the following information:

Output field	Description
Local SNMP Engine ID	The engine ID that identifies the source or destination of the packet.
Engine Boots	The number of times that the SNMP engine reinitialized itself with the same ID. If the engine ID is modified, the boot count is reset to 0.
Engine time	The current time with the SNMP agent.

The **show snmp group** command displays the following information:

Output field	Description
groupname	The SNMP group name configured using the snmp-server group command.
Security model	Indicates which version of SNMP is used for authentication. SNMP version 3 uses a User-Based Security model (RFC 2574) for authentication and privacy services. SNMP version 1 and version 2 use community strings to authenticate SNMP access to management modules. This method can still be used for authentication.

Output field	Description
Security level	<ul style="list-style-type: none"> • none - If the security model shows v1 or v2, then security level is blank. User names are not used to authenticate users; community strings are used instead. • noauthNoPriv - If the security model shows v3 and user authentication is by user name only. • authNoPriv - If the security model shows v3 and user authentication is by user name and the MD5 or SHA algorithm.

Examples

The following example displays output of the **show snmp engineid** command.

```
device# show snmp engineid
Local SNMP Engine ID: 800007c703748ef88315c0
Engine Boots: 24
Engine time: 1586246
```

The following example displays output of the **show snmp group** command.

```
device# show snmp group
groupname = 1n
security model = v3
security level = authNoPriv
ACL id = 1
readview = r
writeview = exit
notifyview = n

groupname = d3
security model = v3
security level = authNoPriv
ACL id = 3
readview = all
writeview = all
notifyview = all

groupname = d4
security model = v3
security level = authNoPriv
ACL id = 3
readview = <none>
writeview = <none>
notifyview = 3
```

Show Commands

show snmp

The following example displays output of the **show snmp server** command.

```
device# show snmp server
  Status: Enabled

  Contact: XYZ
  Location: CopyCenter

Max Ifindex per module: 64

Traps

      nlp-phy: Enable

Total Trap-Receiver Entries: 0
```

The following example displays output of the **show snmp user** command.

```
device# show snmp user
username = bob
ACL id = 2
group = admin
security model = v3
group ACL id = 0
authtype = md5
authkey = 3aca18d90b8d172760e2dd2e8f59b7fe
privtype = des, privkey = 1088359afb3701730173a6332d406eec
engine ID= 800007c70300e052ab0000
```

show span

Displays the Spanning Tree Protocol information for the device.

Syntax

```
show span [ number | designated-protect | fast-uplink-span | pvst-mode | root-protect ]
```

```
show span [ detail [ number | vlan vlan-id [ ethernet stackid/slot/port ] ] ]
```

```
show span [ vlan vlan-id [ ethernet stackid/slot/port | fast-uplink-span ] ]
```

Parameters

number

Displays only the entries after the specified number.

designated-protect

Displays the designated forwarding state disabled.

fast-uplink-span

Displays the status of ports with Fast Uplink Span enabled.

pvst-mode

Displays STP information for the device Per VLAN Spanning Tree (PVST+) compatibility configuration.

root-protect

Displays the STP root guard state.

detail

Displays the detailed STP information for a port.

vlan *vlan-id*

Displays the STP information for a VLAN.

ethernet *stackid/slot/port*

Displays STP information for an Ethernet port.

Modes

The command is supported on all command modes.

Command Output

The **show span** command displays the following information:

Output field	Description
VLAN ID	The port-based VLAN that contains this spanning tree (instance of STP). VLAN 1 is the default VLAN. If you have not configured port-based VLANs on this device, all STP information is for VLAN 1.
Root ID	The ID assigned by STP to the root bridge for this spanning tree.
Root Cost	The cumulative cost from this bridge to the root bridge. If this device is the root bridge, then the root cost is 0.

Show Commands

show span

Output field	Description
Root Port	The port on this device that connects to the root bridge. If this device is the root bridge, then the value is "Root" instead of a port number.
Priority Hex	This device or VLAN STP priority. The value is shown in hexadecimal format.
Max age sec	The number of seconds this device or VLAN waits for a configuration BPDU from the root bridge before deciding the root has become unavailable and performing a reconvergence.
Hello sec	The interval between each configuration BPDU sent by the root bridge.
Hold sec	The minimum number of seconds that must elapse between transmissions of consecutive Configuration BPDUs on a port.
Fwd dly sec	The number of seconds this device or VLAN waits following a topology change and consequent reconvergence.
Last Chang sec	The number of seconds since the last time a topology change occurred.
Chg cnt	The number of times the topology has changed since this device was reloaded.
Bridge Address	The STP address of this device or VLAN.
Port Num	The port number.
Priority Hex	The port STP priority, in hexadecimal format.
Path Cost	The port STP path cost.
State	The port STP state. The state can be one of the following: <ul style="list-style-type: none">• BLOCKING - STP has blocked Layer 2 traffic on this port to prevent a loop. The device or VLAN can reach the root bridge using another port, whose state is FORWARDING. When a port is in this state, the port does not transmit or receive user frames, but the port does continue to receive STP BPDUs.• DISABLED - The port is not participating in STP. This can occur when the port is disconnected or STP is disabled on the port.• FORWARDING - STP is allowing the port to send and receive frames.• LISTENING - STP is responding to a topology change and this port is listening for a BPDU from neighboring bridges in order to determine the new topology. No user frames are transmitted or received during this state.• LEARNING - The port has passed through the LISTENING state and will change to the FORWARDING state, depending on the results of STP reconvergence. The port does not transmit or receive user frames during this state. However, the device can learn the MAC addresses of frames that the port receives during this state and make corresponding entries in the MAC table.• DESIGNATED INCONSISTENT - This shows as DESI-INCONS in the output. You can disallow the designated forwarding state on a port in STP 802.1d or 802.1w with the spanning-tree designated-protect command. If STP tries to put this port into the designated forwarding role, the device would put this port into a designated inconsistent STP state. This is effectively equivalent to the listening state in STP in which a port cannot transfer any user traffic. When STP no longer marks this port as a designated port, the device automatically removes the port from the designated inconsistent state.
Fwd Trans	The number of times STP has changed the state of this port between BLOCKING and FORWARDING.
Design Cost	The cost to the root bridge as advertised by the designated bridge that is connected to this port. If the designated bridge is the root bridge itself, then the cost is 0. The identity of the designated bridge is shown in the Designated Bridge field.
Designated Root	The root bridge as recognized on this port. The value is the same as the root bridge ID listed in the Root ID field.
Designated Bridge	The designated bridge to which this port is connected. The designated bridge is the device that connects the network segment on the port to the root bridge.

The **show span detail** command displays the following information:

Output field	Description
Active Spanning Tree protocol	The VLAN that contains the listed ports and the active Spanning Tree Protocol. The STP type can be one of the following: <ul style="list-style-type: none"> MULTIPLE SPANNING TREE (MSTP) GLOBAL SINGLE SPANNING TREE (SSTP)
Bridge identifier	The STP identity of this device.
Active global timers	The global STP timers that are currently active, and their current values. The following timers can be listed: <ul style="list-style-type: none"> Hello - The interval between Hello packets. This timer applies only to the root bridge. Topology Change (TC) - The amount of time during which the topology change flag in Hello packets will be marked, indicating a topology change. This timer applies only to the root bridge. Topology Change Notification (TCN) - The interval between Topology Change Notification packets sent by a non-root bridge toward the root bridge. This timer applies only to non-root bridges.
Active Timers	The current values for the following timers, if active: <ul style="list-style-type: none"> Message age - The number of seconds this port has been waiting for a Hello message from the root bridge. Forward delay - The number of seconds that have passed since the last topology change and consequent reconvergence. Hold time - The number of seconds that have elapsed since transmission of the last Configuration BPDU.
BPDUs Sent and Received	The number of BPDUs sent and received on this port since the software was reloaded.

Examples

The following example shows the STP information.

```

device# show span
VLAN 1 BPDU cam_index is 3 and the Master DMA Are(HEX)
STP instance owned by VLAN 1

7         80     0    DISABLED    0     0       0000000000000000 0000000000000000
<lines for remaining ports excluded for brevity>

```

Show Commands

show span

The following example shows the detailed STP information.

```
device# show span detail
=====
VLAN 1 - MULTIPLE SPANNING TREE (MSTP) ACTIVE
=====
Bridge identifier - 0x800000e0804d4a00
Active global timers - Hello: 0
Port 1/1/1 is FORWARDING
Port - Path cost: 19, Priority: 128, Root: 0x800000e052a9bb00
Designated - Bridge: 0x800000e052a9bb00, Interface: 1, Path cost: 0
Active Timers - None
BPDUs - Sent: 11, Received: 0
Port 1/1/2 is DISABLED
Port 1/1/3 is DISABLED
Port 1/1/4 is DISABLED <lines for remaining ports excluded for brevity>
```

The following example shows how to display STP information for an individual port in a specific VLAN.

```
device# show span detail vlan 1 ethernet 1/1/1
Port 1/1/1 is FORWARDING
Port - Path cost: 19, Priority: 128, Root: 0x800000e052a9bb00
Designated - Bridge: 0x800000e052a9bb00, Interface: 7, Path cost: 0
Active Timers - None
BPDUs - Sent: 29, Received: 0
```

show span designated-protect

Displays a list of all ports that are not allowed to go into the designated forwarding state.

Syntax

show span designated-protect

Modes

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Usage Guidelines

Examples

The following example indicates that the designated forwarding state is disallowed for interfaces 2/1/7, 2/1/19, and 2/2/3.

```
device(config)# show span designated-protect
Designated Protection Enabled on:
Ports: (U2/M1)   7 19
Ports: (U2/M2)   3
```

History

Release version	Command history
07.3.00g	This command was introduced.

show spx

Displays information on the SPX topology.

Syntax

```
show spx [ cb-port unit/slot/port | csp [ PE-id | all | events [ PE-id | all | misc ] | pe-log ] | debug | lag | mecid | multicast | pe-id identifier | pe-group name | ring { all | chain [ unit/slot/port ] | ID } | zero-ipc ]
```

Command Default

Without parameters, the **show spx** command displays the SPX topology.

Parameters

cb-port *unit/slot/port*

The PE chain attached to this CB port, identified by port. To display information for an entire LAG, any port in the LAG can be entered.

csp

CSP information. May be modified to show all CSP information, information for a single PE, events, or detailed log information.

PE-id

Specific PE (17 - 56) for which general CSP information or CPS events are displayed.

all

Displays CSP information for all PEs. (Or displays all CSP events in the key phrase **csp events all**).

events

Displays CSP event information.

pe-log

Displays a detailed log of CSP events.

misc

Displays miscellaneous CSP event information.

debug

SPX debug information.

lag

SPX LAG information.

mecid

802.1br multicast E-CID information.

multicast

Multicast information.

pe-id *identifier*

The PE chain containing this PE.

pe-group *name*

The PE group for which the PE chain is displayed.

ring

PE ring or rings for which information is displayed.

all

Displays information for all PE rings in the Campus Fabric domain.

chain

Displays information on PE chains in the Campus Fabric domain.

unit/slot/port

Connecting port that identifies the PE chain.

ID

ID of PE ring, in decimal format, for which information is displayed.

zero-ipc

Displays statistics for packets used in the zero-touch or spx interactive-setup process.

Modes

CB configuration mode

PE mode

PE configuration mode

Usage Guidelines

The command can be issued from a CB or a PE; however, the display from a PE is limited to information about the PE itself.

If the CB fails to reload a new unit, check the `Reliable-mail` success count.

Command Output

The **show spx** command displays the following information:

Output field	Description
ID	SPX unit ID (CB or PE; PE units are numbered from 17 to 56).
"S" or "D"	Static or Dynamic. Indicates whether the configuration has been saved to memory. Dynamic configurations are lost when the unit is removed.
Type	FastIron device model (SKU).
Role	Active (active controller in the CB stack), member (CB stack member), standby (standby controller for the CB stack), spx-pe (PE unit).
Mac address	MAC address of the unit.
Pri	Priority of the unit.
State	Local (unit from which the command was entered), remote (unit is not local), or reserve (indicates a reserved, rather than an active, unit).
Comment	Ready (unit is operational). Synchronizing (output example: 21 S ICX7450-24G spx-pe cc4e.248b.a448 N/A remote Synchronizing (st=13)).

Examples

The following example displays information for a CB.

```
device(config)# show spx
T=2h57m47.1: alone: standalone, D: dynamic cfg, S: static
ID   Type           Role      Mac Address      Pri State  Comment

The following example displays information for all PE rings in a Campus Fabric domain.

```
ICX7750-48F Router# show spx ring all
```

```
-----
```

Ring Id	FSM State	CB port	Lag	Remote CB port	Lag	Log Block	Link
1	ACTIVE	1/1/2	3072	1/1/3	3073	PE29x--x	CB1/1/3
2	ACTIVE	3/1/19	3076	3/1/45	3078	CB3/1/19x--x	PE26
3	ACTIVE	2/1/12	3075	3/1/31	3077	PE27x--x	PE28
4	ACTIVE	1/1/5	3079	2/1/9	3074	PE19x--x	PE20

```
-----
```

The following example narrows the output to a specific ring (ring IDs can be derived from the **show spx ring all** command).

```
ICX7750-48F Router# show spx ring 1
```

```
-----
```

Ring Id	FSM State	CB port	Lag	Remote CB port	Lag	Log Block	Link
1	ACTIVE	1/1/2	3072	1/1/3	3073	PE29x--x	CB1/1/3

```
-----
```

The following example shows output for all PE chains in the domain.

```
ICX7750-48F Router# show spx ring chain
```

```
-----
```

CB Port	Lag	Epoch	Ring	Id	FSM State	Remote CB port	Lag	Chain
1/1/2	3072	57	YES	1	ACTIVE	1/1/3	3073	PE23--PE24--PE29x--xCB1/1/3

```
-----
```

PE chain information connecting to CB port 1/1/2 [Lag 3072]

```
-----
```

PE Id	Epoch	FSM state	Uplink port	Casc port	Log Block	Prev PE	Next PE
PE23	57	ACTIVE	23/2/2	23/2/1	NO	--	PE24
PE24	57	ACTIVE	24/2/1	24/1/1	NO	PE23	PE29
PE29	57	ACTIVE	29/1/1	29/2/3	YES	PE24	x--x

```
-----
```

PE chain information connecting to remote CB port 1/1/3 [Lag 3073]

```
-----
```

PE Id	Epoch	FSM state	Uplink port	Casc port	Log Block	Prev PE	Next PE
-------	-------	-----------	-------------	-----------	-----------	---------	---------

```
-----
```

Show Commands
show spx

The following example narrows the output to a PE chain from one CB port (does not have to be the local CB).

```
ICX7750-48F Router# show spx ring chain 1/1/2 (THIS PORT NUMBER CAN BE "CB Port" OR THE "Remote CB Port")
```

```
-----
CB Port   Lag | Epoch | Ring   Id   FSM State | Remote CB port  Lag | Chain
-----
1/1/2    3072 57     YES    1     ACTIVE   1/1/3           3073 PE23--PE24--PE29x--xCB1/1/3
-----
```

```
PE chain information connecting to CB port 1/1/2 [Lag 3072]
```

```
-----

History

Release version	Command history
08.0.40	This command was introduced.
08.0.50	PE ring and zero-IPC parameters added.

show spx connections

Displays information on SPX port connections.

Syntax

show spx connections

Modes

Privileged EXEC mode (from CB)

Usage Guidelines

Use the **show spx connections** command to determine which SPX port from one unit is connected to which SPX port on another unit.

Use the **show spx connections** command to determine whether the data flow on an SPX port is unidirectional (arrows with single head, for example, -->) or bidirectional (arrows with dual heads, for example, <--->).

For details on the connections between each device in an SPX domain, including device status and domain connection topology, use the **show spx** command.

Examples

The following example displays **show spx** output and **show spx connections** output for the same Campus Fabric domain. Connections to two ICX 7450 units serving as active PEs (IDs 17 and 23) are detailed in the **show spx connections** output.

```
ICX7750-48F Router# show spx
T=7m34.5: alone: standalone, D: dynamic cfg, S: static

History

Release version	Command history
08.0.50	This command was introduced.

show spx mecid

Displays IEEE 802.1 BR multicast E-channel identifier (E-CID) information.

Syntax

show spx mecid [**topology** | **all** | **decimal** | **reserved** | **summary**]

Parameters

topology

Displays 802.1 BR ME-CID Topology.

all

Displays all non-reserved/dynamic ME-CIDs in use.

decimal

The ME-CID number. The range is 4096 through 16383.

reserved

Displays all reserved ME-CIDs in use.

summary

ME-CID software settings and memory usage information.

Modes

User EXEC mode

Privileged EXEC mode

Command Output

The **show spx mecid topology** command displays the following information:

Output field	Description
Total Cascade Port (CP)	Displays the details of the total number of Cascade Ports.

The **show spx mecid all** command displays the following information:

Output field	Description
MECID	The ME-CID number.
PEs	The number of port extender units.
VPs	The number of virtual ports.
AW	The number of
State	The FSM state - either created TX Pending, deleted TX Pending, deleted (acknowledgment waiting) or created (stable state).
Shr	Whether the ME-CID is shared or not.
Elements	The element numbers.

Show Commands

show spx mecid

The **show spx mecid decimal** command displays the following information:

Output field	Description
MECID state	The state of the ME-CID - either created TX Pending, deleted TX Pending, deleted (acknowledgment waiting) or created (stable state).
VP state	The state of the virtual port.
MECID	Displays details of the specified ME-CID.

The **show spx mecid summary** command displays the following information:

Output field	Description
alloc	Number of nodes of data that are currently allocated in memory.
in-use	Number of allocated nodes in use.
avail	Number of allocated nodes not in use.
get fail	Number of allocation failures for this node.
limit	Maximum number of nodes that can be allocated for a data structure. This may or may not be configurable, depending on the data structure.
get-mem	Number of successful allocations for this node.
size	The size of the node in bytes.
init	Number of nodes that are allocated during the time of initialization.

Examples

The following example displays the ME-CID topology.

```
device# show spx mecid topology
Total Cascade Port (CP): 3
  1. CP-TR(e2/3/5)  :-->[e56/3/1]PE_56

  2. CP-TR(e1/1/47) :-->[TR(e17/2/1)]PE_17[TR(e17/1/21)]-->
    [TR(e18/1/1)]PE_18[e18/1/2]-->[e19/1/22]PE_19[TR(e19/2/1)]--
>[TR(e20/1/21)]PE_20

  3. CP-TR(e2/3/1)  :-->[TR(e21/3/1)]PE_21
```

The following example displays information about all the ME-CIDs.

```
device# show spx mecid all

History

Release version	Command history
8.0.40	This command was introduced.
8.0.50	The outputs of the show spx mecid all and show spx mecid reserved commands were modified.

show spx multicast cache

Displays multicast E-CID forwarding entries for the PE.

Syntax

show spx multicast cache [ecid]

Parameters

ecid

The multicast E-CID. The allowed range is 4096 through 16384.

Modes

User EXEC mode

Privileged EXEC mode

Usage Guidelines

Command Output

The **show spx multicast cache** command displays the following information:

Output field	Description
E-CID	Point-to-multipoint E-CID.
UpTime	The time elapsed since the ME-CID forwarding cache was setup on the PE unit.
LastUpdate	The time elapsed since this ME-CID forwarding cache was updated.
HWSltMsk	The bitmask used to represent the Packet Processor (PP) hardware chips on which this forward entry is programmed successfully.
L2MC	Hardware replication resource used to replicate traffic for the ME-CID forwarding cache to local ports.
SetID	Identifies the internal software resource used in sharing (optimizing).
Ports	The list of outgoing ports for the specific ME-CID forwarding cache.

Show Commands

show spx multicast cache

Examples

The following command displays multicast E-CID forwarding entries for the PE.

```
device# show spx multicast cache
1      E-CID: 5120  UpTime: 00:03:05  LastUpdate: 00:02:29
      HWSltMsk: 0x1, L2MC: 1025(Shr), SetID: 0x31255948
      Ports 5:
        17/1/1 (00:03:05)  17/1/3 (00:02:37)  17/1/5 (00:03:05)  17/1/7 (00:03:05)
        17/1/10(00:02:29)

2      E-CID: 6451  UpTime: 00:01:31  LastUpdate: 00:00:44
      HWSltMsk: 0x1, L2MC: 1025(Shr), SetID: 0x31255948
      Ports 5:
        17/1/1 (00:01:20)  17/1/3 (00:00:44)  17/1/5 (00:01:20)  17/1/7 (00:01:31)
        17/1/10(00:01:31)

3      E-CID: 9276  UpTime: 00:00:07  LastUpdate: 00:00:07
      HWSltMsk: 0x1, L2MC: 1027(Shr), SetID: 0x31739250
      Ports 2:
        17/1/2 (00:00:07)  17/1/14(00:00:07)
```

History

Release version	Command history
8.0.40	This command was introduced.

show spx multicast resource

Displays multicast memory pool details for the PE unit.

Syntax

show spx multicast resource

Modes

Privileged EXEC mode

Usage Guidelines

Command Output

The **show spx multicast resource** command displays the following information:

Output field	Description
alloc	Number of nodes of data that are currently allocated in memory.
in-use	Number of allocated nodes in use.
avail	Number of allocated nodes not in use.
get-fail	Number of allocation failures for this node.
limit	Maximum number of nodes that can be allocated for a data structure. This may or may not be configurable, depending on the data structure.
get-mem	Number of successful allocations for this node.
size	The size of the node in bytes.
init	Number of nodes that are allocated during the time of initialization.

Examples

The following command displays the multicast memory pool details for the PE unit.

```
device# show spx multicast resource
                alloc in-use  avail get-fail   limit   get-mem  size  init
fwd mcache          64     1    63      0   14848     1    68   64
tx port info       256    54   202      0   59392    54    23  256

Total memory used: 10240 bytes
```

History

Release version	Command history
8.0.40	This command was introduced.

show spx-mon

Gives a snapshot of the SPX system.

Syntax

```
show spx-mon [ history | pe-join unit/sot/port ] [ begin | exclude | include match string ]
```

Parameters

history

Generates a history of SPX activity.

pe-join *unit/sot/port*

Provides PE status for the specified port.

begin *match string*

Specifies where output starts, based on the pattern provided in the match string.

include *match string*

Specifies what information to include in output based on the contents of the match string.

exclude *match string*

Specifies what information to exclude from output based on the contents of the match string.

Modes

Privileged EXEC mode or Global configuration mode.

Usage Guidelines

Use the **show spx-mon** command to determine the health of the Campus Fabric domain (see sample output). The command tells you if the domain is in good health, and if not, what corrective actions to take.

Examples

The following example shows a Campus Fabric domain with two PE units in Ready state, and one PE has reserved configuration only. CLI guidance is given to troubleshoot a potential pe-join issue with the third PE unit.

```
ICX7750-48F Router# show spx-mon
spx-mon is enabled

Total 2 PE(s) attached, 2 attached PE(s) are in Ready state
Number of PEs in Configuration only: 1          <--- Reserved configuration for 1 PE
Number of PEs in Config-mismatch   : 0
Number of PEs in Image-Mismatch    : 0

CLI: sh spx-mon pe-join <cb-cport> can be used to diagnose pe-join issues  <----- CLI help for
additional diagnosis

Active CPU Utilization
1   sec avg 1 percent busy
5   sec avg 1 percent busy
60  sec avg 1 percent busy
300 sec avg 1 percent busy

PE CPU Utilization:      Normal
Spx Interface Utilization: Very low
Spx Interface Errors:    None
PE User Port Errors:     None
```

The following example indicates a configuration mismatch, as port 2/1/1 has no matching PE database. The CLI guidance given is to use **show spx debug lag all** to obtain more information.

```
ICX7750-48F Router# show spx-mon
spx-mon is enabled

Total 2 PE(s) attached, 2 attached PE(s) are in Ready state
Number of PEs in Configuration only: 1
Number of PEs in Config-mismatch   : 0
Number of PEs in Image-Mismatch    : 0

CLI: sh spx-mon pe-join <cb-cport> can be used to diagnose pe-join issues

Active CPU Utilization
1   sec avg 1 percent busy
5   sec avg 1 percent busy
60  sec avg 7 percent busy
300 sec avg 3 percent busy

Port 2/1/1 doesn't have matching PE db          <--- Error condition indicated for Port
2/1/1.
CLI sh spx debug lag all can be used for more information  <--- CLI help for additional diagnosis.
PE CPU Utilization:      Normal
Spx Interface Utilization: Very low
Spx Interface Errors:    None
PE User Port Errors:     None
ICX7750-48F Router#
!!! Temperature is over warning level on stack unit 23 !!!

SYSLOG: <9> Feb 20 13:28:33 System: Stack unit 23 Temperature 58.0 C degrees, warning
SYSLOG: <12> Feb 20 13:28:33 System: Temperature is over warning level on unit 23
```

The following example uses the **show spx-mon pe-join** command to provide status of a PE unit joining through CB SPX port 2/1/1.

```
ICX7750-48F Router# show spx-mon pe-join 2/1/1
Error! Last PE 23 in the chain has no DOWNSTREAM SPX ports in UP state
Above error(s) needs to be corrected...
```

Show Commands
show spx-mon

History

Release version	Command history
08.0.50	This command was introduced.

show stack

Displays information about the units in a stack and a representation of the stack topology.

Syntax

show stack *num*

Parameters

num Displays information for the specified stack unit ID.

Modes

Privileged EXEC mode

Command Output

The **show stack** command displays the following information:

Output field	Description
ID	Specifies the identification number of the stack unit. Each unit in the stack has a unique ID number.
Type	Specifies the type (model) of the stack unit.
Role	Specifies the role of the stack unit. The roles are controller, standby, or member.
Mac Address	Specifies the MAC address of the stack unit. The roles are controller, standby, or member.
Pri	Specifies the priority value assigned to the stack unit. The default value is 128.
State	Specifies whether the stack unit is local or remote. A unit with a State value of Local is the active controller. Units with a State value of Remote are either standby units or member units.
Comment	Indicates if the stack unit is ready (available).

Examples

The following example displays information about a stack with six stack trunks, including a representation of the stack topology.

```
device# show stack
```

```
T=21h22m31.3: alone: standalone, D: dynamic cfg, S: static, A=10, B=11, C=12
```

ID	Type	Role	Mac Address	Pri	State	Comment

```

show stack connection

Displays a representation of stack topology and a detailed connection report that contains information on connection errors or hardware failures.

Syntax

show stack connection

Modes

Privileged EXEC mode

show stack detail

Displays information on all units in the stack, including the role, MAC address, priority, status, and stack connections for each stack unit.

Syntax

show stack detail

Modes

Privileged EXEC mode

Command Output

The **show stack detail** command displays the following information:

Output field	Description
ID	Specifies the identification number of the stack unit. Each unit in the stack has a unique ID number.
Type	Specifies the type (model) of the stack unit.
Role	Specifies the role of the stack unit. The roles are controller, standby, or member.
Mac Address	Specifies the MAC address of the stack unit. The roles are controller, standby, or member.
Pri	Specifies the priority value assigned to the stack unit. The default value is 128.
State	Specifies whether the stack unit is local or remote. A unit with a State value of Local is the active controller. Units with a State value of Remote are either standby units or member units.
Comment	Indicates if the stack unit is ready (available).
Unit #	Specifies the number assigned to the stack unit. Each unit in the stack has a unique unit number. (This is the same as the ID of the stack unit.)
Stack Port Status	Indicates whether the stack port is connected or disconnected. A port with the up status of up is connected to the stack, and a ports with the status of down (dn) is not connected to the stack.
Neighbors	Indicates units in the stack that are connected together. Each unit in the stack is connected to at least one other stack unit.
System uptime	Indicates the amount of time that the stack unit has been running since the last reset. The System uptime is listed for each unit in the stack.

Examples

The following example displays information on a full ICX 7450 stack containing 12 units, with six different models.

```
device# show stack detail

```

show stack failover

Displays information about stack failover.

Syntax

show stack failover

Modes

Privileged EXEC mode

Usage Guidelines

Use the **show stack failover** command to view information about rapid failover for the stack. This command displays if the standby is ready to takeover or not.

Examples

The following example shows which unit is the current standby device and its status.

```
device# show stack failover  
  
Current standby is unit 2. state=ready  
Standby u2 - protocols ready, can failover
```

show stack flash

Displays information about flash memory for stack members.

Syntax

show stack flash

Modes

Privileged EXEC mode

Usage Guidelines

Use the **show stack flash** command to display information about flash memory for stack members.

Command Output

The **show stack flash** command displays the following information:

Output field	Description
ID	Specifies the identification number of the stack unit. Each unit in the stack has a unique ID number.
role	Specifies the role of the stack unit. The roles are controller, standby, or member.
priority	Specifies the priority value assigned to the stack unit. The default value is 128.
config	Indicates the port state (up or down) and identifies the port by number (stack-ID/slot/port). A port with the up status of up is connected to the stack, and a ports with the status of down (dn) is not connected to the stack.
The rest of the fields are used for debug purposes only.	

Examples

The following example display flash memory information..

```
device# show stack flash
There is no startup-config.old
Stack flash that was read in bootup:
ICX7450-24P, ID =4, role= active, pri=200, config=1, jumbo=X PPVLAN=X S2M=0 FIPS=X
stack p: [0]=4/2/1 [1]=4/2/6 default p: 4/2/1(5) 4/2/6(5), , , hash-chain=X vlan#=X
ve#=X stp#=X
active-chg=0
Current written stack flash:
ICX7450-24P, ID =4, role= active, pri=200, config=1, jumbo=X PPVLAN=X S2M=0 FIPS=X
stack p: [0]=4/2/1 [1]=4/2/6 default p: 4/2/1(5) 4/2/6(5), , , hash-chain=X vlan#=X
ve#=X stp#=X
```

show stack link-sync

Displays the status of the link synchronization.

Syntax

show stack link-sync status

Parameters

status Displays link status information.

Modes

Privileged EXEC mode

Command Output

The **show stack link-sync status** command displays the following information:

Output field	Description
STACKING_LINK_GLOBAL_CTRL messages (sent, received)	Number of global control messages sent and received.
STACKING_LINK_INDIVIDUAL_CTRL messages (sent, received)	Number of individual link control messages sent and received.
STACKING_LINK_STATUS messages (sent, received)	Number of link status control messages sent and received.
STACKING_POE_SCTRL messages (sent, received)	Number of Power over Ethernet (POE) control messages sent and received.
STACKING_POE_STATUS messages (sent, received)	Number of POE status messages sent and received.
global_ctrl_dest	Hexadecimal address of the global control destination.
individual_ctrl_dest	Hexadecimal address of the individual link control destination
status_dest	Number representing the destination status.

Examples

The following example shows link synchronization information.

```
device# show stack link-sync status
STACKING_LINK_GLOBAL_CTRL messages sent: 0, received: 0
STACKING_LINK_INDIVIDUAL_CTRL messages sent: 0, received: 0
STACKING_LINK_STATUS messages sent: 235, received: 225
STACKING_POE_SCTRL messages sent: 0, received: 0
STACKING_POE_STATUS messages sent: 0, received: 0
global_ctrl_dest: 0
individual_ctrl_dest: 0
status_dest: 2
```

show stack neighbors

Displays information about stack member neighbors.

Syntax

show stack neighbors

Modes

Privileged EXEC mode

Usage Guidelines

Stack neighbors are identified by unit ID for each stack unit.

Command Output

The **show stack neighbors** command displays the following information:

Output field	Description
U#	The identification number of the unit in the stack. Each unit in the stack has a unique identification number.
Stack-port1	Identifies the neighbor stack unit for stack-port1 of the stack unit with this unit identification number (U#). The neighbor stack unit for stack-port1 of each unit in the stack is listed.
Stack-port2	Identifies the neighbor stack unit for stack-port2 of the stack unit with this unit identification number (U#). The neighbor stack unit for stack-port2 of each unit in the stack is listed.

Examples

The following example output is for a device in a stack with three members.

```
device# show stack neighbors
U#      Stack-port1          Stack-port2
1  (1/2/1-1/2/2) to U2      (2/2/4-2/2/5) (1/2/4-1/2/6) to U3 (3/2/1-3/2/3)
2      (2/2/1) to U3 (3/2/4)      (2/2/4-2/2/5) to U1 (1/2/1-1/2/2)
3  (3/2/1-3/2/3) to U1          (1/2/4-1/2/6) (3/2/4) to U2 (2/2/1)
```

show stack rel-ipc stats

Displays statistics on reliable Interprocessor Communications (IPC) communications that occur between stack units during a session.

Syntax

```
show stack rel-ipc stats { unit num }
```

Parameters

rel-ipc

Abbreviation for reliable Interprocessor Communications, which designates the proprietary packets exchanged between stack units during a communications session.

stats

Session statistics.

unit *num*

Optional parameter used to specify the stack unit number for which session statistics are to be displayed. If you do not specify a stack unit, session statistics are displayed for all units in the stack.

Modes

Privileged EXEC mode

Usage Guidelines

To display session statistics for a particular stack unit, specify the stack unit using the **unit** *num* parameters.

To display session statistics for all units in the stack, do not specify a stack unit.

Command Output

Depending on whether you specify a stack unit, the **show stack rel-ipc stats** command displays reliable IPC statistics for all units in the stack, or for a single unit in the stack. See the example output below.

Show Commands

show stack rel-ipc stats

Examples

The following example is reliable IPC statistics for a stack.

```
device# show stack rel-ipc stats unit 3
Unit 3 statistics:

show stack stack-ports

Displays status information about stack-ports.

Syntax

show stack stack-ports

Modes

Privileged EXEC mode

Global configuration mode

Command Output

For ICX devices, an equal sign is used to indicate connections between trunk ports and the up port status is listed for all trunked ports. The **show stack stack-ports** command displays the following information:

Output field	Description
U# or ID	Stack unit identification number.
Stack-port 1	Indicates port status (up or down) and identifies the port by number (stack-ID/slot/port).
Stack-port 2	Indicates port status (up or down) and identifies the port by number (stack-ID/slot/port).
Stack-ID up (stack-ID/slot/port)	Indicates status (up or down) for the stack unit and the status (up or down) of all configured stacking ports on the unit by number (stack-ID/slot/port).

Examples

The following output displays information about stack port status. Equal signs (=) in command output show connections between trunk ports.

```
device(config)# show stack stack-ports

      active      standby
      +---+      +---+      +---+
=2/1| 1 |2/4==2/1| 3 |2/4--2/1| 2 |2/4=
| +---+      +---+      +---+ |
|-----|
U#   Stack-port1                               Stack-port2
1    up (1/2/1-1/2/2)                          up (1/2/4-1/2/6)
     up ports: 1/2/1
     up ports: 1/2/4

2    up (2/2/1)                                up (2/2/4-2/2/5)
     up ports: 2/2/4

3    up (3/2/1-3/2/3)                          up (3/2/4)
     up ports: 3/2/1
```

show startup-config (SPX)

Displays the startup configuration the PE unit would use in regular switch or router mode.

Syntax

show startup-config

Modes

PE mode

Provisional-PE mode

Usage Guidelines

This command is available only on an ICX 7450 unit configured as an 802.1br Provisional-PE or PE unit with the **spx pe-enable** command. The **show startup-config** command shows the startup configuration that would be used by this unit if it were operating in regular mode as a switch or router.

In PE or Provisional-PE mode, the **show configuration** command shows the configuration in the PE startup file for this unit. In regular switch or router mode, use the **show running-config** command to show the currently running switch or router configuration.

Show Commands

show startup-config (SPX)

Examples

The following example displays the configuration this active PE would have if it returned to regular mode.

```
[PE]local-id@device# show startup-config
*** display startup configuration used in switch/router (not PE) ***
!
Startup-config data location is flash memory
!
Startup configuration:
!

```

History

Release version	Command history
8.0.40	This command was introduced.

show statistics

Displays packet statistics.

Syntax

```
show statistics [ brief ] [ management num | unit unit-number ]
```

```
show statistics [ brief ] [ ethernet stack-id/slot/port [ to stack-id/slot/port | [ ethernet stack-id/slot/port to stack-id/slot/  
port | ethernet stack-id/slot/port ]... ] ]
```

Parameters

brief

Displays brief output.

management *num*

Displays packet statistics on the specified management interface.

unit *unit-number*

Displays packet statistics on all ports in a specific stack unit.

ethernet *stack-id/slot/port*

Displays packet statistics on a specific Ethernet interface.

to *stack-id/slot/port*

Displays packet statistics on a range of Ethernet interfaces.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Usage Guidelines

When you use the **brief** option, the output will have fewer fields.

You can view the packet statistics for a specific Ethernet interface, a list of Ethernet interfaces, and a range of Ethernet interfaces.

Command Output

The **show statistics ethernet** and **show statistics management** command display the following information.

NOTE

The output of the **show statistics** command without any options, and the output of the **show statistics** command when using the **brief** option along with **ethernet**, **management**, or **unit** options display only the Port, In Packets, Out Packets, In Errors, and Out Errors fields.

Output field	Description
Port	The port number.
Link	The link state.
State	The Spanning Tree Protocol (STP) state.
Dupl	The mode (full-duplex or half-duplex).
Speed	The port speed (10 Mbps, 100 Mbps, or 1000 Mbps).
Trunk	The trunk group number, if the port is a member of a trunk group.
Tag	Whether the port is a tagged member of a VLAN.
Pri	The QoS forwarding priority of the port (level0 to level7).
MAC	The MAC address of the port.
Name	The name of the port, if you assigned a name.
InOctets	The total number of good octets and bad octets received.
OutOctets	The total number of good octets and bad octets sent.
InPkts	The total number of packets received. The count includes rejected and local packets that are not sent to the switching core for transmission. NOTE In the output of the show statistics command without any options and when using the brief option along with the ethernet , management , or unit options, this field is shows as "In Packets."
OutPkts	The total number of good packets sent. The count includes unicast, multicast, and broadcast packets. NOTE In the output of the show statistics command without any options and when using the brief option along with the ethernet , management , or unit options, this field is shows as "Out Packets."
InBroadcastPkts	The total number of good broadcast packets received.
OutBroadcastPkts	The total number of good broadcast packets sent.
InMulticastPkts	The total number of good multicast packets received.
OutMulticastPkts	The total number of good multicast packets sent.
InUnicastPkts	The total number of good unicast packets received.
OutUnicastPkts	The total number of good unicast packets sent.
InBadPkts	The total number of packets received for which one of the following is true: <ul style="list-style-type: none"> The CRC was invalid. The packet was oversized. Jabbers: The packets were longer than 1518 octets and had a bad FCS. Fragments: The packets were less than 64 octets long and had a bad FCS. The packet was undersized (short).
InFragments	The total number of packets received for which both of the following were true: <ul style="list-style-type: none"> The length was less than 64 bytes. The CRC was invalid.

Output field	Description
InDiscards	The total number of packets that were received and then dropped due to a lack of receive buffers.
CRC	The total number of packets received for which all of the following was true: <ul style="list-style-type: none"> The data length was between 64 bytes and the maximum allowable frame size. No collision or late collision was detected. The CRC was invalid.
Collisions	The total number of packets received in which a collision event was detected.
LateCollisions	The total number of packets received in which a collision event was detected, but for which a receive error (Rx error) event was not detected.
InErrors	The total number of packets received that had alignment errors or physical errors. Excessive errors for some counters usually indicate a problem. When you operate at a half-duplex setting, some data link errors incrementing in Frame Check Sequence (FCS), alignment, runts, and collision counters are normal. Generally, a one percent ratio of errors to total traffic is acceptable for half-duplex connections. If the ratio of errors to input packets is greater than two or three percent, performance degradation can be noticed. In half-duplex environments, it is possible for both the switch and the connected device to sense the wire and transmit at exactly the same time, resulting in a collision. Collisions may cause runts, FCS, and alignment errors due to the frame not being completely copied to the wire, resulting in fragmented frames. When you operate at full-duplex, errors in FCS, Cyclic Redundancy Checks (CRC), alignment, and runt counters must be minimal. <p>NOTE In the output of the show statistics command without any options and when using the brief option along with the ethernet, management, or unit options, this field is shown as "In Errors".</p>
OutErrors	The total number of packets sent that had alignment errors or physical errors. <p>NOTE In the output of the show statistics command without any options and when using the brief option along with the ethernet, management, or unit options, this field is shown as "Out Errors".</p>
InGiantPkts	The total number of packets for which all of the following was true: <ul style="list-style-type: none"> The data length was longer than the maximum allowable frame size. No Rx error was detected. <p>NOTE Packets are counted for this statistic regardless of whether the CRC is valid or invalid.</p>
InShortPkts	The total number of packets received for which all of the following was true: <ul style="list-style-type: none"> The data length was less than 64 bytes. No Rx error was detected. No collision or late collision was detected. <p>NOTE Packets are counted for this statistic regardless of whether the CRC is valid or invalid.</p>
InJabber	The total number of packets received for which all of the following was true: <ul style="list-style-type: none"> The data length was longer than the maximum allowable frame size. No Rx error was detected. The CRC was invalid.
InFlowCtrlPkts	The total number of flow control packets received.

Show Commands

show statistics

Output field	Description
OutFlowCtrlPkts	The total number of flow control packets transmitted.
InBitsPerSec	The number of bits received per second.
OutBitsPerSec	The number of bits sent per second.
InPktsPerSec	The number of packets received per second.
OutPktsPerSec	The number of packets sent per second.
InUtilization	The percentage of the port bandwidth used by received traffic.
OutUtilization	The percentage of the port bandwidth used by sent traffic.

Examples

The following is sample output from the **show statistics brief management** command.

```
device(config)# show statistics brief management 1

Port      In Packets      Out Packets  Trunk      In Errors      Out Errors
mgmt1     39946           2            2           0              0
Total     39945           2            2           0              0
```

The following is sample output from the **show statistics management** command.

```
device# show statistics management 1

  InUtilization        0.00%      OutUtilization     0.00%
```

show statistics dos-attack

Displays information about ICMP and TCP SYN packets dropped because burst thresholds were exceeded.

Syntax

show statistics dos-attack

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Examples

The following example displays output of the **show statistics dos-attack** command.

```
device# show statistics dos-attack
----- Local Attack Statistics -----
ICMP Drop Count      ICMP Block Count      SYN Drop Count      SYN Block Count
-----
0
0
0
0
----- Transit Attack Statistics -----
Port/VE      ICMP Drop Count      ICMP Block Count      SYN Drop Count      SYN Block Count
-----
1/3/11              0              0              0              0
```

show statistics stack-ports

Displays information about all stacking ports in a stack topology.

Syntax

show statistics stack-ports

Modes

Privileged EXEC mode

Command Output

The **show statistics stack-ports** command displays the following information:

Output field	Description
Port	The number of the port (stack-unit number, slot number, and port number).
In Packets	The number of packets received on this port (incoming packets).
Out Packets	The number of packets sent from this port (outgoing packets).
In Errors	The number of errors received on this port (incoming errors).
Out Errors	The number of errors sent from this port (outgoing errors).

Examples

The following example output is statistics for all stack ports in a stack with seven member units.

```
device# show statistics stack-ports

Port      In Packets  Out Packets  In Errors  Out Errors
1/2/1     22223      4528        0          0
1/2/2     35506      3844        0          0
2/2/1     3161       34173       0          0
2/2/2     24721      3676        0          0
3/2/1     3048       23881       0          0
3/2/2     13540      2857        0          0
4/2/1     2862       13537       0          0
4/2/2     3626       3184        0          0
5/2/1     3183       3621        0          0
5/2/2     3265       13508       0          0
6/2/1     14020      3655        0          0
6/3/1     3652       17705       0          0
7/2/1     17705      3658        0          0
7/3/1     4047       21802       0          0
TOTAL     154559    153629      0          0
```

show statistics traffic-policy

Displays the rate limiting traffic counters and the total packet count and byte count of the traffic filtered by ACL statements.

Syntax

show statistics traffic-policy *TPD-name*

Parameters

TPD-name

Specifies the name of the traffic policy definition for which you want to display ACL and traffic policy counters.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Command Output

The **show statistics traffic-policy** command displays the following information.

Output field	Description
Traffic Policy	The name of the traffic policy.
General Counters	
Port Region#	The port region to which the active traffic policy applies.
Byte Count	The number of bytes that were filtered (matched ACL clauses).
Packet Count	The number of packets that were filtered (matched ACL clauses).
Rate Limiting Counters (in bytes)	
Port Region#	The port region to which the active traffic policy applies.
Green Conformance	The number of bytes that did not exceed the committed information rate (CIR) packet rate.
Yellow Conformance	The number of bytes that exceeded the CIR packet rate.
Red Conformance	The number of bytes that exceeded the peak information rate (PIR) packet rate.

Examples

The following example shows sample output from the **show statistics traffic-policy** command. The output displays ACL and traffic policy counters.

```
device# show statistics traffic-policy tf125c
```

```
Traffic Policy tf125c:
```

```
General Counters:
```

Port Region#	Byte Count	Packet Count
0	235400192	1839051
All port regions	235400192	1839051

```
Rate Limiting Counters (in bytes):
```

Port Region#	Green/Yellow Conformance	Red Conformance
0	225023872	10376320
All port regs	225023872	10376320

show statistics tunnel

Displays statistical information for GRE and IPsec tunnels.

Syntax

```
show statistics tunnel [ tunnel-id ]
```

Parameters

tunnel-id

Specifies the tunnel ID. The default range is from 1 through 44. When the maximum number of GRE tunnels is set to 64 by using the **system-max gre-tunnels** command, the range is from 1 through 92.

Modes

User EXEC mode

Usage Guidelines

This command may be entered in all configuration modes.

Command Output

The **show statistics tunnel** command displays the following information:

Output field	Description
Tunnel Status	Indicates whether the tunnel and line protocol are up or down. Possible values are: <ul style="list-style-type: none">up/up—The tunnel and line protocol are up.up/down—The tunnel is up and the line protocol is down.down/up—The tunnel is down and the line protocol is up.down/down—The tunnel and line protocol are down.
Packet Received	Displays the number of packets received on the tunnel since it was last cleared by the administrator.
Packet Sent	Displays the number of packets sent on the tunnel since it was last cleared by the administrator.
KA recv	Displays the number of keepalive packets received on the tunnel since it was last cleared by the administrator.
KA sent	Displays the number of keepalive packets sent on the tunnel since it was last cleared by the administrator.
GRE tunnel	
InOctets	Displays the number of incoming octets received on the tunnel since it was last cleared by the administrator.
OutOctets	Displays the number of outgoing octets sent on the tunnel since it was last cleared by the administrator.
InPkts	Displays the number of incoming packets received on the tunnel since it was last cleared by the administrator.

Output field		Description
	OutPkts	Displays the number of outgoing packets sent on the tunnel since it was last cleared by the administrator.
IPsec tunnel		
	Bytes Received	Displays the number of bytes received on the tunnel since it was last cleared by the administrator.
	Bytes Sent	Displays the number of bytes sent on the tunnel since it was last cleared by the administrator.

Examples

The following example shows how to display statistical information for tunnel 1.

```
device> show statistics tunnel 1

IP GRE Tunnels
  Tunnel Status  Packet Received  Packet Sent  KA recv  KA sent
  1  up/up        0                0            0         0

IP GRE Tunnel 1 HW Counters:
  InOctets      90                OutOctets    90
  InPkts        1                 OutPkts      1
```

The following example shows how to display statistical information for all tunnels.

```
device> show statistics tunnel

IP GRE Tunnels
  Tunnel Status  Packet Received  Packet Sent  KA recv  KA sent

IPSEC Tunnels
  Tunnel Status  Packet Received  Packet Sent  Bytes Received  Bytes Sent
  9  down/down     0                0            0              0
  10 up/up       50               16442474     7300           9372173444
```

History

Release version	Command history
8.0.40	This command was modified to display GRE-tunnel hardware counters on the Ruckus ICX 7000 series.
8.0.50	This command was modified to display IPsec tunnel information on the Ruckus ICX 7450.

show stp-bpdu-guard

Displays the BPDU guard state.

Syntax

show stp-bpdu-guard

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

VLAN configuration mode

Examples

The following example displays the BPDU guard state.

```
device# show stp-bpdu-guard
BPDU Guard Enabled on:
Interface      Violation
Port 1/1/1    No
Port 1/1/2    No
Port 1/1/3    No
Port 1/1/4    No
Port 1/1/5    No
Port 1/1/6    No
Port 1/1/7    No
Port 1/1/8    No
Port 1/1/9    No
Port 1/1/10   No
Port 1/1/11   No
Port 1/1/12   Yes
Port 1/1/13   No
```

show stp-group

Displays STP topology groups.

Syntax

show stp-group [*group-id*]

Parameters

group-id

Specifies the topology group ID.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

VLAN configuration mode

Examples

The following example displays sample output of the **show stp-group** command.

```
device# show stp-group
Spanning tree Group 1
=====
master-vlan 2
member-vlan none

Common control ports          L2 protocol
no control ports configured
Per vlan free ports
ethernet 1/1/2                Vlan 2
ethernet 1/1/3                Vlan 2
ethernet 1/1/4                Vlan 2
```

show stp-protect-ports

Displays the STP protection configuration.

Syntax

```
show stp-protect-ports [ ethernet stackid/slot/port ]
```

Parameters

ethernet *stackid/slot/port*

Displays the STP protection configuration for a specific Ethernet interface.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

VLAN configuration mode

Examples

The following example displays the STP protection configuration.

```
device# show stp-protect-ports
Port          BPDU Drop Count
1/1/3         478
1/1/5         213
1/1/6         0
1/1/12        31
```

The following example shows the STP protection configuration for a particular Ethernet interface.

```
device# show stp-protect-ports ethernet 1/1/3
STP-protect is enabled on port 1/1/3. BPDU drop count is 478
```

show symmetric-flow-control

Displays the status of symmetric flow control as well as the default or configured total buffer limits and XON and XOFF thresholds.

Syntax

show symmetric-flow-control

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Examples

The following is sample output from the **show symmetric-flow-control** command.

```
device# show symmetric-flow-control
Symmetric Flow Control Information:
-----
SFC: Symmetric Flow Control
Defaults: 1G : Buffers: 272, XOFF Limit: 91, XON Limit: 75
          10G: Buffers: 416, XOFF Limit: 91, XON Limit: 75
```

Unit	SFC Enabled	Total Buffers				XOFF Limit		XON Limit
		1G	10G	1G	10G	1G	10G

show tech-support

Displays technical support information.

Syntax

```
show tech-support [ acl | cluster | cpu | l2 | l3 { ipv4-uc | ipv6-uc } | license | memory | multicast | multicast6 |  
openflow | packet-loss | poe | stack ]
```

Parameters

- acl
Displays ACL configuration log related details.
- cluster
Displays cluster related details.
- cpu
Displays CPU related details.
- l2
Displays Layer 2 related details.
- l3
Displays Layer 3 related details.
- ipv4-uc
Displays Layer 3 IPv4 elated details.
- ipv6-uc
Displays Layer 3 IPv6 elated details.
- license
Displays license elated details.
- memory
Displays memory related details.
- multicast
Displays multicast IPv4 related details.
- multicast6
Displays multicast IPv6 related details.
- openflow
Displays Openflow related details.
- packet-loss
Displays packet loss related details.
- poe
Displays a combination of output from multiple Power over Ethernet (PoE) technical support related commands including **show chassis**, **show inline power details**, **show inline power debug-info**, and **show inline power emesg**.

stack

Displays stack related details.

Modes

Privileged exec mode

Usage Guidelines

The **show tech support** commands can produce extensive output.

Examples

To display technical support information for ACLs, use the following command.

```
device# show tech-support acl
=====
BEGIN : show access-list all

History

Release version	Command history
8.0.50	This command was introduced.

show telnet

Displays Telnet connection and configuration details.

Syntax

show telnet [config]

Parameters

config

Displays Telnet configuration information.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Command Output

The **show telnet config** command displays the following information:

Output field	Description
Telnet Server	Telnet server status - enabled or disabled.
Idle timeout	The configured idle timeout of the Telnet server.
Login timeout	The configured login timeout of the Telnet server.
Login retries	The configured number of retries allowed to connect to the Telnet server.
Strict management VRF	Strict management VRF is enabled or disabled for the Telnet server.
Authentication	The authentication is enabled or disabled for the Telnet server.
suppress-reject-message	Whether the connection rejection message is suppressed or not; if a Brocade device denies Telnet management access to the device, the software sends a message to the denied Telnet client.

Examples

The following example displays output of the **show telnet** command showing the Telnet connections and their status.

```
device(config)# show telnet
Console connections (by unit number):
1      established
      you are connecting to this session
      1 minutes 5 seconds in idle
2      established
      1 hours 4 minutes 18 seconds in idle
3      established
      1 hours 4 minutes 15 seconds in idle
4      established
      1 hours 4 minutes 9 seconds in idle
Telnet connections (inbound):
1      closed
2      closed
3      closed
4      closed
5      closed
Telnet connection (outbound):
6      closed
SSH connections:
1      closed
2      closed
3      closed
4      closed
5      closed
```

The following example displays output of the **show telnet config** command showing Telnet configuration details.

```
device(config)# show telnet config
Telnet server                : Enabled
Idle timeout (minutes)      : 0
Login timeout (minutes)     : 2
Login retries                : 4
Strict management VRF       : Disabled
Authentication               : Disabled
suppress-reject-message     : Disabled
Telnet IPv4 clients         : All
Telnet IPv6 clients         : All
Telnet IPv4 access-group    :
Telnet IPv6 access-group    :
```

show topology-group

Displays topology group information.

Syntax

```
show topology-group [ group-id ]
```

Parameters

group-id

Displays the information of the topology group of the specified ID.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

VLAN configuration mode

Usage Guidelines

Command Output

The **show topology-group** command displays the following information:

Output field	Description
master-vlan	The master VLAN for the topology group. The settings for STP, MRP, or VSRP on the control ports in the master VLAN apply to all control ports in the member VLANs within the topology group.
member-vlan	The member VLANs in the topology group.
Common control ports	The master VLAN ports that are configured with Layer 2 protocol information. The Layer 2 protocol configuration and state of these ports in the master VLAN applies to the same port numbers in all the member VLANs.
L2 protocol	The Layer 2 protocol configured on the control ports. The Layer 2 protocol can be one of the following: <ul style="list-style-type: none">• MRP• STP• VSRP
Per vlan free ports	The ports that are not controlled by the Layer 2 protocol information in the master VLAN.

Examples

The following example displays the topology group information.

```
device# show topology-group
Topology Group 3
=====
master-vlan 2
member-vlan none
Common control ports      L2 protocol
ethernet 1/1/1            MRP
ethernet 1/1/2            MRP
ethernet 1/1/5            VSRP
ethernet 1/2/22           VSRP
Per vlan free ports
ethernet 1/2/3            Vlan 2
ethernet 1/1/4            Vlan 2
ethernet 1/2/11           Vlan 2
ethernet 1/2/12           Vlan 2
```

show traffic-policy

Displays traffic policies that are currently defined on the device.

Syntax

show traffic-policy [*TPD-name*]

Parameters

TPD-name

Specifies the name of the traffic policy.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Command Output

The **show traffic-policy** command displays the following information.

Output field	Description
Traffic Policy	The name of the traffic policy.
Metering	Shows whether rate limiting is configured as part of the traffic policy: <ul style="list-style-type: none">• Enabled: The traffic policy includes a rate-limiting configuration.• Disabled: The traffic policy does not include a rate-limiting configuration.
Mode	If rate limiting is enabled, this field shows the type of metering enabled on the port: <ul style="list-style-type: none">• Fixed Rate-Limiting• Adaptive Rate-Limiting
cir	The committed information rate, in kilobits per second, for the adaptive rate-limiting policy.
cbs	The committed burst size, in bytes, for the adaptive rate-limiting policy.
pir	The peak information rate, in kilobits per second, for the adaptive rate-limiting policy.
pbs	The peak burst size, in bytes, for the adaptive rate-limiting policy.
Counting	Shows whether ACL counting is configured as part of the traffic policy: <ul style="list-style-type: none">• Enabled: The traffic policy includes an ACL counting configuration.• Not Enabled: The traffic policy does not include an ACL counting configuration.
Number of References/Bindings	The number of port regions to which this traffic policy applies. For example, if the traffic policy is applied to a trunk group that includes ports ethernet 9/9, 9/10, 9/11, and 9/12, the value in this field would be 2, because these four trunk ports are in two different port regions.

Examples

The following example is sample output from the **show traffic-policy** command. The output displays traffic policies that are currently defined on the device.

```
device# show traffic-policy t_voip

Traffic Policy - t_voip:
Metering Enabled, Parameters:
Mode: Adaptive Rate-Limiting
cir: 100 Pkts/s, cbs: 2000 Pkts, pir: 200 Pkts/s, pbs: 4000 Pkts
Counting Not Enabled
```

show transmit-counter

Displays traffic counter (also called transmit counters) profiles and traffic counter statistics.

Syntax

```
show transmit-counter { profiles | values number }
```

Parameters

profiles

Displays details of the traffic traffic counter profiles.

values *number*

Displays details of traffic queue counters. The number specifies a valid enhanced traffic counter in the range from 1 through 48.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Usage Guidelines

NOTE

Once the enhanced traffic counters are displayed, the counters are cleared (reset to zero).

Command Output

The **show transmit-counter values** command displays the following information:

Output field	Description
Transmitted Frames	The number of frames transmitted.
Known Unicast	The number of known unicast packets transmitted.
Multicast & Unknown Unicast	The number of multicast and unknown unicast packets transmitted.
Broadcast	The number of broadcast packets transmitted.
Dropped Frames	The number of dropped frames.

Output field	Description
Bridge Egress Filtered	<p>The number of bridged outbound packets that were filtered and dropped. This number includes the number of packets that were dropped because of any of the following conditions:</p> <ul style="list-style-type: none"> • The port was disabled or the link was down. • The port or port region does not belong to the VLAN specified in the transmit counter configuration. • A Layer 2 protocol (for example, spanning tree) had the port in a blocked state. • The source port was suppressed for multi-target packets. • The priority queue specified in the traffic counter was not allowed for some other reason. • Unknown unicast and unregistered multicast packets were filtered.
Congestion Drops	The number of outbound packets that were dropped because of traffic congestion.

Examples

The following is a sample output of the **show transmit-counter profiles** command.

```
device# show transmit-counter profiles

Tx Counter      Port(s)          Vlan Id      Priority      Device      Set
1               1/1/1-1/1/12    All          All          Dev 0       Set0
4               1/ 1/18         1           7           Dev 1       Dev 1       Set0
10             1/1/13-1/1/24  100         All          Dev 1       Set10
```

The following is sample output from the **show transmit-counter values** command.

```
device# show transmit-counter values 1

Transmit Queue Counter Values for Counter 1:
Transmitted Frames:
  Known Unicast      : 17204
  Multicast & Unknown Unicast : 2797
  Broadcast          : 5
Dropped Frames:
  Bridge Egress Filtered : 100
  Congestion Drops      : 0
```

show users

Displays the user account information.

Syntax

show users

Modes

- User EXEC mode
- Privileged EXEC mode
- Global configuration mode

Command Output

The **show users** command displays the following information:

Output field	Description
Username	The username of each user.
Password	The password for each user.
Encrypt	Whether the password encryption is enabled or not.
Priv	The privilege level for the user: 0 - Super User level (full read-write access), 4 - Port Configuration level, 5 - Read Only level
Status	Whether the user status is enabled or not.
Expire Time	The password expiration time in days.

Examples

The following example displays output of the **show users** command.

```
device(config)# show users
Username Password Encrypt Priv Status Expire Time
=====
wonka $1$JVbXZqTW$g9N1/WUipXg6jM6OUKHQZ. enabled 0 enabled Never
xyz $1$13zNygo2$vXOKCwghNvXT/YegDawpU0 enabled 0 enabled Never
aopo $1$d04FqfAw$W6WiSw6gGJv//ClpvJFpQ. enabled 0 enabled Never
```

show version

Displays information about the software version running on the standalone unit or a stacking system.

Syntax

show version [**unit** *unit-num*]

Parameters

unit *unit-num*

Specifies the software version running on a particular unit.

Modes

Stacking configuration mode

User EXEC mode

Usage Guidelines

Depending on device support, the serial numbers of the pluggable or fixed modules are displayed in the output. The role of the stack unit and its bootup ID are displayed in the last line of command output. No role is displayed for standalone units.

Examples

The following is an example of the output displayed from the **show version** command when run on an ICX 7750.

```
device# show version

History

Release version	Command history
08.0.40	The keyword unit and the variable <i>unit-num</i> were introduced.

show vlan

Displays the VLAN information.

Syntax

```
show vlan [ vlan-id [ num ] ] [ brief ] [ ethernet stackid/slot/port ]
```

Parameters

vlan-id

Specifies the VLAN ID.

num

Specifies the number of Layer 3 VLAN entries to skip before the display begins.

brief

Displays the VLAN information summary.

ethernet *stackid/slot/port*

Specifies the Ethernet port for which you want to view VLAN details.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

VLAN configuration mode

Command Output

The **show vlan brief** command displays the following information:

Output field	Description
System-max vlan Params	The system maximum VLAN values (maximum, default, and current).
Default vlan Id	The default VLAN ID number.
Total Number of Vlan Configured	The total number of VLANs configured on the device.
VLANs Configured	The VLAN ID numbers of the VLANs configured on the device.

Examples

The following example shows the output of the **show vlan** command..

```
device# show vlan
Total PORT-VLAN entries: 4
Maximum PORT-VLAN entries: 4060
Legend: [Stk=Stack-Unit, S=Slot]
PORT-VLAN 1, Name DEFAULT-VLAN, Priority level0, Spanning tree On
Untagged Ports: (Stk0/S1) 3 4 5 6 7 8 9 10 11 12 13 14
Untagged Ports: (Stk0/S1) 15 16 17 18 19 20 21 22 23 24 25 26
Untagged Ports: (Stk0/S1) 27 28 29 30 31 32 33 34 35 36 37 38
Untagged Ports: (Stk0/S1) 39 40 41 42 43 44 45 46 47 48
Untagged Ports: (Stk0/S2) 1 2
Tagged Ports: None
Uplink Ports: None
DualMode Ports: None
Mac-Vlan Ports: None
Monitoring: Disabled
PORT-VLAN 10, Name [None], Priority level0, Spanning tree On
Untagged Ports: (Stk0/S1) 1
Tagged Ports: None
Uplink Ports: None
DualMode Ports: None
Mac-Vlan Ports: None
Monitoring: Enabled
PORT-VLAN 20, Name [None], Priority level0, Spanning tree On
Untagged Ports: (Stk0/S1) 2
Tagged Ports: None
Uplink Ports: None
DualMode Ports: None
Mac-Vlan Ports: None
Monitoring: Disabled
```

The following example shows the output of the **show vlan brief** command.

```
device# show vlan brief
System-max vlan Params: Max(4095) Default(64) Current(3210)
Default vlan Id :1
Total Number of Vlan Configured :5
VLANs Configured :1 to 4 10
```

The following example shows the output of the port-based **show vlan brief ethernet** command. The output indicates the membership type of the VLAN.

```
device# show vlan brief ethernet 1/1/5

Port 1/1/5 is a member of 3 VLANs
VLANs 5 101 4094
Untagged VLAN : 1
Tagged VLANs : 5 101 4094
```

History

Release version	Command history
08.0.50	This command was modified to display the VLAN membership type in the show vlan brief ethernet command output.

show vlan-group

Displays the VLAN group configuration information.

Syntax

```
show vlan-group [group-id]
```

Parameters

group-id

Displays the VLAN group configuration information for the specified VLAN group ID.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Usage Guidelines

If you do not specify a group ID, the configuration information for all the configured VLAN groups is displayed.

Examples

The following example displays sample output of the **show vlan-group** command.

```
device# show vlan-group
vlan-group 1 vlan 2 to 20
tagged ethe 1/1/1 to 1/1/2
!
vlan-group 2 vlan 21 to 40
tagged ethe 1/1/1 to 1/1/2
!
```

The following example displays sample output of the **show vlan-group** command for a specific group ID.

```
device# show vlan-group 10
vlan-group 10 vlan 11 to 16
!
```

show voice-vlan

Displays the configuration of a voice VLAN for a particular port or for all ports.

Syntax

```
show voice-vlan [ ethernet stack-id/slot/port ]
```

Parameters

ethernet *stack-id/slot/port*

Displays the voice VLAN configuration for the specified Ethernet interface.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Examples

The following is sample output from the **show voice-vlan** command for all ports.

```
device# show voice-vlan

Port ID      Voice-vlan
1/1/2        1001
1/1/8        150
1/1/15       200
```

The following is sample output from the **show voice-vlan** command for a specific port.

```
device# show voice-vlan ethernet 1/1/2

Voice vlan ID for port 1/1/2: 1001
```

show vrf

Displays IP information for the specified Virtual Routing and Forwarding (VRF).

Syntax

```
show vrf [ vrf-name | detail | resource [ detail ] ]
```

Parameters

vrf-name

Specifies the VRF for which you want to display the information.

detail

Displays detailed VRF instance information. When used along with the **resource** keyword, displays detailed resource information.

resource

Displays resources used by all VRFs.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

VRF configuration mode

Command Output

The **show vrf** command displays the following information.

Output field	Description
VRF <i>vrf-name</i>	The name of the VRF.
default RD	The default route distinguisher for the VRF.
Table ID	The table ID for the VRF.
Routes	The total number of IPv4 and IPv6 unicast routes configured on this VRF.
Configured as management-vrf	Indicates that the specified VRF is configured as a management VRF.
IP Router-Id	The 32-bit number that uniquely identifies the router.
Number of Unicast Routes	The number of unicast routes configured on this VRF.

Examples

The following is sample output from the **show vrf** *vrf-name* command.

```
device(config)# show vrf mvrf

VRF mvrf, default RD 1100:1100, Table ID 11
Configured as management-vrf
IP Router-Id: 10.0.0.1
Interfaces:
ve3300 ve3400
Address Family IPv4
Max Routes: 641
Number of Unicast Routes: 2
Address Family IPv6
Max Routes: 64
Number of Unicast Routes: 2
```

show vsrp

Displays the VSRP information.

Syntax

```
show vsrp [ aware ] [ vlan vlan-id [ vrid-num ] | vrid vrid-num ]  
show vsrp [ brief ]
```

Parameters

aware

Displays information about VSRP-aware devices.

vlan *vlan-id*

Displays VSRP information for the VLAN ID.

vrid *vrid-num*

Displays information for the ports with VSRP enabled.

brief

Displays the VSRP information summary.

Modes

User EXEC mode

Command Output

The **show vsrp** command displays the following information:

Output field	Description
Total number of VSRP routers defined	The total number of VRIDs configured on this device.
VLAN	The VLAN on which VSRP is configured.
auth-type	The authentication type in effect on the ports in the VSRP VLAN.
VRID	The VRID for which the VSRP information is displayed.
state	The device VSRP state for the VRID. The state can be one of the following: <ul style="list-style-type: none">initialize: The VRID is not enabled (activated). If the state remains "initialize" after you activate the VRID, make sure that the VRID is also configured on the other routers and that the routers can communicate with each other.standby: This device is a backup for the VRID.master: This device is the master for the VRID.
Administrative-status	The administrative status of the VRID. The administrative status can be one of the following: <ul style="list-style-type: none">disabled: The VRID is configured on the interface but VSRP or VRRP-E has not been activated on the interface.enabled: VSRP has been activated on the interface.

Output field	Description
Advertise-backup	Whether the device is enabled to send VSRP Hello messages when it is a backup. This field can have one of the following values: <ul style="list-style-type: none"> disabled: The device does not send Hello messages when it is a backup. enabled: The device sends Hello messages when it is a backup.
Preempt-mode	Whether the device can be preempted by a device with a higher VSRP priority after this device becomes the master. This field can have one of the following values: <ul style="list-style-type: none"> disabled: The device cannot be preempted. enabled: The device can be preempted.
save-current	The source of VSRP timer values preferred when you save the configuration. This field can have one of the following values: <ul style="list-style-type: none"> false: The timer values configured on this device are saved. true: The timer values most recently received from the master are saved instead of the locally configured values.
Configured	Indicates the parameter value configured on this device.
Current	Indicates the parameter value received from the master.
Unit	Indicates the formula used for calculating the VSRP priority and the timer scales in effect for the VSRP timers. A timer true value is the value listed in the Configured or Current field divided by the scale value.
priority	The device preferability for becoming the master for the VRID. During negotiation, the backup with the highest priority becomes the master. If two or more backups are tied with the highest priority, the backup interface with the highest IP address becomes the master for the VRID.
hello-interval	The number of seconds between Hello messages from the master to the backups for a given VRID.
dead-interval	The configured value for the dead interval. The dead interval is the number of seconds a backup waits for a Hello message from the master for the VRID before determining that the master is no longer active. If the master does not send a Hello message before the dead interval expires, the backups negotiate (compare priorities) to select a new master for the VRID. If the value is 0, then you have not configured this parameter.
hold-interval	The number of seconds a backup that intends to become the master will wait before actually beginning to forward Layer 2 traffic for the VRID. If the backup receives a Hello message with a higher priority than its own before the hold-down interval expires, the backup remains in the backup state and does not become the new master.
initial-ttl	The number of hops a Hello message can traverse after leaving the device before the Hello message is dropped. A metro ring counts as one hop, regardless of the number of nodes in the ring.
next hello sent in	The amount of time until the master dead interval expires. If the backup does not receive a Hello message from the master by the time the interval expires, either the IP address listed for the master will change to the IP address of the new master, or this Layer 3 switch itself will become the master. This field applies only when this device is a backup.
Member ports	The ports in the VRID.
Operational ports	The member ports that are currently up.
Forwarding ports	The member ports that are currently in the forwarding state. Ports that are forwarding on the master are listed. Ports on the Standby, which are in the blocking state, are not listed.

The **show vsrp aware** command displays the following information:

Show Commands

show vsrp

Output field	Description
Last Port	The most recent active port connection to the VRID. This is the port connected to the current master. If a failover occurs, the VSRP-aware device changes the port to the port connected to the new master. The VSRP-aware device uses this port to send and receive data through the backed-up node.

Examples

The following example shows the output of the **show vsrp aware** command.

```
device# show vsrp aware
Aware port listing
VLAN ID   VRID   Last Port
100       1      1/3/2
200       2      1/4/1
```

The following example shows the output of the **show vsrp vlan *vlan-id* vrid *vrid-num*** command.

```
device# show vsrp vlan 100 vrid 100
VLAN 100
auth-type no authentication
VRID 100

```

show webauth

Displays Web Authentication configuration details.

Syntax

```
show webauth [ allowed-list | authenticating-list | blocked-list | vlan vlan-id [ passcode | webpage ] ]
```

Parameters

allowed-list

Displays a list of hosts that are currently authenticated.

authenticating-list

Displays a list of hosts that are trying to authenticate.

blocked-list

Displays a list of hosts that are currently blocked from any Web Authentication attempt.

vlan *vlan-id*

Displays Web Authentication details on a specific VLAN.

passcode

Displays current dynamic passcode details.

webpage

Displays what text has been configured for Web Authentication pages.

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Interface configuration mode

Web Authentication configuration mode

Usage Guidelines

The **show webauth** command by itself displays information for all VLANs on which Web Authentication is enabled.

Command Output

The **show webauth** command displays the following information:

Output field	Description
WEB AUTHENTICATION (VLAN #)	Identifies the VLAN on which Web Authentication is enabled.
attempt-max-num	The maximum number of Web Authentication attempts during a cycle.
host-max-num	The maximum number of users that can be authenticated at one time.

Show Commands
show webauth

Output field	Description
block duration	The number of seconds a user who failed Web Authentication must wait before attempting to be authenticated.
cycle-time	The number of seconds in one Web Authentication cycle.
port-down-authenticated-mac-cleanup	Indicates if this option is enabled or disabled. If enabled, all authenticated users are deauthenticated if all the ports in the VLAN go down.
reauth-time	The number of seconds an authenticated user remains authenticated. Once this timer expires, the user must reauthenticate.
authenticated-mac-age-time	If a user is inactive, this time shows how many seconds a user has before the user-associated MAC address is aged out. The user will be forced to reauthenticate.
dns-filter	Shows the definition of any DNS filter that has been set.
authentication mode	The authentication mode: username and password (default), passcode, captive-portal, or none. Also displays configuration details for the authentication mode.
RADIUS accounting	Whether RADIUS accounting is enabled or disabled.
Trusted port list	The statically-configured trusted ports of the Web Authentication VLAN.
Secure login (HTTPS)	Whether HTTPS is enabled or disabled.
Web Page Customizations	The current configuration for the text that appears on the Web Authentication pages. Either "Custom Text" or "Default Text" displays for each page type: <ul style="list-style-type: none"> "Custom Text" means the message for the page has been customized. The custom text is also displayed. "Default Text" means the default message that ships with the device is used. The actual text on the Web Authentication pages can be displayed using the show webauth vlan <i>vlan-id</i> webpage command.
Host statistics	The authentication status and the number of hosts in each state.

The **show webauth allowed-list** command displays the following information:

Output field	Description
VLAN #: Web Authentication	The ID of the VLAN on which Web Authentication is enabled.
Web Authenticated List MAC Address	The MAC addresses that have been authenticated.
AuthMode	The client is authenticated using internal server or external server.
User Name	The authenticated username.
Configuration Static/Dynamic	If the MAC address was dynamically (passed Web Authentication) or statically (added to the authenticated list using the add mac command) authenticated.
Authenticated Duration HH:MM:SS	The remainder of time the MAC address will remain authenticated.
Dynamic ACL	The dynamically assigned ACL.

The **show webauth authenticating-list** command displays the following information:

Output field	Description
VLAN #: Web Authentication	The ID of the VLAN on which Web Authentication is enabled.
MAC Address	The MAC addresses that are trying to be authenticated.
AuthMode	The client is authenticated using internal server or external server.
User Name	The User Name associated with the MAC address.
# of Failed Attempts	Number of authentication attempts that have failed.

Output field	Description
Cycle Time Remaining	The remaining time the user has to be authenticated before the current authentication cycle expires. Once it expires, the user must enter a valid URL again to display the Web Authentication Welcome page.

The **show webauth blocked-list** command displays the following information:

Output field	Description
VLAN #: Web Authentication	The ID of the VLAN on which Web Authentication is enabled.
Web Block List MAC Address	The MAC addresses that have been blocked from Web Authentication.
AuthMode	The client is authenticated using internal server or external server.
User Name	The username associated with the MAC address.
Configuration Static/Dynamic	If the MAC address was dynamically or statically blocked. The block mac command statically blocks MAC addresses.
Block Duration Remaining	The remaining time the MAC address has before the user with that MAC address can attempt Web Authentication.

Examples

The following example displays sample output of the **show webauth** command.

```
device#v show webauth
=====
WEB AUTHENTICATION (VLAN 25): Enable

10     closed
```

Commands Sn - Z

slow-start

Configures a slow-start timer interval to extend the time interval beyond the dead-interval time before a Virtual Router Redundancy Protocol Extended (VRRP-E) master device assumes the role of master device after being offline. When the original master device went offline, a backup VRRP-E device with a lower priority became the master device.

Syntax

slow-start *seconds*

no slow-start *seconds*

Command Default

If a slow-start timer is not configured, the master device assumes control from a backup device immediately after the dead interval.

Parameters

seconds

Sets the number of seconds for the slow-start timer. Range from 1 through 57600.

Modes

VRRP-E router configuration mode

Usage Guidelines

When the VRRP-E slow-start timer is enabled, if the master VRRP-E device goes down, the backup device with the highest priority takes over after the expiration of the dead interval. If the original master device subsequently comes back up again, the amount of time specified by the VRRP-E slow-start timer elapses before the original master device takes over from the backup device (which became the master device when the original master device went offline).

This command is supported only for VRRP-E.

The **no** form removes the slow-start configuration.

Examples

The following example sets the slow-start timer interval to 40 seconds.

```
device# configure terminal
device(config)# router vrrp-extended
device(config-vrrpe-router)# slow-start 40
```

snmp-client

Restricts SNMP access to a host with the specified IPv4 or IPV6 address.

Syntax

snmp-client {*ip-address* | **ipv6** *ipv6-address* }

no snmp-client {*ip-address* | **ipv6** *ipv6-address* }

Command Default

SNMP access is not restricted.

Parameters

ip-address

The IPv4 address of the host to which the SNMP access is restricted.

ipv6 *ipv6-address*

Specifies the IPv6 address of the host to which the SNMP access is restricted.

Modes

Global configuration mode

Usage Guidelines

You can specify only one IP address with one command. However, you can enter the command ten times to specify up to ten IP addresses.

The **no** form of the command removes the SNMP access restriction.

Examples

The following example shows how to allow SNMP access only to the host with IP address 192.168.10.1.

```
device(config)# snmp-client 192.168.10.1
```

snmp-server community

Configures the SNMP community string and access privileges.

Syntax

```
snmp-server community community-string { ro | rw } [ acl-name | acl-num | ipv6 ipv6-acl-name | view [ mib-view ] ]
```

```
no snmp-server community community-string { ro | rw } [ acl-name | acl-num | ipv6 ipv6-acl-name | view [ mib-view ] ]
```

Command Default

The SNMP community string is not configured.

Parameters

community-string

Configures the SNMP community string that you must enter to gain SNMP access. The string is an ASCII string and can have up to 32 characters.

ro

Configures the community string to have read-only ("get") access.

rw

Configures the community string to have read-write ("set") access.

acl-name

Filters incoming packets using a named standard access control list (ACL).

acl-num

Filters incoming packets using a numbered ACL.

ipv6 *ipv6-acl-name*

Filters incoming packets using a named IPv6 ACL.

view *mib-view*

Associates a view to the members of the community string. Enter up to 32 alphanumeric characters.

Modes

Global configuration mode

Usage Guidelines

The **view** *mib-view* parameter allows you to associate a view to the members of this community string. If no view is specified, access to the full MIB is granted. The view that you want must exist before you can associate it to a community string.

You can set just one access type, either read-only (ro) or read/write (rw) for a single SNMP community instead of setting both access types. The read/write access supersedes read-only configuration and if read/write is configured for a specified community after read only, the running configuration file only saves the rw configuration line.

If you issue the **no snmp-server community public ro** command and then enter the **write memory** command to save the configuration, the read-only "public" community string is removed and will have no SNMP access. If for some reason the device is brought down and then brought up, the **no snmp-server community public ro** command is restored in the system and the read-only "public" community string has no SNMP access.

The **no** form of the command removes an SNMP community string.

Examples

The following example configures an SNMP community string with read-only access.

```
device# configure terminal
device(config)# snmp-server community private ro
```

The following example configures an ACL to filter SNMP packets.

```
device# configure terminal
device(config)# access-list 25 deny host 10.157.22.98 log
device(config)# access-list 25 deny 10.157.23.0 0.0.0.255 log
device(config)# access-list 25 deny 10.157.24.0 0.0.0.255 log
device(config)# access-list 25 permit any
device(config)# access-list 30 deny 10.157.25.0 0.0.0.255 log
device(config)# access-list 30 deny 10.157.26.0/24 log
device(config)# access-list 30 permit any
device(config)# snmp-server community public ro 25
device(config)# snmp-server community private rw 30
device(config)# write memory
```

The following example associates a view to the members of a community string.

```
device# configure terminal
device(config)# snmp-server community private rw view view1
```

snmp-server contact

Configures the identification of the contact person for the managed node.

Syntax

snmp-server contact *name*

no snmp-server contact *name*

Command Default

Contact information is not configured.

Parameters

name

The contact name. The name can be up to 255 alphanumeric characters. Spaces are allowed.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command removes the contact information.

Examples

The following example configures the identification of the contact person for the device.

```
device(config)# snmp-server contact Sales
```

snmp-server disable

Disables SNMP MIB support.

Syntax

snmp-server disable mib *table*

no snmp-server disable mib *table*

Command Default

SNMP MIB support is enabled.

Parameters

mib *table*

Disables MIB support for a given table. Support for the following tables can be disabled:

dot1d-tp-fdb

Disables SNMP support for dot1dTpFdbTable.

dot1q-fdb

Disables SNMP support for dot1qFdbTable.

dot1q-tp-fdb

Disables SNMP support for dot1qTpFdbTable.

enet-pw

Disables SNMP support for pwEnetTable.

pw

Disables SNMP support for pwTable.

vll-ep

Disables SNMP support for fdryVllEndPointTable.

vpls-ep-vlan-ext

Disables SNMP support for brcdVplsEndptVlanExtStatsTable.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command enables SNMP MIB support.

Examples

The following example disables dot1d-tp-fdb MIB support.

```
device(config)# snmp-server disable mib dot1d-tp-fdb
```

snmp-server enable

Configures SNMP access only to specific clients.

Syntax

snmp-server enable ethernet *stack/slot/port* [**to** *stack/slot/port* | [**ethernet** *stack/slot/port* **to** *stack/slot/port* | **ethernet** *stack/slot/port*] ...]

no snmp-server enable ethernet *stack/slot/port* [**to** *stack/slot/port* | [**ethernet** *stack/slot/port* **to** *stack/slot/port* | **ethernet** *stack/slot/port*] ...]

snmp-server enable vlan *vlan-id*

no snmp-server enable vlan *vlan-id*

Command Default

SNMP access is not restricted.

Parameters

ethernet *stack/slot/port*

Specifies the Ethernet interface on which web management should be enabled.

to *stack/slot/port*

Specifies the range of Ethernet interfaces.

vlan *vlan-id*

Specifies that web management should be enabled on the clients of the specified VLAN.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command removes the SNMP access restriction.

Examples

The following example configures the SNMP access only to a client in VLAN 40.

```
device(config)# snmp-server enable vlan 40
```

The following example configures SNMP access to a range of Ethernet interfaces.

```
device(config)# snmp-server enable ethernet 1/1/1 to ethernet 1/1/5
```

snmp-server enable mib

Enables MIB support for SNMP server.

Syntax

snmp-server enable mib *mib-name*

no snmp-server enable mib *mib-name*

Command Default

MIB support is enabled by default.

Parameters

mib-name

Enables support for one of the following MIBs:

np-qos-stat

Enables SNMP support for brcdNPQosStatTable.

tm-dest-qstat

Enables SNMP support for brcdTMDestUcastQStatTable.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command disables the SNMP MIB support.

Examples

The following example enables the brcdTMDestUcastQStatTable MIB support.

```
device(config)# snmp-server enable mib tm-dest-qstat
```

snmp-server enable traps

Enables SNMP traps for various events.

Syntax

snmp-server enable traps *event*

no snmp-server enable traps *event*

Command Default

Traps are enabled by default.

Parameters

event

The event for which the traps should be enabled. Enables the traps for one of the following events:

authentication

Generates the trap when the authentication occurs.

cold-start

Generates the trap after a cold start.

fan-failure

Generates the trap when there is a fan failure and when the issue is resolved.

fan-speed-change

Generates the trap when there is a change in fan speed.

ikev2

Generates the trap for Internet Key Exchange Protocol, v2 (IKEv2) events.

ipsec

Generates the trap for Internet Protocol Security (IPsec) events.

link-down

Generates the trap when the link is down.

link-oam

Generates the trap for link OAM.

link-up

Generates the trap when the link is up.

mac-authentication

Generates the trap when a MAC address is added or deleted.

mac-notification

Generates the trap after a MAC authentication.

metro-ring

Generates the trap when there is a change in the Metro Ring configuration.

module-inserted

Generates the trap when a module is inserted.

module-removed

Generates the trap when a module is removed.

new-root

Generates a control STP trap for newRoot events, as defined in RFC 1493.

nlp-phy-40g

Generates the trap during PHY calibration on the 40-Gbps and 4x10-Gbps stack ports.

power-supply-failure

Generates the trap when there is a power supply failure and when the issue is resolved.

redundant-module

Generates the control enterprise trap snTrapMgmtModuleRedunStateChange for redundant module events.

syslog

Generates syslogMsgNotification traps.

temperature

Generates the trap when there is a temperature change.

topology-change

Generates the control STP trap topologyChange defined in RFC 1493 for topology changes.

udld

Generates the control enterprise traps for Unidirectional Link Detection (UDLD) events.

vsrp

Generates the control enterprise Virtual Switch Redundancy Protocol (VSRP) trap snTrapVsrplfStateChange.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command disables the traps.

The **ipsec** and **ikev2** options are only supported on the Brocade FastIron ICX 7450, with an FPGA-based add-on crypto card.

Examples

The following example enables SNMP traps on the device for MAC notification globally.

```
device(config)# snmp-server enable traps mac-notification
```

History

Release version	Command history
8.0.10	The mac-notification keyword was added.

Commands Sn - Z

snmp-server enable traps

Release version	Command history
8.0.50	The ipsec and ikev2 keywords were added.

snmp-server enable traps holddown-time

Configures the wait time before starting to send SNMP traps.

Syntax

snmp-server enable traps holddown-time *time*
no snmp-server enable traps holddown-time *time*

Command Default

The default hold-down time is 60 seconds.

Parameters

time

The time in seconds. The valid range is from 1 through 600 seconds. The default is 60 seconds.

Modes

Global configuration mode

Usage Guidelines

When a Brocade device starts up, the software waits for Layer 2 convergence (STP) and Layer 3 convergence (OSPF) before beginning to send SNMP traps to external SNMP servers. Until convergence occurs, the device may not be able to reach the servers, in which case the messages are lost.

By default, a Brocade device uses a one-minute hold-down time to wait for the convergence to occur before starting to send SNMP traps. After the hold-down time expires, the device sends the traps, including traps such as "cold start" or "warm start" that occur before the hold-down time expires.

When you have a stack of eight or more units, you must increase the trap hold-down time from the default (60 seconds) to five minutes (300 seconds). This will prevent the loss of initial boot traps.

The **no** form of the command changes the hold-down time to the default value.

Examples

The following example changes the hold-down time for SNMP traps to 30 seconds.

```
device(config)# snmp-server enable traps holddown-time 30
```

snmp-server enable traps mac-notification

Enables the MAC-notification trap whenever a MAC address event is generated on a device or an interface.

Syntax

snmp-server enable traps mac-notification
no snmp-server enable traps mac-notification

Command Default

MAC-notification traps are disabled on the device.

Modes

Global configuration
Interface configuration

Usage Guidelines

The **no** form of this command disables SNMP traps for MAC-notification events. The SNMP MAC-notification trap functionality allows an SNMPv3 trap to be sent to the SNMP manager when MAC addresses are added or deleted in the device.

Examples

The following example enables SNMP traps on the device for MAC-notification globally:

```
device(config)# snmp-server enable traps mac-notification
```

The following example disables SNMP traps on the device for MAC-notification globally:

```
device(config)# no snmp-server enable traps mac-notification
```

History

Release version	Command history
08.0.10	This command was introduced.

snmp-server engineid local

Modifies the default SNMPv3 engine ID.

Syntax

snmp-server engineid local *engineid-string*

no snmp-server engineid local *engineid-string*

Command Default

A default engine ID is generated during system startup.

Parameters

engineid-string

Specifies the engine ID as a hexadecimal character string with an even number of characters.

Modes

Global configuration mode

Usage Guidelines

The default engine ID guarantees the uniqueness of the engine ID for SNMP version 3. A default engine ID is generated during system startup. To determine the default engine ID of the device, enter the **show snmp engineid** command. Use the **snmp-server engineid local** command to change the default engine ID.

Each user localized key depends on the SNMP server engine ID, so all users must be reconfigured whenever the SNMP server engine ID changes.

NOTE

Because the current implementation of SNMP version 3 does not support Notification, remote engine IDs cannot be configured at this time.

The **engineid-string** variable consists of 11 octets, entered as hexadecimal values. There are two hexadecimal characters in each octet. There must be an even number of hexadecimal characters in an engine ID.

The default engine ID has a maximum of 11 octets:

- Octets 1 through 4 represent the agent's SNMP management private enterprise number as assigned by the Internet Assigned Numbers Authority (IANA). The most significant bit of Octet 1 is "1". For example, "000007c7" is the ID for Brocade Communications, Inc. in hexadecimal. With Octet 1 always equal to "1", the first four octets in the default engine ID is always "800007c7" (which is 1991 in decimal).
- Octet 5 is always 03 in hexadecimal and indicates that the next set of values represents a MAC address.
- Octets 6 through 11 form the MAC address of the lowest port in the management module.

The engine ID must be a unique number among the various SNMP engines in the management domain.

The **no** form of the command sets the engine ID to the default.

Commands Sn - Z
snmp-server engineid local

Examples

The following example shows how to change the default engine ID.

```
device(config)# snmp-server engineid local 800007c70300e05290ab60
```

snmp-server group

Creates user-defined groups for SNMPv1/v2c/v3 and configures read, write, and notify permissions to access the MIB view.

Syntax

```
snmp-server group groupname { v1 | v2c } [ access { standard-ACL-id | ipv6 ipv6-ACL-name } ] [ notify viewname ] [ read viewname ] [ write viewname ]
```

```
no snmp-server group groupname { v1 | v2c } [ access { standard-ACL-id | ipv6 ipv6-ACL-name } ] [ notify viewname ] [ read viewname ] [ write viewname ]
```

```
snmp-server group groupname v3 { auth | noauth | priv } [ access { standard-ACL-id | ipv6 ipv6-ACL-name } ] [ notify viewname ] [ read viewname ] [ write viewname ]
```

```
no snmp-server group groupname v3 { auth | noauth | priv } [ access { standard-ACL-id | ipv6 ipv6-ACL-name } ] [ notify viewname ] [ read viewname ] [ write viewname ]
```

Command Default

Six default groups are supported to associate the default SNMPv3 user groups and the default SNMPv1/v2c community groups with the view configuration.

NOTE

This command is not used for SNMP version 1 and SNMP version 2. In these versions, groups and group views are created internally using community strings. When a community string is created, two groups are created, based on the community string name. One group is for SNMP version 1 packets, while the other is for SNMP version 2 packets.

Parameters

groupname

Specifies the name of the SNMP group to be created.

v1

Specifies SNMP version 1.

v2c

Specifies SNMP version 2.

v3

Specifies SNMP version 3.

auth

Specifies that only authenticated packets with no privacy are allowed to access the specified view. This parameter is available only for SNMPv3 user groups.

noauth

Specifies that no authentication and no privacy are required to access the specified view. This parameter is available only for SNMPv3 user groups.

priv

Specifies that authentication and privacy are required from the users to access the view. This parameter is available only for SNMPv3 user groups.

access

Specifies an access list associated with the SNMP group.

standard-ACL-id

Specifies the standard IP access list and allows the incoming SNMP packets to be filtered based on the standard ACL attached to the group.

ipv6

Specifies the IPv6 ACL for the SNMP group.

ipv6-ACL-name

Specifies the IPv6 access list and allows incoming SNMP packets to be filtered based on the IPv6 ACL attached to the group.

notify *viewname*

Specifies the name of the view that enables you to provide access to the MIB for trap or inform. This allows the administrators to restrict the scope of varbind objects that will be part of the notification. All of the varbinds need to be in the included view for the notification to be created.

read *viewname*

Specifies the name of the view that enables you to provide read access.

write *viewname*

Specifies the name of the view that enables you to provide both read and write access.

viewname

Specifies the name of the view to which the SNMP group members have access. If no view is specified, then the group has no access to the MIB. The default viewname is "all", which allows access to the entire MIB.

Modes

Global configuration mode

Usage Guidelines

Maximum number of SNMP groups supported is 10.

The **no** form of the command removes the configured SNMP server group.

Examples

The following example creates SNMP server group entries for SNMPv3 user group with auth permission.

```
device(config)# snmp-server group admin v3 auth ipv6 acl_1 read all write all notify all
```

History

Release version	Command history
08.0.20a	The ipv6 <i>ipv6-ACL-name</i> keyword-argument pair was introduced.

snmp-server host

Configures a trap receiver to ensure that all SNMP traps sent by the Brocade device go to the same SNMP trap receiver or set of receivers, typically one or more host devices on the network.

Syntax

```
snmp-server host { host-ipaddr | ipv6 host-ipv6-addr } [ version { v1 | v2c } [ community-string [ port port-num ] ] ]  
no snmp-server host { host-ipaddr | ipv6 host-ipv6-addr } [ version { v1 | v2c } [ community-string [ port port-num ] ] ]  
snmp-server host { host-ipaddr | ipv6 host-ipv6-addr } [ version v3 { auth | noauth | priv } name [ port port-num ] ]  
no snmp-server host { host-ipaddr | ipv6 host-ipv6-addr } [ version v3 { auth | noauth | priv } name [ port port-num ] ]
```

Command Default

The SNMP trap receiver is not configured.

Parameters

host-ipaddr

Specifies the IP address of the trap receiver.

ipv6 *host-ipv6-addr*

Specifies the IPv6 address of the trap receiver.

version

Configures the SNMP version or security model.

v1

Specifies SNMP version 1.

v2c

Specifies SNMP version 2c.

community-string

Specifies an SNMP community string configured on the device.

v3

Specifies SNMP version 3.

auth

Specifies that only authenticated packets with no privacy are allowed to access the specified view. This parameter is available only for SNMPv3 user groups.

noauth

Specifies that no authentication and no privacy are required to access the specified view. This parameter is available only for SNMPv3 user groups.

priv

Specifies that authentication and privacy are required from the users to access the view. This parameter is available only for SNMPv3 user groups.

name

Specifies the SNMP security name or user.

port *port-num*

Configures the UDP port to be used by the trap receiver. The default port number is 162.

Modes

Global configuration mode

Usage Guidelines

The device sends all the SNMP traps to the specified hosts and includes the specified community string. Administrators can therefore filter for traps from a Brocade device based on IP address or community string. When you add a trap receiver, the software automatically encrypts the community string you associate with the receiver when the string is displayed by the CLI or Web Management interface. The software does not encrypt the string in the SNMP traps sent to the receiver.

The SNMP community string configured can be a read-only string or a read-write string. The string is not used to authenticate access to the trap host but is instead a useful method for filtering traps on the host. For example, if you configure each of your Brocade devices that use the trap host to send a different community string, you can easily distinguish among the traps from different devices based on the community strings.

The Multiple SNMP Community Names feature introduced the ability to configure one default community string (where a community string is not mapped to any SNMP context) and one community string per SNMP context for a single trap host. One community name per line is allowed. For protocol-specific MIBS, Brocade devices send the trap originating from specific VRF instance and the corresponding community name mapped to the SNMP context associated with that VRF is sent in the trap. When the Brocade devices send the trap originating from a default VRF instance, the default community string is sent in the trap. Using the community string in the trap, administrators can easily distinguish among the traps originated from different VRF instances. If you enter the **show running-config** command it displays multiple **snmp-server host** command instances for each host; one community name per line.

Specifying the port allows you to configure several trap receivers in a system. With this parameter, a network management application can coexist in the same system. Devices can be configured to send copies of traps to more than one network management application.

The **no** form of the command removes the configured SNMP server host.

Examples

The following example configures 10.10.10.1 as the trap receiver.

```
device(config)# snmp-server host 10.10.10.1 version v2c mypublic port 200
```

The following example configures 2002::2:2 as the trap receiver and specifies that only authenticated packets with no privacy are allowed to access the specified view.

```
device(config)# snmp-server host ipv6 2002::2:2 version v3 auth user-private port 110
```

snmp-server legacy

Configures legacy values for SNMP MIBs.

Syntax

```
snmp-server legacy { iftype | module-type }  
no snmp-server legacy { iftype | module-type }
```

Command Default

SNMP MIBs have the user-configured values.

Parameters

iftype

Configures to the use of legacy Ethernet interface names for ifType.

module-type

Configures to the use of legacy enum values for snAgentConfigModuleType.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command changes the settings back to the non-legacy values.

Examples

The following example configures to the use of legacy Ethernet interface names for ifType.

```
device(config)# snmp-server legacy iftype
```

snmp-server location

Configures the SNMP server location.

Syntax

snmp-server location *string*

no snmp-server location *string*

Command Default

The SNMP server location is not configured.

Parameters

string

The physical location of the server. The string can be up to 255 alphanumeric characters. Spaces are allowed.

Modes

Global configuration mode

Usage Guidelines

You can configure a location for a device and save the information locally in the configuration file for future reference. This information is not required for system operation but is suggested.

The **no** form of the command removes the configured location.

Examples

The following example configures the physical location of the SNMP server.

```
device(config)# snmp-server location United States
```

snmp-server max-ifindex-per-module

Configures the maximum number of ifindexes per module.

Syntax

snmp-server max-ifindex-per-module *number*

no snmp-server max-ifindex-per-module *number*

Command Default

The system assigns 64 indexes to each module on the device.

Parameters

number

Specifies the maximum number of ifindexes per module (20, 40 or 64).

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command resets the maximum number of ifindexes per module as 64.

SNMP Management Information Base (MIB) uses Interface Index (ifIndex) to assign a unique value to each port on a module or slot. You can assign 20, 40, and 64 ifindexes per module.

Examples

The following example configures the number of ifindexes per module to 40.

```
device(config)# snmp-server max-ifindex-per-module 40
```

snmp-server preserve-statistics

Decouples SNMP statistics from CLI-based statistics.

Syntax

snmp-server preserve-statistics

no snmp-server preserve-statistics

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command couples the SNMP statistics from the CLI based statistics.

Examples

The following example shows how to decouple SNMP statistics from CLI-based statistics.

```
device(config)# snmp-server preserve-statistics
```

snmp-server pw-check

Controls password check on file operation MIB objects.

Syntax

snmp-server pw-check

no snmp-server pw-check

Command Default

Password check is not configured.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command removes the password check on file operation MIB objects.

Once the password check is enabled, if a third-party SNMP management application does not add a password to the password field when it sends SNMP set requests to a device, by default the device rejects the request.

Examples

The following example configures password check on file operation MIB objects.

```
device(config)# snmp-server pw-check
```

snmp-server trap-source

Configures an interface as the source for all traps.

Syntax

snmp-server trap-source { **ethernet** *stack-id/slot/port* | **loopback** *number* | **ve** *number* }

no snmp-server trap-source { **ethernet** *stack-id/slot/port* | **loopback** *number* | **ve** *number* }

Command Default

An SNMP trap generator is not configured.

Parameters

ethernet *stack-id/slot/port*

Specifies an Ethernet interface address to be used as the source for all traps.

loopback *number*

Specifies a loopback interface address to be used as the source for all traps.

ve *number*

Specifies a Virtual Ethernet interface address to be used as the source for all traps.

Modes

Global configuration mode

Usage Guidelines

Regardless of the port that the Brocade device uses to send traps to the receiver, the traps always arrive from the same source IP address.

The **no** form of the command removes the configured interface as the SNMP trap generator.

Examples

The following example configures an Ethernet interface as the SNMP trap generator source.

```
device(config)# snmp-server trap-source ethernet 1/1/1
```

The following example configures a loopback interface as the SNMP trap generator source.

```
device(config)# snmp-server trap-source loopback 10.0.1.1
```

snmp-server user

Creates or changes the attributes of SNMPv3 users, and allows an SNMPv3 user to be associated with the user-defined group name.

Syntax

```
snmp-server user user-name group-name v3 [ access acl-num ] [ auth { md5 | sha } auth-password [ priv { aes | des } password-string ] ]
```

```
no snmp-server user user-name group-name v3 [ access acl-num ] [ auth { md5 | sha } auth-password [ priv { aes | des } password-string ] ]
```

Command Default

SNMP users are not configured.

Parameters

user-name

Specifies the SNMP username or security name used to access the management module.

group-name

Identifies the SNMP group to which this user is associated or mapped.

v3

Configures the group using the User Security Model (SNMPv3).

access

Specifies the access list associated with the user.

acl-num

Standard IP access list number allowing access. The valid values are from 1 through 99.

auth

Specifies the type of encryption the user must have to be authenticated.

md5

Configures the HMAC MD5 algorithm for authentication.

sha

Configures the HMAC SHA algorithm for authentication.

auth-password

Specifies the authorization password for the user (8 through 16 characters for MD5; 8 through 20 characters for SHA).

priv

Configures the encryption type (DES or AES) used to encrypt the privacy password.

aes

Configures CFB128-AES-128 encryption for privacy.

des

Configures CBC56-DES encryption for privacy.

password-string

Specifies the DES or AES password string for SNMPv3 encryption for the user. The password must have a minimum of 8 characters.

Modes

Global configuration mode

Usage Guidelines

The **snmp-server user** command creates an SNMP user, defines the group to which the user will be associated, defines the type of authentication to be used for SNMP access by this user, specifies either the **AES** or **DES** encryption types used to encrypt the privacy password.

All users must be mapped to an SNMP group. Groups are defined using the **snmp-server group** command.

NOTE

The SNMP group to which the user account will be mapped should be configured before creating the user accounts; otherwise, the group will be created without any views. Also, ACL groups must be configured before configuring user accounts.

NOTE

The ACL specified in a user account overrides the ACL assigned to the group to which the user is mapped. If no ACL is entered for the user account, then the ACL configured for the group will be used to filter packets.

The **priv** parameter specifies the encryption type (**DES** or **AES**) used to encrypt the privacy password. If the encrypted keyword is used, do the following:

- If **DES** is the privacy protocol to be used, enter **des** followed by a 16-octet DES key in hexadecimal format for the DES-password-key . If you include the encrypted keyword, enter a password string of at least 8 characters.
- If **AES** is the privacy protocol to be used, enter **aes** followed by the AES password key. For a small password key, enter 12 characters. For a big password key, enter 16 characters.

The **no** form of the command removes the SNMP access.

Examples

The following example configures an SNMP user account.

```
device(config)# snmp-server user user1 admin v3 access 2 auth md5 abc123 priv des xyz123
```

snmp-server view

Creates an SNMP view.

Syntax

snmp-server view *view-name* *mib-subtree* { **excluded** | **included** }

no snmp-server view *view-name* *mib-subtree* { **excluded** | **included** }

Command Default

All MIB objects are automatically excluded from any view unless they are explicitly included.

Parameters

view-name

Configures the alphanumeric name to identify the view. The names cannot contain spaces.

mib-subtree

Configures the name of the MIB object or family. You can use a wildcard (*) in the numbers to specify a sub-tree family.

excluded

Configures the MIB family identified to be excluded from the view.

included

Configures the MIB family identified to be included in the view.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command removes the configured SNMP view.

SNMP views are named groups of MIB objects that can be associated with user accounts to allow limited access for viewing and modification of SNMP statistics and system configuration. SNMP views can also be used with other commands that take SNMP views as an argument.

MIB objects and MIB sub-trees can be identified by a name or by the numbers called object identifiers (OIDs) that represent the position of the object or sub-tree in the MIB hierarchy.

NOTE

All MIB objects are automatically excluded from any view unless they are explicitly included; therefore, when creating views using the **snmp-server view** command, indicate which portion of the MIB you want users to access.

Examples

The following example assigns the view called "admin" a community string or user group. The "admin" view allows access to the Brocade MIB objects that begin with the 1.3.6.1.4.1.1991 object identifier.

```
device(config)# snmp-server view admin 1.3.6.1.4.1.1991 included
```

source-interface

Configures the source IP address of the Network Time Protocol (NTP) packets.

Syntax

source-interface { **ethernet** *stack-id/slot/port* | **loopback** *num* | **ve** *num* }

no source-interface { **ethernet** *stack-id/slot/port* | **loopback** *num* | **ve** *num* }

Command Default

When the system sends an NTP packet, the source IP address is normally set to the lowest IP address of the interface through which the NTP packet is sent.

Parameters

ethernet *stack-id/slot/port*

Configures the source IP address for an NTP packet as that of the specified Ethernet interface.

loopback *num*

Configures the source IP address for an NTP packet as that of the specified loopback interface.

ve *num*

Configures the source IP address for an NTP packet as that of the specified Virtual Ethernet interface.

Modes

NTP configuration mode

Usage Guidelines

The specified interface will be used for the source address for all packets sent to all destinations. If a source address is to be used for a specific association, use the **source** keyword in the **peer** or **server** command.

NOTE

If the source interface is not configured, the lowest IP address in the outgoing interface will be used in the NTP packets.

The **no** form of the command resets the source IP address of the NTP packets as the IP address of the interface through which the NTP packets are sent.

Examples

The following example configures the source IP address for an NTP packet as that of the specified Ethernet interface.

```
device(config)# ntp
device(config-ntp)# source-interface ethernet 1/1/3
```

source-ip

Sets the source IP address of an ERSPAN mirror.

Syntax

source-ip *ip-addr*

no source-ip *ip-addr*

Command Default

A source IP is not configured for the ERSPAN profile.

Parameters

ip-addr

Specifies the IP address in the format A.B.C.D.

Modes

Monitor profile mode

Usage Guidelines

The source IP address can be any IP on the router.

The **no** form of the command removes the IP address from the monitor profile.

Examples

The following example sets the source IP address in ERSPAN profile 3.

```
device(config)# monitor-profile 3 type ERSPAN
device(config-monitor-profile 3)# source-ip 2.2.2.2
device(config-monitor-profile 3)# exit
```

History

Release version	Command history
8.0.40	This command was introduced.

source-guard enable

Enables IP source guard on a port, per-port-per-vlan, virtual interface or on a range of ports.

Syntax

source-guard enable

no source-guard enable

Command Default

IP source guard is disabled.

Modes

Interface configuration mode.

Usage Guidelines

You can enable IP source guard on a range of ports within a given slot only. Enabling IP source guard across multiple slots is not supported.

The following considerations apply:

- In a specific port range if a port is added as tagged to a VLAN with or without a VE defined for that VLAN, the port will be excluded from IP Source Guard programming.
- If a port is added as an untagged port in a VLAN with a VE defined for the VLAN, the port will be excluded from IP Source Guard programming.
- If a port is added as untagged without a VE defined for the VLAN, IP Source Guard programming is allowed on the port.

The **no** form of the command disables IP source guard on the specified interface.

Examples

The following example enables IP source guard on an interface.

```
device# configure terminal
device(config)# interface ethernet 1/1/4
device(config-if-e10000-1/1/4)# source-guard enable
```

The following example enables IP source guard on a virtual interface.

```
device(config)# vlan 2
device(config-vlan-2)# tag ethernet 1
Added tagged port(s) ethernet 1 to port-vlan 2
device(config-vlan-2)# router-interface ve 2
device(config-vlan-2)# interface ve 2
device(config-vif-2)# source-guard enable ethernet 1
```

Commands Sn - Z

source-guard enable

The following command enables IP source guard on a range of ports in the same slot.

```
device# configure terminal
device(config)# interface ethernet 1/1/1
device(config-if-e10000-1/1/1)# interface ethernet 1/1/21 to 1/1/25
device(config-mif-1/1/21-1/1/25)# source-guard enable
```

The following error displays if you try to configure ports across multiple slots.

```
device(config)# interface ethernet 1/1/18 to 2/1/18
Error - cannot configure multi-ports on different slot
```

History

Release version	Command history
8.0.40a	This command was modified to support enabling IP source guard on a range of ports.

spanning-tree

Configures STP on all ports on a device.

Syntax

```
spanning-tree [ single ] [ forward-delay seconds ] [ hello-time seconds ] [ max-age seconds ] [ priority number ]  
no spanning-tree [ single ] [ forward-delay seconds ] [ hello-time seconds ] [ max-age seconds ] [ priority number ]
```

Command Default

STP is not enabled. Once STP is enabled, the STP port parameters are preconfigured with default values.

Parameters

single

Enables Single STP.

forward-delay *seconds*

Configures the time period a port waits before it forwards an RST BPDU after a topology change. This value ranges from 4 through 30 seconds. The default is 15 seconds.

hello-time *seconds*

Configures the time interval between two Hello packets. This value ranges from 1 through 10 seconds. The default is 2 seconds.

max-age *seconds*

Configures the time period the device waits to receive a Hello packet before it initiates a topology change. The time period ranges from 6 through 40 seconds. The default is 20 seconds.

priority *number*

Configures the priority of the bridge. The value ranges from 0 through 65535. A lower numerical value means the bridge has a higher priority. Thus, the highest priority is 0. The default is 32768.

Modes

Global configuration mode

VLAN configuration mode

Usage Guidelines

You can specify some or all of the parameters on the same command line.

The **single** option which configures a Single STP is available only in the global configuration mode.

The value of **max-age** must be greater than the value of **forward-delay** to ensure that the downstream bridges do not age out faster than the upstream bridges (those bridges that are closer to the root bridge).

Configuring the STP parameters is optional. All parameters have default values. Additionally, all values will be globally applied to all ports on the system or on the port-based VLAN for which they are defined.

The **no** form of the command disables STP.

Examples

The following example configures a Single STP.

```
device(config)# spanning-tree single
```

The following example configures the STP parameters.

```
device(config)# vlan 200  
device(config-vlan-200)# spanning-tree forward-delay 4 hello-time 5 max-age 4 priority 20
```

spanning-tree 802-1w

Configures the 802.1w parameters.

Syntax

spanning-tree 802-1w [**single**] [**force-version** *number*] [**forward-delay** *seconds*] [**hello-time** *seconds*] [**max-age** *seconds*] [**priority** *number*]

no spanning-tree 802-1w [**single**] [**force-version** *number*] [**forward-delay** *seconds*] [**hello-time** *seconds*] [**max-age** *seconds*] [**priority** *number*]

Interface configuration mode

spanning-tree 802-1w { **admin-edge-port** | **admin-pt2pt-mac**}

no spanning-tree 802-1w { **admin-edge-port** | **admin-pt2pt-mac**}

Command Default

The 802.1w port parameters are preconfigured with default values.

Parameters

single

Configures Single STP.

force-version *number*

Forces the bridge to send BPDUs in a specific format. 0 for STP compatibility mode and 2 for RSTP default mode.

forward-delay *seconds*

Configures the time period a port waits before it forwards an RST BPDUs after a topology change. This value ranges from 4 through 30 seconds. The default is 15 seconds.

hello-time *seconds*

Configures the time interval between two Hello packets. This value ranges from 1 through 10 seconds. The default is 2 seconds.

max-age *seconds*

Configures the time period the device waits to receive a Hello packet before it initiates a topology change. The time period ranges from 6 through 40 seconds. The default is 20 seconds.

priority *number*

Configures the priority of the bridge. The value ranges from 0 through 65535. A lower numerical value means the bridge has a higher priority. Thus, the highest priority is 0. The default is 32768.

admin-edge-port

Configures the port to be an operational edge port for all VLANs.

admin-pt2pt-mac

Configures the port to be on a point-to-point link link for all VLANs.

Modes

Global configuration mode

VLAN configuration mode

Interface configuration mode

Usage Guidelines

The value of **max-age** must be greater than the value of **forward-delay** to ensure that the downstream bridges do not age out faster than the upstream bridges (those bridges that are closer to the root bridge).

Configuring the STP parameters is optional. All parameters have default values. Additionally, all values will be globally applied to all ports on the system or on the port-based VLAN for which they are defined.

The **no** form of the command sets the parameters to the default values.

Examples

The following example shows how to configure the 802.1w parameters.

```
device(config)# vlan 200
device(config-vlan-200)# spanning-tree 802-1w force-version 6 forward-delay 5 hello-time 4 max-age 4
priority 5
```

spanning-tree 802-1w ethernet

Enables the spanning-tree 802.1w port commands on Ethernet ports.

Syntax

spanning-tree 802-1w [**single**] **ethernet** *stackid/slot/port* [**admin-edge-port**] [**admin-pt2pt-mac**] [**force-migration-check**] [**path-cost** *number*] [**priority** *number*] [**disable**]

no spanning-tree 802-1w [**single**] **ethernet** *stackid/slot/port* [**admin-edge-port**] [**admin-pt2pt-mac**] [**force-migration-check**] [**path-cost** *number*] [**priority** *number*] [**disable**]

Command Default

The 802.1w port parameters are pre-configured with default values.

Parameters

single

Configures a Single STP.

ethernet *stackid/slot/port*

Specifies the Ethernet port on which you want to configure the 802.1w parameters.

admin-edge-port

Enables the port as an edge port in the domain.

admin-pt2pt-mac

Enables a port that is connected to another port through a point-to-point link. The point-to-point link increases the speed of convergence. This parameter, however, does not auto-detect whether or not the link is a physical point-to-point link.

force-migration-check

Forces the specified port to send one RST BPDU. If only STP BPDUs are received in response to the send RST BPDU, then the port will return to sending STP BPDUs.

path-cost *number*

Configures the cost of the port path to the root bridge. 802.1w prefers the path with the lowest cost. The path cost ranges from 1 through 20,000,000.

priority *number*

Sets the priority for the port. The priority value ranges from 0 through 240, in increments of 16. The default value is 128.

disable

Disables 802.1w for the interface on the VLAN.

Modes

Global configuration mode

VLAN configuration mode

Usage Guidelines

Configuring the parameters is optional. All parameters have default values. Additionally, all values will be globally applied to all ports on the system or on the port-based VLAN for which they are defined.

The **no** form of the command disables the spanning tree on a VLAN

Examples

The following example shows the spanning tree configuration for the specified Ethernet port.

```
device(config)# vlan 200
device(config-vlan-200)# spanning-tree 802-1w ethernet 1/1/3 admin-edge-port admin-pt2pt-mac force-
migration-check path-cost 5 priority 10
```

spanning-tree ethernet

Configures the path and priority costs for a port.

Syntax

```
spanning-tree [ single ] ethernet stackid/slot/port { disable | path-cost { number | auto } | priority number }
```

```
no spanning-tree [ single ] ethernet stackid/slot/port { disable | path-cost { number | auto } | priority number }
```

Command Default

The Ethernet port parameters are preconfigured with default values.

Parameters

single

Configures a Single STP.

disable

Disables STP for the interface on the VLAN.

path-cost *number*

Configures the cost of the port path to the root bridge. STP prefers the path with the lowest cost. The range is from 0 through 65535.

auto

Configures the cost of the port path to be the value set by the system software.

priority *number*

Sets the priority for the port. The priority value ranges from 0 through 240, in increments of 16. The default value is 128.

Modes

Global configuration mode

VLAN configuration mode

Usage Guidelines

The **single** keyword is available only in global configuration mode.

Configuring STP parameter values is optional. All parameters have default values. Additionally, all values will be globally applied to all ports on the system or on the port-based VLAN for which they are defined.

The default path cost depends on the port type:

- 10 Mbps - 100
- 100 Mbps - 19
- 1 Gbps - 4
- 10 Gbps - 2

The **no** form of the command disables the STP on the Ethernet port.

Examples

The following example shows how to configure the path cost and priority for an Ethernet port.

```
device(config)# vlan 10  
device(config-vlan-10)# spanning-tree ethernet 1/1/5 path-cost 15 priority 64
```

spanning-tree designated-protect

Disallows the designated forwarding state on a port in STP 802.1d or 802.1w.

Syntax

spanning-tree designated-protect
no spanning-tree designated-protect

Command Default

STP (802.1d or 802.1w) can put a port into designated forwarding state.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of this command allows the designated forwarding state on a port in STP 802.1d or 802.1w. If STP tries to put a port into designated forwarding state, the device puts this port into the designated inconsistent STP state. This is effectively equivalent to the listening state in STP in which a port cannot forward any user traffic. When STP no longer marks this port as a designated port, the port is automatically removed from the designated inconsistent state.

NOTE

You use this command to enable Designated Protection at the port-level while the designated inconsistent state is a per-STP-instance, per-port state.

NOTE

You cannot enable Designated Protection and Root Guard on the same port.

Examples

The following example disallows the designated forwarding state on interface 1/1/1.

```
device(config)# ethernet interface 1/1/1
device(config-if-e1000-1/1/1)# spanning-tree designated-protect
```

History

Release version	Command history
07.3.00g	This command was introduced.

spanning-tree root-protect

Configures STP root guard.

Syntax

spanning-tree root-protect

no spanning-tree root-protect

Command Default

Root guard is disabled by default.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of the command disables STP root guard.

Examples

The following example shows how to enable RSTP on a port.

```
device(config)# interface ethernet 1/1/1  
device(config-if-e1000-1/1/1)# spanning-tree root-protect
```

spanning-tree rstp

Enables 802.1w Draft 3 in a port-based VLAN.

Syntax

```
spanning-tree [ single ] rstp  
no spanning-tree [ single ] rstp
```

Command Default

RSTP is disabled by default.

Parameters

single
Configures single RSTP on the device.

Modes

Global configuration mode
VLAN configuration mode

Usage Guidelines

You must enter the command separately in each port-based VLAN in which you want to run 802.1w Draft 3.

This command does not enable STP. To enable STP, first enter the **spanning-tree** command without the **rstp** parameter. After you enable STP, enter the **spanning-tree rstp** command to enable 802.1w Draft 3.

The **no** form of the command disables RSTP.

Examples

The following example shows how to enable RSTP on a port.

```
device(config)# vlan 10  
device(config-vlan-10)# spanning-tree rstp
```

speed-duplex

Sets link speed and mode (full or half duplex, or slave or master).

Syntax

```
speed-duplex { 10-full | 10-half | 100-full | 100-half | 1000-full | 1000-full-master | 1000-full-slave | 10g-full | |  
10g-full-master | 10g-full-slave | 2500-full | 2500-full-master | 2500-full-slave | auto }
```

```
no speed-duplex
```

Command Default

By default, the speed is auto-negotiated.

Parameters

10-full

10M, full duplex

10-half

10M, half duplex

100-full

100M, full duplex

100-half

100M, half duplex

1000-full

1G, full duplex

1000-full-master

1G, full duplex, master

1000-full-slave

1G, full duplex, slave

10g-full

10G, full duplex

10g-full-master

10G, full duplex, master

10g-full-slave

10G, full duplex, slave

2500-full

2.5G, full duplex

2500-full-master

2.5G, full duplex, master

2500-full-slave

2.5G, full duplex, slave

auto

Auto-negotiation. This is the default.

Modes

Interface configuration mode

Usage Guidelines

The Gigabit Ethernet copper ports are designed to auto-sense and auto-negotiate the speed and duplex mode of the connected device. If the attached device does not support this operation, you can manually enter the port speed to operate at either 10, 100, or 1000 Mbps. The default and recommended setting is 10/100/1000 auto-sense.

On FastIron devices, when setting the speed and duplex-mode of an interface to 1000-full, configure one side of the link as master (1000-full-master) and the other side as slave (1000-full-slave).

Both ends of the link must be configured to operate at the same speed.

On the ICX 7450-32ZP 2.5G ports, this command works in port pairs only. The port speed for the following ports should be changed together: 25-26, 27-28, 29-30, and 31-32.

The **no** form of the command restores the default.

Examples

The following example changes the port speed of copper interface 1/1/8 on a device from the default of 10/100/1000 auto-sense, to 100 Mbps operating in full-duplex mode.

```
device(config)# interface ethernet 1/1/8
device(config-if-e1000-1/1/8)# speed-duplex 100-full
```

spt-threshold

Changes the number of packets the device receives using the RP before switching to the SPT.

Syntax

spt-threshold *num-of-packets*

no spt-threshold *num-of-packets*

Command Default

By default, the device switches from the RP to the SPT after receiving the first packet for a given IPv6 PIM Sparse group.

Parameters

num-of-packets

Specifies the number of packets as a 32-bit integer.

Modes

Router IPv6 PIM configuration mode

Usage Guidelines

Each IPv6 PIM Sparse router that is a DR for an IPv6 receiver calculates a short path tree (SPT) towards the source of the IPv6 multicast traffic. The first time the device configured as an IPv6 PIM router receives a packet for an IPv6 group, it sends the packet to the RP for that group, which in turn will forward it to all the intended DRs that have registered with the RP. The first time the device is a recipient, it receives a packet for an IPv6 group and evaluates the shortest path to the source and initiates a switchover to the SPT. Once the device starts receiving data on the SPT, the device proceeds to prune itself from the RPT.

You can change the number of packets the device receives using the RP before switching to using the SPT. If you enter a specific number of packets, the device does not switch over to using the SPT until it has sent the number of packets you specify using the RP.

The **no** form of the command resets the default behavior, that is, the device switches from the RP to the SPT after receiving the first packet for a given IPv6 PIM Sparse group. The device maintains a separate counter for each IPv6 PIM Sparse source-group pair.

Examples

The following example changes the number of packets the device receives using the RP before switching to the SPT.

```
device(config)# ipv6 router pim
device(config-ipv6-pim-router)# spt-threshold 1000
```

The following example changes the number of packets the device receives using the RP before switching to the SPT for a specified VRF.

```
device(config)# ipv6 router pim vrf blue
device(config-ipv6-pim-router-vrf-blue)# spt-threshold 1000
```

spx allow-pe-movement

Allows you to move PE units to other CB SPX ports without changing the PE ID or changing any related port configuration.

Syntax

spx allow-pe-movement
no spx allow-pe-movement

Command Default

By default, a PE ID may change when a PE unit is moved.

Modes

Global configuration mode.

Usage Guidelines

The **no** form of the command disables the feature.

The existing PE ID is used but the **pe-id cb-port id1 id2** configuration typically used in PE ID assignment is ignored when **allow-pe-movement** is configured.

All port configuration in the PE still applies.

When you move a PE unit to a new port with **spx allow-pe-movement** configured, the system detaches the port, and protocols register a "port down" event. When the PE joins with the same number on a new SPX port or LAG, the unit is treated as a new PE, and protocols initialize normally.

Brocade recommends removing **spx allow-pe-movement** configuration once you are finished moving PE units. After removing the configuration, execute the **write memory** command.

Examples

The following example enables retaining IDs when PE units are moved.

```
device# configure terminal  
device(config)# spx allow-pe-movement
```

History

Release version	Command history
08.0.50	This command was introduced.

spx cb-configure

Enters 802.1br control bridge (CB) configuration mode, where SPX ports and LAGs are configured.

Syntax

spx cb-configure

no spx cb-configure

Modes

Router configuration mode.

Usage Guidelines

The **no** form of the command removes all CB configuration and is available only when **cb-enable** configuration is not present.

The **spx cb-configure** command is available only when the control bridge has been enabled on an eligible router. The router must be an ICX 7750 device.

In CB configuration mode, zero-touch provisioning can be enabled, and zero-touch-ports can be configured. In addition, multicast E-CIDs, SPX ports, SPX LAGs, and PE IDs can be configured. SPX ports and LAGs can be configured in advance or on live links.

Examples

The following example enables 802.1br CB mode and enters CB configuration mode.

```
device# configure terminal
device(config)# spx cb-enable
Spanning Tree Protocols require a reload. Are you sure? (enter 'y' or 'n'): y
ICX7750-20Q Router(config)# System is now in 802.1br control bridge (CB) mode.
[ System reload follows ]
!
!
device# config terminal
device (config)# spx cb-configure
device(config-spx-cb) # ?
  clear                Clear table/statistics/keys
  end                  End Configuration level and go to Privileged
                      level
  exit                 Exit current level
  multi-spx-lag        Configure two lags of a live link
  multi-spx-port       Configure two ports of a live link
  no                   Undo/disable commands
  pe-id                PE ID assignment provision
  quit                 Exit to User level
  show                 Show system information
  spx-lag               Configure one CB lag
  spx-port              Configure one or more CB ports
  write                 Write running configuration to flash or terminal
  zero-touch-enable    actively send probe
  zero-touch-ports     Configure zero touch ports
  <cr>
device (config-spx-cb) #
```

Commands Sn - Z

spx cb-configure

The following command removes the CB configuration. The first attempt is blocked because the CB is enabled. After the CB is disabled, the command is allowed, but a warning is displayed, and you are required to confirm the request.

```
device# configure terminal
device(config)# no spx cb-configure
Error! "no spx cb-config" is not allowed due to "spx cb-enable".
device(config)# no spx cb-enable
System is no longer in 802.1br control bridge (CB) mode.
device(config)# no spx cb-config
Warning! will remove all config in "spx cb-config". Are you sure? (enter 'y' or 'n'):
```

History

Release version	Command history
08.0.40	This command was introduced.
08.0.50	The command was modified to include zero-touch-enable and zero-touch-ports commands.

spx cb-enable

Enables a standalone ICX 7750 or an ICX 7750 stack as an SPX control bridge (CB).

Syntax

spx cb-enable
no spx cb-enable

Command Default

SPX is not enabled by default.

Modes

Router configuration mode

Usage Guidelines

The **no** form of the command disables SPX on the device.

Enter the command on the standalone unit or on the active controller of the ICX 7750 stack that will become the CB for an SPX domain.

If spanning tree protocol (xSTP) is configured on the ICX 7750, the command must be followed by a system reload. In this case, you are prompted that a reload is required. If you confirm the command, the reload occurs automatically. The CB units are then reloaded, but not the PE units.

Use the **cb-configure** command to configure SPX ports and LAGs.

Examples

The following example enables a CB on an ICX 7750 router.

```
device# configure terminal
device(config)# spx cb-enable
```

History

Release version	Command history
8.0.40	This command was introduced.

spx interactive-setup

Allows you to configure several options interactively: change existing PE IDs, discover and assign IDs to new PE units, and convert existing or new standalone devices to PE units.

Syntax

spx interactive-setup

Command Default

None.

Modes

Privileged EXEC mode.

Usage Guidelines

You can abort SPX interactive-setup at any time by pressing <CTRL>-C.

SPX interactive-setup will abort after two minutes of inactivity.

You can use SPX interactive-setup for configuration that is not possible with SPX zero-touch features.

You can use SPX interactive-setup to handle invalid topologies by specifying units to form a valid topology.

If not all units are discovered when you run **spx interactive-setup**, you can run the utility again.

Examples

The following example shows options available under **spx interactive-setup**.

```
ICX7750-20Q Router# spx interactive-setup
You can abort interactive-setup at any stage by <ctrl-c>
0: quit
1: change PE IDs
2: discover and convert new units (no startup-config flash) to PEs
3: discover and convert existing/new standalone units to PEs
Please type your selection:
```

The following example uses the SPX interactive-setup utility to change two existing PE IDs.

```

ICX7750-48F Router(config)# spx cb-config
ICX7750-48F Router(config-spx-cb)# no zero-touch-enable <-- You cannot run spx interactive-setup
                                                    when zero-touch is enabled.

ICX7750-48F Router(config-spx-cb)# end
ICX7750-48F Router# spx interactive-setup
You can abort spx interactive-setup at any stage by <ctrl-c>
0: quit
1: change PE IDs
2: discover and convert new units (no startup-config flash) to PEs
3: discover and convert existing/new standalone units to PEs

History

Release version	Command history
08.0.50	This command was introduced.

spx pe-enable

Enables SPX port extender (PE) mode.

Syntax

spx pe-enable

no spx pe-enable

Command Default

PE mode is not enabled by default.

Modes

Router configuration mode

Usage Guidelines

The **no** form of the command disables PE mode and returns the unit to regular mode.

NOTE

After you enter the no form of the command, even if you have executed the **write memory** command to save the **spx pe-enable** configuration in the PE startup file, the device removes the **spx pe-enable** configuration from the PE startup file immediately after entering regular mode. Then, when you enter **spx pe-enable** and **reload**, the device returns an error because **spx pe-enable** is not configured in the startup file.

A device cannot be enabled as a PE if stacking is enabled on the unit. The command is available only on an ICX 7450 router.

A standalone unit switches between regular and Provisional-PE mode immediately when **spx pe-enable** is configured or removed. When a provisional PE returns to regular mode after the **no spx pe-enable** command is issued, the **spx pe-enable** configuration is immediately removed from the PE startup file if the file exists. This is to prevent accidentally reloading the unit to PE mode.

The PE can be configured once it is enabled; however, the PE configuration is not saved until the **write memory** command is entered, followed by the **reload** command.

Examples

The following example enables an ICX 7450 standalone unit and moves it to Provisional-PE mode.

```
device# configure terminal
device(config)# spx pe-enable
Enter provisional PE mode. CLI is limited to spx unit 1.
After finishing all configuration, please "write memory" and reload this unit to be a PE.
[Provisional-PE]ICX7450-48F Router(config)# show running-config
Current configuration:
!
ver 08.0.40b1T213
!
spx pe-enable
spx unit 1
  module 1 icx7450-48f-sf-port-management-module
  module 2 icx7400-xgf-4port-40g-module
  module 4 icx7400-qsfp-lport-40g-module
  spx-port 1/2/1
  spx-port 1/2/3
!
end

[Provisional-PE]device(config)# write memory
Flash Memory Write (118 bytes)
[Provisional-PE]device(config)#
Write spx_pe.boot done.

[Provisional-PE]device(config)# exit
[Provisional-PE]device# reload
Are you sure? (enter 'y' or 'n'): y
```

The following example shows a provisional PE that returns to regular mode after the **no spx pe-enable** is entered.

```
device# configure terminal
device(config)# spx pe-enable
Enter provisional PE mode. CLI is limited to spx unit 1.
After finishing all configuration, please "write memory" and reload this unit to be a PE.
[Provisional-PE]device(config)# write memory
Flash Memory Write (118 bytes)
[Provisional-PE]device(config)#
Write PE startup file done.

[Provisional-PE]device(config)# no spx pe-enable
Leave provisional PE mode. Spx unit 1 configuration becomes invisible.
device(config)#

[ Note: the device immediately removes "spx pe-enable" from the PE startup file. ]

device(config)# spx pe-enable
Enter provisional PE mode. CLI is limited to spx unit 1.
After finishing all configuration, please "write memory" and reload this unit to be a PE.
[Provisional-PE]ICX7450-48F Router(config)# end
[Provisional-PE]ICX7450-48F Router# reload
Error! provisional PE can only reload to PE mode, but boot file has no "spx pe-enable".
Please do "write memory" and try again, or "no spx pe-enable" to go back to switch/router mode.
```

History

Release version	Command history
8.0.40	This command was introduced.

spx suggested-id

Defines a preferred ID for the PE unit being configured.

Syntax

spx suggested-id *number*

Command Default

The provisional PE does not suggest an ID by default.

Parameters

number

Decimal number from 17 through 56 proposed as the ID for the PE unit being configured.

Modes

Provisional-PE configuration mode

PE configuration mode

Usage Guidelines

The command is available only on the ICX 7450, and only after the **spx pe-enable** command has been entered. That is, the command is available only on a PE or a provisional PE unit; it is not available from the control bridge (CB).

The suggested ID does not necessarily become the PE ID. Reserved configuration on the CB that matches the new PE unit takes precedence. Furthermore, if the ID is already assigned, it is not reassigned.

All SPX configuration created on the provisional PE must be saved with the **write-memory** command, followed by the **reload** command to take effect.

Examples

The following example suggests that the PE being configured be given the PE ID 20 when it joins a CB. Locally, the provisional PE or PE always refers to itself as SPX unit 1.

```
device# configure terminal
device(config)# spx pe-enable
Enter provisional PE mode. CLI is limited to spx unit 1.
After finishing all configuration, please "write memory" and reload this unit to be a PE.
[Provisional-PE]device(config)# spx suggested-id 20
```

History

Release version	Command history
8.0.40	This command was introduced.

spx unconfigure

Removes the PE startup file and recovers the designated PE unit or units to regular mode.

Syntax

```
spx unconfigure { me | id | all | unit-id id-list }
```

Parameters

me

Unconfigures the PE on which the command is issued.

id

Entered as a decimal from a CB, unconfigures the PE unit with that ID.

all

If issued from a CB, unconfigures all PEs in the SPX domain.

unit-id *id-list*

If issued from a CB, unconfigures multiple PEs designated in the *id-list*. The list of units is separated by commas. No spaces are allowed in the list. A range may also be included; for example:

- **spx unconfigure unit-id** 17-19
- **spx unconfigure unit-id** 17,18,19-21,23

Modes

Provisional-PE mode

PE mode

CB router mode

Usage Guidelines

The **spx unconfigure all** command can be issued only on a CB. This form of the command removes the SPX startup file of every PE and CB unit in the SPX domain. It also reloads all PE units. The CB unit from which the command is issued and other CB units in the configuration are not reloaded.

The **spx unconfigure id** command can be issued only from a CB. It removes the PE startup file of the specified PE and reloads it.

The **spx unconfigure unit-id id-list** command can be issued only from a CB. It removes the PE startup file of multiple specified PEs and reloads them.

The **spx unconfigure me** command removes the PE startup file from the PE unit on which the command is issued. The startup configuration file for regular mode is not affected. If it is a PE unit, it reloads. A device in regular mode or in Provisional-PE mode does not reload.

The startup configuration file for regular mode is not affected by the **spx unconfigure** command.

Examples

In the following example, the **spx unconfigure me** command is entered on a PE unit.

```
[PE]local-id@device# spx unconfigure me  
This unit will remove the PE startup file and reload as a standalone. Are you sure? (enter 'y' or 'n'):
```

The following example shows the system response when the **spx unconfigure me** command is entered in Provisional-PE mode (on a PE that is configured but for which the configuration has not been written to memory and reloaded).

```
[Provisional-PE]device# spx unconfigure me  
This unit will remove the PE startup file. Are you sure? (enter 'y' or 'n'):
```

The following example unconfigures a list of PE units from the CB. No spaces are allowed in the PE list.

```
ICX 7750# configure terminal  
ICX 7750(config)# spx unconfigure unit-id 17,18,19-22,25
```

History

Release version	Command history
08.0.40	This command was introduced.
08.0.50	The unit-id key word was added to allow for a list of IDs to be unconfigured simultaneously.

spx unit

Configures a reserved SPX unit or certain parameters on a live SPX unit.

Syntax

spx unit *id*

no spx unit *id*

Command Default

Without prior configuration, the SPX unit joins an SPX domain as a dynamic PE, and its dynamic configuration is lost when it leaves.

Parameters

id

Designates the PE unit to be configured.

Modes

CB configuration mode

PE configuration mode

Provisional-PE configuration mode

Usage Guidelines

The **no** form of the command removes a reserved SPX unit. It can be entered only from a CB unit. An error message is displayed if the **no** form of the command is entered for a live unit, and the command fails. As an exception, you can remove a live unit that is in a non-operational state due to configuration (module) mismatch. In this case, the CB can remove the configuration, learn the modules from the PE unit, and place it in a ready state.

A CB unit can configure an SPX unit with a unit number from 17 through 56. A PE or provisional PE can only configure unit 1 (itself) and does not have knowledge of its future ID number in the SPX domain.

These command can be configured under **spx unit: spx-name, module, spx-port, spx-lag**. On a PE or provisional PE, the **module** command cannot be configured.

If you configure parameters for a live SPX unit, the CB pushes the new configuration to the live unit immediately.

When you create a reserved SPX unit, you must configure modules for the unit. Modules can only be configured on a CB unit.

Examples

The following example creates a configuration for SPX unit 18 from a CB.

```
device# configure terminal
device(config)# spx unit 18
device(config-spx-unit-18)# spx-name bldg2-floor2-stk 18
device(config-spx-unit-18)# module 1 icx7450-48f-sf-port-management-module
device(config-spx-unit-18)# module 2 icx7400-xgf-4port-40g-module
device(config-spx-unit-18)# module 4 icx7400-qsfp-1port-40g-module
```

The following example configures an SPX port and an SPX LAG from a CB.

```
device# configure terminal
device(config)# spx unit 21
device(config-spx-unit-21)# spx-port 21/2/4
device(config-spx-unit-21)# spx-lag 21/1/10 to 21/1/11
device(config-spx-unit-21)# exit
```

The following example first shows a PE being created, with system-generated ports and module information. The SPX number is always 1 in PE or Provisional-PE configuration mode. SPX ports 1/2/1 and 1/2/3 are generated by the system in this case because there is a 4 X 10-Gbps module in slot 2. The example then shows a user modification to a LAG and an SPX port, still in Provisional-PE mode. As indicated in system messages, you should use the **write memory** command to save the configuration.

```
device(config)# spx pe-enable
Enter provisional PE mode. CLI is limited to spx unit 1.
After finishing all configuration, please "write memory" and reload this unit to be a PE.
[Provisional-PE]device(config)# show run

History

Release version	Command history
8.0.40	This command was introduced.

spx zero-touch-deny

Configures a standalone unit so that it cannot be discovered by the SPX zero-touch or SPX interactive-setup utility.

Syntax

spx zero-touch-deny
no spx zero-touch-deny

Command Default

By default, an eligible unit is discoverable (within a presentable configuration).

Modes

Global configuration mode.

Usage Guidelines

The **no** form of the command returns the unit to a discoverable state. It does not re-enable the zero-touch feature, however.

The **spx zero-touch-deny** command also removes **zero-touch-enable** and **spx pe-enable** under SPX CB configuration.

The command can be entered from an ICX 7250 or an ICX 7450 standalone.

The command cannot be applied to an ICX 7250 or ICX 7450 that is already in Provisional-PE or PE mode.

If you configure **spx pe-enable** on a device, the **spx zero-touch-deny** configuration is removed. Likewise, the **spx zero-touch-deny** command removes the **spx pe-enable** command.

Examples

The following example configures the unit so that it cannot be discovered as an SPX PE candidate.

```
device# configure terminal
device(config)# spx zero-touch-deny
```

History

Release version	Command history
08.0.50	This command was introduced.

spx-lag

Configures one end of a multi-port connection on a CB or a PE unit.

Syntax

```
spx-lag port-list [ pe-group name ]
```

```
no spx-lag port-list [ pe-group name ]
```

Command Default

By default, a LAG does not exist.

Parameters

port-list

Designates the ports to include in the LAG. The port list can contain a list of ports (1/1/2 2/1/2 3/1/2), a range of ports (1/1/2 to 1/1/3), or a combination (1/1/2 to 1/1/3 3/1/2).

pe-group *name*

Designates the PE group name associated with the LAG. This option is available in CB configuration mode.

Modes

CB configuration mode

Provisional-PE mode

PE mode

Usage Guidelines

The **no** form of the command with the correct list of ports in the LAG removes the LAG. The optional **pe-group** configuration is ignored when removing the SPX LAG.

An SPX LAG can contain from 2 through 16 ports. An SPX LAG allows noncontiguous ports. The **spx-lag** command can be configured for a control bridge (CB) as a cascade LAG or for a PE unit. An SPX LAG on a CB can span multiple units. An SPX LAG on a PE unit can contain only ports on the same unit.

You can remove a LAG member by re-entering the **spx-lag** command without the port number that you want to remove. If you create a new SPX LAG that contains a member of another SPX LAG or a previously configured SPX port, the new LAG replaces the old LAG or SPX port.

SPX LAGs and SPX ports are mutually exclusive in their membership. For example, if you configure an SPX LAG containing ports 17/2/1 to 17/2/3, the system removes the configured SPX port 17/2/1. If you configure SPX port 17/2/1, the system removes the port from the LAG and creates the two-port LAG 17/2/2 to 17/2/3.

The system blocks the **spx-lag** command if executing it would make any PE unreachable. However, it allows the command to break a ring into two chains.

The optional PE group name can be used when assigning PE IDs from the CB with the **pe-id** command. It can also be used in the **show spx pe-group** command to focus command output. If you enter the **spx-lag** command and omit the previously assigned PE group name, the name is removed from the LAG, and it is replaced by the primary port of the SPX LAG in the SPX configuration.

Examples

The following example configures a LAG that includes ports from CB units 1, 2, and 3.

```
device# configure terminal
device(config)# spx cb-configure
device(config-spx-cb)# spx-lag 1/1/10 2/1/2 3/1/1
```

The following example configures a LAG and then configures a second LAG that replaces the first because port 2/1/9 is in both LAGs.

```
device# configure terminal
device(config)# spx cb-configure
device(config-spx-cb)# spx-lag 1/1/7 2/1/9 3/1/10
device(config-spx-cb)# spx-lag 2/1/9 3/1/12
spx-lag 1/1/7 2/1/9 3/1/10 is replaced by spx-lag 2/1/9 3/1/12.
```

The following example configures a two-port SPX LAG on a provisional PE.

```
device# configure terminal
device(config)# spx pe-enable
Enter provisional PE mode. CLI is limited to spx unit 1.
After finishing all configuration, please "write memory" and reload this unit to be a PE.
[Provisional-PE]device(config)#
[Provisional-PE]device(config)# spx unit 1
[Provisional-PE]device(config-spx-unit-1)# spx-lag 1/2/1 to 1/2/2
```

The following example is executed from the CB and removes an SPX LAG from a PE unit. The command can be entered from the CB for a live PE or for a reserved configuration.

```
ICX7750-20Q Router# configure terminal
ICX7750-20Q Router(config)# spx unit 17
ICX7750-20Q Router(config-spx-unit-17)# no spx-lag 17/2/1 to 17/2/2

spx-lag 17/2/1 to 17/2/2 is removed
```

History

Release version	Command history
8.0.40	This command was introduced.

spx-mon enable

Enables spx-mon analysis tools.

Syntax

spx-mon enable

no spx-mon enable

Command Default

The tool is disabled by default.

Modes

Global configuration mode.

Usage Guidelines

The **no** form of the command disables spx-mon.

Examples

The following example enables spx-mon tools on the device.

```
device# configure terminal
device(conf)# spx-mon enable
```

History

Release version	Command history
08.0.50	This command was introduced.

spx-port

Configures one or more SPX ports for the control bridge (CB) or a port extender (PE) unit.

Syntax

spx-port *unit/slot/port* [**pe-group** *name*]

no spx-port *unit/slot/port* [**pe-group** *name*]

Command Default

By default, no SPX port is configured. Some exceptions are noted under *Usage Guidelines*.

Parameters

unit/slot/port

Designates the port to be configured as an SPX port.

pe-group *name*

Names the PE group associated with the SPX port or LAG.

Modes

CB configuration mode

SPX configuration mode (on the CB)

Provisional-PE configuration mode

PE configuration mode

Usage Guidelines

The **no** form of the command removes the SPX port.

The **pe-group** option is available only for CB SPX ports or LAGs, not for SPX ports or LAGs on a PE unit.

SPX LAGs and SPX ports are mutually exclusive in their membership. For example, if you configure an SPX LAG containing ports 17/2/1 to 17/2/3, the system removes the configured SPX port 17/2/1. If you configure SPX port 17/2/1, the system removes the port from the SPX LAG and creates the two-port LAG 17/2/2 to 17/2/3.

The system blocks the **spx-port** command if executing it would make any PE unreachable.

The **pe-group** *name* option can be used in the **pe-id** command when assigning PE IDs. It can also be used in the **show spx pe-group** command to focus command output.

If you enter the **spx-port** command and omit the previously assigned pe-group name, the name is removed from the port, and it is replaced by the port number in display output.

When you configure **spx pe-enable** on a device and it enters Provisional-PE mode the first time, the device generates two SPX ports. If it has any 4 X 10-Gbps modules installed, the system generates SPX port 1/x/1 and SPX port 1/x/3, where "x" represents the lowest module number of any 4 X 10-Gbps modules installed. If no 4 X 10-Gbps module is

installed, the device generates up to two SPX ports using installed 40-Gbps modules. If no 4 X 10-Gbps or 40-Gbps module is installed in the device, no SPX ports are generated.

Examples

The following example configures SPX port 1/2/2 on the CB.

```
device# configure terminal
device(config)# spx cb-configure
device(config-spx-cb)# spx-port 1/2/2
```

In the following example, the CB configures SPX port 21/2/4 as part of the reserved configuration for PE unit 21.

```
device# configure terminal
device(config)# spx unit 21
device(config-spx-unit-21)# spx-port 21/2/4
device(config-spx-unit-21)# exit
device(config)#
```

History

Release version	Command history
8.0.40	This command was introduced.

ssh

Starts an SSH2 client connection to an SSH2 server using password authentication.

Syntax

```
ssh { hostname | ipv4-address } [ public-key { dsa | rsa } ] [ port-num ]
```

```
ssh ipv6 { hostname | ipv6-address } [ public-key { dsa | rsa } ] [ outgoing-interface type number ] [ port-num ]
```

Command Default

SSH2 client connection is not established.

Parameters

hostname

Specifies the host name of the SSH server.

ipv4-address

Specifies the IPv4 address of the SSH server.

public-key

Configures the type of public key authentication to use for the connection. If you do not enter this parameter, the default authentication type is password.

dsa

Specifies the public key authentication type as DSA.

rsa

Specifies the public key authentication type as RSA.

port-num

Specifies that the SSH2 connection will use a non-default SSH2 port. The default is 22.

ipv6

Identifies the remote IPv6 SSH server.

ipv6-address

Specifies the IPv6 address of the SSH server.

outgoing-interface

Configures the outgoing interface for Link-Local address.

type

Specifies the interface type.

number

Specifies the interface number. Use ? to get the list of supported interfaces.

Modes

Privileged EXEC mode

Examples

The following example starts an SSH2 client connection to an SSH2 server using password authentication.

```
device# ssh 192.168.10.1
```

The following example starts an SSH2 client connection to an SSH2 server using public key authentication.

```
device# ssh ipv6 2001::1 public-key dsa
```

The following example starts an SSH2 client connection to an SSH2 server using public key authentication.

```
device# ssh ipv6 2001::1 public-key dsa outgoing-interface ethernet 1/1/1 26
```

ssh access-group

Configures an ACL that restricts SSH access to the device.

Syntax

```
ssh access-group { acl-num | acl-name | ipv6 ipv6-acl-name }
```

```
no ssh access-group { acl-num | acl-name | ipv6 ipv6-acl-name }
```

Command Default

SSH access is not restricted.

Parameters

acl-num

The standard access list number. The valid values are from 1 through 99.

acl-name

The standard access list name.

ipv6 *ipv6-acl-name*

The IPv6 access list name.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command removes the SSH access restriction.

Examples

The following example shows how to configure an ACL that restricts SSH access to the device. In this example, ACL 10 is configured. The device allows SSH access to all IP addresses except those listed in ACL 10.

```
device(config)# access-list 10 permit host 10.168.144.241
device(config)# access-list 10 deny host 10.168.144.242 log
device(config)# access-list 10 permit host 10.168.144.243
device(config)# access-list 10 deny any
device(config)# ssh access-group 10
```

ssm-enable

Globally enables source-specific multicast (SSM).

Syntax

```
ssm-enable [ range { address-range | acl-id } ]  
no ssm-enable range { address-range | acl-id }
```

Command Default

SSM mode is disabled.

Parameters

range
Configures the IP multicast address range.

address-range
Configures the SSM range of IP multicast address.

acl-id
Specifies the ACL number or name.

Modes

IPv4 PIM router configuration mode
IPv6 PIM router configuration mode
VRF configuration mode

Usage Guidelines

PIM-SM must be enabled on any ports on which you want SSM to operate.

In the case of IPv4 PIM router configuration mode, the *address-range* can be specified in the format A.B.C.D P.Q.R. S where P.Q.R.S is the network mask or as A.B.C.D/L. If the address is not configured, the range will default to 232/8 as assigned by the Internet Assigned Numbers Authority (IANA) for use with SSM.

In the case of IPv6 PIM router configuration mode, the *address-range* can be specified in the format X:X::X/M. If the address is not configured, the address range will default to ff30:/12 as assigned by the Internet Assigned Numbers Authority (IANA) for use with SSM.

Examples

The following example enables SSM on an IPv6 PIM-SM-enabled port.

```
device(config)# ipv6 router pim  
device(config-ipv6-pim-router)# ssm-enable
```

The following example enables SSM on an IPv4 PIM-SM-enabled port.

```
device(config)# ip router pim  
device(config-ip-pim-router)# ssm-enable
```

The following example enables SSM on an IPv6 PIM-SM-enabled port.

```
device(config)# ipv6 router pim my_vrf  
device(config-ipv6-pim-router-vrf-my_vrf)# ssm-enable ff44::/32
```

stack disable

Prevents a device from joining a traditional stack and from listening for, or sending, stacking packets.

Syntax

stack disable

no stack disable

Command Default

Stacking is disabled by default.

Modes

Global configuration mode and Stack unit configuration mode

Usage Guidelines

To remove the restriction that prevents the unit from joining a stack, use the **no stack disable** command.

Examples

The following example disables the device from joining a stack.

```
device# configure terminal
device(config)# stack disable
Disable stacking. This unit will not be a part of any stack
```

History

Release version	Command history
08.0.00a	This command was introduced.

stack enable

Enables stack configuration on the device. Enter this command on the intended active controller.

Syntax

stack enable
no stack enable

Command Default

Stacking is not enabled on the device.

Modes

Global configuration mode
Stack unit configuration mode

Usage Guidelines

Use the **no** form of the command to remove stacking capability from the device.

NOTE

When you use the **no stack enable** command, the unit can still be called to join an active stack. To prevent this, use the **stack disable** command instead.

You must remove all configuration information from the port before issuing the **stack enable** command.

For manual configuration, the **stack enable** command must be issued on each device in the stack.

Examples

The following example enables stack configuration on the device.

```
device# config terminal
device(config)# stack enable
Enable stacking. This unit actively participates in stacking
```

History

Release version	Command history
08.0.00a	This command was introduced.

stack mac

Manually configures a specific MAC address for a traditional stack.

Syntax

stack mac *mac-address*

no stack mac *mac-address*

Command Default

Beginning with FastIron release 08.0.20, when a stack is enabled or when hitless-failover occurs, a default stack MAC address is assigned if none is configured. In earlier releases, the stack assumed the MAC address of the active controller by default.

Parameters

mac-address

Specifies the MAC address to be used for the stack.

Modes

Active stack controller configuration mode

Usage Guidelines

Enter the **no** form of this command to revert to the use of the active controllers' MAC address.

The MAC address is a hexadecimal value entered in the format xxxx.xxxx.xxxx.

Examples

The following example configures the stack MAC address manually as 0000.0163.0022.

```
device(config)# stack mac 0000.0163.0022
device(config)# show running-config
Current configuration:
!
ver 08.0.40
!
stack unit 1
  module 1 icx7750-48-xgc-port-management-module
  module 2 icx7750-qsfp-6port-qsfp-240g-module
stack rconsole-off
stack mac 0000.0163.0022
!
breakout ethe 1/2/6
!
!
!
global-stp
!
store-and-forward
!
lag ccep1 dynamic id 3
```

History

Release version	Command history
08.0.00a	This command was introduced.
08.0.20	Stack behavior was modified so that a default MAC address is assigned when the stack is enabled or when hitless failover occurs if no stack MAC address has been configured.

stack-port

Selects only one of the two stacking ports as a stacking port, which allows you to use the other port as a data port.

Syntax

stack-port *unit/slot/port*
no stack-port

Command Default

By default, both default ports serve as stacking ports on a stack unit.

Parameters

unit
Stack unit ID

slot
Slot or module on the unit where the interface resides.

port
Interface to be configured as the sole stack port on the unit.

Modes

Stack-unit configuration mode.

Usage Guidelines

The **no** form of the command restores both default stacking ports on the device.

The **stack-port** command should not be used on a live stack.

Examples

The following example configures Port 3/2/1 as the only stacking port on stack unit 3.

```
device# configure terminal
device(config)# stack unit 3
device(config-unit-3)# stack-port 3/2/1
Set only one stacking port 3/2/1
```

stack secure-setup

Configures a stack automatically, to add units to an existing traditional stack, or to change stack member IDs.

Syntax

stack secure-setup

Modes

Privileged EXEC mode of a stack unit

Usage Guidelines

Stacking must be enabled with the **stack enable** command before the **stack secure-setup** command can be issued.

When the **stack secure-setup** command is issued on a unit that is not already the active controller, the unit becomes the active controller.

Examples

In the following example, an ICX 7250 traditional stack is formed using **stack secure-setup** command.

```
device# stack secure-setup
device# Discovering the stack topology...

11      12  ICX7250-48P   cc4e.24b4.2eb0
Do you accept the unit id's (y/n)? : y
```

stack suggested-id

Specifies the preferred stack unit ID for a standalone device before it joins a stack.

Syntax

stack suggested-id *stack-unit*

no stack suggested-id *stack-unit*

Parameters

stack-unit

Specifies the numeric stack unit ID.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command removes the stack unit ID.

The **stack suggested-id** command is configured on a standalone device before it joins a stack and becomes a member. The command is not for the active controller. Because the active controller always keeps its bootup ID during stack formation, it does not use the suggested-id value.

The system attempts to assign a bootup ID of a device as its stack unit ID. However, due to timing issues or the possible unavailability of the bootup ID, a device might not get the stack unit ID that you want when the stack is formed. The optional **stack suggested-id** command allows you to specify the stack unit ID for member devices when you are configuring a traditional or mixed stack using the manual configuration method.

Examples

The following example sets the stack unit ID on a standalone device to 3.

```
device# configure terminal
device(config)# stack suggested-id 3
```

stack suppress-warning

Stops periodic output of background stack diagnostic reports.

Syntax

stack suppress-warning

no stack suppress-warning

Command Default

By default, background diagnostics are displayed periodically on the active stack controller.

Modes

Stack active controller configuration mode

Usage Guidelines

Use the **no** form of the command to restore periodic output of background diagnostic reports.

Examples

In the following example, background diagnostic reports are turned off for the stack.

```
Device# configure terminal
Device(config)# stack suppress-warning
```

stack switch-over

Switches active controllers without reloading the stack and without packet loss to services and protocols supported by hitless stacking.

Syntax

stack switch-over

Command Default

With FastIron release 08.0.20, the **stack switch-over** command is allowed by default. In earlier releases, hitless failover must first be enabled.

Modes

Global configuration mode on a stack controller

Usage Guidelines

Use the **stack switch-over** command before reloading or performing maintenance on the currently active controller. Hitless failover must be enabled for the command to be used; otherwise, an error message is issued.

The command cannot be used during stack election or during configuration of a multi-stack-trunk.

A standby controller must exist and must have learned stack protocols for the command to be used. The standby controller must have the same priority as the active controller for the command to be used.

More than 120 seconds must have passed since the previous switchover or failover for the command to be accepted.

Examples

The following example shows the **stack switch-over** command being entered and the resulting output. You must confirm the switch-over before it can take effect by entering **y** when prompted.

```
device# stack switch-over
Standby unit 8 will become active controller, and unit 1 will become standby
Are you sure? (enter 'y' or 'n'): y
Unit 1 is no longer the active controller
```

History

Release version	Command history
08.0.00a	This command was introduced.
08.0.20	Hitless failover is enabled by default. The stack switch-over command is allowed by default as a result.

stack-trunk

Configures a stack to form a trunk from contiguous links on one side of a stack connection.

Syntax

stack-trunk *stack-unit/slotnum/portnum* **to** *stack-unit/slotnum/portnum*

no stack-trunk *stack-unit/slotnum/portnum* **to** *stack-unit/slotnum/portnum*

Parameters

stack-unit

Specifies the stack unit ID.

slotnum

Specifies the slot number.

portnum

Specifies the port number in the slot.

Modes

Stack unit configuration mode

Usage Guidelines

Use the **no** form of the command to disable the stack trunk configuration.

The **stack-trunk** command must be configured on the stack units on both ends of the trunk. Use this command in a new environment on the first deployment of a stack.

To enable the **stack-trunk** command, the primary port in the trunk must be configured under the **stack-port** command configuration.

Do not use the **stack-trunk** command in a production environment. Use the **multi-stack-trunk** command instead.

Examples

In the following example, ports 1/2/3 and 1/2/4 are configured as a stacking trunk on stack unit 1.

```
Device# configure terminal
Device(config)# stack unit 1
Device(config-unit-1)# stack-trunk 1/2/3 to 1/2/4
```

stack unconfigure

Returns a stack member to its pre-stacking configuration or state.

Syntax

stack unconfigure [*stack-unit* | **all** | **me** | **clean**]

Parameters

stack-unit

Specifies the numerical ID of a stack member. This option is available on the active controller only.

all

Specifies all stack members. This option is available on the active controller only.

me

Specifies the stack member from which the command is executed. The command removes the unit from the stack and boots it up as a standalone. When the unit rejoins the stack, its standalone startup-config file is saved in a backup file. This option is available on stack member consoles only.

clean

Specifies that the startup configuration be removed from the unit on which the command is executed and that the unit be rebooted as a clean unit. This option is available on stack member consoles only.

Modes

Privileged EXEC mode

Usage Guidelines

When a stack unit that did not have an original startup configuration file is unconfigured, it becomes a clean unit. It is possible that this unit could automatically rejoin the stack if its module configuration matches the configuration of the active controller. To prevent this from happening accidentally, disconnect the unit to be unconfigured, and then issue the **stack unconfigure me** command on it.

Examples

In the following example, stack unit 2 is unconfigured in a traditional stack.

```
device(config)# show stack
alone: standalone, D: dynamic config, S: static config
ID  Type           Role      Mac Address      Pri  State  Comment
1  S  ICX7250-24     active  0012.f2eb.a900  128  local  Ready
2  S  ICX7250-24P   standby 00f0.424f.4243  0    remote Ready
3  S  ICX7250-24     member  00e0.5201.0100  0    remote Ready

device# stack unconfigure 2
Will recover pre-stacking startup config of this unit, and reset it. Are you sure?
(enter 'y' or 'n'): y

Stack 2 deletes stack bootup flash and recover startup-config.txt from .old

device# show stack
alone: standalone, D: dynamic config, S: static config
ID  Type           Role      Mac Address      Pri  State  Comment
1  S  ICX7250-24     active  0012.f2eb.a900  128  local  Ready
2  S  ICX7250-24P   member  0000.0000.0000  0    reserved
3  S  ICX7250-24     standby 00e0.5201.0100  0    remote  Ready
```

History

Release	Command History
07.4.00	This command was introduced.
08.0.00a	The mixed-stack option was added. The rollback option was deprecated.
8.0.40	Removed the mixed-stack option as this is not supported on ICX 7750, ICX 7450, and ICX 7250 devices.

static ethernet

Enables a static protocol VLAN membership.

Syntax

static ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]

no static ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]

Command Default

A static protocol VLAN membership is not configured.

Parameters

stackid/slot/port

Specifies the Ethernet port on which the static protocol VLAN membership is to be enabled.

to *stackid/slot/port*

Specifies the range of ports on which the static protocol VLAN membership is to be enabled.

Modes

IP protocol VLAN configuration mode

IPX protocol VLAN configuration mode

IPv6 protocol VLAN configuration mode

AppleTalk protocol VLAN configuration mode

DECnet protocol VLAN configuration mode

NetBIOS protocol VLAN configuration mode

Other protocol VLAN configuration mode

IP subnet VLAN configuration mode

Usage Guidelines

The **no** form of the command disables the static protocol VLAN membership.

Examples

The following example shows how to enable static protocol VLAN membership.

```
device (config)# vlan 3
device(config-vlan-3)# ip-subnet 10.1.2.0/24 name Yellow
device(config-vlan-ip-subnet)# no dynamic
device(config-vlan-ip-subnet)# static ethernet 1/1/9 to 1/1/16 ethernet 1/1/25
```

static-mac-address

Configures a static MAC address and assigns the address to the premium queue.

Syntax

static-mac-address *ethernet-mac-address* **ethernet** *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*] ...] [**priority** *number*]

no static-mac-address *ethernet-mac-address* **ethernet** *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*] ...] [**priority** *number*]

static-mac-address *ethernet-mac-address* **drop**

no static-mac-address *ethernet-mac-address* **drop**

Command Default

By default, all MAC addresses are in the best-effort queue.

Parameters

ethernet-mac-address

Specifies the MAC address of the Ethernet interface.

ethernet *stackid/slot/port*

Specifies the Ethernet interface.

to

Specifies the range of the Ethernet ports.

priority *number*

Configures a priority to the Ethernet MAC address. The values are from 0 through 7.

drop

Drop the packets to and from the specified Ethernet MAC address.

Modes

Global configuration mode (in case of a single VLAN)

VLAN configuration mode (in case of multiple VLANs)

Usage Guidelines

The **no** form of the command clears the static MAC address configuration.

Examples

The following example configures a static MAC address on a range of Ethernet interfaces with priority 7.

```
device(config)# static-mac-address 0000.0063.67ff ethernet 1/1/1 to 1/1/6 priority 7
```

Commands Sn - Z

static-mac-address

The following example configures a VLAN to drop packets with a source or destination MAC address.

```
device(config)# vlan 2
device(config-vlan-2)# static-mac-address 0000.0063.67FF drop
```

store-and-forward

Resets the switching method for forwarding packets from cut-through to store-and-forward.

Syntax

store-and-forward

no store-and-forward

Command Default

The switching method is cut-through.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the default packet-forwarding method to cut-through.

Ethernet devices support two basic switching methods for packet forwarding: store-and-forward and cut-through. The default method on ICX 7750 devices is cut-through. You can configure the **store-and forward** command to change it to store-and-forward.

NOTE

You must save the configuration and reload for the change to take effect.

A store-and-forward device does not make a forwarding decision on a data packet until it has received the whole frame and checked its integrity; a cut-through device starts the forwarding process soon after it makes the forwarding decision on an incoming frame that is, it might start forwarding before the entire packet is received. This reduces forwarding latency, especially for longer packets. However, there are many factors to consider when selecting which switching method is best for your environment and in some cases it is desirable to change from the default method and configure a device to store-and-forward.

The following table describes some of the differences in how packets are handled depending on the switching method.

Feature	Cut-through	Store-and-forward
Forwarding	Data forwarding starts before an entire packet is received	Device waits for entire packet received before processing.
Latency	Low latency, less than 1 micro second.	Higher latency; latency depends on frame size.
FCS Errors	FCS errors may be propagated from one device to another.	FCS errors are checked and error packets are discarded in the MAC receive.
MTU size	MTU size is validated by MAC receive. Oversize packets are marked as error packets but not dropped in the MAC receive.	MTU size is validated by MAC receive. Oversize packets are dropped at the MAC layer.

Examples

This example globally enables **store-and-forward** packet switching and saves the configuration.

```
Device(config)# store-and-forward  
Device(config)# write memory  
Device(config)# end
```

History

Release version	Command history
08.0.10b	This command was introduced.

stp-bpdu-guard

Enables STP BPDU Guard on the Ethernet interfaces.

Syntax

stp-bpdu-guard
no stp-bpdu-guard

Command Default

STP BPDU Guard is disabled by default.

Modes

Interface configuration mode

Usage Guidelines

When a BPDU Guard-enabled port is disabled by BPDU Guard, the Brocade device places the port in the errdisable state and displays a message on the console indicating that the port is errdisabled.

The **no** form of the command disables the STP BPDU Guard on the Ethernet interfaces.

Examples

The following example shows how to enable the STP BPDU Guard on a port.

```
device(config)# interface ethernet 1/2/1
device(config-if-e1000-1/2/1)# stp-bpdu-guard
```

The following example shows how to enable the STP BPDU Guard on multiple ports.

```
device(config)# interface ethernet 1/1/1 to 1/1/9
device(config-mif-1/1/1-1/1/9)# stp-bpdu-guard
```

stp-group

Changes the CLI to the STP group configuration level.

Syntax

stp-group *group-id*
no stp-group *group-id*

Parameters

group-id
Specifies the STP group ID. The value ranges from 1 through 32.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command exits the STP group configuration level.

Examples

The following example shows how to change to the STP group configuration level.

```
device(config)# stp-group 1  
device(config-stp-group-1)#
```

stp-protect

Prevents an end station from initiating or participating in STP topology changes.

Syntax

stp-protect

no stp-protect

Command Default

STP protection is disabled by default.

Modes

Interface configuration mode

Usage Guidelines

This command causes the port to drop STP BPDUs sent from the device on the other end of the link.

The **no** form of the command disables STP protection on the port.

Examples

The following example shows how to enable STP protection on a port.

```
device(config)# interface ethernet 1/1/2
device#(config-if-e1000-1/1/2)# stp-protect
```

summary-address (OSPFv3)

Configures route summarization for redistributed routes for an Autonomous System Boundary Router (ASBR).

Syntax

summary-address *IPv6-addr/mask*
no summary-address

Command Default

Summary addresses are not configured.

Parameters

A:B:C:D/LEN

IPv6 address and mask for the summary route representing all the redistributed routes in dotted decimal format.

Modes

OSPFv3 router configuration mode
OSPFv3 VRF router configuration mode

Usage Guidelines

Use this command to configure an ASBR to advertise one external route as an aggregate for all redistributed routes that are covered by a specified IPv6 address range. When you configure an address range, the range takes effect immediately. All the imported routes are summarized according to the configured address range. Imported routes that have already been advertised and that fall within the range are flushed out of the AS and a single route corresponding to the range is advertised.

If a route that falls within a configured address range is imported by the device, no action is taken if the device has already advertised the aggregate route; otherwise the device advertises the aggregate route. If an imported route that falls within a configured address range is removed by the device, no action is taken if there are other imported routes that fall within the same address range; otherwise the aggregate route is flushed.

You can configure up to 32 address ranges.

The device sets the forwarding address of the aggregate route to 0 and sets the tag to 0. If you delete an address range, the advertised aggregate route is flushed and all imported routes that fall within the range are advertised individually. If an external link-state-database-overflow condition occurs, all aggregate routes and other external routes are flushed out of the AS. When the device exits the external LSDB overflow condition, all the imported routes are summarized according to the configured address ranges.

If you use redistribution filters in addition to address ranges, the Brocade device applies the redistribution filters to routes first, then applies them to the address ranges.

If you disable redistribution, all the aggregate routes are flushed, along with other imported routes.

This option affects only imported, type 5 external routes. A single type 5 LSA is generated and flooded throughout the AS for multiple external routes.

Examples

The following example configures a summary address of 2001:db8::/24 for routes redistributed into OSPFv3. The summary prefix 2001:db8::/24 includes addresses 2001:db8::/1 through 2001:db8::/24. Only the address 2001:db8::/24 is advertised in an external link-state advertisement.

```
device# configure terminal
device(config)# ipv6 router ospf
device(config-ospf6-router)# summary-address 2001:db8::/24
```

suppress-acl-seq

Suppresses sequence numbers associated with all ACL rules.

Syntax

suppress-acl-seq
no suppress-acl-seq

Modes

ACL policy configuration mode

Usage Guidelines

Upgrading from a version prior to 8.0.50 to 8.0.50 or later adds default sequence numbers—beginning with 10, incrementing by 10—to all configured ACLs.

If you need to downgrade to a version prior to 8.0.50, run this command first to suppress ACL-rule sequence numbers.

Although running this command removes sequence numbers, it does not change the current order of rules within each ACL.

The **no** version of this command resets the configuration to display default sequence numbers.

Examples

The following example suppresses rule sequence numbering.

```
device# configure terminal
device(config)# acl-policy
device(config-acl-policy)# suppress-acl-seq
```

The following example restores default rule sequence numbering.

```
device# configure terminal
device(config-acl-policy)# no suppress-acl-seq
device(config-acl-policy)#show ip access-list 8
```

```
Standard IP access list 8: 3 entries
10: permit host 1.1.1.1 log
20: permit 36.10.0.0 0.0.0.255 log
30: deny any log
```

History

Release	Command History
8.0.50	This command was introduced.

switch-over-active-role

Activates switchover of the active and standby management modules without any packet loss to the services and protocols that are supported by hitless management.

Syntax

switch-over-active-role

Command Default

Switchover is not enabled.

Modes

Privileged EXEC mode

Usage Guidelines

Hitless failover must be enabled before a hitless switchover can be executed.

If this command is entered when hitless failover is disabled, the following message will appear on the console:

```
Switch-over is not allowed. Reason: hitless-failover not configured.
```

NOTE

This command is supported only on FastIron SX devices.

Examples

The following example switches over to the standby module.

```
device# switch-over-active-role
Are you sure? (enter 'y' or 'n'): y
Running Config data has been changed. Do you want to continue
the switch-over without saving the running config? (enter 'y' or 'n'): n
Please save the running config and try switch-over again
```

symmetrical-flow-control enable

Enables symmetrical flow control (SFC) globally for priorities.

Syntax

symmetrical-flow-control enable [all]
no symmetrical-flow-control enable

Command Default

SFC is globally disabled.

Parameters

all
Specifies SFC on all priorities. If you do not specify the **all** keyword, SFC is enabled only on priorities 0-4. This parameter is optional.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this restores the default flow-control settings.

Configuring the **symmetrical-flow-control enable** command enables SFC globally for priorities 0-4 by default and optionally for all priorities (0-7)

By default, the system runs in tail-drop mode, with all ports honoring 802.3x flow control and disabling 802.3x transmit. The **symmetrical-flow-control enable** command enables transmission of 802.3x pause frames.

Configuring the **symmetrical-flow-control enable** command changes priority-to-PG mapping.

You cannot configure the **symmetrical-flow-control enable** command if the **priority-flow-control** command is enabled.

If the **symmetrical-flow-control enable** command is not enabled, you cannot configure the **flow-control generate-only** or the **flow-control both** commands in interface configuration mode.

NOTE

In FastIron Release 08.0.20 and later releases, SFC is not supported for ports across stack units in ICX 7750 devices or across stack units or for ports across master and slave packet-processor (pp) devices in ICX7450-48 units.

Examples

The following example shows how to enable SFC:

```
Device(config)# symmetrical-flow-control enable
```

The following example shows how to enable all priorities to send the IEEE 802.3x pause:

```
Device(config)# symmetrical-flow-control enable all
```

The following example shows how to enable SFC for Generate-only mode:

```
Device(config)# symmetrical-flow-control enable  
Device(config)# flow-control generate-only
```

The following example shows how to enable SFC for both Honor and Generate-only mode:

```
Device(config)# symmetrical-flow-control enable  
Device(config)# flow-control both
```

History

Release version	Command history
8.0.10	This command was introduced.

symmetric-flow-control enable

Enables symmetric flow control globally on all full-duplex data ports of a standalone unit or on all full-duplex data ports of a particular unit in a traditional stack.

Syntax

symmetric-flow-control enable [**unit** *stack-unit* [*stack-unit*] ...]

no symmetric-flow-control enable [**unit** *stack-unit* [*stack-unit*] ...]

Command Default

Symmetric flow control is disabled, and tail drop mode is enabled.

Parameters

unit *stack-unit*

Specifies one of the units in a stacking system for which symmetric flow control is to be enabled. You can specify up to eight units.

Modes

Global configuration mode

Usage Guidelines

Because flow control is enabled by default on all full-duplex ports, these ports always honor received 802.3x Pause frames, whether or not symmetric flow control is enabled.

The **no** form of the command disables symmetric flow control.

Examples

The following example enables symmetric flow control globally on all full-duplex data ports of a standalone unit.

```
device(config)# symmetric-flow-control enable
```

The following example enables symmetric flow control on all full-duplex data ports of unit 4 in a traditional stack.

```
device(config)# symmetric-flow-control enable unit 4
```

symmetric-flow-control set

Sets symmetric flow control parameters.

Syntax

symmetric-flow-control set *port-type* { **buffers** *value* [**unit** *unit-value*] | **xoff** *num* **xon** *num* }

no symmetric-flow-control set *port-type* { **buffers** *value* [**unit** *unit-value*] | **xoff** *num* **xon** *num* }

Command Default

1G: Buffers: 272; XOFF Limit: 91; XON Limit: 75

10G: Buffers: 416; XOFF Limit: 91; XON Limit: 75

Parameters

port-type

Specifies the port type. The port type can be one of the following:

1

Sets the buffer limits or XOFF and XON limits for 1G ports.

2

Sets the buffer limits or XOFF and XON limits for 10G ports.

3

Sets the buffer limits or XOFF and XON limits for 100G ports.

buffers *value*

Sets the total buffer limits. The value can range from 64 through 320 for 1G ports and from 64 through 1632 for 10G ports. The default value for 1G ports is 272 and for 10G ports is 416 .

unit *unit-value*

Specifies the buffer limit for a stack unit.

xoff *num*

Sets the XOFF limit. The minimum value is 60 percent, and the maximum value is 95 percent.

xon *num*

Sets the XON limit. The minimum value is 50 percent and the maximum value is 90 percent.

Modes

Global configuration mode

Usage Guidelines

Use the **show symmetric** command to view the default or configured buffer limit or XON and XOFF thresholds.

The **no** form of the command deletes the configured symmetric flow control values.

Examples

The following example changes the thresholds for all 1G ports.

```
device(config)# symmetric-flow-control set 1 xoff 91 xon 75
```

The following example changes the total buffer limit for all 10G ports.

```
device(config)# symmetric-flow-control set 2 buffers 128
```

```
Total buffers modified, 1G: 320, 10G: 128
```

system-max gre-tunnels

Allocates maximum number of GRE tunnels.

Syntax

system-max gre-tunnels *number*
no system-max gre-tunnels *number*

Command Default

Default number of GRE tunnels is 16.

Parameters

number
Specifies the number of GRE tunnels to allocate. Valid value are 16 to 64. The default value is 16.

Modes

Privileged EXEC mode

Usage Guidelines

This configuration determines the interface range that is supported for an interface tunnel. For example, if the system-max value is reduced, it is possible that the configured interfaces may be rejected after a system reload.

The **no** form of the command resets the number of GRE tunnels to 16.

Examples

The following example allocates 60 GRE tunnels.

```
device# system-max gre-tunnels 60
device(config)# write memory
device(config)# exit
device# reload
```

system-max hw-traffic-conditioner

Configures the maximum number of traffic policies supported on a Layer 3 device.

Syntax

system-max hw-traffic-conditioner *num*

Command Default

The default is 992.

Parameters

num

Specifies the maximum number of active traffic policies. Value is 992.

Modes

Global configuration mode

Examples

The following example sets the maximum number of active traffic policies to 992.

```
device(config)# system-max hw-traffic-conditioner 992
```

system-max igmp-snoop-group-addr

Sets the maximum number of IGMP group addresses on a device.

Syntax

system-max igmp-snoop-group-addr *num*
no system-max igmp-snoop-group-addr

Command Default

The default number of IGMP group addresses is supported.

Parameters

num

Specifies the maximum number of IGMP group addresses supported. The range is a value from 256 through 8192. The default for IGMP snooping group addresses is 4096.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the default maximum.

The configured number of IGMP group addresses is the upper limit of an expandable database. Client memberships exceeding the group limit are not processed.

The following describes the IGMP group address limits for Brocade devices:

- ICX 7750 switches support 8192 IGMP group addresses.
- ICX 7750 routers support 6K IGMP group addresses.
- ICX 7250 devices support 8192 IGMP group addresses.
- ICX 7450 devices support 8192 IGMP group addresses.

Examples

This example sets maximum number of IGMP snooping group addresses to 1600.

```
device(config)# system-max igmp-snoop-group-addr 1600
```

system-max igmp-snoop-mcache

Configures the maximum number of IGMP snooping cache entries supported on a device.

Syntax

system-max igmp-snoop-mcache *num*
no system-max igmp-snoop-mcache

Command Default

The default number of IGMP snooping cache entries is supported.

Parameters

num

Specifies the maximum number of IGMP snooping cache entries supported. The range is a value from 256 through 8192. The default is 512 entries.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the default maximum.

The following describes the IGMP snooping multicast cache (mcache) resource limits for Brocade devices:

- ICX 7750 switches support 8192 IGMP snooping mcache entries.
- ICX 7750 routers support 6K IGMP snooping mcache entries.
- ICX 7250 devices support 8192 IGMP snooping mcache entries.
- ICX 7450 devices support 8192 IGMP snooping mcache entries.

Examples

This example shows how to configure the maximum number of IGMP snooping mcache entries supported on the device to 2000.

```
device(config)# system-max igmp-snoop-mcache 2000
```

system-max ip6-route

Configures maximum IPv6 routes, used to initialize hardware during system init.

Syntax

system-max ip6-route *number*
no system-max ip6-route *number*

Command Default

The default number of routes depends on the platform. Refer to the Usage Guidelines section.

Parameters

number
 Specifies the number of IPv6 routes. Refer to the Usage Guidelines section.

Modes

Global configuration mode

Usage Guidelines

The maximum and minimum number of IPv6 routes that can be configured depends on the platform.

The **system-max ip6-route** command cannot be configured for ICX7250 and ICX7450 devices, for which system maximum route values are derived from the **ip-route** value.

Platform	Minimum	Default	Maximum
ICX 7250	N/A	N/A	N/A
ICX 7450	N/A	N/A	N/A
ICX 7750	5120	5120	7168

The **no** form of the command resets the number of IPv6 routes to the default value.

Examples

The following example configures the number of IPv4 routes as 5000.

```
device(config)# system-max ip6-route 5000
device(config)# write memory
```

system-max ip-route

Increases the capacity of the IP route table.

Syntax

system-max ip-route *number*

no system-max ip-route *number*

Command Default

The default is 12000 for ICX 7250 and ICX 7450 devices and 98304 for ICX 7750 devices.

Parameters

number

The maximum number of routes in the IP route table.

Modes

Global configuration mode

Usage Guidelines

The supported ranges and defaults for IP routes vary by platform:

Product	Default number of IP routes	Supported range
ICX 7250	12000	4096 to 15168
ICX 7450	12000	4096 to 15168
ICX 7750	98304	98304 to 131072

You must save the configuration and reload the software to place the system maximum change into effect.

The **no** form of the command resets the values to the default.

Examples

The following example increases the capacity of the IP route table:

```
device(config)# system-max ip-route 5000
device(config)# write memory
device(config)# exit
device# reload
```

system-max ip6-route-default-vrf

Configures maximum IPv6 routes to be allocated for the default VRF instance.

Syntax

system-max ip6-route-default-vrf *number*

no system-max ip6-route-default-vrf *number*

Command Default

The default number of IPv6 routes to be allocated for the default VRF instance depends on the platform. Refer to the Usage Guidelines section.

Parameters

number

Specifies the number of IPv6 routes to be allocated for the default VRF instance. Refer to the Usage Guidelines section.

Modes

Global configuration mode

Usage Guidelines

The maximum, minimum, and default number of IPv6 routes to be allocated for the default VRF instance.

Platform	Mininum	Default	Maximum
ICX 7250	N/A	N/A	N/A
ICX 7450	64	5120	5120
ICX 7750	64	2048	7168

The **no** form of the command resets the number of IPv6 routes allocated for the default VRF instance to the default.

Examples

The following example sets the number of IPv4 routes for the default VRF instance as 3000.

```
device(config)# system-max ip6-route-default-vrf 3000
device(config)# write memory
```

system-max ip-route-default-vrf

Configures maximum IPv4 routes to be allocated for the default VRF instance.

Syntax

system-max ip-route-default-vrf *number*
no system-max ip-route-default-vrf *number*

Command Default

The default number of IPv4 routes to be allocated for the default VRF instance depends on the platform. Refer to the Usage Guidelines section.

Parameters

number
Specifies the number of IPv4 routes to be allocated for the default VRF instance. Refer to the Usage Guidelines section.

Modes

Global configuration mode

Usage Guidelines

The maximum, minimum, and default number of IPv4 routes to be allocated for the default VRF instance.

Platform	Mininum	Default	Maximum
ICX 7250	N/A	N/A	N/A
ICX 7450	1024	12000	15168
ICX 7750	256	65536	131072

The **no** form of the command resets the number of IPv4 routes allocated for the default VRF instance to the default.

Examples

The following example sets the number of IPv4 routes for the default VRF instance as 13000.

```
device(config)# system-max ip-route-default-vrf 13000  
device(config)# write memory
```

system-max ip6-route-vrf

Configures default maximum IPv6 routes to be allocated per user-defined VRF.

Syntax

system-max ip6-route-vrf *number*
no system-max ip6-route-vrf *number*

Command Default

The default number of the maximum IPv6 routes to be allocated per user-defined VRF depends on the platform. Refer to the Usage Guidelines section.

Parameters

number

Specifies the number of maximum IPv6 routes to be allocated per user-defined VRF. Refer to the Usage Guidelines section.

Modes

Global configuration mode

Usage Guidelines

The maximum, minimum, and the default number of IPv6 routes to be allocated per user-defined VRF depends on the platform.

Platform	Minimum	Default	Maximum
ICX 7250	N/A	N/A	N/A
ICX 7450	64	100	5120
ICX 7750	16	1024	7168

The **no** form of the command resets the number of maximum IPv6 routes to be allocated per user-defined VRF to the default.

Examples

The following example configures the number of IPv6 routes to be allocated per user-defined VRF as 1500.

```
device(config)# system-max ip6-route-vrf 1500
device(config)# write memory
```

system-max ip-route-vrf

Configures default maximum IPv4 routes to be allocated per user-defined VRF.

Syntax

system-max ip-route-vrf *number*
no system-max ip-route-vrf *number*

Command Default

The default number of the maximum IPv4 routes to be allocated per user-defined VRF depends on the platform. Refer to the Usage Guidelines section.

Parameters

number

Specifies the number of maximum IPv4 routes to be allocated per user-defined VRF. Refer to the Usage Guidelines section.

Modes

Global configuration mode

Usage Guidelines

The maximum, minimum, and the default number of IPv4 routes to be allocated per user-defined VRF depends on the platform.

Platform	Minimum	Default	Maximum
ICX 7250	N/A	N/A	N/A
ICX 7450	128	1024	15168
ICX 7750	64	4096	131072

The **no** form of the command resets the number of maximum IPv4 routes to be allocated per user-defined VRF to the default.

Examples

The following example configures the number of IPv4 routes to be allocated per user-defined VRF as 1500.

```
device(config)# system-max ip-route-vrf 1500  
device(config)# write memory
```

system-max static-ip-arp

Configures the maximum number of static ARP table entries.

Syntax

system-max static-ip-arp *number*

no system-max static-ip-arp *number*

Command Default

The default is 512 entries.

Parameters

number

Specifies the number of entries the static ARP table can hold. Valid range is 512 to 6000. The default is 512.

Modes

Global configuration mode

Usage Guidelines

You must save the configuration to the startup-config file and reload the software after changing the static ARP table size to place the change into effect.

The **no** form of the command resets the number of entries the static ARP table can hold to 512.

Examples

The following example increases the maximum number of static ARP table entries you can configure to 1000.

```
device(config)# system-max ip-static-arp 1000
device(config)# write memory
device(config)# end
device# reload
```

system-max ip-subnet-port

Increases the number of IP subnet interfaces that can be configured on each port of the device.

Syntax

system-max ip-subnet-port *number*

no system-max ip-subnet-port *number*

Command Default

The default number of IP subnet interfaces is 24.

Parameters

number

Specifies the maximum number of IP subnets per port. The range is from 24 through 128. The default value is 24.

Modes

Global configuration mode

Usage Guidelines

You must save the configuration and reload the software to place the system maximum change into effect.

The **no** form of the command resets the value to the default.

Examples

The following example increases the capacity of the IP subnet interfaces.

```
device(config)# system-max ip-subnet-port 64
device(config)# write memory
device(config)# exit
device# reload
```

system-max ip-vrf

Configures maximum VRF instances supported by the software.

Syntax

system-max ip-vrf *number*

no system-max ip-vrf *number*

Command Default

The default number of VRF instances supported by the software depends on the platform. Refer to the Usage Guidelines section.

Parameters

number

Configures the number of VRF instances supported. Refer to the Usage Guidelines section.

Modes

Global configuration mode

Usage Guidelines

The range of maximum and minimum configurable VRF instance and the default values depends on the platform.

Platform	Minimum	Default	Maximum
ICX 7250	4	16	16
ICX 7450	4	16	16
ICX 7750	16	128	128

The **no** form of the command resets the VRF instance to the default value.

Examples

The following example configures the maximum number of VRF instance as 20.

```
device(config)# system-max ip-vrf 20
device(config)# write memory
device(config)# end
```

system-max mac

Changes the capacity of the MAC address table.

Syntax

system-max mac *number*

no system-max mac *number*

Command Default

The default capacity is 32768 MAC addresses.

Parameters

number

The maximum number of MAC addresses in the MAC table. The valid value is 32768.

Modes

Global configuration mode

History

Release	Command History
8.0.40	The command is not valid as you cannot change the number in ICX 7750, ICX 7450, and ICX 7250 devices.

system-max mac-notification-buffer

Changes the value of the MAC-notification buffer.

Syntax

system-max mac-notification-buffer *size*

no system-max mac-notification-buffer *size*

Command Default

The default buffer size is 4000.

Parameters

size Sets the buffer queue size to maintain MAC-notification events.

Modes

Global configuration

Usage Guidelines

no

Examples

This example changes the value of the MAC-notification buffer:

```
device(config)# system-max mac-notification-buffer 8000
```

This example sets the MAC-notification buffer to default size:

```
device(config)# no system-max mac-notification-buffer 4000
```

History

Release version	Command history
08.0.10	This command was introduced.

system-max max-ecmp

Configures the maximum limit of ECMP paths at the system level.

Syntax

```
system-max max-ecmp [ num ]  
no system-max max-ecmp [ num ]
```

Command Default

The default value is 8.

Parameters

num

Specifies the maximum number of ECMP paths and can be from 8 through 32.

Modes

Global configuration mode

Usage Guidelines

The **system-max max-ecmp** command is supported only on the Brocade ICX 7750.

If the maximum number of ECMP paths is not configured at the system level, by default, you can configure the maximum number of IP load sharing paths to a value from 2 through 8.

The configuration of the maximum number of IP load sharing paths to a value more than 8 is determined by the maximum number of ECMP paths configured at the system level using the **system-max max-ecmp** command.

You cannot configure the maximum number of IP load sharing paths higher than the value defined at the system level.

You cannot configure the maximum number of ECMP paths at the system level to a value less than the configured IP load sharing value.

You must save the configuration and reload the device for the maximum ECMP value change to take effect.

The **no** form of the command removes the maximum number of ECMP paths defined at the system level.

Examples

The following example defines the maximum number of ECMP paths that can be configured in the system as 20.

```
device(config)# system-max max-ecmp 20  
device(config)# write memory  
device(config)# exit  
device# reload
```

History

Release version	Command history
08.0.30	This command was introduced.

system-max max-ip-mac

Changes the maximum number of MAC addresses that can be configured on IP interfaces.

Syntax

```
system-max max-ip-mac number  
no system-max max-ip-mac number
```

Command Default

The default maximum of MAC addresses to be configured on IP interfaces is 120.

Parameters

number

The maximum number of MAC addresses to be configured on IP interfaces. The valid range is from 120 through 248. The default value is 120.

Modes

Global configuration mode

Usage Guidelines

Each physical or virtual Ethernet (VE) interface can be configured with only one MAC address. There is a maximum number of IP interfaces (248 on which an IP MAC address can be configured and the number of Virtual Router Redundancy Protocol (VRRP) virtual interfaces that can be supported simultaneously is affected by any increase over the default number of 120 interfaces. If the **system-max max-ip-mac** command is set above 120, a reduction in the number of IPv4 VRRP entries supported is calculated as <configured-value> - 120. For example, if the **system-max max-ip-mac** command is set to 130, the number of IPv4 VRRP entries is reduced by 10 entries (130-120).

You must save the configuration and reload the software before the changed maximum number takes effect.

The **no** form of the command resets the value to the default.

Examples

The following example increases the maximum number of MAC addresses that can be configured on IP interfaces.

```
device# configure terminal  
device(config)# system-max max-ip-mac 140  
Total IP-MAC entries supported is changed to 140  
Total VRRP instances supported changed to 370, IPv4 VRRP instances: 228, IPv6 VRRP instances 120  
Reload required. Please write memory and then reload or power cycle.  
device(config)# write memory  
device(config)# exit  
device# reload
```

History

Release version	Command history
8.0.40	This command was introduced.

system-max mld-snoop-group-addr

Sets the maximum number of multicast listening discovery (MLD) group addresses on a device.

Syntax

system-max mld-snoop-group-addr *num*
no system-max mld-snoop-group-addr

Command Default

The default number of MLD group addresses is supported.

Parameters

num

Specifies the maximum number of MLD group addresses supported. The range is a value from 256 through 8192. The default for MLD snooping group addresses is 4096.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the default maximum.

The configured number of MLD group addresses is the upper limit of an expandable database. Client memberships exceeding the group limit are not processed.

The following describes the MLD group address limits for Brocade devices:

- ICX 7750 switches support 8192 MLD group addresses.
- ICX 7750 routers support 6K MLD group addresses.
- ICX 7250 devices support 8192 MLD group addresses.
- ICX 7450 devices support 8192 MLD group addresses.

Examples

This example sets maximum number of MLD snooping group addresses to 4000.

```
device(config)# system-max mld-snoop-group-addr 4000
```

system-max mld-snoop-mcache

Configures the maximum number of multicast listening discovery (MLD) snooping cache entries supported on a device.

Syntax

```
system-max mld-snoop-mcache num  
no system-max mld-snoop-mcache
```

Command Default

The default number of MLD snooping cache entries is supported.

Parameters

num
Specifies the maximum number of MLD snooping cache entries supported. The range is 256 to 8192. The default is 512 entries.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the default maximum.

The following describes the MLD snooping multicast cache (mcache) resource limits for Brocade devices:

- ICX 7250 and ICX 7450 devices support up to 8192 MLD snooping mcache entries.
- ICX 7750 switches support up to 8192 MLD snooping mcache entries.
- ICX 7750 routers support 3072 MLD snooping mcache entries.
- In Release 8.0.10a and later releases, ICX 7750 routers support 6144 MLD snooping mcache entries.

Examples

This example shows how to set the maximum number of MLD snooping mcache entries to 8000.

```
device(config)# system-max mld-snoop-mcache 8000
```

system-max msdp-sa-cache

Configures the maximum number of source active (SA) messages in the Multicast Source Discovery Protocol (MSDP) cache.

Syntax

system-max msdp-sa-cache *num*

no system-max msdp-sa-cache *num*

Command Default

4096 MSDP SA messages is supported.

Parameters

num

Specifies the maximum number of MSDP SA messages supported. The range is 1024 to 8192. The default is 4096 messages.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command restores the default maximum.

Examples

The following example sets the maximum number of MSDP SA messages to 6000.

```
device(config)# system-max msdp-sa-cache 6000
```

system-max pim6-hw-mcache

Sets the maximum number of SG entries allowed in the device.

Syntax

system-max pim6-hw-mcache *num*
no system-max pim6-hw-mcache *num*

Command Default

512 SG entries are supported.

Parameters

num

Specifies the maximum number of entries. The range is 256 to 1024; the default: 512.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command restores the default maximum.

You can use the **max-mcache** command to define the maximum number of repeated PIM traffic sent from the same source address and received by the same destination address.

Examples

The following example sets the maximum number of SG entries allowed in the device to 900.

```
device(config)# system-max pim6-hw-mcache 900
```

system-max pim-hw-mcache

Sets the maximum number of SG entries allowed in the device.

Syntax

system-max pim-hw-mcache *num*
no system-max pim-hw-mcache *num*

Command Default

1024 SG entries are supported.

Parameters

num
Specifies the maximum number of entries. The range is 256 to 6144; the default: 1024.

Modes

Global configuration mode

Usage Guidelines

The **system max pim-hw-mcache** replace the **system-max pim mcache** command.
The **no** form of the command restores the default maximum.

Examples

The following example sets the maximum number of SG entries allowed in the device to 900.

```
device(config)# system-max pim-hw-mcache 900
```

system-max rmon-entries

Configures the maximum number of entries allowed in the RMON control table.

Syntax

system-max rmon-entries *value*

no system-max rmon-entries *value*

Command Default

The default number of RMON entries allowed in the RMON control table is 1024 on ICX 7450 and ICX 7250 devices and 2048 on ICX 7750 devices.

Parameters

value

Specifies the maximum number of entries. The value can range from 128 to 32768 on ICX 7450 and ICX 7250 devices. The value can range from 2048 to 32768 on ICX 7750 devices.

Modes

Global configuration mode

Usage Guidelines

This command configures the maximum number of entries allowed in the RMON control table, including alarms, history, and events.

NOTE

In order for the change to take effect, you must save the change to the startup-config file and reload or reboot.

The **no** form of the command resets the maximum number of entries allowed in the RMON table to the default value.

Examples

The following example sets the maximum number of RMON entries to 3000.

```
device(config)# system-max rmon-entries 3000
device(config)# write memory
device(config)# exit
device# reload
```

system-max spanning-tree

Configures the system maximum value for the number of spanning tree instances.

Syntax

system-max spanning-tree *number*
no system-max spanning-tree *number*

Command Default

The default number of spanning tree instances is 32.

Parameters

number

Configures the number of spanning tree instances. The range is from 1 through 254.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command resets the system maximum value of spanning tree instances to the default.

Examples

The following example shows how to set the maximum number of spanning tree instances.

```
device(config)# system-max spanning-tree 254
```

system-max view

Configures the maximum number of SNMP views available on a device.

Syntax

system-max view *number-of-views*

no system-max view *number-of-views*

Command Default

The default number of views is 10.

Parameters

number-of-views

Specifies the maximum number of SNMPv2 and SNMPv3 views. The number of views can range from 10 through 65535. The default value is 10.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command resets the number of views to the default value of 10.

Examples

The following example configures the maximum number of SNMP views as 15.

```
device(config)# system-max view 15
```

system-max virtual-interface

Increases the maximum number of virtual routing interfaces you can configure.

Syntax

system-max virtual-interface *num*

no system-max virtual-interface *num*

Command Default

The default maximum number of virtual interfaces that can be configured is 255.

Parameters

num

Specifies the maximum number of the virtual routing interface that can be configured. The range depends on the device being configured.

Modes

Global configuration mode

Usage Guidelines

The number of virtual routing interfaces supported on your product depends on the device and, for chassis devices, the amount of DRAM on the management module. The **write memory** command must be executed to save the changes and a reload is required.

The **no** form of the command removes the configured maximum number of virtual routing interfaces and resets the maximum value to the default.

Examples

The following example shows how to increase the maximum number of virtual routing interfaces.

```
device(config)# system-max virtual-interface 512
device(config)# write memory
device(config)# end
device# reload
```

system-max vlan

Increases the maximum number of VLANs you can configure.

Syntax

system-max vlan *num*

no system-max vlan *num*

Command Default

The default maximum value is 64 VLANs.

Parameters

num

Specifies the maximum number of VLANs you can configure. The range depends on the device being configured.

Modes

Global configuration mode

Usage Guidelines

Although you can specify up to 4095 VLANs, you can configure only 4094 VLANs. VLAN ID 4094 is reserved for use by Single STP. The **write memory** command must be executed to save the changes and a reload is required. The number of VLANs supported on your product depends on the device and, for chassis devices, the amount of DRAM on the management module.

The **no** form of the command removes the maximum number of VLANs and resets the maximum value to 64.

Examples

The following example shows how to increase the maximum number of VLANs.

```
device(config)# system-max vlan 2048
device(config)# write memory
device(config)# end
device# reload
```

table-map

Maps external entry attributes into the BGP routing table, ensuring that those attributes are preserved after being redistributed into OSPF.

Syntax

table-map *string*

no table-map *string*

Parameters

string

Specifies a route map to be whose attributes are to be preserved. Range is from 1 through 63 ASCII characters.

Modes

BGP configuration mode

BGP address-family IPv6 unicast configuration mode

BGP address-family IPv4 unicast VRF configuration mode

BGP address-family IPv6 unicast VRF configuration mode

Usage Guidelines

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

Use this command only to set the tag values. Normally, a route map is applied on routes (and therefore the routes are updated) before it is stored in the BGP routing table. Use the **table-map** command to begin the update before the routes are stored in the IP routing table.

Configurations made by this command apply to all peers.

Route maps that contain **set** statements change values in routes when the routes are accepted by the route map. For inbound route maps (route maps that filter routes received from neighbors), the routes are changed before they enter the BGP4 routing table. For tag values, if you do not want the value to change until a route enters the IP routing table, you can use a table map to change the value. A table map is a route map that you have associated with the IP routing table. The device applies the **set** statements for tag values in the table map to routes before adding them to the routing table. To configure a table map, you first configure the route map, then identify it as a table map. The table map does not require separate configuration. You can have only one table map.

NOTE

Use table maps only for setting the tag value. Do not use table maps to set other attributes. To set other route attributes, use route maps or filters. To create a route map and identify it as a table map, enter commands such those shown in the first example below. These commands create a route map that uses an address filter. For routes that match the IP prefix list filter, the route map changes the tag value to 100 and is then considered as a table map. This route map is applied only to routes that the device places in the IP routing table. The route map is not applied to all routes. The first example below assumes that IP prefix list p11 has already been configured.

The **no** form of the command removes the table map.

Examples

The following example illustrates the execution of the **table-map** command.

```
device# configure terminal
device(config)# route-map tag_ip permit 1
device(config-route-map tag_ip)# match ip address prefix-list p11
device(config-route-map tag_ip)# set tag 100
device(config-route-map tag_ip)# exit
device(config)# router bgp
device(config-bgp-router)# table-map tag_ip
```

The following example removes a table map in the IPv6 address family.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast
device(config-bgp-ipv6u)# no table-map tag_ip
```

tacacs-server deadtime

Configures the duration for which the device waits for the primary authentication server to reply before deciding the TACACS server is dead and trying to authenticate using the next server.

Syntax

tacacs-server deadtime *time*

no tacacs-server deadtime *time*

Command Default

The default duration is three seconds.

Parameters

time

The time in seconds. The valid values are from 1 through 5. The default is 3.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command resets the duration for which the device waits for a reply before deciding that the server is dead.

Examples

The following example configures the dead time as four seconds.

```
device(config)# tacacs-server deadtime 4
```

tacacs-server enable

Configures the device to allow TACACS server management access only to clients connected to ports within port-based VLAN.

Syntax

tacacs-server enable vlan *vlan-number*

no tacacs-server enable vlan *vlan-number*

Command Default

By default, access is allowed on all ports.

Parameters

vlan *vlan-number*

Configures access only to clients connected to ports within the VLAN.

Modes

Global configuration mode

Usage Guidelines

You can restrict management access to a Brocade device to ports within a specific port-based VLAN. VLAN-based access control works in conjunction with other access control methods. Clients connected to ports that are not in the VLAN are denied management access.

The **no** form of the command removes the restriction.

Examples

The following example shows how to allow TACACS server access only to clients in a specific VLAN.

```
device(config)# tacacs-server enable vlan 10
```

tacacs-server host

Configures the TACACS server host to authenticate access to a Brocade device.

Syntax

tacacs-server host { *ipv4-address* | *host-name* | *ipv6-address* } [**auth-port** *port-num* [**acct-port** *port-num* [{ **accounting-only** | **authentication-only** | **authorization-only** | **default** } [**key** *key-string*]]]]

no tacacs-server host { *ipv4-address* | *host-name* | *ipv6-address* } [**auth-port** *port-num* [**acct-port** *port-num* [{ **accounting-only** | **authentication-only** | **authorization-only** | **default** } [**key** *key-string*]]]]

Command Default

The TACACS server host is not configured.

Parameters

ipv4-address

Configures the IPv4 address of the TACACS server.

host-name

Configures the host name of the TACACS server.

ipv6-address

Configures the IPv6 address of the TACACS server.

auth-port *port-num*

Configures the authentication UDP port. The default value is 1812.

acct-port *port-num*

Configures the accounting UDP port. The default value is 1813.

accounting-only

Configures the server to be used only for accounting. Supported for TACACS+ only.

authentication-only

Configures the server to be used only for authentication. Supported for TACACS+ only.

authorization-only

Configures the server to be used only for authorization. Supported for TACACS+ only.

default

Configures the server to be used for any AAA operation. Supported for TACACS+ only.

key *key-string*

Configures the TACACS key for the server. Supported for TACACS+ only.

Modes

Global configuration mode

Usage Guidelines

You can specify up to eight servers. If you add multiple TACACS or TACACS+ authentication servers to the Brocade device, the device tries to reach them in the order you add them. To use a TACACS server to authenticate access to a Brocade device, you must identify the server to the Brocade device. In a TACACS configuration, you can designate a server to handle a specific AAA task. For example, you can designate one TACACS server to handle authorization and another TACACS server to handle accounting. You can specify individual servers for authentication and accounting, and authorization. You can set the TACACS key for each server.

The **no** form of this command removes the configuration.

Examples

The following example shows how to configure a TACACS server to authenticate access to a Brocade device.

```
device(config)# tacacs-server host 192.168.10.1
```

The following example shows how to specify different TACACS servers for authentication and accounting.

```
device(config)# tacacs-server host 10.2.3.4 auth-port 1800 acct-port 1850 default key abc  
device(config)# tacacs-server host 10.2.3.5 auth-port 1800 acct-port 1850 authentication-only key def  
device(config)# tacacs-server host 10.2.3.6 auth-port 1800 acct-port 1850 accounting-only key ghi
```

tacacs-server key

Configures the value that the Brocade device sends to the TACACS server when trying to authenticate user access.

Syntax

tacacs-server key *key-string*

no tacacs-server key *key-string*

Command Default

The TACACS server key is not configured.

Parameters

key-string

Specifies the key as an ASCII string. The value for the key parameter on the Brocade device should match the one configured on the TACACS server. The key can be from 1 to 32 characters in length and cannot include any space characters.

Modes

Global configuration mode

Usage Guidelines

The **tacacs-server key** command is used to encrypt TACACS packets before they are sent over the network.

The **no** form of the command removes the TACACS server key configuration.

Examples

The following example shows how to configure a TACACS server key.

```
device(config)# tacacs-server key abc
```

tacacs-server retransmit

Configures the maximum number of retransmission attempts for a request when a TACACS authentication request times out.

Syntax

tacacs-server retransmit *number*

no tacacs-server retransmit *number*

Command Default

The default number of retries is three.

Parameters

number

The maximum number of retries the Brocade software will retransmit the request. The valid values are from 1 through 5. The default is 3.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command resets the maximum number of retransmission attempts to the default.

Examples

The following example shows how to set the maximum number of retransmission attempts to four.

```
device(config)# tacacs-server retransmission 4
```

tacacs-server timeout

Configures the number of seconds the Brocade device waits for a response from a TACACS server before either retrying the authentication request or determining that the TACACS servers are unavailable and moving on to the next authentication method in the authentication method list.

Syntax

tacacs-server timeout *time*

no tacacs-server timeout *time*

Command Default

The default timeout value is three seconds.

Parameters

time

The time in seconds. Valid values are from 1 through 15 seconds. The default is 3.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command sets the timeout value to the default.

Examples

The following example shows how to set the TACACS server timeout value to 10 seconds.

```
device(config)# tacacs-server timeout 10
```

tagged ethernet

Tags a port to allow communication among the different VLANs to which the port is assigned.

Syntax

tagged ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*]...]

no tagged ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*]...]

Parameters

ethernet *stackid/slot/port*

Specifies the Ethernet interface to configure as a tagged port.

to *stackid/slot/port*

Specifies a range of Ethernet interfaces.

Modes

VLAN configuration mode

Usage Guidelines

Tagging does not apply to the default VLAN. The ports are defined as either tagged or untagged at the VLAN level.

The **no** form of the command removes the tagging of the Ethernet ports.

Examples

The following example tags the port 1/1/9 to VLAN 4.

```
device(config)# vlan 4
device(config-vlan-4)# tagged ethernet 1/1/9
```

tag-profile

Configures or changes the tag profile for 802.1ad tagging.

Syntax

tag-profile *tag-number*

no tag-profile *tag-number*

Command Default

The default tag number is 0x8100.

Parameters

tag-number

Specifies the number of the tag. The value can be 0x8100 (default) or 0xffff.

Modes

Global configuration mode

Usage Guidelines

Tag profiles on a single port, or a group of ports, can be configured to point to the global tag profile.

The **no** command removes the tag profile configuration.

Examples

The following example shows how to configure the tag profile.

```
device(config)# tag-profile 9500
```

tag-profile enable

Directs the individual ports or a range of ports to the tag profile.

Syntax

tag-profile enable

no tag-profile enable

Command Default

The tag profile is not enabled.

Modes

Interface configuration mode

Usage Guidelines

Tag profiles on a single port, or a group of ports, can be configured to point to the global tag profile.

The tag type and tag profile cannot be configured at the same time.

The **no** form of the command disables the tag profile for ports.

Examples

The following example shows how to enable tag profile for a single port.

```
device(config)# interface ethernet 1/1/1  
device(config-if-e1000-1/1/1)# tag-profile enable
```

The following example shows how to enable tag profile for multiple ports.

```
device(config)# interface ethernet 1/1/1 ethernet 1/2/1  
device(config-mif-1/1/1,1/2/1)# tag-profile enable
```

tag-type

Enables 802.1ad tagging for aggregated VLANs.

Syntax

tag-type *num* [**ethernet** *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]]

no tag-type *num* [**ethernet** *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]]

Command Default

802.1ad tagging is not enabled.

Parameters

num

Specifies the tag type can be a hexadecimal value from 0 - ffff. The default is 8100.

ethernet *stackid/slot/port*

Specifies the ports that will use the defined 802.1Q tag.

to *stackid/slot/port*

Specifies a range of ports that will use the defined 802.1Q tag.

Modes

Global configuration mode

Usage Guidelines

802.1ad tagging provides finer granularity for configuring 802.1Q tagging, enabling you to configure 802.1Q tag types on a group of ports. This command allows you to create two identical 802.1Q tags (802.1ad tagging) on a single device.

To enable 802.1ad tagging, configure an 802.1Q tag on the untagged edge links (the customer ports) to any value other than the 802.1Q tag for incoming traffic.

If you specify a single port number, the 802.1Q tag applies to all ports within the port region. If you do not specify a port or range of ports, the 802.1Q tag applies to all Ethernet ports on the device.

NOTE

Brocade devices treat a double-tagged Ethernet frame as a Layer 2-only frame. The packets are not inspected for Layer 3 and Layer 4 information, and operations are not performed on the packet utilizing Layer 3 or Layer 4 information.

The tag type and tag profile cannot be configured at the same time.

The **no** form of the command removes the tag type configuration.

Examples

The following example shows how to enable the 802.1ad tagging.

```
device(config)# tag-type 9100 ethernet 1/1/11 to 1/1/12
```

telnet

Enables a Telnet connection from the Brocade device to a remote IPv6 host using the console.

Syntax

```
telnet { host-name | host-ipaddress } [ remote-port-num ]
```

```
telnet { host-name | host-ipv6address } [ outgoing-interface { ethernet stack/slot/port | ve ve-num } ] [ remote-port-num ]
```

Parameters

host-name

Specifies the host name of the remote host.

host-ipaddress

Specifies the IPv4 address of the remote host.

remote-port-num

Specifies the port number on which the Brocade device establishes the Telnet connection. Valid values are 1 to 65535. If you do not specify a port number, the Brocade device establishes the Telnet connection on port 23.

host-ipv6address

Specifies the IPv6 address of the remote host.

outgoing-interface

Identifies the interface that must be used to reach the remote host.

ethernet *stack/slot/port*

Identifies the Ethernet interface that must be used to reach the remote host.

ve *ve-num*

Identifies the VE interface that must be used to reach the remote host.

Modes

Privileged EXEC mode

Usage Guidelines

The **telnet** command establishes a Telnet connection from a Brocade device to a remote host using the console. Up to five read-access Telnet sessions are supported on the router at one time. Write-access through Telnet is limited to one session, and only one outgoing Telnet session is supported on the router at one time. To see the number of open Telnet sessions at any time, enter the **show telnet** command.

Examples

The following example establishes a Telnet connection to a remote host with the IPv6 address of 2001:DB8:3de2:c37::6.

```
device# telnet 2001:DB8:3de2:c37::6
```

telnet access-group

Configures an ACL that restricts Telnet access to the device.

Syntax

```
telnet access-group { acl-num | acl-name | ipv6 ipv6-acl-name }
```

```
no telnet access-group { acl-num | acl-name | ipv6 ipv6-acl-name }
```

Command Default

Telnet access is not restricted.

Parameters

acl-num

The standard access list number. The valid values are from 1 through 99.

acl-name

The standard access list name.

ipv6 *ipv6-acl-name*

The IPv6 access list name.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command removes the Telnet access restriction.

Examples

The following example shows how to configure an ACL that restricts Telnet access to the device. In this example, ACL 10 is configured. The device allows Telnet access to all IP addresses except those listed in ACL 10.

```
device(config)# access-list 10 deny host 10.157.22.32 log
device(config)# access-list 10 deny 10.157.23.0 0.0.0.255 log
device(config)# access-list 10 deny 10.157.24.0 0.0.0.255 log
device(config)# access-list 10 deny 10.157.25.0/24 log
device(config)# access-list 10 permit any
device(config)# telnet access-group 10
device(config)# write memory
```

telnet client

Restricts Telnet access to a host with the specified IP address.

Syntax

telnet client { *ipv4-address* [*client-mac*] | **any** *client-mac* | **ipv6** *ipv6-address* }

no telnet client { *ipv4-address* [*client-mac*] | **any** *client-mac* | **ipv6** *ipv6-address* }

Command Default

Remote Telnet access is not restricted.

Parameters

ipv4-address

Allows Telnet access only to the host with the IPv4 address.

client-mac

The host MAC address.

any *client-mac*

Allows Telnet access to a host with any IP address but with the specified MAC address.

ipv6 *ipv6-address*

Allows Telnet access to a host with the specified IPv6 address.

Modes

Global configuration mode

Usage Guidelines

You can specify only one IP address with one command. However, you can enter the command ten times to specify up to ten IP addresses.

The **no** form of the command removes the restriction and allows Telnet access to all the clients.

Examples

The following example shows how to allow Telnet access only to the host with IP address 192.168.10.1 and MAC address 1111.2222.3333.

```
device(config)# telnet client 192.168.10.1 1111.2222.3333
```

telnet login-retries

Configures the number of attempts you can enter a correct username and password before the device disconnects the Telnet session.

Syntax

telnet login-retries *number*

no telnet login-retries *number*

Command Default

By default, four attempts are supported.

Parameters

number

The number of retries the device prompts you for a username and password before disconnecting the Telnet session. The valid values are from 0 through 5. The default is 4.

Modes

Global configuration mode

Usage Guidelines

If you are connecting to the Brocade device using Telnet, the device prompts you for a username and password. By default, you have up to four chances to enter a correct username and password. If you do not enter a correct username or password after four attempts, the Brocade device disconnects the Telnet session.

The **no** form of the command resets the number of attempts to the default.

NOTE

You must configure Telnet with the **enable telnet authentication local** command to enable only a specific number of Telnet login attempts.

Examples

The following example shows how to configure up to five chances to enter a correct username and password before getting disconnected.

```
device(config)# telnet login-retries 5
```

telnet login-timeout

Configures the login timeout for a Telnet session.

Syntax

telnet login-timeout *time*
no telnet login-timeout *time*

Command Default

The default login timeout is one minute.

Parameters

time
Time in minutes. The valid values are from 1 through 10. The default is 1.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command sets the login timeout value to the default.

Examples

The following example shows how to set the login timeout value of a Telnet session to ten minutes.

```
device(config)# telnet login-timeout 10
```

telnet server enable

Configures Telnet access only to clients in a specific VLAN.

Syntax

telnet server enable vlan *vlan-num*

no telnet server enable vlan *vlan-num*

Command Default

Telnet access is not restricted.

Parameters

vlan *vlan-num*

Configures access only to clients connected to ports within the VLAN.

Modes

Global configuration mode

Usage Guidelines

You can restrict Telnet access to a Brocade device to ports within a specific port-based VLAN. VLAN-based access control works in conjunction with other access control methods. Clients connected to ports that are not in the VLAN are denied management access.

The **no** form of the command allows Telnet access to all clients.

Examples

The following example shows how to allow Telnet access only to clients connected to ports within port-based VLAN 40.

```
device(config)# telnet server enable vlan 40
```

telnet server suppress-reject-message

Configures the device to suppress the Telnet connection rejection message.

Syntax

telnet server suppress-reject-message

no telnet server suppress-reject-message

Command Default

Rejection messages are sent.

Modes

Global configuration mode

Usage Guidelines

By default, if a Brocade device denies Telnet management access to the device, the software sends a message to the denied Telnet client. You can optionally suppress the rejection message. When you enable the option, a denied Telnet client does not receive a message from the Brocade device. Instead, the denied client simply does not gain access.

The **no** form of the command configures the device to send the rejection message.

Examples

The following example shows the configuration to suppress the connection rejection message sent by the device to a denied Telnet client.

```
device(config)# telnet server suppress-reject-message
```

telnet strict-management-vrf

Allows incoming Telnet connection requests only from the management VRF and not from the out-of-band (OOB) management port.

Syntax

telnet strict-management-vrf

no telnet strict-management-vrf

Command Default

When the management VRF is configured, incoming Telnet connection requests are allowed from the ports that belong to the management VRF and from the OOB management port.

Modes

Global configuration mode

Usage Guidelines

The **telnet strict-management-vrf** command is applicable only when the management VRF is configured. If a management VRF is not configured, configuring the **telnet strict-management-vrf** command displays an error message.

The **telnet strict-management-vrf** command does not prevent a connection initiated from the OOB management interface if the management interface VRF and the management VRF are the same. The user must configure either the **management exclude all oob** command or the **management exclude telnet oob** command.

For the Telnet server, changing the management VRF configuration or configuring the **telnet strict-management-vrf** command does not affect the existing Telnet connections. The changes are applied only to new incoming connection requests.

The **telnet strict-management-vrf** command and the **management exclude** command are mutually exclusive. If the latter command is configured, outbound Telnet connections are not blocked.

The **no** form of the command enables the incoming Telnet connection requests from ports that belong to the management VRF and from the out-of-band management port.

Examples

The following example allows incoming Telnet connection requests from the management VRF only.

```
device(config)# telnet strict-management-vrf
```

History

Release version	Command history
8.0.50	This command was introduced.

Related Commands

[management exclude](#)

telnet timeout

Configures the duration of time, a Telnet session can remain idle before it is timed out.

Syntax

telnet timeout *time*

no telnet timeout *time*

Command Default

The Telnet session never times out.

Parameters

time

The time in minutes. The valid values are from 0 through 240. The default is 0; the session never times out.

Modes

Global configuration mode

Usage Guidelines

An idle Telnet session is a session that is still sending TCP ACKs in response to keep alive messages from the device, but is not being used to send data.

The **no** form of the command resets the default timeout value.

Examples

The following example shows how to set the Telnet session idle timeout to 100 minutes.

```
device(config)# telnet timeout 100
```

temperature warning

Changes the temperature threshold at which the device sends a syslog message and an SNMP trap.

Syntax

```
temperature warning { stack-id temp-threshold }
```

Command Default

The default threshold varies by the hardware device. Refer to the hardware installation guide for your device.

Parameters

stack-id

Stack number. Value is from 1 to 8.

temp-threshold

Temperature warning level, in Celsius. See Usage Guidelines for more details.

Modes

Privileged EXEC mode

Usage Guidelines

There is no **no** form of this command.

When setting the *temp-threshold* option, you must not set this level higher than the maximum value allowed by your device. The temperature warning level must be at least five degrees Celsius less than the temperature shutdown level, which is automatically set by the device.

Examples

The following example sets the temperature threshold to 75°C.

```
device# temperature warning 1 75
```

terminal monitor

Enables the real-time display for a Telnet or SSH session.

Syntax

terminal monitor

Command Default

Real-time display is not enabled.

Modes

Privileged EXEC mode

Usage Guidelines

The command toggles the feature on and off. The CLI displays a message to indicate the status change for the feature. To enable or disable the feature in the management session, enter the **terminal monitor** command again.

Any terminal logged on to a Brocade switch can receive real-time Syslog messages when the **terminal monitor** command is issued.

Examples

The following example enables real-time display for a Telnet or SSH session.

```
device# terminal monitor
Syslog trace was turned ON
SYSLOG: <9>device, Power supply 2, power supply on left connector, failed
SYSLOG: <14>device, Interface ethernet 6, state down
SYSLOG: <14>device, Interface ethernet 2, state up
```

The following example disables real-time display for a Telnet or SSH session.

```
device# terminal monitor
Syslog trace was turned OFF
```

tftp client enable

Configures the device to allow TFTP access only to clients in a specific VLAN.

Syntax

tftp client enable vlan *vlan-num*

no tftp client enable vlan *vlan-num*

Command Default

TFTP client access is enabled for all the clients.

Parameters

vlan *vlan-num*

Configures access only to clients connected to ports within the VLAN.

Modes

Global configuration mode

Usage Guidelines

You can restrict TFTP access to a Brocade device to ports within a specific port-based VLAN. VLAN-based access control works in conjunction with other access control methods. Clients connected to ports that are not in the VLAN are denied management access.

The **no** form of the command allows access to all clients.

Examples

The following example shows how to allow TFTP access only to clients connected to ports within port-based VLAN 40.

```
device(config)# tftp client enable vlan 40
```

tftp disable

Disables TFTP client access.

Syntax

tftp disable

no tftp disable

Command Default

TFTP client access is enabled.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command enables TFTP client access.

Examples

The following example shows how to disable TFTP client access.

```
device(config)# tftp disable
```

tftp-server

Specifies the address or name of the TFTP server to be used by the DHCP client.

Syntax

```
tftp-server { address | name server-name }
```

Parameters

address

Specifies the IP address of the DHCP server.

name *server-name*

Configures the TFTP server specified by the server name.

Modes

DHCP server pool configuration mode.

Usage Guidelines

If DHCP options 66 (TFTP server name) and option 150 (TFTP server IP address) are both configured, the DHCP client ignores option 150 and tries to resolve the TFTP server name (option 66) using DNS.

Examples

The following example specifies the TFTP server to be used by the DHCP client.

```
device(config)# ip dhcp-server-pool cabo  
device(config-dhcp-cabo)# tftp-server 10.7.5.48
```

tftp-server (IMAGE)

Configures the TFTP server location where auto image copy can download a software image.

Syntax

tftp-server *ip-address* **image-location** *path*

no tftp-server *ip-address* **image-location** *path*

Command Default

No TFTP server location is configured for auto image copy downloads.

Parameters

ip-address

Specifies the IP address of the TFTP server.

image-location *path*

Specifies the directory path to the software image on the TFTP server.

Modes

Global configuration mode

Usage Guidelines

To avoid image mismatch issues, set up a TFTP server for auto image copy before configuring a stack.

The **no** form of the command removes the TFTP server configuration.

Examples

The following example specifies a TFTP server location where a software image is located:

```
device(config)# tftp-server 10.1.2.1 image-location /server/builds/
```

History

Release version	Command history
8.0.00a	This command was introduced.

timeout (EFM-OAM)

Configures the time in seconds for which the local Data Terminal Equipment (DTE) waits to receive OAM Protocol Data Units (OAMPDUs) from the remote entity.

Syntax

timeout *value*

no timeout *value*

Command Default

The default value is 5 seconds.

Parameters

value

Specifies the time in seconds for which the local DTE must wait for OAMPDUs from the remote entity. The value range can be from 1 through 10 seconds.

Modes

EFM-OAM protocol configuration mode

Usage Guidelines

If the local DTE does not receive any OAMPDU within the specified period, the peer is considered down and the EFM-OAM discovery process will start over again.

The **no** form of the command restores the default value of 5 seconds.

Examples

The following example configures the timeout value as 10 seconds.

```
device(config)# link-oam
device(config-link-oam)# timeout 10
```

History

Release version	Command history
08.0.30	This command was introduced.

timers (BGP)

Adjusts the interval at which BGP KEEPALIVE and HOLDTIME messages are sent.

Syntax

```
timers { keep-alive keepalive_interval hold-time holdtime_interval }  
no timers
```

Parameters

keep-alive *keepalive_interval*

Frequency in seconds with which a device sends keepalive messages to a peer. Range is from 0 through 65535 seconds. The default is 60.

hold-time *holdtime_interval*

Interval in seconds that a device waits to receive a keepalive message from a peer before declaring that peer dead. Range is from 0 through 65535 seconds. The default is 180.

Modes

BGP configuration mode

Usage Guidelines

The KEEPALIVE and HOLDTIME message interval is overwritten when the **fast-external-failover** command takes effect on a down link to a peer.

You must enter a value for **keep-alive** before you can enter a value for **hold-time**. Both values must be entered. If you only want to adjust the value of one parameter, enter the default value of the parameter that you do not want to adjust.

The **no** form of the command clears the timers.

Examples

The following example sets the keepalive timer for a device to 120 seconds and the hold-timer to 360 seconds.

```
device# configure terminal  
device(config)# router bgp  
device(config-bgp-router)# timers keep-alive 120 hold-time 360
```

timers (OSPFv3)

Configures Link State Advertisement (LSA) pacing and Shortest Path First (SPF) timers.

Syntax

```
timers { lsa-group-pacing interval | spf start hold }
```

Command Default

Enabled.

Parameters

lsa-group-pacing *interval*

Specifies the interval at which OSPFv3 LSAs are collected into a group and refreshed, check-summed, or aged by the OSPFv3 process. Valid values range from 10 to 1800 seconds. The default is 240 seconds.

spf

Specifies start and hold intervals for SPF calculations for performance. The values you enter are in milliseconds.

start

Initial SPF calculation delay. Valid values range from 0 to 65535 seconds. The default is 5 seconds.

hold

Minimum hold time between two consecutive SPF calculations. Valid values range from 0 to 65535 seconds. The default is 10 milliseconds.

Modes

OSPFv3 router configuration mode

OSPFv3 router VRF configuration mode

Usage Guidelines

The device paces LSA refreshes by delaying the refreshes for a specified time interval instead of performing a refresh each time an individual LSA refresh timer expires. The accumulated LSAs constitute a group, which the device refreshes and sends out together in one or more packets.

The LSA pacing interval is inversely proportional to the number of LSAs the device is refreshing and aging. For example, if you have a large database of 10,000 LSAs, decreasing the pacing interval enhances performance. If you have a small database of about 100 LSAs, increasing the pacing interval to 10 to 20 minutes may enhance performance.

The **no timers lsa-group-pacing** command restores the pacing interval to its default value.

The **no timers spf** command sets the SPF timers back to their defaults.

Examples

The following example sets the LSA group pacing interval to 30 seconds.

```
device# configure terminal
device(config)# ipv6 router ospf
device(config-ospf6-router)# timers lsa-group-pacing 30
```

The following example sets the SPF delay time to 10 and the hold time to 20.

```
device# configure terminal
device(config)# ipv6 router ospf
device(config-ospf6-router)# timers spf 10 20
```

timers (RIP)

Specifies how often RIP update messages are sent.

Syntax

timers { *update-timer time-out-timer hold-down-timer garbage-collection-timer* }

no timers { *update-timer time-out-timer hold-down-timer garbage-collection-timer* }

Command Default

Defaults differ by timer. Refer to timer parameter descriptions.

Parameters

update-timer

Sets the amount of time between RIP routing updates. The default is 30 seconds. Possible values are 3 through 21845 seconds.

timeout-timer

Sets the amount of time after which a route is considered unreachable. The default is 180 seconds. Possible values are 9 through 65535 seconds.

hold-down-timer

Sets the amount of time during which information about other paths is ignored. The default is 180 seconds. Possible values are 0 through 65535 seconds.

garbage-collection-timer

Sets the amount of time after which a route is removed from the RIP routing table. The default is 120 seconds. Possible values are 0 through 65535.

Modes

RIP router configuration mode.

Usage Guidelines

The **no** form of the command returns all timers to their default settings.

RIP must be enabled before you can set the timers. All timer values, including values that are not being modified, must be present when you enter the command.

Examples

The following command sets the RIP update timer to 30 seconds, the RIP timeout timer to 180 seconds, the RIP hold-down timer to 185 seconds, and the RIP garbage collection timer to 120 seconds.

```
device# configure terminal
device(config)# router rip
device(config-rip-router)# timer 30 180 185 120
```

timers (RIPng)

Adjusts RIPng timers.

Syntax

timers { *update-timer time-out-timer hold-down-timer garbage-collection-timer* }

no timers { *update-timer time-out-timer hold-down-timer garbage-collection-timer* }

Command Default

Defaults differ by timer. Refer to timer parameter descriptions.

Parameters

update-timer

Sets the amount of time between RIPng routing updates. The default is 30 seconds. Possible values are 3 through 65535 seconds.

timeout-timer

Sets the amount of time after which a route is considered unreachable. The default is 180 seconds. Possible values are 9 through 65535 seconds.

hold-down-timer

Sets the amount of time during which information about other paths is ignored. The default is 180 seconds. Possible values are 9 through 65535 seconds.

garbage-collection-timer

Sets the amount of time after which a route is removed from the RIPng routing table. The default is 120 seconds. Possible values are 9 through 65535.

Modes

RIPng router configuration mode

Usage Guidelines

The **no** form of the command returns the timers to their default settings.

RIPng must be enabled before you can set the timers.

You must enter values for all of the timers, even those you do not want to reset. This is true for the **no** form of the command as well.

Examples

The following example adjusts the setting for the garbage collection timer and retains default settings for all other timers.

```
device# configure terminal
device(config)# ipv6 router rip
device(config-ripng-router)# timers 30 180 180 110
```

topology-group

Configures the topology group.

Syntax

topology-group *group-id*

no topology-group *group-id*

Command Default

A topology group is not configured.

Parameters

group-id

Specifies the topology group ID. The ID ranges from 1 through 256.

Modes

Global configuration mode

Usage Guidelines

Each topology group contains a master VLAN and can contain one or more member VLANs and VLAN groups. You must configure the master VLAN and member VLANs or member VLAN groups before you configure the topology group.

You can configure up to 30 topology groups. Each group can control up to 4096 VLANs. A VLAN cannot be controlled by more than one topology group. The topology group must contain a master VLAN and can also contain individual member VLANs, VLAN groups, or a combination of individual member VLANs and VLAN groups.

The **no** form of the command removes the topology group.

Examples

The following example configures the topology group with ID 2 and adds master VLAN and member VLANs.

```
device(config)# topology-group 2
device(config-topo-group-2)# master-vlan 2
device(config-topo-group-2)# member-vlan 3
device(config-topo-group-2)# member-vlan 4
device(config-topo-group-2)# member-vlan 5
device(config-topo-group-2)# member-group 2
```

traceroute

Determines the path through which a Brocade device can reach another device.

Syntax

```
traceroute [ vrf vrf-name ] ipv4-address [ source-ip ip-address ] [ minttl min-value ] [ maxttl max-value ] [ numeric ]  
[ timeout value ]
```

```
traceroute host-name [ source-ip ip-address ] [ minttl min-value ] [ maxttl max-value ] [ numeric ] [ timeout value ]
```

```
traceroute ipv6 [ vrf vrf-name ] ipv6-address [ minttl min-value ] [ maxttl max-value ] [ numeric ] [ timeout value ]
```

```
traceroute ipv6 host-name [ minttl min-value ] [ maxttl max-value ] [ numeric ] [ timeout value ]
```

Parameters

vrf *vrf-name*

Specifies the Virtual Routing and Forwarding (VRF) instance.

ipv4-address

Specifies the host IPv4 address.

source-ip *ip-address*

Configures an IP address to be used as the origin for the traceroute.

minttl *min-value*

Specifies the minimum Time to Live (TTL) value (hops). The value can range from 1 through 255. The default value is 1.

maxttl *max-value*

Specifies the maximum TTL value (hops). The value can range from 1 through 255. The default value is 30.

numeric

Displays IP addresses in number format instead by name.

timeout *value*

Configures echo request timeout, in seconds. The value can range from 1 through 120. The default value is 2.

host-name

Specifies the host name.

ipv6

Displays IPv6-related information.

ipv6-address

Specifies the host IPv6 address.

Modes

User EXEC mode

Privileged EXEC mode

Usage Guidelines

The CLI displays trace-route information for each hop as soon as the information is received. Traceroute requests display all responses to a given TTL. In addition, if there are multiple equal-cost routes to the destination, the Brocade device displays up to three responses by default.

Examples

The following example issues an IPv4 traceroute.

```
device> traceroute 10.33.4.7
```

The following example issues an IPv6 traceroute.

```
device> traceroute ipv6 2001:DB8::21:22
```

track-port

Configures link-state tracking for a specific Virtual Router Redundancy Protocol (VRRP) or VRRP Extended (VRRP-E) interface.

Syntax

```
track-port { ethernet slot/port | ve num } [ priority num ]  
no track-port { ethernet slot/port | ve num } [ priority num ]
```

Command Default

The link-state of VRRP and VRRP-E interfaces is not tracked.

Parameters

ethernet *slot port*

Configures link-state tracking for a specific Ethernet slot and port number. A forward slash "/" must be entered between the slot and port numbers.

ve *number*

Configures link-state tracking for a virtual Ethernet interface. Valid values range from 1 through 255.

priority *num*

Sets the track priority. Valid numbers are from 1 through 254. The tracking priority number is used when a tracked interface up or down event is detected. For VRRP, if the tracked interface becomes disabled, the current router priority is reduced to the track-port priority. (For VRRP only, interface tracking does not have any effect on an owner router; the owner priority can not be changed from 255.) For VRRP-E, if the tracked interface becomes disabled, the current router priority is reduced by the track-port priority. For VRRP, the default is 2, and for VRRP-E, the default is 5.

Modes

VRID interface configuration mode

Usage Guidelines

This command can be used for VRRP or VRRP-E.

For VRRP, the tracked interface can be any valid Ethernet, or virtual Ethernet interface other than the one on which this command is issued. The maximum number of interfaces you can track per virtual router is 16.

Enter the **no track-port** command with the specified interface to remove the tracked port configuration.

Examples

The following example configures link-state tracking on interface 1/2/4 and sets the track priority to 60:

```
device(config)# configure terminal
device(config)# interface ethernet 1/1/6
device(config-if-e1000-1/1/6)# ip vrrp vrid 1
device(config-if-e1000-1/1/6-vrid-1)# track-port ethernet 1/2/4 priority 60
```

track-port (VSRP)

Configures the VRID on one interface to track the link state of another interface on the device.

Syntax

```
track-port { ethernet stackid/slot/port | ve number } [ priority number ]  
no track-port { ethernet stackid/slot/port | ve number } [ priority number ]
```

Command Default

The VRID does not track an interface.

Parameters

ethernet *stackid/slot/port*

Configures the Ethernet interface to track.

ve *number*

Configures the virtual Ethernet interface to track.

priority *number*

Changes the VSRP priority of the interface. The range is from 1 through 254.

Modes

VSRP VRID configuration mode

Usage Guidelines

Configuring this command is useful for tracking the state of the exit interface for the path for which the VRID is providing redundancy.

If the interface configured for tracking goes down, the VSRP VRID priority is reduced by the amount of the track port priority you specify.

The **priority** option changes the priority of the specified interface, overriding the default track port priority. To change the default track port priority, use the **backup track-priority** command.

The **no** form of the command removes the link state tracking.

Examples

The following example configures the VRID to track an Ethernet interface .

```
device(config)# vlan 200  
device(config-vlan-200)# vsrp vrid 1  
device(config-vlan-200-vrid-1)# track-port ethernet 1/2/4
```

The following example configures the VRID to track a VE interface.

```
device(config)# vlan 200
device(config-vlan-200)# vsrp vrid 1
device(config-vlan-200-vrid-1)# track-port ve 4 priority 4
```

traffic-policy count

Configures a traffic policy and enables counting the number of bytes and the conformance level per packet.

Syntax

traffic-policy *traffic-policy-def* **count**

no traffic-policy *traffic-policy-def* **count**

Command Default

No traffic policy is applied.

Parameters

traffic-policy-def

Specifies the name of the traffic policy definition, in no more than seven alphanumeric characters.

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command deletes a traffic policy definition.

Examples

This example configures a traffic policy named TPD and enables counting of bytes and conformance levels.

```
device#configure terminal
device(config)#traffic-policy TPD count
```

traffic-policy rate-limit adaptive

Configures an ACL-based flexible-bandwidth traffic policy to define rate limits on packets so that you can allow for bursts above the limit.

Syntax

traffic-policy *traffic-policy-def* **rate-limit adaptive** **cir** *cir-value* **cbs** *cbs-value* **pir** *pir-value* **pbs** *pbs-value* **count**

traffic-policy *traffic-policy-def* **rate-limit adaptive** **cir** *cir-value* **cbs** *cbs-value* **pir** *pir-value* **pbs** *pbs-value* **exceed-action drop** [**count**]

traffic-policy *traffic-policy-def* **rate-limit adaptive** **cir** *cir-value* **cbs** *cbs-value* **pir** *pir-value* **pbs** *pbs-value* **exceed-action permit-at-low-pri** [**count** | **remark-cos** [**count**]]

no traffic-policy *traffic-policy-def* **rate-limit adaptive** **cir** *cir-value* **cbs** *cbs-value* **pir** *pir-value* **pbs** *pbs-value* **count**

no traffic-policy *traffic-policy-def* **rate-limit adaptive** **cir** *cir-value* **cbs** *cbs-value* **pir** *pir-value* **pbs** *pbs-value* **exceed-action drop** [**count**]

no traffic-policy *traffic-policy-def* **rate-limit adaptive** **cir** *cir-value* **cbs** *cbs-value* **pir** *pir-value* **pbs** *pbs-value* **exceed-action permit-at-low-pri** [**count** | **remark-cos** [**count**]]

Command Default

No traffic policy is applied.

Parameters

traffic-policy-def

Specifies the name of the traffic policy definition, in no more than seven alphanumeric characters.

count

Enables counting the number of bytes and the conformance level per packet. The single-rate three-color marker (srTCM) mechanism described in RFC 2697 is used.

cir *cir-value*

Specifies the committed information rate (CIR) in Kbps, that is, the guaranteed rate of inbound traffic that is allowed on a port. The range is 64 through 1,000,000 Kbps.

cbs *cbs-value*

Specifies the committed burst size (CBS), that is, the number of bytes per second allowed on a port before some packets exceed the CIR. You must specify a value greater than 0.

pir *pir-value*

Specifies the peak information rate (PIR) in Kbps, that is, the most inbound traffic that is allowed on a port. The *pir-value* must be equal to or greater than the *cir-value*.

pbs *pbs-value*

Specifies the peak burst size (PBS), that is, the most bytes per second allowed in a burst before all packets exceed the PIR. You must specify a value greater than 0.

exceed-action

Specifies the action for traffic that is more than is configured in the *cir-value* variable. If you do not configure this keyword, traffic that exceeds the *cir-value* is dropped

drop

Specifies dropping traffic that exceeds the rate limit.

count

Enables counting the number of bytes and the conformance level per packet. The two-rate three-color marker (trTCM) mechanism described in RFC 2698 is used.

permit-at-low-pri

Specifies permitting packets that exceed the *cir-value* and forward them at the lowest priority.

remark-cos

Sets the 802.1p priority of dropped packets to 0, that is, it sets the COS/PCP field value to 0 for the low priority traffic for any packet exceeding the rate limit set by the traffic policy

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command deletes a traffic policy definition.

Traffic policies must be referenced by one or more ACLs before they can be effective. The policies are effective on ports to which the ACLs that reference them are bound.

NOTE

You cannot delete a traffic policy definition that a port is currently using. To delete a traffic policy, you must first unbind the associated ACL.

It is recommended that you specify a PBS value that is equal to or greater than the size of the largest possible IP packet in the stream.

Examples

This example configures a traffic policy named TPDA4 that specifies a CIR of 10000 Kbps, a CBS of 1600 Kbps, a PIR of 20000 Kbps, and a PBS of 1000 Kbps and dropping any traffic that exceeds those limits.

```
device# configure terminal
device(config)# traffic-policy TPDA4 rate-limit adaptive cir 10000 cbs 1600 pir 20000 pbs 4000 exceed-
action drop
```

traffic-policy rate-limit fixed

Configures an ACL-based fixed-rate traffic policy to define rate limits on packets. It either drops all traffic that exceeds the limit, or forwards it at the lowest priority level.

Syntax

traffic-policy *traffic-policy-def* **rate-limit fixed** *cir-value* **count**

traffic-policy *traffic-policy-def* **rate-limit fixed** *cir-value* **exceed-action drop** [**count**]

traffic-policy *traffic-policy-def* **rate-limit fixed** *cir-value* **exceed-action permit-at-low-pri** [**count** | **remark-cos** [**count**]]

no traffic-policy *traffic-policy-def* **rate-limit fixed** *cir-value* **count**

no traffic-policy *traffic-policy-def* **rate-limit fixed** *cir-value* **exceed-action drop** [**count**]

no traffic-policy *traffic-policy-def* **rate-limit fixed** *cir-value* **exceed-action permit-at-low-pri** [**count** | **remark-cos** [**count**]]

Command Default

No traffic policy is applied.

Parameters

traffic-policy-def

Specifies the name of the traffic policy definition, in no more than seven alphanumeric characters.

cir-value

Specifies the committed information rate (CIR) in Kbps, that is, the guaranteed rate of inbound traffic that is allowed on a port. The range is 64 through 1,000,000 Kbps.

count

Enables counting the number of bytes and the conformance level per packet. The single-rate three-color marker (srTCM) mechanism described in RFC 2697 is used.

exceed-action

Specifies the action for traffic that is more than is configured in the *cir-value* variable. If you do not configure this keyword, traffic that exceeds the *cir-value* is dropped

drop

Specifies dropping traffic that exceeds the rate limit.

count

Enables counting the number of bytes and the conformance level per packet. The single-rate three-color marker (srTCM) mechanism described in RFC 2697 is used.

permit-at-low-pri

Specifies permitting packets that exceed the *cir-value* and forward them at the lowest priority.

remark-cos

Sets the 802.1p priority of dropped packets to 0, that is, it sets the COS/PCP field value to 0 for the low priority traffic for any packet exceeding the rate limit set by the traffic policy

Modes

Global configuration mode

Usage Guidelines

The **no** form of this command deletes a traffic policy definition.

Traffic policies must be referenced by one or more ACLs before they can be effective. The policies are effective on ports to which the ACLs that reference them are bound.

NOTE

You cannot delete a traffic policy definition that is currently in use on a port. To delete a traffic policy, you must first unbind the associated ACL.

Examples

This example configures a traffic policy named TPD1 that specifies a CIR of 100 Kbps and dropping any traffic that exceeds the limit.

```
device# configure terminal
device(config)# traffic-policy TPD1 rate-limit fixed 100 exceed-action drop
```

transform

Configures a transform set for an IPsec proposal.

Syntax

```
transform esp
```

Command Default

Encapsulating Security Payload (ESP)

Parameters

```
esp
```

Specifies the Encapsulating Security Payload transform set.

Modes

IPsec proposal configuration mode

Usage Guidelines

Only ESP is currently supported. Therefore, you do not need to configure the transform set for an IPsec proposal because the only option is configured by default.

Examples

The following example shows how to configure ESP as the transform set for an IPsec proposal named ipsec_prop.

```
device(config)# ipsec proposal ipsec_prop
device(config-ipsec-proposal-ipsec_prop)# transform esp
```

History

Release version	Command history
8.0.50	This command was introduced.

trunk-threshold

Configures the threshold value for the number of active member ports in a LAG, below which all the ports in a LAG group are disabled.

Syntax

trunk-threshold *number*

no trunk-threshold *number*

Command Default

The trunk threshold is set to 1.

Parameters

number

Specifies the number of ports as the threshold number. You can specify a threshold from 1 (the default) up to the number of ports in the LAG group.

Modes

LAG configuration mode

Usage Guidelines

When a LAG is shut down because the number of ports drops below the configured threshold, the LAG is kept intact and it is re-enabled if enough ports become active to reach the threshold.

NOTE

The **trunk-threshold** command cannot be used in conjunction with protected link groups.

NOTE

The **trunk-threshold** command is only applicable for the configuration of static LAGs.

The **trunk-threshold** command should be configured only at one end of the LAG. If it is set on both ends, link failures will result in race conditions and the LAG not function properly. Use a short LACP timeout when setting the **trunk-threshold** value equal to the number of links in the LAG or connecting to third-party devices.

The **no** form of the command removes the **trunk-threshold** configuration.

Examples

The following example shows how to establish a LAG group consisting of four ports, and then establish a threshold for this LAG group of three ports. If the number of active ports drops below three, then all the ports in the LAG group are disabled.

```
device(config)# lag blue static
device(config-lag-blue)# ports ethernet 1/3/1 to 1/3/4
device(config-lag-blue)# trunk-threshold 3
```

trunk-type

Configures the resilient hashing mode as the load sharing type for active ports in a link aggregation group (LAG).

Syntax

trunk-type resilient-hash
no trunk-type resilient-hash

Command Default

The default load sharing type is static hashing type.

Parameters

resilient-hash
Enables the resilient hashing type for active ports in a LAG.

Modes

LAG configuration mode

Usage Guidelines

The **no** form of the command resets the trunk hashing mode to static hashing mode.

NOTE

This configuration is only applicable for configuration of static or dynamic LAGs.

Examples

The following example shows how to establish a LAG group consisting of three ports, define the primary port for this LAG group, and finally configure resilient hashing on the primary port.

```
device(config)# lag blue static
device(config-lag-blue)# ports ethernet 1/1/1 to 1/1/3
device(config-lag-blue)# primary-port 1/1/1
device(config-lag-blue)# trunk-type resilient-hash
```

History

Release version	Command history
08.0.50	This command was introduced.

trust dscp

Configures the device to honor DSCP-based QoS for routed and switched traffic.

Syntax

trust dscp

no trust dscp

Command Default

The interface honors the Layer 2 CoS value.

Modes

Interface configuration mode

Usage Guidelines

The **no** form of the command disables the device from honoring DSCP-based QoS.

NOTE

This command is not supported with 802.1p priority override.

Examples

The following example honors DSCP-based QoS.

```
device(config)# interface ethernet 1/1/1  
device(config-if-e1000-1/1/1)# trust dscp
```

trust-port

Configures ports of a Web Authentication VLAN as trusted ports.

Syntax

trust-port ethernet *stack/slot/port* [**to** *stack/slot/port*]

no trust-port ethernet *stack/slot/port* [**to** *stack/slot/port*]

Command Default

Ports of a Web Authentication VLAN are not trusted.

Parameters

ethernet *stack/slot/port*

Configures the specified Ethernet interface as a trusted port.

to *stack/slot/port*

Configures a range of Ethernet interfaces as trusted.

Modes

Web Authentication configuration mode

Usage Guidelines

All hosts connected to the trusted ports need not authenticate and are automatically allowed access to the network.

The **no** form of the command removes the trusted port configuration.

Examples

The following example shows how to configure an Ethernet interface as a trusted port.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# trust-port ethernet 1/1/1
```

The following example shows how to configure a range of ports as trusted.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# trust-port ethernet 1/1/1 to 1/1/10
```

tunnel destination

Configures the destination address for a specific tunnel interface.

Syntax

tunnel destination { *ip address* }

no tunnel destination { *ip address* }

Command Default

No tunnel interface destination is configured.

Parameters

ip address

Specifies the IPv4 address of an interface.

Modes

Interface tunnel configuration mode

Usage Guidelines

Use the **no tunnel destination** command to remove the configured destination for the tunnel interface.

You must ensure that a route to the tunnel destination exists on the tunnel source device and create a static route if necessary.

Examples

This example configures the IP address 10.1.2.3 as the destination address for a specific tunnel interface.

```
device# configure terminal
device(config)# interface tunnel 3
device(config-tnif-3)# tunnel destination 10.1.2.3
```

Related Commands

[tunnel source](#)

tunnel mode gre ip

Enables generic routing encapsulation (GRE) over on a tunnel interface and specifies that the tunneling protocol is IPv4.

Syntax

tunnel mode gre ip
no tunnel mode gre ip

Command Default

GRE is disabled.

Modes

Interface tunnel configuration mode

Usage Guidelines

Use the **no tunnel mode gre ip** command to disable the GRE IP tunnel encapsulation method for the tunnel interface.

Examples

This example enables GRE IP encapsulation on a tunnel interface.

```
device# configure terminal
device(config)# interface tunnel 3
device(config-tnif-3)# tunnel mode gre ip
```

Related Commands

[interface tunnel](#)

tunnel mode ipsec

Configures the mode of a virtual tunnel interface (VTI) as IPsec.

Syntax

tunnel mode ipsec ipv4

no tunnel mode ipsec ipv4

Command Default

The tunnel mode is not configured for a VTI.

Parameters

ipv4

Specifies the application of IPsec protection for IPv4 packets transmitted over the tunnel. Only IPv4 is currently supported for IPsec.

Modes

Tunnel interface configuration mode

Usage Guidelines

The **no** form of the command removes the IPsec mode configuration for the VTI.

Examples

The following example shows how to set the mode for tunnel 1 to IPsec for IPv4 traffic.

```
device# configure terminal
device(config) interface tunnel 1
device(config-tnif-1)# tunnel mode ipsec ipv4
```

History

Release version	Command history
8.0.41	This command was introduced.

tunnel mode ipv6ip

Configures the tunnel mode as a manual IPv6 tunnel.

Syntax

tunnel mode ipv6ip

no tunnel mode ipv6ip

Command Default

A tunnel is not configured.

Modes

Interface tunnel configuration mode

Usage Guidelines

You can use a manually configured tunnel to connect two isolated IPv6 domains. You should deploy this point-to-point tunneling mechanism if you need a permanent and stable connection.

The **no** form of the command removes the configured tunnel mode.

Examples

The following example configures the tunnel mode as a manual IPv6 tunnel.

```
device(config)# interface tunnel 1
device(config-tnif-1)# tunnel source ethernet 1/1/1
device(config-tnif-1)# tunnel destination 10.162.100.1
device(config-tnif-1)# tunnel mode ipv6ip
device(config-tnif-1)# ipv6 enable
```

tunnel path-mtu-discovery

Enables Path MTU Discovery (PMTUD).

Syntax

```
tunnel path-mtu-discovery { age-timer { time | infinite } | disable }
no tunnel path-mtu-discovery { age-timer { time | infinite } | disable }
```

Command Default

PMTUD is enabled by default.

Parameters

age-timer

Configures the time after which the path MTU resets to its original value.

time

Sets the time after which the path MTU resets to its original value. Valid values are 10 to 30 minutes. The default value is 10 minutes.

infinte

Sets the aging time as infinite, that is, disables aging for PMTUD.

disable

Disables aging for PMTUD.

Modes

Tunnel interface configuration mode

Usage Guidelines

The **no** form of the command disables PMTUD and resets the aging to the default value of 10 minutes.

Examples

The following example changes the reset time (default age timer) to a value of 25.

```
device(config)# tunnel interface 1
device(config-tnif-1)# tunnel path-mtu-discovery age-timer 25
```

The following example disables aging for PMTUD.

```
device(config)# tunnel interface 1
device(config-tnif-1)# tunnel path-mtu-discovery disable
```

tunnel protection ipsec profile

Configures an IPsec profile for an IPsec virtual tunnel interface (VTI).

Syntax

tunnel protection ipsec profile *ipsec-profile-name*
no tunnel protection ipsec profile *ipsec-profile-name*

Command Default

An IPsec profile is not configured for the VTI.

Parameters

ipsec-profile-name
Specifies the name of the IPsec profile to secure packets that go out on this interface.

Modes

Interface configuration mode

Usage Guidelines

Before executing this command, the tunnel mode must be set to ipsec by using the **tunnel mode ipsec** command.
The **no** form of the command removes the IPsec profile configuration.

Examples

The following example shows how to configure an IPsec profile named prof_blue on a VTI with the tunnel ID 1 for an IPsec IPv4 tunnel.

```
device# configure terminal
device (config)# interface tunnel 1
device(config-tnif-1)# tunnel mode ipsec ipv4
device(config-tnif-1)# tunnel protection ipsec profile prof_blue
```

History

Release version	Command history
8.0.41	This command was introduced.

tunnel source

Configures the source address or a source interface for a specific tunnel interface.

Syntax

tunnel destination { *ip address* | **ethernet** *stackid / slot / port* | **loopback** *number* | **ve** *vlan_id*}

no tunnel destination { *ip address* | **ethernet** *stackid / slot / port* | **loopback** *number* | **ve** *vlan_id*}

Command Default

No source address or interface is configured.

Parameters

ip address

Specifies the IPv4 address of an interface.

ethernet *stackid / slot / port*

Specifies an Ethernet interface.

loopback *number*

Specifies an loopback port.

ve *vlan_id*

Specifies a VE interface.

Modes

Interface tunnel configuration mode

Usage Guidelines

Use the **no tunnel source** command to remove the configured source for the tunnel interface.

The tunnel source address should be one of the router IP addresses configured on a physical, loopback, or VE interface, through which the other end of the tunnel is reachable. The source interface must have at least one IP address configured on it.

Examples

This example configures the IP address 10.1.2.4 as the source address for a specific tunnel interface.

```
device# configure terminal
device(config)# interface tunnel 3
device(config-tunif-3)# tunnel source 10.1.2.4
```

Commands Sn - Z

tunnel source

This example sets an Ethernet interface as a source tunnel.

```
device# configure terminal
device(config)# interface tunnel 1
device(config-tunif-1)# tunnel source ethernet 3/1
```

Related Commands

[tunnel destination](#)

tunnel tos

Configures the Type of Service (ToS) value for an IPsec virtual tunnel interface (VTI).

Syntax

tunnel tos *tos*

no tunnel tos *tos*

Command Default

The Type of Service is not configured for the IPsec VTI.

Parameters

tos

Specifies the Type of Service (ToS) value. The range is from 0 through 255.

Modes

Tunnel interface configuration mode

Usage Guidelines

When ToS is not configured for an IPsec VTI, the ToS value that is configured on the inner IP header is copied to the outer IP header.

ToS configuration is only supported on IPsec tunnel interfaces. The mode of the VTI must be set to **ipsec** before executing this command.

The **no** form of the command removes the ToS configuration on the VTI.

Examples

The following example shows how to configure a ToS value of 3 for an IPsec tunnel identified as 1.

```
device(config)# interface tunnel 1
device(config-tnif-1)# tunnel mode ipsec ipv4
device(config-tnif-1)# tunnel tos 3
```

History

Release version	Command history
8.0.41	This command was introduced.

tunnel vrf

Configures the base VRF for an IPsec virtual tunnel interface (VTI).

Syntax

tunnel vrf *name*
no tunnel vrf *name*

Command Default

The default VRF is the base VRF for the IPsec VTI.

Parameters

name
Specifies the name of the base VRF.

Modes

Tunnel interface configuration mode

Usage Guidelines

Configuration of a base VRF is only supported on IPsec tunnel interfaces. The mode of the VTI must be set to **ipsec** before executing this command.

The **no** form of the command removes the base VRF configuration for the VTI.

Examples

The following example shows how to configure a VRF named blue as the base VRF for an IPsec tunnel identified as 1.

```
device(config)# interface tunnel 1  
device(config-tnif-1)# tunnel mode ipsec ipv4  
device(config-tnif-1)# tunnel vrf blue
```

History

Release version	Command history
8.0.41	This command was introduced.

unknown-unicast limit (enable)

Configures the maximum number of unknown unicast packets allowed per second.

unknown-unicast limit *num* **kbps**

no unknown-unicast limit *num* **kbps**

Unknown unicast rate limiting is disabled.

num

Specifies the maximum number of unknown unicast packets per second. The value can be 1 to 8388607.

kbps

Enables byte-based limiting. The value can be 1 to Max Port Speed.

Interface configuration mode

Use 0 or the **no** form of the command to disable limiting.

The following example enables a unknown unicast limit of 131072 kbps.

```
device(config)# interface ethernet 9/1/1
device(config-if-e1000-9/1/1)# unknown-unicast limit 131072 kbps
```

Release version	Command history
8.0.10	The command was introduced.

unknown-unicast limit (logging)

Enables Syslog logging of unknown unicast packets.

Syntax

unknown-unicast limit *num* **kbps** [**log**]

no unknown-unicast limit *num* **kbps** [**log**]

Command Default

Unknown unicast rate logging is disabled.

Parameters

num

Specifies the maximum number of packets per second. The value can be any 1 to 8388607.

kbps

Enables byte-based limiting. The value can be 1 to Max Port Speed.

log

Enables Syslog logging when the multicast limit exceeds *num* **kbps** .

Modes

Interface configuration mode

Usage Guidelines

Use 0 or the **no** form of the command to disable limiting.

Examples

The following example enables unknown unicast logging when the configured limit exceeds 100 Kbps.

```
device(config)# interface ethernet 1/2/1
device(config-if-e1000-1/2/1)# unknown-unicast limit 100 kbps log
```

History

Release version	Command history
8.0.10	The command was introduced.
8.0.40a	The command was modified to include the keyword log .

unmount disk0

Unmounts the external USB.

Syntax

unmount disk0

Modes

User EXEC mode.

Examples

The following example unmounts the external USB.

```
device# unmount disk0
```

History

Release version	Command history
08.0.30	This command was introduced.

untagged

Adds untagged ports to the VLAN.

Syntax

untagged ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port to stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]

no untagged ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port to stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]

Parameters

ethernet *stackid/slot/port*

Configures and adds the ports as untagged.

to *stackid/slot/port*

Configures and adds a range of ports to be added as untagged ports.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of the command removes the untagged ports on the VLAN.

Examples

The following example shows how to add untagged ports to a port-based VLAN.

```
device(config)# vlan 222 by port
device(config-vlan-222)# untagged ethernet 1/1/1 to 1/1/8
```

update-lag-name

Changes the name of an existing LAG without causing any impact on the functionality of the LAG.

Syntax

update-lag-name *new-name*

Parameters

new-name

Specifies the new name for the LAG.

Modes

LAG configuration mode

Usage Guidelines

The new name must be unique and unused.

Examples

The following example renames LAG blue to blue1.

```
device(config)# lag blue static
device(config-lag-blue)# update-lag-name blue1
INFORMATION: Lag blue with ID 1 is updated to new name blue1
device(config)#
```

History

Release version	Command history
08.0.30	This command was introduced.

update-time (BGP)

Configures the interval at which BGP next-hop tables are modified. BGP next-hop tables should always have IGP (non-BGP) routes.

Syntax

update-time *sec*
no update-time *sec*

Parameters

sec
Update time in seconds. Valid values range from 0 through 30. Default is 5 seconds.

Modes

BGP configuration mode
BGP address-family IPv6 unicast configuration mode

Usage Guidelines

When this command is entered in BGP global configuration mode, it applies only to the IPv4 address family. Use this command in BGP address-family IPv6 unicast configuration mode for BGP4+ configurations.

The update time determines how often the device computes the routes (next-hops). Lowering the value set by the **update-time** command increases the convergence rate.

By default, the device updates the BGP next-hop tables and affected BGP routes five seconds following IGP route changes. Setting the update time value to 0 permits fast BGP convergence for situations such as a link failure or IGP route changes, starting the BGP route calculation in sub-second time.

NOTE

Use the **advertisement-interval** command to determine how often to advertise IGP routes to the BGP neighbor.

Examples

The following example permits fast convergence for the IPv4 unicast address family.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# update-time 0
```

The following example sets the update time interval to 30 the IPv6 unicast address family.

```
device# configure terminal
device(config)# router bgp
device(config-bgp-router)# address-family ipv6 unicast
device(config-bgp-ipv6u)# update-time 30
```

update-time (RIP)

Specifies how often the device sends RIP route advertisements to its RIP neighbors.

Syntax

update-time *value*

no update-time *value*

Command Default

By default, the update interval is 30 seconds.

Parameters

value

Specifies the update interval in seconds. Allowable values are from 3 through 21845.

Modes

RIP router configuration mode

Usage Guidelines

The **no** form of the command returns the update interval to its default value.

The update time can also be modified through the RIP **timers** command.

Examples

The following example configures the RIP router to send route advertisements to its neighbors every two minutes (120 seconds).

```
device# configure terminal
device(config)# router rip
device(config-rip-router)# update-time 120
```

uplink-switch

Defines uplink ports and enables uplink switching.

Syntax

uplink-switch ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]

no uplink-switch ethernet *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*] ...]

Command Default

Uplink ports are not configured.

Parameters

ethernet *stackid/slot/port*

Defines the Ethernet ports as an uplink port and enables uplink switching on the ports.

to *stackid/slot/port*

Defines a range of ports as uplink ports and enables uplink switching on these ports.

Modes

VLAN configuration mode

Usage Guidelines

Uplink switching is supported on MCT VLANs. ICLs and CCEPs can be configured as uplink switch ports. Both cluster devices should have exactly the same uplink switch port memberships with respect to the ICL and CCEPs.

NOTE

Do not use this command when protocol VLANs or PVLANS are in the same VLAN.

The **no** form of the command disables uplink switching on ports.

Examples

The following example configures uplink ports within a port-based VLAN.

```
device(config)# vlan 10 by port
device(config-vlan-10)# untagged ethernet 1/1/1 to 1/1/24
device(config-vlan-10)# untagged ethernet 1/2/1 to 1/2/2
device(config-vlan-10)# uplink-switch ethernet 1/2/1 to 1/2/2
```

use-radius-server

Maps a RADIUS server to a port.

Syntax

use-radius-server *ip-address*

no use-radius-server *ip-address*

Command Default

The RADIUS server is not mapped to any port.

Parameters

ip-address

The IP address of the RADIUS server.

Modes

Interface configuration mode

Usage Guidelines

Once the RADIUS server is mapped to a port, the port sends the RADIUS request to the configured RADIUS server.

The **no** form of the command removes the mapping of the RADIUS server to the port.

Examples

The following example shows how to map a RADIUS server to the interface 1/1/3 (port 3). Port 3 sends a RADIUS request to 10.10.10.103 first, because it is the first server mapped to the port. If the request fails, the server will go to 10.10.10.110.

```
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# use-radius-server 10.10.10.103
device(config-if-e1000-1/1/1)# use-radius-server 10.10.10.110
```

username

Creates or updates a user account.

Syntax

username *username-string* { [**privilege** *privilege-level*] { **password** *password-string* | **create-password** *password-string* | **nopassword** } | **access-time** *begin-time to end-time* | **enable** | **expires** *days* }

no username *username-string* [[**privilege** *privilege-level*] { **password** *password-string* | **create-password** *password-string* | **nopassword** } | **access-time** *begin-time to end-time* | **enable** | **expires** *days*]

Command Default

The user account is not created.

Parameters

username-string

The configured username. You can enter up to 48 characters.

privilege *privilege-level*

Sets the user's privilege level. The default privilege level is 0. You can specify one of the following levels:

0

Super User level (full read-write access).

4

Port Configuration level.

5

Read Only level.

password *password-string*

Configures the password for the user. You can enter up to 48 characters.

create-password *password-string*

Creates an encrypted password for the user. You can enter up to 48 characters.

nopassword

Configures the user login without a password.

access-time *begin-time to end-time*

Configures the access permission for a specified period of time of the day, that is, between the specified beginning access time and ending access time.

enable

Enables the user for login access after the login access is disabled.

expires *days*

Configures the password expiration time in days. The valid values are from 1 through 365.

Modes

Global configuration mode

Usage Guidelines

You must be logged in with Super User access (privilege level 0) to add or delete user accounts or configure or modify other access parameters.

By default, user account details can be deleted or modified without any authentication. Unauthorized deletion or modification of the user account can be prevented using the **service local-user-protection** command. If the user account security is enabled using the **service local-user-protection** command, deletion of user accounts or changing the password or privilege level of the user is permitted only upon successful validation of the existing user password.

If the **enable strict password enforcement** command is enabled on the device, for the password string, you must enter a minimum of eight characters containing the following combinations:

- At least two uppercase characters
- At least two lowercase characters
- At least two numeric characters
- At least two special characters

You can use the **show user** command to display the user account details.

The **no** form of the command removes the user or the other user parameters.

Examples

The following example configures the privilege level of Super User access (0) for a user.

```
device(config)# username user1 privilege 0 password *****
```

The following example configures an unencrypted password for a user.

```
device(config)# username user1 password xpassx
```

The following example configures an encrypted password for a user.

```
device(config)# username user1 create-password xpassx
```

The following example creates a user account without a password.

```
device(config)# username user1 nopassword
```

The following example configures the access time for a user.

```
device(config)# username user1 access-time 00:00:00 to 12:00:00
```

The following example enables a user account if it is disabled.

```
device(config)# username user1 enable
```

The following example sets the user password to expire in 30 days.

```
device(config)# username user expires 30
```

Commands Sn - Z

username

The following example prompts the user to confirm existing password before successful password modification.

```
device(config)# username user1 password xpassx
device(config)# service local-user-protection
device(config)# username user1 password ypasswordy
User already exists. Do you want to modify: (enter 'y' or 'n'): y
To modify or remove user, enter current password: *****
```

History

Release version	Command history
8.0.40	This command was modified to prompt the user to enter a valid password before deleting a user account or modifying the password or privilege level of the user.

username (Local database)

Creates a user record in the local user database.

Syntax

username *username* **password** *password-string*
no username *username* [**password** *password-string*]

Command Default

User records are not created.

Parameters

username

Specifies the username for the user as an ASCII string. You can specify up to 31 characters.

password *password-string*

Specifies the password for the user. You can specify up to 29 characters.

Modes

Local user database configuration mode

Usage Guidelines

You can add up to 30 usernames and passwords to a local user database.

The **no** form of the command removes the user record from the local user database.

Examples

The following example creates a new user account and adds it to a local user database.

```
device(config)# local-userdb userdb1  
device(config-localuserdb-userdb1)# username XYZ password A5!fk3p
```

use-v2-checksum

Enables the v2 checksum computation method for an IPv4 Virtual Router Redundancy Protocol version 3 (VRRPv3) session.

Syntax

use-v2-checksum

no use-v2-checksum

Command Default

VRRPv3 uses the v3 checksum computation method.

Modes

VRRP configuration mode

Usage Guidelines

The **no** form of this command enables the default v3 checksum computation method in VRRPv3 sessions.

Some non-Brocade devices only use the v2 checksum computation method in VRRPv3. This command enables the v2 checksum computation method in VRRPv3 and provides interoperability with these non-Brocade devices.

Examples

The following example shows the v2 checksum computation method enabled in IPv4 and IPv6 VRRPv3 instances.

```
Brocade(config)# interface ve 3
Brocade(config-vif-3)# ipv4 vrrp vrid 2
Brocade(config-vif-3-vrid-2)# version v3
Brocade(config-vif-3-vrid-2)# use-v2-checksum
```

```
Brocade(config)# interface ve 3
Brocade(config-vif-3)# ipv6 vrrp vrid 2
Brocade(config-vif-3-vrid-2)# use-v2-checksum
```

History

Release version	Command history
08.0.01	This command was introduced for IPv6 VRRPv3 sessions running on FastIron device images.
08.0.10b	This command was modified for IPv4 VRRPv3 sessions running on FastIron device images.

use-vrrp-path

Suppresses RIP advertisements for interfaces on which Virtual Router Redundancy Protocol (VRRP) or VRRP Extended (VRRP-E) backup routers are configured.

Syntax

use-vrrp-path
no use-vrrp-path

Command Default

RIP advertisements are sent from the backup router interface.

Modes

RIP router configuration mode

Usage Guidelines

A VRRP backup router includes route information for the interface that is backing up in RIP advertisements. As a result, other routers receive multiple paths for the interface and might unsuccessfully use the path to the backup router rather than the path to the master router. If the VRRP backup routers are suppressed from advertising the backed-up interface in RIP, other routers learn only the path to the master router for the backed-up interface.

The **no** form of this command resets the default behavior and RIP advertisements are sent from the backup router interface.

Examples

The following example enables RIP advertisement suppression for information about interfaces on VRRP or VRRP-E backup routers.

```
device# configure terminal
device(config)# router rip
device(config-rip-router)# use-vrrp-path
```

The following example disables RIP advertisement suppression.

```
device# configure terminal
device(config)# router rip
device(config-rip-router)# no use-vrrp-path
```

vendor-class

Specifies the vendor type and configuration value for a DHCP client.

Syntax

```
vendor-class { ascii | ip | hex} value
```

Parameters

ascii

The ASCII value of the DHCP client.

ip

The IP address of the DHCP client.

hex

The hexadecimal value of the DHCP client.

Modes

DHCP server pool configuration mode.

Examples

The following example specifies the vendor type and configuration value for a DHCP client.

```
device(config)# ip dhcp-server-pool cabo  
device(config-dhcp-cabo)# vendor-class ascii waikiki
```

verify

Allows the verification of boot images based on hash codes and the generation of hash codes where needed.

Syntax

```
verify { md5 | sha1 | crc32 } { primary | secondary } [ string ]
```

Parameters

md5

Verifies the file content using an MD5 checksum and generates a 16-byte hash code.

sha1

Verifies the file content using SHA-1 and generates a 20-byte hash code.

crc32

Verifies the file content using CRC32 and generates a 4-byte hash code.

primary

Verifies the primary boot image.

secondary

Verifies the secondary boot image.

string

A valid image file name or a generated hash code value.

Modes

Privileged EXEC mode

Usage Guidelines

This feature lets you select from three data integrity verification algorithms:

- MD5: Message-digest algorithm (RFC 1321)
- SHA1: US Secure Hash Algorithm (RFC 3174)
- CRC: Cyclic redundancy check algorithm

Examples

The following example shows how the **verify** command can be used to generate an MD5 hash value for the secondary image.

```
device# verify md5 secondary
device#.....Done
Size = 2044830, MD5 01c410d6d153189a4a5d36c955653862
```

Commands Sn - Z

verify

The following example shows how the **verify** command can be used to generate a SHA-1 hash value for the secondary image.

```
device# verify sha1 secondary
device#.....Done
Size = 2044830, SHA1 49d12d26552072337f7f5fcaef4cf4b742a9f525
```

The following example shows how the **verify** command can be used to generate a CRC32 hash value for the secondary image.

```
device# verify crc32 secondary
device#.....Done
Size = 2044830, CRC32 b31fcbc0
```

The following example shows how the **verify** command can be used to verify the hash value of a secondary image with a known value.

```
device# verify md5 secondary 01c410d6d153189a4a5d36c955653861
device#.....Done
Size = 2044830, MD5 01c410d6d153189a4a5d36c955653861
Verification SUCCEEDED.
```

The following example shows how the **verify** command can be used to verify the SHA-1 hash value of a secondary image with a known value.

```
device# verify sha1 secondary 49d12d26552072337f7f5fcaef4cf4b742a9f525
device#.....Done
Size = 2044830, sha 49d12d26552072337f7f5fcaef4cf4b742a9f525
Verification SUCCEEDED.
```

The following example shows how the **verify** command can be used to verify the CRC32 hash value of a secondary image with a known value.

```
device# verify crc32 secondary b31fcbc0
device#.....Done
Size = 2044830, CRC32 b31fcbc0
Verification SUCCEEDED
```

version

Sets the version number for a Virtual Router Redundancy Protocol (VRRP) session.

Syntax

version { **v2** | **v3** }

no version { **v2** | **v3** }

Command Default

VRRP version 2 is the default.

Parameters

v2

Configures VRRP version 2 for this session.

v3

Configures VRRP version 3 for this session.

Modes

Virtual routing ID interface configuration mode

Usage Guidelines

The **no** form of this command resets the VRRP session to the default of version 2.

VRRP version 2 supports IPv4 addresses, and VRRP version 3 supports both IPv4 and IPv6 addresses.

NOTE

Mixed mode (VRRPv2 and VRRPv3) is not supported in the same VRRP virtual routing ID (VRID) session.

Examples

The following example sets VRRP routing instance VRID 1 to version 3.

```
device# configure terminal
device(config)# router vrrp
device(config)# interface ethernet 1/1/6
device(config-if-e1000-1/1/6)# ip address 10.53.5.1/24
device(config-if-e1000-1/1/6)# ip vrrp vrid 1
device(config-if-e1000-1/1/6-vrid-1)# version v3
```

violation

Configures the device to take actions when a security violation occurs; either drop packets from the violating address (and allow packets from secure addresses), or disable the port for a specified time.

Syntax

```
violation { restrict age | shutdown time }
```

```
no violation { restrict age | shutdown time }
```

Command Default

The action to be taken when security violation occurs is not configured.

Parameters

restrict

Configures the device to drop packets from a violating address and allow packets from secure addresses.

age

Configures the time, in minutes, for which the device drops packets from a violating address. The valid values are from 0 through 1440 minutes. The default is 5 minutes. Specifying 0 drops packets from the violating address permanently.

shutdown *time*

Configures the device to disable the port for a specified amount of time, in minutes, when a security violation occurs. The valid values are from 0 through 1440 minutes. Specifying 0 shuts down the port permanently when a security violation occurs.

Modes

Port security configuration mode

Port security interface configuration mode

Usage Guidelines

A security violation can occur when a user tries to connect to a port where a MAC address is already locked, or the maximum number of secure MAC addresses has been exceeded. When a security violation occurs, an SNMP trap and syslog message are generated. You can configure the device to take one of two actions when a security violation occurs; either drop packets from the violating address (and allow packets from secure addresses), or disable the port for a specified time.

When the **restrict** option is used, the maximum number of MAC addresses that can be restricted is 128. If the number of violating MAC addresses exceeds this number, the port is shut down. An SNMP trap and the following syslog message are generated: "Port Security violation restrict limit 128 exceeded on interface ethernet port_id ". This is followed by a port shutdown syslog message and trap. Aging for restricted MAC addresses is done in software. There can be a worst case inaccuracy of one minute from the specified time. The restricted MAC addresses are denied in hardware.

The **no** form of the command removes the security violation action settings.

Examples

The following example configures the device to drop packets from a violating address and allow packets from secure addresses.

```
device(config)# interface ethernet 1/7/11
device(config-if-e1000-1/7/11)# port security
device(config-port-security-e1000-1/7/11)# violation restrict
```

The following example shows how to specify the number of minutes that the device drops packets from a violating address.

```
device(config)# interface ethernet 1/7/11
device(config-if-e1000-1/7/11)# port security
device(config-port-security-e1000-1/7/11)# violation restrict 5
```

The following example shuts down the port for 5 minutes when a security violation occurs.

```
device(config)# interface ethernet 1/7/11
device(config-if-e1000-1/7/11)# port security
device(config-port-security-e1000-1/7/11)# violation shutdown 5
```

virtual-ip

Configures the IP address of the Aruba ClearPass server as the virtual IP address.

Syntax

virtual-ip *ip-address*

no virtual-ip *ip-address*

Command Default

A virtual IP address is not configured.

Parameters

ip-address

Specifies the IP address of the Aruba ClearPass server where the web pages are hosted.

Modes

Captive portal configuration mode

Usage Guidelines

The **no** form of the command removes the virtual IP address configuration.

Examples

The following example configures the IP address of the Aruba ClearPass server as the virtual IP address.

```
device(config)# captive-portal cp_brocade
device(config-cp-cp_brocade)# virtual-ip 10.21.240.42
```

History

Release version	Command history
8.0.40	This command was introduced.

virtual-port

Configures the HTTP port number to facilitate HTTP services for the clients in external Web Authentication.

Syntax

virtual-port *http-port-number*

no virtual-port *http-port-number*

Command Default

A virtual port number is not configured.

Parameters

http-port-number

Specifies the port number. By default, HTTPS is used and the default port number for HTTPS is 443.

Modes

Captive portal configuration mode

Usage Guidelines

The protocol configured in the Captive Portal profile must be the same as the protocol configured as part of web management access using the **web-management** command.

You can also specify HTTP mode and the default port number for HTTP is 80.

The **no** form of the command removes the virtual port number configuration.

Examples

The following example configures the virtual port number used by HTTP.

```
device(config)# captive-portal cp_brocade
device(config-cp-cp_brocade)# virtual-port 80
```

History

Release version	Command history
8.0.40	This command was introduced.

vlan

Creates VLANs.

Syntax

vlan *vlan-id* [**to** *vlan-id* | [*vlan-id to vlan-id* | *vlan-id*] ...] [**name** *string*] [**by port**]

no vlan *vlan-id* [**to** *vlan-id* | [*vlan-id to vlan-id* | *vlan-id*] ...] [**name** *string*] [**by port**]

Command Default

The default VLAN is 1.

Parameters

vlan-id

Specifies the VLAN ID.

to *vlan-id*

Creates a range of VLANs.

name *string*

Specifies the name of the VLAN. The name can be up to 32 characters in length.

by port

Configures the VLAN as a port-based VLAN.

Modes

Global configuration mode

Usage Guidelines

You can configure up to 1023 port-based VLANs on a device running Layer 2 code or 4061 port-based VLANs on a device running Layer 3 code. Each port-based VLAN can contain either tagged or untagged ports. A port cannot be a member of more than one port-based VLAN unless the port is tagged.

NOTE

VLAN IDs 4087, 4090, and 4093 are reserved for Brocade internal use only. VLAN 4094 is reserved for use by Single STP. Also, VLAN IDs 4091 and 4092 may be reserved for Brocade internal use only. If you want to use VLANs 4091 and 4092 as configurable VLANs, you can assign them to different VLAN IDs

The **no** form of the command removes the VLAN.

Examples

The following example shows how to create a port-based VLAN.

```
device(config)# vlan 222 by port
```

The following example shows the port-based VLAN configuration.

```
device(config)# vlan 10 name IP_VLAN by port
device(config-vlan-10)# untagged ethernet 1/1/1 to 1/1/6
added untagged port ethe 1/1/1 to 1/1/6 to port-vlan 10.
```

The following example shows how to create continuous and discontinuous VLANs.

```
device(config)# vlan 2 to 7 20 25
device(config-mvlan-2*25)#
```

The following example shows how to create continuous VLANs.

```
device(config)# vlan 2 to 7
device(config-mvlan-2-7)#
```

The following example shows how to create discontinuous VLANs.

```
device(config)# vlan 2 4 7
device(config-mvlan-2*7)#
```

vlan-config

Configures Virtual Local Area Network (VLAN) tasks such as adding ports to a VLAN, moving untagged port membership between VLANs, and removing ports from a VLAN.

Syntax

vlan-config add [**all-tagged**]

vlan-config move [**untagged** *VLAN ID*]

vlan-config remove [**all** | **vlan** *VLAN ID*]

Command Default

These commands work only when there are active VLANs preconfigured on the device.

Parameters

add

Adds a port to all the configured active VLANs.

all-tagged

Adds an interface to all VLANs as tagged members.

move

Moves an untagged port from one VLAN to another VLAN.

untagged *VLAN ID*

Moves the specific untagged VLAN port to another VLAN. It also moves the default VLAN of a dual mode port to another VLAN. The VLAN ID ranges from 1 to 4095.

remove

Removes a tagged or an untagged port from the VLAN.

all

Removes all VLANs from the physical port.

vlan *VLAN ID*

Removes the VLAN as specified by the VLAN ID from the physical port. The VLAN ID ranges from 1 to 4095.

Modes

Interface configuration mode

Usage Guidelines

Using the **vlan-config add** command, you can associate a port to all active VLANs in the system. This command cannot be run on a multiple interface command mode. It is not available on a private VLAN-enabled port and is not applicable to VLAN groups, MCT VLANs, GVRP, SPX PE ports, and flex-auth ports.

NOTE

The command line prompt will not be available for the next command until the port is added to all VLANs in the system.

Using the **vlan-config move** command, you can move untagged ports from one VLAN to another without having to remove an untagged port from the old VLAN and to again add it to the new VLAN. This command can be run on a multiple interface command mode.

NOTE

- If a new VLAN is not configured, the system allows creation of a new VLAN and the port is added to it. However, if the port is part of a port extender device and has allowed VLANs configured on it, then the system does not allow creation of a new VLAN.
- The VLAN port that is being moved should either be a dual mode port or should be part of a non-default VLAN. A port cannot be moved to or from a private VLAN.

Examples

The following example adds an interface to all tagged VLANs in the system.

```
device(config)# interface ethernet 1/1/9
device(config-if-e1000-1/1/9) vlan-config add all-tagged
```

The following example moves the specific untagged membership of 1/1/9 from a VLAN to VLAN 40 in the system.

```
device(config)# interface ethernet 1/1/9
device(config-if-e1000-1/1/9) vlan-config move untagged 40
```

The following example removes all VLANs from the physical port in the system.

```
device(config)# interface ethernet 1/1/9
device(config-if-e1000-1/1/9) vlan-config remove all
```

History

Release version	Command history
08.0.50	This command was introduced.

vlan-group

Configures a VLAN group.

Syntax

vlan-group *num* **vlan** *vlan-id* [**to** *vlan-id*]
no **vlan-group** *num* **vlan** *vlan-id* [**to** *vlan-id*]

Command Default

A VLAN group is not configured.

Parameters

- num*
Specifies the group VLAN ID. The values can be from 1 through 32.
- vlan** *vlan-id*
Specifies the starting VLAN ID to create a VLAN group.
- to** *vlan-id*
Specifies the ending VLAN ID. This is a continuous range of individual VLAN IDs.

Modes

Global configuration mode

Usage Guidelines

Specify the low VLAN ID first and the high VLAN ID second. The command adds all of the specified VLANs to the VLAN group. You can add up to 256 VLANs with the command at one time.

If a VLAN within the range you specify is already configured, or if the range contains more than 256 VLANs, the VLAN group is not created and an error message is displayed.

To add more than 256 VLANs, enter the **add-vlan** command in VLAN group configuration mode.

The **no** form of the command deletes the VLAN group.

Examples

The following example shows the VLAN group configuration.

```
device(config)# vlan-group 1 vlan 2 to 255
```

voice-vlan

Creates a voice VLAN ID for a port, or for a group of ports on which a voice over IP (VOIP) phone is connected.

Syntax

voice-vlan *num*

no voice-vlan *num*

Command Default

A voice VLAN ID is not configured.

Parameters

num

Specifies a valid VLAN ID. Valid values are between 1 and 4095.

Modes

Interface configuration mode

Usage Guidelines

When you configure a voice VLAN ID on the port to which the VoIP phone is connected, the device automatically detects and reconfigures the VoIP phone when it is physically moved from one port to another within the same device.

When the Brocade device receives the VoIP phone query, it sends the voice VLAN ID in a reply packet to the VoIP phone. The VoIP phone then configures itself within the voice VLAN.

As long as the port to which the VoIP phone is connected has a voice VLAN ID, the phone will configure itself into that voice VLAN. If you change the voice VLAN ID, the software will immediately send the new ID to the VoIP phone, and the VoIP phone will reconfigure itself with the new voice VLAN.

Some VoIP phones may require a reboot after configuring or reconfiguring a voice VLAN ID.

The **no** form of the command removes the voice VLAN ID from the port.

Examples

The following example creates a VLAN ID for a port.

```
device(config)# interface ethernet 2/1/1
device(config-if-e1000-2/1/1)# voice-vlan 1001
```

The following example creates a VLAN ID for a group of ports.

```
device(config)# interface ethernet 1/1/2 to 1/1/10
device(config-if-e1000-1/1/2-1/1/10)# voice-vlan 1005
```

vrf

Configures a Virtual Routing and Forwarding (VRF) and enters VRF configuration mode.

Syntax

vrf *vrf-name*

no vrf *vrf-name*

Command Default

A VRF is not created.

Parameters

vrf-name

Specifies the name of the VRF. The name can be up to 255 characters.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command removes the VRF.

Examples

The following example configures a VRF and enters VRF configuration mode.

```
device(config)# vrf vrfl  
device(config-vrf-vrfl)#
```

vrf forwarding

Assigns a VRF routing instance to an interface.

Syntax

vrf forwarding *vrf-name*

no vrf forwarding *vrf-name*

Command Default

VRF routing instance is not assigned to an interface.

Parameters

vrf-name

Specifies the name of the VRF that the interface is being assigned to.

Modes

Interface configuration mode

Usage Guidelines

When the VRF is configured on a tunnel, all IPv4 and IPv6 addresses are removed. The tunnel loopback configuration is removed.

The **no** form of the command removes the VRF routing instance assigned to an interface. IP addresses and protocol configuration on this Layer 3 interface are removed.

Examples

The following examples assigns a VRF instance to the Ethernet interface 1/1/1.

```
device(config)# interface ethernet 1/1/1
device(config-if-e1000-1/1/1)# vrf forwarding guest
```

vsrp

Configures VSRP on a device.

Syntax

vsrp vrid *vrid-num*

no vsrp vrid *vrid-num*

Command Default

VSRP is not configured.

Parameters

vrid *vrid-num*

Configures the VRID for the VLAN. The VRID range is from 1 through 255.

Modes

VLAN configuration mode

Usage Guidelines

The **no** form of the command clears the VSRP configuration.

Examples

The following example shows how to configure the VRID.

```
device(config)# vlan 200
device(config-vlan-200)# vsrp vrid 1
```

vsrp auth-type

Configures a simple text-string as a password in packets sent on the interface.

Syntax

vsrp auth-type { **no-auth** | **simple-text-auth** *password* }

no vsrp auth-type { **no-auth** | **simple-text-auth** *password* }

Command Default

By default, no authentication is configured.

Parameters

auth-type

Configures the VSRP authentication type.

no-auth

Configures the VRID and interface without authentication.

simple-text-auth *password*

Configures the VRID to use simple text authentication with a password up to 8 characters long.

Modes

VLAN configuration mode

Usage Guidelines

If the interfaces on which you configure the VRID use authentication, the VSRP packets on those interfaces also must use the same authentication.

- No authentication - The interfaces do not use authentication.
- Simple - The interfaces use a simple text-string as a password in packets sent on the interface. If the interfaces use simple password authentication, the VRID configured on the interfaces must use the same authentication type and the same password.

Examples

The following example shows how to configure a simple password.

```
device(config)# vlan 200
device(config-vlan-200)# vsrp auth-type simple-text-auth ourpword
```

vsrp-aware

Configures the security features on a VSRP-aware device.

Syntax

vsrp-aware vrid *vrid* **tc-vlan-flush**

no vsrp-aware vrid *vrid* **tc-vlan-flush**

vsrp-aware vrid *vrid* { **no-auth** | **simple-text-auth** *password* } [**port-list** **ethernet** *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*]...]]

no vsrp-aware vrid *vrid* { **no-auth** | **simple-text-auth** *password* } [**port-list** **ethernet** *stackid/slot/port* [**to** *stackid/slot/port* | [**ethernet** *stackid/slot/port* **to** *stackid/slot/port* | **ethernet** *stackid/slot/port*]...]]

Command Default

VSRP-aware security features are not configured.

Parameters

vrid *vrid*

Specifies the VRID of the VSRP device. The valid range is from 1 through 255.

tc-vlan-flush

Flushes the MAC addresses learned on the VSRP-aware VLAN upon topology change.

no-auth

Configures no authentication as the preferred VSRP-aware security method. The VSRP device will not accept incoming packets that have authentication strings.

simple-text-auth *password*

Defines an authentication string to accept incoming VSRP Hello packets. The password can be up to 8 characters in length.

port-list

Configures the range of ports to include in the configuration.

ethernet *stackid/slot/port*

Specifies the Ethernet interface.

to *stackid/slot/port*

Specifies the range of Ethernet interfaces.

Modes

VLAN configuration mode

Usage Guidelines

When the **tc-vlan-flush** option is enabled, MAC addresses will be flushed at the VLAN level, instead of at the port level. MAC addresses will be flushed for every topology change received on the VSRP-aware ports. When you configure the **tc-vlan-flush** option on a VSRP-aware device, and the device receives VSRP Hello packets from the VSRP master, VSRP authentication is automatically configured. However, if the VSRP-aware device does not receive VSRP Hello packets from the VSRP master when the **tc-vlan-flush** option is configured, you must manually configure VSRP authentication.

The **no** form of the command clears the security features on the VSRP-aware device.

Examples

The following example shows how to configure the MAC addresses to be flushed at the VLAN level.

```
device(config)# vlan 200
device(config-vlan-200)# vsrp-aware vrid 11 tc-vlan-flush
```

The following example shows how to configure a simple authentication string for the VSRP.

```
device(config)# vlan 10
device(config-vlan-10)# vsrp-aware vrid 3 simple-text-auth pri-key
```

The following example shows how to configure no authentication for the VSRP.

```
device(config)# vlan 10
device(config-vlan-10)# vsrp-aware vrid 2 no-auth
```

The following example shows how to configure no authentication for a range of Ethernet ports.

```
device(config)# vlan 10
device(config-vlan-10)# vsrp-aware vrid 4 no-auth port-list ethernet 1/1/1 to 1/1/4
```

web access-group

Configures an ACL that restricts web management access to the device.

Syntax

web access-group { *acl-num* | *acl-name* | **ipv6** *ipv6-acl-name* }

no web access-group { *acl-num* | *acl-name* | **ipv6** *ipv6-acl-name* }

Command Default

Web management access is not restricted.

Parameters

acl-num

The standard access list number. The valid values are 1 through 99.

acl-name

The standard access list name.

ipv6 *ipv6-acl-name*

The IPv6 access list name.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command removes the restriction of web management access for an ACL.

Examples

The following example shows how to configure an ACL that restricts web management access to the device. In this example, ACL 12 is configured. The device denies web management access from the IP addresses listed in ACL 12 and permits web management access from all other IP addresses. Without the last ACL entry for permitting all packets, this ACL would deny web management access from all IP addresses.

```
device(config)# access-list 12 deny host 209.157.22.98 log
device(config)# access-list 12 deny 209.157.23.0 0.0.0.255 log
device(config)# access-list 12 deny 209.157.24.0/24 log
device(config)# access-list 12 permit any
device(config)# web access-group 12
device(config)# write memory
```

web client

Restricts web management access to a host with a specified IP address.

Syntax

web client {*ip-address* | **ipv6** *ipv6-address* }

no web client {*ip-address* | **ipv6** *ipv6-address* }

Command Default

Web management access is not restricted.

Parameters

ip-address

The IPv4 address of the host to which the web management access is restricted.

ipv6 *ipv6-address*

The IPv6 address of the host to which the web management access is restricted.

Modes

Global configuration mode

Usage Guidelines

You can specify only one IP address with one command. However, you can enter the command ten times to specify up to ten IP addresses.

The **no** form of the command removes the web management access restriction.

Examples

The following example shows how to restrict web management access to the host with IP address 192.168.10.1.

```
device(config)# web client 192.168.10.1
```

webauth

Configures a Web Authentication VLAN and enters the Web Authentication configuration mode.

Syntax

webauth

no webauth

Modes

VLAN configuration mode

Usage Guidelines

Use the **enable** command in the Web Authentication configuration mode to enable Web Authentication.

The **no** form of the command removes the Web Authentication VLAN.

Examples

The following example shows how to configure a Web Authentication VLAN.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config(config-vlan-10-webauth)#
```

The following example deletes a Web Authentication VLAN.

```
device(config)# vlan 10
device(config-vlan-10)# no webauth
```

webauth-redirect-address

Configures a redirect address for Web Authentication to prevent the display of error messages saying that the certificate does not match the name of the site.

Syntax

webauth-redirect-address *address-string*

no webauth-redirect-address [*address-string*]

Command Default

By default, the Web Authentication address returned to the browser is the IP address of the switch.

Parameters

address-string

Specifies the redirect address. You can specify up to 64 alphanumeric characters.

Modes

Global configuration mode

Web Authentication configuration mode

Usage Guidelines

You can enter any value for the address string , but entering the name on the security certificate prevents the display of error messages saying that the security certificate does not match the name of the site.

On a Layer 2 device, the command is supported in Global configuration mode and on a Layer 3 device the command is supported in Web Authentication configuration mode.

The **no** form of the command resets the redirect address to that of the IP address of the switch.

Examples

The following example shows how to set the Web Authentication redirect address on a Layer 3 switch.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# webauth-redirect-address my.domain.net
```

web-management

Configures web management access options.

Syntax

web-management [**enable** { **vlan** *vlan-id* | **ethernet** *stack/slot/port* [**to** *stack/port/slot* | [**ethernet** *stack/slot/port* **to** *stack/port/slot* | **ethernet** *stack/slot/port*]...] }]

no web-management [**enable** { **vlan** *vlan-id* | **ethernet** *stack/slot/port* [**to** *stack/port/slot* | [**ethernet** *stack/slot/port* **to** *stack/port/slot* | **ethernet** *stack/slot/port*]...] }]

web-management [**allow-no-password** | **connection-receive-timeout** *timeout-value* | **frame** { **bottom** | **front-panel** | **menu** } | **hp-top-tools** | **http** | **https** | **list-menu** | **page-menu** | **page-size** *size* | **session-timeout** *time* | **tcp-port** *port-num*]

no web-management [**allow-no-password** | **connection-receive-timeout** *timeout-value* | **frame** { **bottom** | **front-panel** | **menu** } | **hp-top-tools** | **http** | **https** | **list-menu** | **page-menu** | **page-size** *size* | **session-timeout** *time* | **tcp-port** *port-num*]

web-management [**refresh** { **front-panel** | **port-statistic** | **rmon** | **stp** | **tftp** } *refresh-time*]

no web-management [**refresh** { **front-panel** | **port-statistic** | **rmon** | **stp** | **tftp** } *refresh-time*]

Command Default

Web management is enabled.

Parameters

enable

Enables web management only to clients in a specific VLAN or Ethernet interface.

vlan *vlan-id*

Specifies that web management should be enabled on the clients of the specified VLAN.

ethernet *stack/sport/slot*

Specifies the Ethernet interface on which web management should be enabled.

to *stack/sport/slot*

Specifies the range of Ethernet interfaces.

allow-no-password

Allows the web server to have no password.

connection-receive-timeout *timeout-value*

Specifies the web connection receive timeout.

frame

Enables a frame.

bottom

The bottom frame.

front-panel

The front-panel frame.

menu

The menu frame.

hp-top-tools

Enables the support of HP Top Tools.

http

Enables web management for HTTP access.

https

Enables web management for HTTPS access.

list-menu

Displays the web menu as a list.

page-menu

Enables the page menu.

page-size *size*

Configures the maximum number of entries on a page.

session-timeout *time*

Configures the web session timeout in seconds. Valid values are from 5 through 65000.

tcp-port *port-num*

Configures the HTTP port. The default port is 80.

refresh

Configures the page refresh (polling time) in seconds.

front-panel

Configures the front-panel refresh time.

port-statistic

Configures the port statistic refresh time.

rmon

Configures the RMON statistics refresh time.

stp

Configures the STP statistics refresh time.

tftp

Configures the TFTP statistics refresh time.

refresh-time

The refresh time in seconds.

Modes

Global configuration mode

Usage Guidelines

The **no** form of the command removes the web management configurations.

Examples

The following example shows how to enable web management for HTTPS access.

```
device(config)# web-management https
```

The following example shows how to enable web management access only to clients connected to ports within port-based VLAN 10.

```
device(config)# web-management enable vlan 10
```

The following example shows how to enable web management access on a range of Ethernet interfaces.

```
device(config)# web-management enable ethernet 1/1/1 to 1/2/3
```

The following example shows how to configure the front-panel refresh time to 30 seconds.

```
device(config)# web-management refresh front-panel 30
```

webpage custom-text

Customizes the text that appears on the title bar, login button, header, and footer on the Web Authentication pages.

Syntax

```
webpage custom-text { bottom footer | login-button button-text | title title-text | top header }
```

```
no webpage custom-text { bottom footer | login-button button-text | title title-text | top header }
```

Command Default

The default header text is "Welcome to Brocade Communications, Inc. Web Authentication Homepage".

The default title bar text is "Web Authentication".

The default login button text is "Login".

The default footer text is "This network is restricted to authorized users only. Violators may be subjected to legal prosecution. Activity on this network is monitored and may be used as evidence in a court of law. Copyright <year> Brocade Communications, Inc."

Parameters

bottom *footer*

Customizes the footer on a Web Authentication page. Specify up to 255 alphanumeric characters for the string.

login-button *button-text*

Customizes the login button that appears on the bottom of the Web Authentication Login page. Enter up to 32 alphanumeric characters for the string.

title *title-text*

Customizes the title bar that appears on all Web Authentication pages. You can specify up to 128 alphanumeric characters.

top *header*

Customizes the header that appears on all Web Authentication pages. You can specify up to 255 alphanumeric characters.

Modes

Web Authentication configuration mode

Usage Guidelines

You can use the **show webauth** command to view the configured text for Web Authentication pages.

The **no** form of the command resets the text to the default.

Examples

The following example shows how to customize the text on the title bar.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# webpage custom-text title "Brocade Secure Access Page"
```

The following example shows how to customize the header that appears on all Web Authentication pages.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# webpage custom-text top "Welcome to Network One"
```

The following example shows how to customize the login button that appears on the bottom of the Web Authentication Login page.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# webpage custom-text login-button "Press to Log In"
```

The following example shows how to customize the footer that appears on all Web Authentication pages.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# webpage custom-text bottom "Network One Copyright 2010"
```

webpage logo

Customizes the logo that appears on all Web Authentication pages and its placement.

Syntax

```
webpage logo { copy tftp { ipv4-address | ipv6-address } file-name | align { left | center | right } }  
no webpage logo [ copy tftp { ipv4-address | ipv6-address } file-name | align [ left | center | right ] ]
```

Command Default

By default, the logo is left-aligned at the top of the page.

Parameters

copy tftp

Copies an image from the TFTP server to the switch.

ipv4-address

Specifies the IPv4 address of the TFTP server.

ipv6-address

Specifies the IPv6 address of the TFTP server.

file-name

Specifies the name of the file that must be copied from the TFTP server to the switch.

align

Configures the placement of the logo on the Web Authentication pages.

left

Aligns the logo to the left at the top of the page.

right

Aligns the logo to the right at the top of the page.

center

Aligns the logo to the center at the top of the page.

Modes

Web Authentication configuration mode

Usage Guidelines

To customize the banner image, use TFTP to upload an image file from a TFTP server to the FastIron switch. The image file can be in the jpg, bmp, or gif format, and its file size must be 64 KB or less. When you upload a new image file, it will overwrite the existing image file.

The **no** form of the command deletes the logo from all Web Authentication pages and removes it from flash memory.

NOTE

The **webpage logo** command downloads the image file and stores it in the device flash memory. Therefore, it is not necessary to follow this command with a **write memory** command.

Examples

The following example shows how to replace the existing logo with a new one.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# webpage logo copy tftp 10.10.5.1 brocadelogo.gif
```

The following example shows how to right-justify the log at the top of the page.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# webpage logo align right
```

webpage terms

Customizes the text box that appears on the Web Authentication Login page.

Syntax

webpage terms copy tftp { *ipv4-address* | *ipv6-address* } *file-name*

no webpage terms copy tftp { *ipv4-address* | *ipv6-address* } *file-name*

Command Default

By default, the text box is empty and is not visible.

Parameters

copy tftp

Copies an ASCII text file from a TFTP server to the switch.

ipv4-address

The IPv4 address of the TFTP server.

ipv6-address

The IPv4 address of the TFTP server.

file-name

Specifies the name of the text file on the TFTP server.

Modes

Web Authentication configuration mode

Usage Guidelines

The text file size must not exceed 2 KB.

NOTE

The **webpage terms** command downloads the text file and stores it in the device flash memory. Therefore, it is not necessary to follow this command with a **write memory** command.

The **no** form of the command reverts back to the default; that is, the textbox is empty and not visible.

Examples

The following example shows how to create or replace a text box.

```
device(config)# vlan 10
device(config-vlan-10)# webauth
device(config-vlan-10-webauth)# webpage terms copy tftp 10.10.5.1 policy.txt
```

wpad

Specifies the Proxy Auto-Config (PAC) file location using the Web Proxy Auto-Discovery (WPAD) protocol.

Syntax

wpad *ASCII -string*

no wpad *ASCII -string*

Parameters

ASCII-string

The full network location of the PAC file.

Modes

DHCP server pool configuration mode

Usage Guidelines

The **no** form of the command removes the specified string from the server pool.

Examples

The following example specifies the location of the PAC file.

```
device(config)# ip dhcp-server pool cabo  
device(config-dhcp-cabo)# wpad http://172.26.67.243:8080/wpad.dat
```

History

Release version	Command history
8.0.40	This command was introduced.

write terminal

Displays the running configuration.

Syntax

write terminal

Modes

User EXEC mode

Privileged EXEC mode

Global configuration mode

Usage Guidelines

This command performs the same function as the **show running-config** command.

Examples

The following example displays the running configuration.

```
device(config)# write terminal

xwindow-manager

Specifies the IP addresses of systems that are running the X Window System Display Manager and are available to the client.

Syntax

xwindow-manager *ip-address* [*ip-address*] [*ip-address*]

no xwindow-manager *ip-address* [*ip-address*] [*ip-address*]

Parameters

ip-address

Specifies an IP address of the system running the X Window System Display Manager.

Modes

DHCP server pool configuration mode

Usage Guidelines

You can configure a maximum of three X Window System Display Manager IP addresses in a DHCP server pool.

The **no** form of the command removes the X Window System Display Manager IP addresses from the DHCP server pool.

Examples

The following example configures the IP addresses of systems that are running the X Window System Display Manager in a DHCP server pool.

```
device(config)# ip dhcp-server pool cabo
device(config-dhcp-cabo)# xwindow-manager 10.38.12.1 10.38.12.3 10.38.12.5
```

History

Release version	Command history
8.0.30b	This command was introduced.

zero-touch-enable

Allows the CB in a Campus Fabric (SPX) domain to discover PE candidates and convert them to active PE units.

Syntax

zero-touch-enable
no zero-touch-enable

Command Default

Disabled by default.

Modes

CB configuration sub-mode.

Usage Guidelines

The **no** form of the command disables zero-touch functions.

The command should be disabled if the user does not intend to discover new units in the domain.

Brocade recommends removing **zero-touch-enable** configuration after all PEs are added.

The command cannot discover existing PE or provisional PE units.

The command is available only on an ICX 7750 device configured as a CB.

Related commands:

- **zero-touch-ports**
- **spx interactive-setup**
- **spx zero-touch-deny**

Examples

The following example enables the zero-touch utility. It also removes **spx zero-touch-deny** configuration, if present.

```
device# configure terminal
device(config)# spx cb-configure
device(config-spx-cb)# zero-touch-enable
```

History

Release version	Command history
08.0.50	This command was introduced.

zero-touch-ports

Defines additional ports on which candidate PE units can be discovered when the zero touch provisioning utility or spx interactive-setup is enabled.

Syntax

zero-touch-ports *portlist*

no zero-touch-ports *portlist*

Command Default

By default, ports are not used for PE discovery.

Parameters

portlist

Port, list of ports, port range, or combination to be used for discovering 802.1br (SPX) PE candidates.

Modes

CB configuration mode.

Usage Guidelines

The **no** form of the command disables zero-touch and spx-interactive probes on the specified ports and makes them available for other uses.

Only CB ports can be configured as zero-touch ports.

Port ranges for zero-touch ports are independent from SPX port or LAG ranges. Changing one range does not affect the other.

Ports designated as zero-touch ports are used only to discover new PE candidates. They do not modify existing SPX ports or LAGs. For example, if a user connects a new link between the CB and an existing PE unit, the new link is not discovered. The user must manually add or remove a port to or from an existing SPX link or SPX LAG.

Brocade recommends that **zero-touch-ports** designation be removed once all candidate PEs have been discovered. Once the designation is removed, the ports can be configured for other purposes.

Related commands:

- **zero-touch-enable**
- **spx interactive-setup**

Examples

The following example designates a range of ports from 1/1/10 through 1/1/20 as zero-touch-ports.

```
device# configure terminal
device(config)# spx cb-configure
device(config-spx-cb)# zero-touch-ports 1/1/10 to 1/1/20
```

The following example designates three independent ports (2/1/5, 2/1/7, and 3/1/9) as well as a range of ports (3/1/2 to 3/1/5) as zero-touch ports.

```
device# configure terminal
device(config)# spx cb-configure
device(config-spx-cb)# zero-touch-ports 2/1/5 2/1/7 3/1/2 to 3/1/5 3/1/9
```

The following example removes **zero-touch-ports** designation from two ports, 1/1/7 and 1/1/8.

```
device# configure terminal
device(config)# spx cb-configure
device(config-spx-cb)# no zero-touch-ports 1/1/7 to 1/1/8
```
